INTRODUCTION

§ 1. The History of the Ulus of Jochi and the Ways It Has Been Interpreted in Modern Times

Mirkasym Usmanov

We can correctly evaluate both historical figures and peoples only when we have information about their lives in all their manifestations; judging figures and peoples based on separate facts and separate sides of their activity is wholly an unscientific method, unfortunately, used sometimes by contemporary historians.

V. Bartold

Instead of a preface

In the history of a number of ethnoses of medieval Eurasia, including nations that were a part of the former Russian Empire, its successor (the USSR), and the modern Russian Federation, there is always an epoch that was covered, especially during the Soviet Union period, quite distinctively, and sometimes even absurdly contradictorily and deceitfully. We are referring to the history of peoples of the country of the 13–16th centuries in general—that is, the epoch of Ulus of Jochi—the state that became famous under the name of the Golden Horde. The formation of this state, which by size of territory and number of its constituent peoples could be called a great Eurasian Empire, took place from 1240–1260, as a result of the dissolution of the Great Mongol power that had formed in the first quarter of the same century.

The events connected with the formation of the Mongol power itself took place at the end of the 12th and the first quarter of the 13th centuries in Central Asia, where, as a result of the unification of nomadic 'principalities' that had been enemies for a long time, a new Khanate was formed. At its head was a most talented and lucky 'prince' by name of Temuchin (Temuchjin), who obtained the name-title of *Chinggis Khan* (1180) when he was crowned. Later on he won victories over other Mongolian and Turkic nomadic 'principalities'. At the great Kurultai, which took

place in the summer of 1206 in the valley of the Onon river, the formation was declared of a united Mongolian state headed by a *Khagan*—that is, 'Khan of Khans', the great Khan in the person of Chinggis Khan.

All the events of the first part of the 13th century that occurred on two continents—Asia and Europe—are connected with the name of this ruler. For, after consolidating his power and implementing a number of important military administrative and social changes—that is, *reforms*, Chinggis Khan embarked on a sequence of foreign territorial expansions that was typical of that period.

During the lifetime of Chinggis-Khan, his state first absorbed the lands and tribes of the Altai-Sayan Mountains, a part of Southern Siberia, and Uighur principalities by various methods—political pressure or military operations. As a result of constant military campaigns, the Mongols conquered North China, states and peoples of Middle Asia, the North Caucasus, Crimea and the kingdom of the Tanguts of Xi Xia. The Mongolian influence stretched from the Sea of Japan and the Yellow Sea in the east to the Lower Volga Regions and the North Caucasus in the west. Thus, in 15 to 20 years Chinggis Khan created a large-scale, multi-ethnic state that, in fact, was a new empire.

After the death of Chinggis Khan (1227), his sons and grandsons continued to conquer.

In the east the Jurchen state, the empire of the South Sung Dynasty, and Korean states were conquered. In the south-west, the cities and regions of Afghanistan, Iran, Iraq and Transcaucasia were also subjugated. In the north-west, Volga Bulgaria, principalities of north-east Rus', and some parts of South-Eastern Europe were exposed to invasions. Some principalities and regions in the extreme west and north-west, acknowledging their dependence on the Mongols, were in the position of protectorates or vassals, having a certain autonomy, but regularly forced to pay tribute, taxes and recruits to be warriors in the Mongol army. This happened, for example, to countries and peoples whose princes, at least, some of them, didn't put up strong resistance and strove to find a common language with their conquerors...

Thus, in 40 to 50 years the large-scale and multi-national power of the Chinggisids was created—the Great Mongol Empire—or more precisely, a super empire, stretching from the Pacific Ocean almost to the Atlantic Ocean.

However, the Chinggisid superpower was not destined to last long. About 50 to 60 years after the beginning of foreign expansions, it began to disintegrate. This was due to internal contradictions because of the differences in the social, economic, ethnic, cultural, political and religious interests of the different regions and uluses, and was hastened when the central power weakened in the 1260s because of the struggle between Khubilai and Ariq Böke for the great Khan throne. Thus, four new states were formed—the ulus of the Great Khan (the Empire of Yuan) and uluses of Jochi, Chagatai and Hulagu. They also were great empires both by territory and population.

* * *

In historiography, the date the Ulus of Jochi—the Golden Horde—received independence is generally cited as the 1240s—that is, the period when Batu Khan returned from the Western campaign to the Volga Region. This is most likely incorrect. This date is a result of absolutizing the information of later editors of Russian chronicles who, behind the back of the powerful 'Batu Khan', who was authorita-

tive for them and for Russian princes, could not realize (often when looking back) the significance of the Great Khan—the genuine sovereign of a united power. Latter researchers did not consider the fact that Batu Khan, who was a regent of the Great Khan (the second person by rank in the united empire), remained a unitarist to the end of his life.

Besides the position of Batu (died in 1255), the trips in 1255 and 1256 of Sartaq and Ulakchi (Ulagach) to Karakorum for the Great Khan to confirm their ascensions to the throne also contradict this dating. It is also worth noting that the attempts of Berke Khan (1256–1266) to mint his own coins failed because of sanctions of the great khan's authority. Only Mengu-Timur, the ruler of the Golden Horde from 1266–1282, began minting coins with the title of an independent ruler. And his money was not taken out of circulation. Beginning with this Khan, the Horde rulers in the early Russian chronicles are systematically styled as *Caesars*. Hence, the legal independence of Ulus Jochi should date to the end of the 1260s, more precisely, the spring of 1269, when the Chinggisids met and feasted on the Talas river. At the same time, some elements of an allied relationship were maintained between uluses.

Among the four ulus empires formed after the superpower disintegrated, the Ulus of Jochi and its vassal countries was, apparently, the largest one by territory. But by population, it was significantly behind the Yuan Empire.

The boundaries of Ulus of Jochi, beginning with Sayan-Altai-Tien-Shan mountains in the east, going along the lower reaches of the Syr Darya, covering the Khwarezm, the North Caspian, a significant part of the Caucasus, including Iranian Azerbaijan, Crimea, and the Black Sea Steppes in the south, went as far as the Lower Danube. In the west, the boundaries included the lands of the south Russian principalities, politically dependent countries including principalities of north-east Rus'. After Alexander Yaroslavich acknowledged the dependence of the Novgorod principality on Batu Khan, they also became vassals of Ulus of Jochi. Then, absorbing the territory of the Bulgarian kingdom, going through the Urals to cover west and southern Siberia, they went

as far as the Sayan Mountains. (Some researchers believe that the northern territories of the Jochid state reached the Arctic Ocean.)

As one can observe from this approximate description, the territory of the empire of Jochi and countries dependent on it was vast, but some parts of the south-east border were not stable. After several centuries, it almost coincided with a significant and the main part of the territory of the Russian Empire and its successor—the USSR.

The population of the Golden Horde was multi-ethnic. The ancestors of all the nations that now live in these areas were represented. The population was predominantly from the steppe and forest-steppe zones and a number of settled regions. The Khwarezm, Middle and Lower Volga Region, a part of the North Caucasus and Crimea, the so-called south Russian steppes were dominated by the Turkic peoples. In most cases they were native speakers of Kipchak and partially Oguz dialects. There were also some representatives of Iranian, Caucasus-Iberian, Alan-Circassian, Finnish-Ugric and east Slavic peoples.

During the conquests and later on, when the Chinggisids were administratively developing the main part of the country, there were some, sometimes significant, changes in the former ethnic map of this part of Eurasia because a kind of 'grinding' occurred—a mixing of tribes and peoples, especially within the Turkic ethnos. As a result, ratios of the components of the subsequent ethnic process were changed. To understand this complicated problem, the Turkification of the Mongols in the Golden Horde should be examined.

Thus, Ulus of Jochi formed as an independent state within a political-dynasty area as a result of the disintegration of the Mongol super empire. But it itself, by territory, and by the composition of the population, and also by the presence of many dependent, tax-paying countries with their many-language populations, was a new state that preserved, naturally, elements of the Mongol (Chinggisid) state culture. A conglomeration of Turkic nations who assimilated the Mongols that arrived, and the Chinggisids themselves, played a predominant role in it. Hence, those authors who try to

depict the Golden Horde as a 'national state' of only Mongols, or as some specific Turkic nation, or worse, as one later nation that formed after the empire disintegrated, are mistaken or are simplifying complicated events.

The Ulus of Jochi existed to the end of the 15th century as an united state, although it had experienced internal contradictions since the 1360s, and was extremely weakened as a result of a terrible plague ('the black plague'). Finally it fell at the very beginning of the 16th century (1502) as a result of an attack of the Crimean Khanate, which was a satellite of the Ottoman Empire. Hence, the state of Jochi—the Golden Horde—existed for 200 to 250 years. During that time it had a lasting influence on the social life, administrative institutions, culture and psychology of its peoples.

However, as was already mentioned, this period of history, which was significant in its length and vast in the territory it encompassed, has been researched, to put it mildly, obviously not completely, even purposely distorted. We will give some examples among the newest discoveries.

* * *

In 1995, the Institute of Oriental Studies of the Russian Academy of Sciences published the second volume of a six-volume textbook of the history of the eastern peoples that was fundamental in its content as well as in its quality. It has a significant text (the whole 4th chapter) named 'The Mongols and the Mongol Conquest'. In the latest parts of it, the history of the peoples of Middle Asia and Iran is briefly discussed, there is also a paragraph on the Delhi Sultanate of the 13th century. However, almost nothing is said about the history of Ulus of Jochi. The group of authors, the editorial board, apparently considered the history of the Golden Horde to be part of the history of Russia. But it is known that Ulus of Jochi, according to its origins, political history, territory, population composition, and its sources, its particular spiritual-material culture, was and remains a part of the medieval East. The authors of the volume knew all that very well. So I suppose that in 'voluntarily' refusing to discuss the history of an inherent part of the

East, at least, of all Eurasia, they just did not want to deal with historic traditions and the numerous authors of Russian history that are still alive. The history of a country, which, as some Russians say dryly, has an 'unpredictable past'...

As for discussions of the history of the Golden Horde in the Russian and especially in the Soviet historical tradition, they were quite unique. First this historiographic tradition did not have one single direction or degree of objectivity. On equal footing with the conservative official direction, which passed over many facts in silence—that is, was strongly politicized, there was a quite scientific school, represented by a limited amount of research that contained high quality information and interpretations of facts and that at least tried to throw light on the past quite fairly and reliably when possible. We are speaking about particular works of a number of pre-revolutionary Russian orientalists and just several scientists of the Soviet period. However, these more or less objective contributions were forgotten or crudely suppressed because of the order of the Central Committee of the All-Union Communist Party (of the Bolsheviks) from 9 August 1944, which can be summarized as follows:

'7. Suggest the Tatar regional committee of All-Union Communist Party (of the Bolsheviks) organize the scientific development of the history of Tatarstan, eliminate mistakes committed by some historians and literary people of a nationalistic character in describing the history of Tatarstan (embellishing the Golden Horde, popularizing the Khan-feudal epic poem about Edigu). Pay particular attention to researching and describing the history of the joint struggle of the Russian, Tatar and other nations of the USSR against alien invaders...'.*

*The C.P. S.U. in Resolutions and Decisions of Its Congresses, Conferences, and Plenary Meetings of the Central Committee (1898–1986). Vol. 7. 1938–1945, Moscow: Politgadat, 1985, p. 518; first published in 'Partiynoe stroitel'stvo (Party building)' magazine, 1944, № 15/16, p. 29–32.

By that order, regardless of its scientific-like tone, the Golden Horde was declared only 'parasitical', a spontaneous state formation, arisen as if by accident, and so it did not have any culture or natural development, and it only plundered and devastated Rus', the Russian nation, and so on. In other words, the East and the Turkic world represented by the Golden Horde was opposed to the West, Christianity.

Historiographically such a policy was carried out by ignoring and silencing the more or less objective works of Russian historians. Such works were exposed to so-called 'party ideological criticism', therefore, were taken out, or more precisely, were banished from active scientific circulation, but at the same time, semi-official interpretations written 'in the light of' that order were published almost in mass editions. Mass distribution was achieved both by encouraging publicist and literary critic statements on historical topics, by specially written movies, and by the many thousands, even the many millions of various history textbooks designed to totally brainwash the population, in particular, the young generation. For example, history textbooks on the USSR expressing sharply negative appraisals about nomads, 'Mongol-Tatars' in general, the Golden Horde in particular, designed to instill a xenophobic dislike, half-racist hatred and contempt for them were published in huge editions. Thus, each textbook edited by A. Shestakov (1955, for examples of appraisals see pages 31–33), S. Alekseev and V. Karpov (1958, p. 152) were printed in the millions. There were 4,898,000 copies printed of the two editions of the 7th grade textbook of B. Rybakov, A. Sakharov, et al (1985, p. 82–83, 85–86; 1987). In 1945–1952 and in 1956–1959, 4,740,000 copies of the 8th grade textbook of L. Bushchina were published. It should be noted that these and other 'all-Union' textbooks, except local dubbed editions, were also translated into the languages of the 'brotherly' peoples. University textbooks actually were like school ones, with the same interpretations. For instance, university textbooks of M. Tikhomirov and S. Dmitriev (1948, p. 63, 65, 87) and collective textbooks

edited by B. Grekov (1947, p. 154) and B. Rybakov (1975, p. 111) were printed in editions of 550,000 copies. If each school textbook was read by about two to three pupils, then a university textbook 'completed the education' of students for at least 10 to 15 years. So they actually reached more people than school textbooks. The national phobias penetrate even contemporary textbooks. For example, in 6th grade textbooks (Danilov, Kosulina, 2007, p. 137, 20,000 copies; Sakharov, 2007, p. 110, 10,000 copies), there is an image of Mongol cannibals from an English (!) miniature from the 13th century (!). In both cases, the same picture is accompanied by the caption 'Brutality of the Mongols', as if one British item from the 13th century could prove this people practiced cannibalism. This example vividly demonstrates the level of quality of Russian textbooks... The totality of such propaganda, and also the medieval myths about the 'Tatars' have a 'positive' effect even on textbooks in some foreign countries...

As a result, the relatively objective works of a few Russian scientists only 'trickled' in, and were overwhelmed by the 'torrent' of, so to speak, 'party', that is, semi-official statements. As for good quality works of modern foreign researchers, they were classified as 'bourgeois', or untruthful, and often were kept in half-closed special departments of capital libraries or just were not accessible in Russia at all.

The history of the Golden Horde was discussed in the post-war Soviet Union in a way that, in general works, it only touched upon Russian principalities incidentally, in connection with particular aspects of the history of the Rus'. At the same time, both the formation and the prolonged existence of the Jochid nation was treated almost as a 'boil' on the healthy body of others. The Golden Horde itself was depicted exclusively as a backward nomadic state, which was, 'naturally', at a very low stage of development.

In general, the center of the whole historical process during the 13–15th centuries was shown to be north-east Rus', in particular the Moscow principality, in comparison with which, the Horde and its capital cities were just commonplace provinces. But, as is

known from sources and research, the princes and boyars, and also the church leaders, constantly visited the Horde to 'kowtow' to the Khan, deliver taxes collected from Rus', request a yarliq to become a prince, get approval for throne succession in Rus', inform on their rivals, give bribes to the Khan's civil servants, request safe-conduct charters and Tarkhan privileges, and so on. It is quite strange, to put it mildly, that the important administrative and political problems of the 'center' would be resolved in a 'wild and barbaric', according to their logic, 'province'... As a result of all this, the history of Russian principalities, the rise of north-east Rus', the sources of its political claim to the 'Horde legacy' and to a post-Horde 'Tatar yurt' were all deprived of their virility.

Interpreting history in this way leads to constant emphasis of the 'backwardness', 'wildness' and 'cruelty' of the Mongols, who executed some princes, etc. As if in other countries, conquerors did not execute enemies, and princes struggling for power did not kill each other, did not gouge out the eyes of their rivals, did not put them on the stake, did not quarter those they defeated...

To the same degree, the constantly repeated assertions that the 'wild and backward' Mongol-Tatars committed 'wholesale slaughter' of the population of conquered countries and cities, drove 'hundreds of thousands into slavery', etc, are not properly thought through. How do we then answer the following elementary questions: Is it possible that during military confrontations, backwardness and wildness could play a crucial role, but not maturity and culture, which would presuppose a corresponding technique and experience? Or did naturally 'cruel' conquerors expect to exploit the corpses of the people they 'slaughtered wholesale' of 'devastated' countries? In this case, who did they, the Mongols, have to count in their census and why did they actually do all that?

It must be categorically stated that in all conquests without exception and regardless of race, level of culture, religion, executors and their victims, there is no avoiding loss of life. People perished as well, of course, in

the Mongol conquests. In some places less, in some places more. As sober-minded Russian historians of the past (M. Ivanin, V. Bartold, B. Vladimirtsov, et al.) specifically noted, the degree of violence of Chinggis Khan and his successors basically did not differ from that of other world conquerors of the past (we should add, of modern times). Weren't the wars and conquests of the non-nomadic western countries accompanied by a loss of life, the strong massacring the weak? Otherwise where did the dozens and dozens of tribes and nations that colonized territories and continents disappear to, including medieval Europe itself? How do we explain the deaths of thousands and thousands of Novgorodians during the time of Ivan III and Ivan IV? How do we characterize the complete 'transformation' of Kazan after 1552 into an ethnic Russian city by population?!

So when discussing the history of wars and conquests of the past, we should not explain the degree of loss of life or the destruction of cities by the ethnic and cultural 'qualities' of the invaders or their victims. Cruelty and bloodthirstiness of people and human societies in general, in particular to its own kind, in contrast to the animal world, are the same across all times and countries of the world. No conquerors, regardless of their race, culture, language or religion, have given out 'elixirs of life' or freedom to the conquered peoples after victorious campaigns.

In this regard, I would like to specifically note that the statements about a 'peaceful symbiosis' between the Golden Horde and Rus' are just as dubious. There were 'allied relations' between the Sarai rulers, certain princes, and their clans in Rus', but only those of a powerful suzerain and obedient vassal. There were princes who considered it a beneficial position for themselves, but there were also those who kowtowed, not only to the Khan, but also to the lords, with their fists in their pockets. It was these princes that looked around waiting for any changes. Those princes that were 'waiting for something' were denounced by their own brothers. Stories of all the famous empires and their satellites are full of such examples. The Golden Horde and Rus' were no exception.

Local vassal rulers also participated in the economic exploitation of the people of conquered countries. Ivan I Danilovich's transformation into 'Ivan Kalita' (Turk. *kalta* means 'sack', in reference to the 'purse' with money that he generously distributed to the Horde) was not due to credit from some international bank. It is an indisputable fact that conquerors exploit the people of conquered countries. But local vassals also take some responsibility for the level of exploitation, in all times and places.

Even the statements used constantly to indicate the brutality of the Mongol-Tatars—that they drove hundreds of thousands of captives into slavery in foreign lands—do not stand up to criticism. There are also dubious assertions that the cities of the Golden Horde emerged and grew during the entire period of existence of the state due to captured artisans. It is true that prisoners were used during the attacks on the next settlements, even to construct certain buildings, but this was not an invention of the Mongols. To allege that cities of the Golden Horde functioned by the aid of prisoners for the entire time they existed is an ill-considered statement. If these assertions from medieval sources and the authors who blindly repeated them later were actually true, it would be difficult to answer the following basic questions. Firstly, how can we explain the increase in population of north-east Rus' and its cities in the second half of the 13–14th centuries? And secondly, from whom did the princes, including Ivan Kalita and others, collect taxes for Sarai and its treasury to stockpile tightly packed purses?

The 'assertions from medieval sources' was not mentioned arbitrarily. There are sources that some historians will gladly trust, actually quite many. But after reviewing them more carefully, one may find that they are quite far from accurate. We are going to demonstrate several examples.

* * *

In 1970, a large and multifaceted collection of works was published called 'Tatar-Mongols in Asia and Europe' consisting of articles of leading medieval historians. As one of re-

Image of atrocities
committed by Mongols,
from the illustrated
chronicle of Matthew
of Paris. 13th century.

viewers wrote convincingly, this collection 'is the first successful step in creating an integrated work' on the history of the Tatar-Mongol conquests [Kargalov, 1972, p. 180]. However, as it was noted in another review [Usmanov, 1972, p. 182–185], a peculiar weakness of many articles of this edition is the almost complete absence of a critical attitude toward the information and numerical data of medieval written sources. For example, the article by N. Svistunova discusses the capture of 10,000, 20,000, 50,000, 100,000 captives by the Mongols in China [Tatar-Mongols, 1970, p. 272–283]. It seems that these Chinese people voluntarily surrendered en masse, or the relatively small number of Mongols all turned into security guards who were not able to make further conquests.

Even I. Petrushevsky's article didn't contain elementary criticism. He, for example, wrote that in December 1221, 'the Mongols, having laid siege to and taken Herat, **slaughtered all** the people in it'. It would seem that the large population of Herat was done once and for all. But, according to other quotes from the same author, during the second storm of Herat in 1222, 'there were **1,600,000 people killed**'. The author considers this figure to be '**reliable**'. But it turns out that in 1270, 1288, 1289 and in the next years, Herat oasis and the city of Herat were devastated and some of the people were driven into slavery, but in 1291 'peasants and **city dwellers...** participated' in anti-Mongol uprisings of Herat maliks. Such is the 'plausibility' of figures from the sources [ibid., p. 182–185, 224, 229, 242 et al, highlighted by the author, *M.U.*]

These and other examples (there are hundreds of them) show that not only 'precise' numerical data, but also descriptive quantitative indicators of ancient and medieval sources in any language of the history of any country are conditional and hyperbolic-like in the meanings of 'much' and 'very much', but not more. If we should not agree with the statement that 'history is the lie commonly agreed upon' or 'history is politics overturned in the past', but are called to care about the scientific quality of this peculiar field of human knowledge, then we should not submissively drag ourselves behind ancient and medieval authors who were politicians of their times. They perceived the defeat of their class, the death of their community, and that of their ancestors as the death of the whole people and country. It was these writer politicians from the camp of the defeated who unfairly assessed the human traits, cultural level, and religious views of their opponents, and in doing so they 'exact revenge' upon them for the defeat of 'their' people.

To the same degree, the panegyrics of the conquerors, 'gatherers of lands', who praise the kindness and humanity of 'their' leaders who bring culture and only 'happiness' to peoples of conquered, subjugated lands are subjective and slanted. Unfortunately, even latter researchers of these issues are sometimes similar to all of them.

Batu Khan's conquest and subjugation of countries and peoples of Eastern Europe, which lasted for 7–8 years, was certainly accompanied by military and civilian deaths, unbelievable suffering, and humiliation of

many who survived. Some cities and fortresses that quite naturally put up stubborn and heroic resistance to the foreign invaders were also destroyed (just like everywhere else and at all times).

However, there were ruined cities and deserted settlements that turned into wastelands as a result of long internecine wars between bitterly competing principalities in Eastern Europe even before the Mongols. So it is hardly fair to fall back on an ethnically discriminatory interpretation to explain tragedies, flattering one nation by racially humiliating others in hindsight. And Mongols, as conquerors, weren't any better or worse than their intellectual equals when it came to cruelty.

It all happened in the history of mankind.

However, life went on. Ruined cities were rebuilt, as has been established by researchers who strove for objectivity, and new bustling cities emerged (see works of V. Bartold, F. Ballod, G. Fedorov-Davydov, V. Egorov, M. Kramarovsky, etc.). New generations of people were born, grew and reproduced. Capitals and big cities of the empire, as in all times, attracted more and more migrants from everywhere, from the outskirts of the country, seeking a piece of bread, work, striving for success, a career. In fact, an entirely new world was arising, new living conditions were emerging. Interregional and international cultural, economical, trade, political relations were evolving...

According to the archaeological research of scholars that have studied just several of the Golden Horde cities,

- 'they had **advanced artistic handicrafts**, including pottery production';
- 'an **urban** eastern medieval **culture blossomed splendidly** that was absolutely alien to nomads';
- 'a literary language developed, the so-called "Volga Turki", in which **literature was written** (...);
- these 'cities were inhabited by Polovtians, Bulgars, Russians, people from Middle Asia, the Caucasus, Crimea, etc. **These were the people who built this city culture**' [Fedorov-Davydov, 1976; highlighted by the author, *M.U.*].

On the other hand, there is one more view of the level of this culture and, in general, the place of the Jochid state in history:

- 'There are two stereotypes about the Golden Horde. The first is that it is an enemy of Russia. As if the country lived under the yoke of the Horde for 300 years and in general, it was a nightmare, we hardly got rid of it. This stereotype is wrong because the fragmented Rus' fell under the control of a big **world state that as a civilization was much more advanced than Rus'**. Then Moscow princes, using the Golden Horde, got stronger and created their own state that later replaced the Golden Horde'.

- 'One more stereotype exists. They say that there was a large, amazing state called the Golden Horde, but Russians came, attacked the state and destroyed it. In reality, history tells us something else. Many states were formed during the Mongol invasion. It was a huge steppe empire that had trade ties with Iran, Italy, North Caucasus, Crimea, and Siberia. This state adopted Islam and, thus, **joined the high culture of that time**'.

- '**Examples of urban civilization of the Golden Horde**, which, by the way, was called Golden by Russians themselves, because they were amazed by the luxury...' are worthy of public attention [Piotrovsky, 2005; highlighted by the author, *M.U.*].

These principal statements belong to two experts in material culture, art and history of the peoples of the East. G.Fedorov-Davydov, who devoted more than forty years of his life to study the history and archaeology of the Volga Region peoples, including peoples of the Jochid Empire, used the most objective and reliable sources to disprove the former incorrect ideas about the level of culture in the Golden Horde. Along with his students he created a whole school to study this subject. His publications on Golden Horde numismatics have been included in the golden fund of Russian historiography.

M. Piotrovsky, director of Hermitage, one of the largest depositories of written sources on the material culture and art of many countries and peoples, comes to his conclusion based on a comparative understanding of his-

tory and culture on the scale of world history. He is right to criticize the second stereotype. One shouldn't offer simplistic and primitive explanations for the reasons the Golden Horde fell. We would like to add to his accurate brief note.

In recent years, along with valid scientific research, we have seen questionable publications and statements appear on the subject. In contrast to previous, strongly negative evaluations, they are novel in that they mechanically replace old negative epithets with their antonyms as follows: everything 'black' is replaced by 'white' or vice versa. Historians that formerly tried to explain the past of their people in isolation from the history of the Golden Horde, as if didn't exist at all, now, focusing only on it, have begun to pay insufficient attention to other past periods of the same people. Or former belligerent followers of the concept 'against idealizing the history of the Tatar-Mongols', that accused other views of all sins, suddenly turned into active apologists of the 'flourishing and great' Golden Horde, where supposedly everything was in harmony. All kinds of amateurs also came on the scene who had read three or four popular books on the subject and began to create subsequent editions, presenting them as a 'new word'. Amateurs like these, by taking proper nouns from tales, can come up with 'new' principalities and even mythological states.

Such publications don't cover many aspects of social or political life, which are full of sharp contradictions and dramatic clashes. In the Golden Horde, like in all empires, luxury and abundance were found side by side with poverty and hardship; freedom and prosperity of some were due to the dependence and miserable position of others both inside the 'ruling' ethnos and the conquered, dependent people. Due to territorial issues, the empires, including the Ulus of Jochi, fought wars outside the country and clashed with some of its 'own' people inside it. In this regard, the Golden Horde was no different from other empires. For this reason, fatal contradictions and conflicts occurred and intensified during certain stages of development of the empire.

However, in the Ulus of Jochi, like in the other long-lived world empires, some institutes and components of high state culture were adopted, developed or created, such as:

- functioning of an effective government administration, advanced financial and tax systems;
- operation of well functioning communication system, including the yam postal system;
- preservation of effective military system, minimization of crime, ensuring safety of town and roads;
- formation of urban civilization on a broad scale that was new to this region;
- implementation of a model of religious tolerance in the multi-confessional empire, non-interference in spiritual-cultural life, written language and language of subject and dependent people;
- formation of advanced written Turkic-Tatar language and culture of record keeping based on it, rise of various types of applied and domestic arts;
- preservation and development of the structure of ruling stratas locally, for example, princely families, boyarship, landowners, clergy, monasteries, etc.

One may not know that all these existed in the Golden Horde. It is not a fault, but the problem of the knowledge and qualification level of a historian.

A reader who reads contemporary textbooks is right when he notices that, all of that, if it existed at all, is the result of the cruel exploitation of a subjugated people, especially in Rus'! I agree. Firstly, the Chinggisids conquered another countries and people not to give them freedom or 'rescue' them from others; secondly, not to 'enlighten' them with their religions. Their goal was to exploit conquered people. Indeed, in the Golden Horde people paid a 10% tax on profits. If they collected a lot more in Rus' then, initially, at the early stage, it was undoubtedly due to the tax farmers collecting tribute, then local rulers like Ivan Kalita and his successors, who were diligently collecting tribute for the khan's treasury. However, the latter used these additional exactions, as it is rightly pointed out,

to strengthen the power of the prince, which later lead to the establishment of a new state—Muscovite state. On the other hand, the critical reader also can ask the following question: have there been any large states, empires, that didn't exploit the subjugated population? Even in the Soviet Union, where the goal was to build a society 'free of exploitation of one person by another', workers received just a small part of the price of the products they made, while collective farmers (kolkhozniki), which didn't have passports, so were modern-day serfs, didn't even know what a salary and pension were up to the 1960s–1970s...

Generally speaking, we need to state the following: it was following the lumpenization of the urban population, serfdom of the peasantry, victimization of millions of citizens of the state, generous sacrifice of a huge number of troops during World War II, and finally, deportation, or more precisely, long-lasting genocide of more than ten helpless ethnic groups, right on 9 August 1944, when there was no need for 'brothers and sisters' anymore, that the Bolshevik authorities of the USSR adopted a special decree of the Central Committee of the All-Union Communist Party (of the Bolsheviks), in the light of which the long-disappeared state of the Golden Horde and its main population were turned into a particular kind of historical bugaboo by a continuous beating that supposedly fostered in people a feeling of 'historical justice' and principles of 'socialistic humanism'.

Against the 'horror' of the Golden Horde yoke, contemporary cruelties just 'faded'...

The appearance of this decree, which was accepted for implementation by local party and Soviet organs, was associated with the practical aspirations of the Bolshevik authorities of the country. Following the deportation of the Crimean Tatars and other non-Slavic, non-Christian ethnic groups of the Lower Volga region and North Caucasus (as if there were no collaborationists among other ethnic groups!), the fate of the Tatars of the Volga and Cis-Ural Regions also appeared on the agenda. Possible locations for their deportation were even discussed (recently annexed Tuva or the bogs of Western Siberia). But there was an-

other near-impossible problem—gathering up the multi-million Tatar population across the entire Soviet Union, from the Baltic States to Kamchatka. (Just one-fourth, or maybe even one-fifth of all Tatars lived in the Tatar Autonomous Soviet Socialist Republic. The anti-Tatar component of Stalin's national policy can be clearly traced starting back from the 1920s, when the crackdown on the Tatar party organization, with the execution of its leader M. Sultan-Galiyev, was the first step in the chain of multiple repressions.) For this reason, they had to 'limit' themselves to the decree, which was intended to expose these people to spiritual extermination by distortion and profanation of one of the most important periods of their history.

Thus, the country aspiring to 'authentic internationalism' in the 20th century was overcome by a notorious, racism-tinged *Eurocentrism*, in the tradition of the 18–19th centuries. There were also aspirations to transform this into a form of *Rusocentrism*.

The most typical manifestation of the latter can be seen in the far-fetched statement that the conquering of the Rus' by the Mongols supposedly saved Western Europe from conquest. People and societies, especially sustainable states, according to elementary logic, first of all, save themselves... (In connection with this myth it is interesting to mention the following: some Bulgarist-followers in Kazan attempted to transcribe the myth to Bulgar history: as if, the Bulgars' 'strong repulsion' of the Mongols in 1223 and resistance in 1236 'detained for several years' the conquest of Rus'...).

This was the overall current in the interpretation of Golden Horde history recently, that is, in Soviet times. In this way, it stands out from the state and aspirations of scientific thought and the positions of leading representatives of oriental studies in pre-revolutionary Russia, when, along with jingoistic and conservative-semiofficial aspirations, there were diverging interpretations of the country's past. In this regard, it is instructive to recall not only N. Bichurin, O. Kovalevsky, D. Banzarov, G. Sablukov, I. Berezin, M. Ivanin, etc, who lived in the 19th century, but also B. Vladi-

I. Glazunov. Triptych 'The Battle of Kulikovo: Temporary advantage of Tatars'. 1980.

mirtsov, V. Bartold and partially the early A. Yakubovsky (who was later forced to controversially interpret the history of the Golden Horde), who lived and worked in the Soviet period, but were actually representatives of the old-Russian school of scientific oriental studies. Oriental studies and its representatives were characterized by a culture of independent thinking, consideration of alternative opinions, and a respect for the people whose history was being studied, though they had certain faults, largely resulting from the limited experiences of their predecessors and the relatively small number of available resources. They were free of totalitarian single-mindedness and aspirations to cater to the whims of the party-administrative management.

All of this should be taken into consideration when developing new books on the history of the Ulus of Jochi, which, for many reasons, is a vital necessity.

* * *

Thus, the 3rd volume of this seven-volume 'History of the Tatars from ancient times' is aimed at creating an *objective* history of the Ulus of Jochi—of the empire which was later known by the name of the Golden Horde.

It should be noted that along with 'normal' politicized distortions of history associated, generally, with ethnic prejudices (they are not

worth repeating), there was an appearance of *nonsensical* statements which denied the historicity of many events in world history, such as the Mongol conquests, while Batu Khan is equated with Alexander Nevsky, etc.

Naturally, there is a commitment to *objectivity*. As qualified researchers know, it is impossible to reproduce the past with all of its details, especially of the remote past. That's why historians have to be satisfied with covering the most important focal points of one or another particular period in history. Moreover, the category of *objectivity* itself in historical research is relative and acts as a two-faced Janus: on the one hand, because of the relative, or objectively limited reproduction of the object of study, on the other hand, because of the ability of 'consumers' (readers) to accept, deny, or be willing or unwilling to accept the proffered interpretation. As a result, real feedback from a specific audience also may be relative.

Thus, along with positive evaluations of the information and interpretations contained in this book, there might also be a critical attitude towards its content and particular aspects of the concept. This is quite natural. Criticism and concrete suggestions will only be beneficial, because such searches, discussions, and useful reevaluations will result in a closer *approximation* to the truth.

It should be noted that the history of Ulus of Jochi is an integral part of the histories of many Eurasian peoples, first of all, of course, the Turkic-speaking peoples. If the eastern part of the empire—the Kok Horde—was inhabited by ancestors of the medieval Siberian Tatars, some of the Bashkirs, the inhabitants of the Altai-Sayan Mountains and southern Siberia, modern Kazakhs, Kirghiz, Karakalpaks, some future (western) Uzbeks, etc., then the western part—the Ak Horde, which in particular was called the Golden Horde—was inhabited by the ancestors of the Volga region and Cis-Ural Tatars, some of the Bashkirs, Nogai tribes, Crimean Tatars, also some peoples in the North Caucasus, for instance, the Balkars, Karachay, Kumyks, Ossetians, Circassians, etc. The history of the Finno-Ugric peoples of the Volga and Cis-Ural Regions also include a Golden Horde period. To a certain extent, the same applies to the history of the Azerbaijanis, Armenians and Georgians. Regardless of the will or aims of recent historians and politicians, it is important to show the place of the Golden Horde in north-eastern history, especially that of the Muscovite Rus'. It is this power which found its feet firmly in the 14–15th centuries, claimed the political legacy of the Horde, including the 'Tatar yurts', since the 16th century, adopted the tsar title for Russian rulers during the disintegration period of the khan's power, and started to lay the foundation of the great future empire of Eurasia—the Russian Empire.

Research on the Golden Horde historical periods of different peoples requires taking into consideration the peculiarities of the past of that part of the empire (east, west, south, north; the settled regions or steppe areas) where the ancestors of the people were based. Sometimes there were significant variations between the regions of the Ulus of Jochi.

It is necessary to note the following: with such a large number of 'descendents', at least those claiming the legacy of the Ulus of Jochi, the 'heaviest part of the burden', that is, the 'moral responsibility' for historical legacy, was and is carried, primarily, by the Volga region and the Crimean Tatars. This is indicated both by the formation of several Tatar states

following the fall of the Golden Horde (Astrakhan, Kazan, Kasimov, Crimean, and Siberian khanates and the Nogai Horde), and a decree of the Central Committee of the All-Union Communist Party (of the Bolsheviks), addressed to the leadership of the Tatar Autonomous Soviet Socialist Republic in particular, and through it to the 'titular' people, that is, the entire Tatar people. This is the same people that suffered the burden of official ideological and psychological pressure for more than half a century, in which school textbooks, institutions of higher education, films and works of fiction, designed for the general education of the young generation of all the peoples of the USSR, ingrained a spirit of contempt for nomads, the peoples of the east, and the Mongol-Tatars, including modern Tatars.

In order to understand the meaning of the officially sanctioned pressure, one needs to step into the 'skin' of the Tatars in the Volga and Cis-Ural Regions, whose children, returning home from school after history lessons, said in tears that they 'don't want to be Tatars'... But they want to be Tatars, who try to get rid of the 'damned' name; that wanted and still want to change the historically developed ethnonym (as if this would be followed by a new decree stating love for them...). Finally, those Tatars, that either distort their history or try to shift the blame on the shoulders of others, simultaneously abuse and humiliate them...

The infamous bloody xenophobic events in Russian cities should not come as a surprise as the seeds of this phenomenon were richly planted in the recent past in the form of 'historical' hatred of certain peoples, based on the idea of the exceptional nature of a single ethnos and a gradation of peoples by types (into 'soviet', 'autonomous', 'kray', 'oblast', etc.); this played a large role in the tragic fate of the country called the USSR...

However, the harsh historical reality led to inevitable corrections with the beginning of Perestroika. One of its first steps was to cancel history exams in all education institutions across the country, including the Russian Federation. That was the true and infamous fall of the so called Marxist-Leninist, or, to be clear,

Bolshevik-Messianic, that is inherently false, historical conception. In its total conception, tolerating no dissidence or elementary justice, the 'Mongol-Tatar story', or rather, the history of Eurasia in the 13–16th centuries comprised only a small chapter, or even just a paragraph...

It should also be noted that recognizing the continued importance and place of the Golden Horde period in the study of the Tatar past, the authors of this project didn't underestimate the importance of the Bulgar and other, both earlier and later ages, for a complete understanding and interpretation of their history. For this reason *the first book* of the collection, consisting of seven volumes, was devoted to a broad illustration of the history of the Eurasian steppes. This volume doesn't contain anything specific about the contemporary Tatar ethnos, as the people living in the Volga region, but includes a historical ethnographic background, upon which the Turkic world itself developed along with other authentic civilizations, which relate by language and spiritual-material culture, figuratively speaking, and are the *proto-ancestors* of contemporary Tatars. Their ethnogenesis begins to become clearer, but isn't completed yet, beginning in the age of the Bulgars and Kipchaks and their states.

This period is addressed in *the second volume* of the seven-volume collection. This ethnogenetic process—the formation of contemporary Tatars as an autonomous ethnos within the Turkic world in general, and the Turkic-Tatar community, in particular, is more or less finished a later, during the Golden Horde age, as a result of the amalgamation and ethnic consolidation of Muslimized Turks: Bulgars, Kipchaks and partially Turkified Finno-Ugric tribes in the region.

However, it is reasonable to mention the following. Due to the special character of the ethnogenesis of people, as well as because of the complexity of social and military-political processes and features of cultural development in Eurasia in the 13–16th centuries in general, the history of contemporary Tatars in the Volga and Cis-Ural Regions is considered to be *much broader* than the history of the Bulgar society, but at the same time *nar-*

rower than the history of the Golden Horde, especially the entire Ulus of Jochi. After understanding this unique 'puzzle', we will be able not only to correctly comprehend, but also rationally explain the peculiarities of our national history.

* * *

This volume was compiled with the help of prominent experts in the sphere, both from Kazan, and other cities of the Russian Federation and from abroad. Young representatives of this sphere of knowledge were also involved. Presumably, none of them claims their writing to be the ultimate truth.

Materials from this volume are not presented as parts of an 'impersonal' collectively compiled monograph, but as a thematically successive collection of opinion pieces (essays) with a research background, sometimes using the same sources and historiographic material. It is therefore possible, even inevitable, that some repetitions, differences or even disputes will occur between them, which, according to the editors, is quite acceptable.

It must be emphasized that the managers of the project didn't impose their version of the issues on the authors, because any given conception may contain several different interpretations of one and the same phenomena. As practice shows, creative latitude leads to the increased personal responsibility of authors and the quality of their research.

It should also be noted that when writing anthroponyms, toponyms, and terms not included in quotations, the authors followed the Turkological tradition, which is the most widely used in Russian Oriental Studies.

Naturally, not all of the questions studied have sufficient amounts of available sources and corresponding historiographic experiences. For this reason, the team of authors will be grateful for constructive criticism and concrete suggestions, which, presumably, will be useful for further research and publications on the history of Ulus of Jochi.

Along with the project managers, an active role in defining the structure of the volume and determining the research conception was played by Doctors of Historical Sciences

D. Iskhakov and *I. Zagidullin*, and Candidates of Historical Sciences *A. Arslanova*, *I. Izmaylov*, *B. Khamidullin* and other colleagues. We are grateful to our foreign colleagues and colleagues from other cities, including the Professors *István Vásáry*, *Ch. Halperin*, *Uli Schamiloglu*, *Hansgerd Göckenjan*, *K. Baidakov*, *A. Belavin*, *A. Kadyrbayev*, *M. Kramarovskiy*, *E. Kychanov*, *M. Poluboyarinova*, *V. Trepavlov*, *Y. Khudyakov*, *A. Yurchenko* and to many others for their advice during the preliminary discussions of the book's structure, and for their courtesy in writing separate chapters and paragraphs for this research.

Appendixes to the volume were prepared by: *A. Arslanova*, *M. Gatin*, *I. Izmaylov*, *A. Kadyrbayev*, *F. Nuriyeva*, *R. Khrapachevsky*, and *A. Yurchenko*.

Pictures on the text were provided by the authors; illustrations were chosen by *I. Izmaylov* and *B. Khamidullin*.

Lists of sources and references, and abbreviations were prepared by *A. Arslanova*, *I. Izmaylov*, and *L. Zigangareeva*.

The index of names and the political-geographic index were prepared by *B. Izmaylov*, *L. Zigangareeva*, and *L. Suleymanova*.

Articles by *U. Schamiloglu*, *I. Vásáry* and *Ch. Halperin* were translated from English by *A. Arslanova*; the article by *Hansgerd Göckenjan* was translated from German by *I. Gilyazov*.

The volume is illustrated by artifacts from collections of the following Russian museums: The National Museum of the Republic of Tatarstan, The State Hermitage Museum, The State Historical Museum of Russia, Bolgar State Historical and Architectural Reserve, Bilyar State Historical and Archaeological and Natural Museum-Reserve, Saratov Regional Museum of Local Lore, Astrakhan State United Historical and Architectural Museum-Reserve, Volgograd Regional Museum of Local Lore, as well as museums and libraries in several other countries. Part of the illustrations was kindly provided by Moscow Publishing and Producing Center 'Design. Information. Cartography' (Atlas Tartarica. The History of Tatars and peoples of Eurasia. The Republic of Tatarstan yesterday and today. M., 2006).

§ 2. Historiography and Sources

The Ulus of Jochi and the Golden Horde: the official name of the country and the historical tradition

Iskander Izmaylov

Ulus of Jochi played a prominent role in the history of world civilization. Events, that accompanied the emergence, formation and development of this state had a global scope and impact. The powerful medieval Tatar empire, stretching from Irtysh in the east to Danube in the west, from the White Sea in the north to the Black and Caspian Seas in the south, had played a leading role in the fate of the world of that time. The medieval Empire of the Jochids had a huge impact on the fate of Eurasia, and was a key stage in the history of the Turkic-Tatar peoples.

Contemporaries used different terms to name the state: the Arabs called it 'the Kingdom of the North Tatars', 'the State of Desht-i Kipchak' or 'Ulus of Jochi' (or his descendants, for example, 'Ulus of Uzbek'), the Europeans called it 'Tataria' or 'the country of Comans' (that is, Kipchaks), the Russians called it the 'Horde' or 'the Kingdom of Tatars'.

Meanwhile, the official (for internal use) name of this medieval state—'Ulug Ulus' or 'Ulug Orda' ('Big/Great state') is also known due to preserved Tatar yarliqs of the 14–16th centuries [Usmanov, 1979, p. 189–193]. Obviously, it served as a self-designation for official diplomatic correspondence and for grant acts. With the gradual fall of Ulus of Jochi, the scope of this term became restricted, and took on meaning of the khanate in the Volga region (according to Russian sources—'The Great Horde', that is, a calque from the Tatar—Ulug Ulus). Following its complete dissolution, it was adopted by the khans of the Crimean Khanate, who considered themselves to be its legal heirs.

The name 'Golden Horde' passed into the scientific literature from the Russian tradition ('Kazan history' and historical-journalistic literature of the end of the 16–17th centuries). In the earliest Russian chronicles, the Ulus of Jochi didn't have an official name, and different expressions were used instead: 'from Tatars', 'to Batu', etc. However, already at the end of the

13th century, along with these expressions, the term 'to Orda' or 'to the tsar' begins to circulate, which emphasizes the fact that the Rus' sensitively captured the nuances of the general imperial policy and reacted to acquisition of judicially independent status by the Ulus of Jochi. Since the latter half of the 14th century, along with the term 'Orda', Russian chronicles began to use the term 'the Blue Orda', as a calque of the Tatar term 'Kok-Orda', and as a name of the Volga region lands, the rulers of which were playing an increasingly important role in khanate politics.

According to some researchers [Bogatova, 1970; Fedorov-Davidov, 1973, p. 64–67; Sultanov, 2001, p. 15–17], the origin of this name is directly associated with the name of the khan's headquarters or, to be more specific, with the grand yurt of the Turkic-Mongol invaders, decorated with gold and expensive fabric. For example, Arab historians of the 10th century noted that there was a 'golden tent' in the headquarters of the Uighur ruler, while the Persian historian of the 14th century Rashid al-Din mentioned that the headquarters of Chinggis Khan were officially called *Urdu-i zarin buzurg* ('Big / Great Golden Horde') [Rashid al-Din, 1960, II, p. 230]. Describing the headquarters of the Great Khan Ugedei near Karakorum, the capital of the empire, he also noted that 'there is such a big tent that it can hold thousand people, and that tent is never knocked down. Its fasteners are made of gold, it is trimmed by fabrics; it was called "Sira urdu"—"Golden Horde", "Golden headquarters"' [Ibid, p. 41]. Interesting corresponding evidence about the structure of the tent of the great khan is preserved in the report of the papal envoy Giovanni da Pian del Carpine to the court of the great khan. In 1246, he was in the headquarters during the enthronement of the Khan Guyuk, where a big tent was installed for the ceremony, 'which they call the Golden Horde... The tent was installed on posts, covered with golden plates and nailed to a tree by golden nails,

on the top and inside of the walls it was covered with canopy, and with other fabrics from outside' [Puteshestviya, 1957, p. 76].

According to these sources, we can assume that for Turkic-Mongol states of Middle Asia, the yellow (golden) color was a symbol of supreme power, granted by heavenly hosts, which, most likely, dated back to the Chinese tradition of imperial symbolism. This is the way in which the tradition to install golden tents for Khagans should be interpreted for the Uyghurs, Kidans and Jurchens. Taking into consideration the similarity between the medieval terms 'golden', 'imperial', and 'great', the name 'golden' itself was surely considered by contemporaries as 'great'. In this way, this tradition of color naming was adopted in the empire of Chinggis Khan, where it became a part of the new imperial culture that preserved the power of tradition in the Chinggisids states.

During the formation of independent uluses, the tradition of naming the khan's headquarters the 'Golden Horde' proliferated across all Chinggisid states. It is unsurprising that according to the works of Arab-Persian authors, the Ulus of Jochi khans's headquarters were also called 'golden' [Collection of Works Related to the History of the Golden Horde, 1884, p. 290]. Obviously, the term 'Golden Horde' could have been a synonym for the khan's headquarters and even for the central authority in the Ulus of Jochi.

In contemporary world studies, two terms are used in equal measure to name the state—the 'Golden Horde' and 'Ulus of Jochi'.

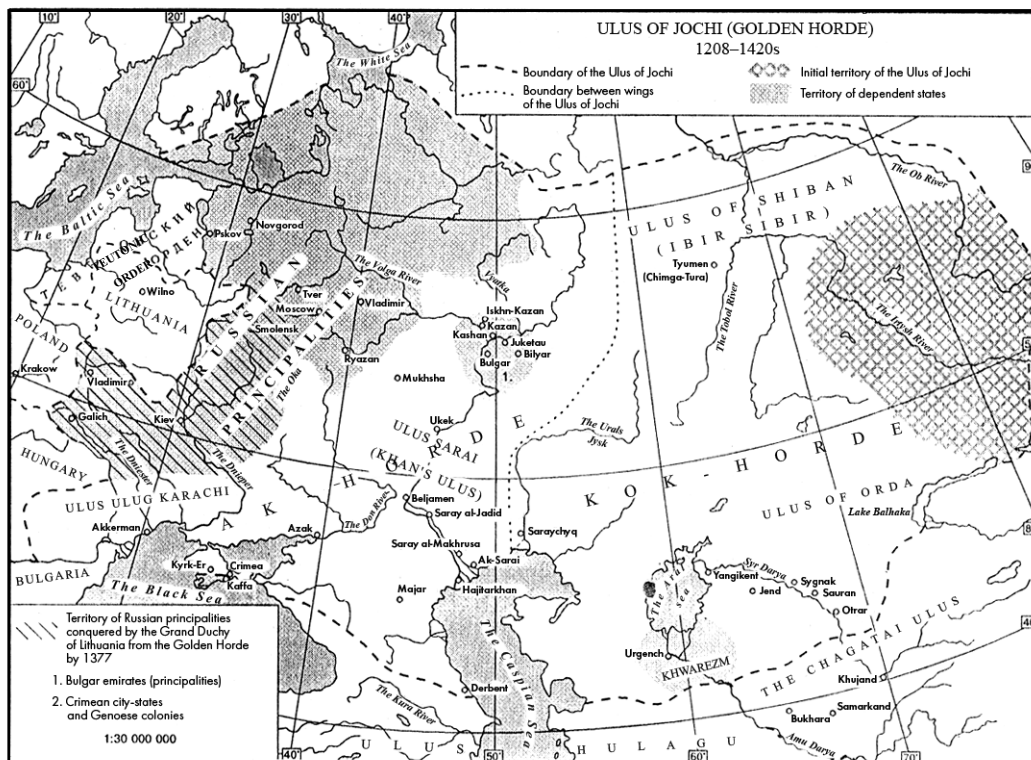

Among the many controversial points about Golden Horde history is the question of origins, or the time when it was formed and its own history began. The most popular contemporary point of view is that the history of the Ulus of Jochi begins in 1243, when Batu Khan, who was returning back from a western campaign, began to set strict internal management structures for conquered countries. Other historians (L. Gumilev), who agree that the history of the Jochid state begins much earlier, put forward a thesis about the evolvement of the 'Ulus of Jochi' into the 'Golden Horde' after 1243. However, this seems to be a rather artificial scheme.

In regards to questions over the date when the Ulus of Jochi was formed, as in some other

questions, the historiographic tradition strongly dominates over historians. This occurred in Russian science as early as the end of the last century, and developed in the works of two totally difference schools of both 'sovereign' and 'Eurasian' historians. The unity of their views is not accidental. Both traditions accept the year 1243 as the beginning of the Golden Horde (thus, often contrasting it with the notion of 'Ulus of Jochi'), in an attempt to emphasize the importance and stages of the conquest of the Russian principalities by Mongol khans. On this basis, the 'sovereign' school attempts to supplement the events of the 'Batu invasion' with a wider scope and scale against the general background of the Mongol campaigns (see the works of B. Grekov, V. Kargalov, V. Kuchkin, V. Egorov, etc.). Meanwhile, historians are often prone to 'Russian centerism' in their accounts and inadvertently support the positions set by church chroniclers in the 13th century, who saw historical evidence, figuratively speaking, from the narrow windows of their cells. The 'Eurasian' tradition stands on a slightly different ground. According to it, the Golden Horde is a symbiosis of the settled Rus' and nomadic Horde, which could have formed, of course, following the unification in 1243 (see the works of G. Vernadsky, L. Gumilev).

Meanwhile, if we take our mind off the problems of the Golden Horde and stop considering it as a unique historical phenomenon, we can see that, except for some elements of identity, its history, culture, state structure, and military science do not differ strongly from those of other Chinggisid states. In light of deeper studies of the roots of Ulus of Jochi, it appears that the 'Eurasian' theory wasn't always justified in focusing on the uniqueness of Horde and on the importance of the Rus' in its internal political history; this ignored similarities with other earlier and synchronous nomadic powers in Middle Asia. In this regard, it is significant that the history of Chagataid Ulus practically begins during the life of Chinggis Khan, some time after the conquest of Khorasan and Mawarannahr by the Mongols. In other words, the Ulus of Jochi latently existed as an independent state long before the conquest of Eastern Europe.

Indeed, following his return from the western campaign, Batu Khan was focused on orga-

Map of the Ulus of Jochi by I. Izmaylov

nizing the governmental system in his ulus, but it is clear that long before these campaigns, the ulus already existed as a special military-administrative unit. The descendants of Jochi inherited it from their father, to whom it was granted by Chinggis Khan; he ruled there since 1227 with the same type of rules of dependence on the power of the Great Khan as in the 40s in the 13th century.

That is why a number of historians (V. Bartold, M. Safargaliev) thought that the origins of the Ulus of Jochi should be looked for in the Chinggis Khan era, in the period in which he allocated uluses to his three elder sons (Jochi, Ugedei and Tului) for the first time. This point of view seems to be the most reasonable and allows us to trace both the emergence of the Golden Horde from the depths of the Mongol Empire and the stages of the formation of its political independence.

The foundation of the Jochid state was laid during the life of Chinggis Khan. In the reasonable opinion of V. Bartold, Chinggis Khan allocated an ulus to his elder son Jochi in 1207–1208,

following the conquest of Siberian peoples [Bartold, 1963, p. 421–422]. Later, he was given other western lands, including Khwarezm and Desht-i Kipchak. However, at the time, most of the lands were yet to be conquered.

Following the death of Jochi, Batu was given his father's throne, and his rights to the territory comprising Siberia, Khwarezm, Bulgaria, Desht-i Kipchak and other western countries were approved at the all-Mongol kurultais in 1228–1229, when the question of the political heritage of Chinggis Khan was raised for discussion. It was decided then to continue further conquests of the western lands, and the Great Khan Ugedei gave this task to members of the Jochid house. But the Jochids couldn't perform this task on their own. At the new kurultai in 1235, Ugedei assigned 13 more Chinggisids with troops to help Batu Khan.

In spring 1235, a huge army under the command of Batu invaded Eastern Europe and initiated a series of conquests that lasted from 1236 to 1242, resulting in the conquest of a large part of Western Europe by the Chinggisids. Already

in 1243, following his return to the Volga region, Batu realized that his own forces were not enough to attack Europe and focused on consolidating and arranging his own ulus. The travels of vassal land rulers to get yarliqs for the right to reign indicates the establishment of a new power. The system of levying tributes and taxes on the population of conquered countries was set up at the same time. However, the real milestone in the establishment of the Horde reign over Rus' and other conquered settled lands falls to 1257–1259, when the great khan carried out a census of the subject population and introduced a single taxation system by house, while beginning to demand the fulfillment of various duties (yam [postal], military, etc.) and establishing the institute of vicegerents—baskaks.

All of these developments significantly strengthened the Ulus of Jochi so that already at the end of the 50s of the 13th century its rulers acquired almost total independence from the Great Khan, resulting in the depiction of the 'great tamga' of the Jochid clan on the coins of Berke Khan (1257–1266). This independence was reinforced more thoroughly by the grandson of Batu, Mengu-Timur Khan (1266–1282). Following his enthronement, he crushed a rebellion of pro-Mongol nobility and began to conduct a policy of total independence from the power of the Great Khan, being the first to mint coins with his name, which was striking proof of his independence. He was also successful in external policy. During the internecine war that flared up between the descendants of Chinggis Khan for power over Middle Asia and Eastern Turkistan, Mengu-Timur managed to thwart the plans for isolationism of the Ulus of Jochi and struck a number of major blows to the descendants of Hulagu. A kurultai was summoned in 1269 on the river Talas (Semirechye) which determined

the boundaries between the possessions of the Chinggisids and led to the formal collapse of the consolidated empire of Chinggis Khan.

Thus, the formation of the Ulus of Jochi as an independent power took place in the period from 1207/08 to 1269. During this time, the Golden Horde transformed from an appanage allocated by Chinggis Khan to his son Jochi within the Mongol Empire to an independent state—the Empire of the Jochids. The important milestones in this process were the recognition of the rights of Jochi descendants to possessions following the death of Chinggis Khan in 1227, the start of the reorganization of conquered lands of Eastern Europe (1243), and creation of the census for setting up regular taxation and the establishment of a single administrative system (1257–1259).

The stages of establishing statehood coincided with changes in the size of the territory of the state, which only comprised the native ulus in western Siberia in 1208, but after 1243 extended and comprised lands from the Danube to Irtysh and from Derbent to the Upper Cis-Ural Region. As a result of the internal political crisis and pressure from neighboring powers, the territory of the Ulus of Jochi started to decrease at the end of the 14th century. Gradually, it ceased to exist as a single state in the 20s–40s of the 15th century. Independent Tatar khanates emerged on its territory. Some lands got independence, such as the Russian principalities, headed by the Grand Principality of Moscow. Gradually, only the central part on the Lower Volga region was left from the vast empire and continued to carry the name of Ulug Ulus, or, according to Russian sources, the Great Horde. However, it also fell under the blows of other Tatar khanates in 1502, thus ending the existence of the Empire of the Jochids.

I. The history of the Jochid Ulus Studies in the Russian and foreign science

Iskander Izmaylov

Disputes about the role and place of the Ulus of Jochi in history are endless and probably will never be finished. The Golden Horde,

flashing like a bright comet in the sky of history, scorched contemporaries, leaving terrible burns and a blinding sense of grandeur. It is

Grave of J. Hammer-Purgstall

difficult to develop a common approach to the heritage of this medieval state, which existed for almost two hundred years, not only because of its huge influence on the historical life of Eurasia, but also due to the fact that it involves the cultural and historical heritage of many contemporary peoples; the medieval Tatar ethnosis was formed in its depths.

The history of the Ulus of Jochi is steeped in legends, misled by mistakes and covered with the gaping failures of 'blind spots'. The history contains many mysteries and omissions. Many of them are successfully solved; the others were and still are a subject of fierce debate in Russian and foreign historiography. Some of them are caused by the complexity of the issue itself and the fragmentariness and paucity of information, while others are caused by ideological reasons, which prevailed and still prevail over historians, limiting and regulating their 'corridor of opportunities' for understanding and grasping the historical phenomenon. It seems that the case is not only and not so much about a historiographic problem as it is about mental barriers, which, along with recently existing direct prohibitions and instructions of

the people in power, hindered and continue to hinder the creation of clear, logical, and consistent paradigms of history about this medieval state. It is quite obvious that fierce debates and discussions around the heritage of the Ulus of Jochi did not emerge yesterday but are rooted in the distant past and date back to the mythologems of church chronicles. The formation of contemporary approaches to this topic only exacerbated them and gave them a scientific appearance, uplifting them to the level of scientific conceptions and historical tradition.

This process began at the beginning of the 19th century, when in 1826, the Russian Academy of Science announced a three-year long competition to the scientific world of Russia and Europe for a paper about the consequences of the Mongol conquest of Russia, promising an award in the amount of 100 golden chervonets to the winner. However, as time went on, the required paper didn't appear. Apparently, candidates were confused by the complexity of the topic and the large volume of sources necessary for study.

Due to the failure, the academy had to extend the topic and continue the competition in 1832. Now, the call was to 'write the history of the Ulus of Jochi, or the so called Golden Horde, critically treated on the basis of eastern sources, including hoards of coins preserved from the khans of this dynasty, and old Russian, Polish, Hungarian and other chronicles, mentioned in the works of contemporary Europeans, and other data' and offered an award twice as large as the previous one [Collection of Works Related to the History of the Golden Horde, 1884, p. 557]. After three years, the massive work of the famous German orientalist J. von Hammer-Purgstall was submitted to academicians for approval. In this work, the author presented the history of the Ulus of Jochi as an independent historical phenomenon and attempted to describe it with all possible completeness, based on the examples of other medieval states. This work, despite a number of shortcomings, such as incomplete use of eastern sources and Russian chronicles, was the first and most complete research of the history of the Golden Horde, and was quite professional for the level of science at the time. It would

seem that he deserved the award. However, the commission headed by the academician H. Fraehn concluded that the topic hadn't undergone the required scientific elaboration and the author didn't receive the award. Why wasn't he even encouraged? The key role here surely was played by extra-scientific factors. On the one hand, this can be explained by the lack of any serious Russian research. Academics still remembered the stormy speeches of M. Lomonosov which contained accusations of anti-patriotism and appeals to the imperial court with demands 'to protect indigenous Russian history' from domination by foreigners, prompted by the appearance of the work of the German historian G. Miller, in which he dared to emphasize the role of the vikings-'Rus' in the formation of the Old Russian State. On the other hand, the beginning of the study of the Golden Horde coincided with the rise of Russian national identity and the formation of imperial ideology with its mythologems on the special role of the admission of European culture by 'Asian foreigners'. It was rather painful to accept the fact that at some point in the past, not only was Rus' a subject of representatives of these Asians, but was obviously culturally inferior. Apart from that, Russian historians looked at the history of Eastern European peoples through a prism set by the works of V. Tatishchev and N. Karamzin, which relied on retelling chronicles, and, consequently, adopted the Orthodox-Tsarist conception of the history of the Rus'. Thus, the study of Golden Horde history was entangled in a web of ideological priorities and political interests from the very beginning of its scientific conceptualization.

In the 19th century, this subject was studied in three general directions. A large group of historians looked at it through the prism of Russian history. This group was dominated by

S. Solovyov

V. Klyuchevsky

historians of the 'state' school of historiography, including S. Solovyov, V. Klyuchevsky, P. Milyukov, among others. The keynote of their works was formulated in the idea of S. Solovyov: '...a historian is not entitled to interrupt the natural sequence of events since the latter half of the 13th century, especially the gradual transition of tribal princely relations into state relations, by inserting the Tatar period, highlighting the Tatar period and Tatar relations, the result of which would be the compulsory covering over of the main phenomena and the main reasons behind these phenomena' [Solovyov, 1988, p. 54]. This idea, that the 'Tatars and Tatar relations' are an external and low-priority phenomenon in the description of developmental tendencies of the

Russian State and society resulted not only in an underestimation of the key importance of this period for Rus', but also crossed out the history of the Ulus of Jochi from the list of priority tasks of Russian historiography. Since then, the history of the Orda was mentioned in the works of Russian historians almost solely in the context of Russian history, as an external factor that negatively affected its course and the direction of its development.

Historians of the 'state' school regarded the very influence of the Golden Horde on the fate of Russia in an ambivalent way. On one hand, negatively, as a factor of the constant threat of war. For instance, V. Klyuchevsky wrote: 'Struggle with the steppe nomad, Polovtsian, evil Tatar, that lasted from the 8th to the end

of the 17th centuries is the heaviest historical memory of the Russian people... Neighboring the hostile predatory steppe Asian for a millennium is a circumstance that itself can cover more than one European flaw in Russian historical life' [Klyuchevsky, 1987, p. 84]. On the other hand, these historians emphasized that it was the policy of the rulers of the Horde that allowed Moscow to rise and achieve hegemony over other principalities, largely contributing to the conservation of imperial, authoritarian traditions and a delay in the socio-economic development of Rus'. However, their works, despite the attention to Russian-Horde relations, don't contain objective characteristics of the Ulus of Jochi as a highly developed society with an urban culture, but continuously cultivate the opinion about the underdevelopment and 'barbarity' of the Tatars.

It is interesting to note that this conception appeared on the pages of European works of history. For instance, while gathering information for his monograph 'The secret diplomatic history of the 18th century', K. Marx, who could read in Russian very well, tried to prove that the current condition of Russian society, the atrocities of the tsarist regime, the horrors of serfdom and the policy of repressing peoples freedom, can be related to... 'the Tatar yoke'*. His original phrase was often repeated in Russian historiography: 'This yoke not only

suppressed, but also humiliated and seared the souls of people, its victims. Tatars established the regime of systematic terror; devastation and bloodshed were commonplace' [Marx, 1899, p. 78]. Thus, the logical circle has been closed: the church chronicle tradition became the basis for works of Russian historians; they were used as a factual base for the works of western 'classics of Marxism', which, in turn, became a methodological conception for Soviet historiography. However, it is notable that Soviet historians didn't hasten to quote many other passages from this work of K. Marx, which contains many hard-hitting words characterizing Russian statehood and the external policy of Russia, because of which the work of the 'classic of Marxism' was never translated into Russian in the Soviet period.

Russian Oriental Studies took a different path. Orientalists P. Savelyev, V. Grigoryev, I. Berezin, G. Sablukov, V. Velyaminov-Zernov, V. Tiesenhausen, N. Veselovsky and V. Bartold focused on identifying new sources on the history of the Ulus Jochi and their critical study. Their works were characterized by a comprehensive approach to the subject, an intention to consider the phenomenon of the Golden Horde as a whole, and study of the internal functioning mechanisms of the state using eastern written and numismatic sources and decrees.

I. Berezin (1818–1896) can be rightfully added to the list of Russian scientist-orientalists who were engaged in research on the history of the Golden Horde and the translation of eastern sources into Russian with the provision of valuable comments and notes. He is credited for the introduction of new, previously unstudied, earlier eastern sources into scientific circulation. For instance, while working at the Kazan university, I. Berezin began to publish 'The libraries of eastern historians' (the first volume was published in 1849). The characteristic feature of the historical works of N. Berezin was that he was studying the history of the Jochid Ulus based on primary sources, which, according to the author, should have contributed to deeper research. First of all, he suggested translating and publishing several works based on the works of the Persian scholar and statesman Rashid al-Din, and also analyzing written

* 'The Tatar Yoke' ('Tatar Mongol', 'Mongol Tatar') is the traditional name for the system of rule over the Russian principalities by the Khans of Jochi Ulus in the 13–15th centuries, loaded with a negative sense and understood as 'cruel and merciless oppression and suppression' in Russian historiography. The term 'Tatar Yoke' stems from the church tradition and historical journalism of the late 16 and early 17th centuries ('Kazan History'). From the end of the 18 century to the 20th century, it reappeared in the works of Russian historians, sometimes in the form of 'The Tatar-Mongol Yoke', which was supported by tendentiously selected facts and later took form of an historiographical concept. The negative evaluations of 'The Tatar Yoke', introduced by Karl Marx and Joseph Stalin were widely used in Soviet historical science. Contemporary studies show the complex nature of the interaction of the Russian princes and the Khans of the Golden Horde, irreducible to the church mythologema of 'The Tatar Yoke' [Nasonov, 1940; Kargalov, 1980; Nazarov, 1983; Kuchkin, 1991; Vernadskiy, 1997; Halperin, 1986; 1987; de Hartog, 1996; Gorskiy, 2000].

sources of the Golden Horde itself in order to reconstruct the history of the Golden Horde [Berezin, 1850; 1852]. His extensive article about the Mongol-Tatar invasion of Eastern Europe [Berezin, 1853; 1855] includes vast extracts from the works of eastern authors (Rashid al-Din, Juwayni, Vassaf, etc.), and extracts are provided with detailed comments. However, by introducing new eastern sources into scientific circulation,

I. Berezin confines himself to an explanation of the texts, providing neither conclusions nor generalizations.

Russian historical science also owes the introduction of the most valuable source on Mongol history into the scientific circulation to I. Berezin—the 'Jami' al-Tawarikh' by Rashid al-Din. Evaluating the scientific activities of I. Berezin in the researching Golden Horde history on the basis of eastern sources, we need to mention that his ideas and collected rich factual data contributed greatly to the development of Russian Oriental Studies [see: Arslanova, 1986, p. 116–117]. Highly appreciating the activities of the scientist, V. Bartold wrote that 'the merits of that generation of orientalists, whom I. Berezin belonged to, are determined not only by completing, but by setting the scientific tasks, and in this respect the scientist, who wrote that 'Russian orientalists are obliged to explain the Mongol period of the Russian history, and not only in word, but also in deed, proved the understanding of this obligation; the publisher of the "Library of eastern historians" and the book of Rashid al-Din, have full right for the gratitude of posterity' [Bartold, 1926, p. 72].

The famous orientalist G. Sablukov greatly contributed to the study of Golden Horde state history (see: [Valeyev, 1993]). A numismatist, archaeologist and historian, he knew eastern languages very well. His 'Essay on the internal condition of the Kipchak tsardom' [Sablukov, 1844] (2nd edition, see: [Sablukov, 1895]), published in 1844, laid the foundation for studies of the Golden Horde internal system, based on,

I. Berezin

V. Tiesenhausen

first of all, Tatar sources—yarliqs and numismatics. V. Grigoryev commented on that work: '...we... believe that this article is a remarkable phenomenon. In particular, we wonder how he managed to take up the task so cleverly and come up with so many new and sound information about the topic, whereas Hammer, with four hundred sources in his "History of the Golden Horde", couldn't write anything useful' [Grigoryev, 1876, p. 312].

Of special note are the outstanding works of the talented source-study expert, archaeologist and numismatist baron V. Tiesenhausen (1825–1902), who prepared two volumes of abstracts for publication from eastern (Arab and Persian) sources, containing information about the history of the Ulus of Jochi. In order to perform this task, V. Tiesenhausen went to Europe in 1880 and extracted information from manuscripts of various European collections. He brought back many abstracts, significantly complementing information that he had collected before from available sources [Rozen, 1865, p. 231–236]. The product of his years-long work was a collection of extracts from Arab and Persian works on the history of the Golden Horde. This work can be rightly called a feat in Russian Oriental Studies [Arslanova, 1986, p. 114–116]. In 1884, he published the first volume of the 'Collection of materials on the history of the Golden Horde', including extracts from Arab works. In the preface of the collection, the author recognized the great importance of the performed work for Russian science in general, writing the following: 'Lack of a profound, possibly-complete and

V. Bartold

Sh. Marjani

critically treated history of the Golden Horde or Ulus of the Jochids, that is the appanage of the descendants of Jochi, the elder son of Chinggis Khan, is one of the most important and sensitive gaps in our Russian history, depriving us of the opportunity not only to study the course and entire system of this vast and specific semi-nomadic empire, that for more than two centuries had been disposing the destinies of Russia, but to correctly evaluate the degree of its impact on Russia, conclusively determine what was specifically affected by the Mongol-Tatar domination and how it actually hampered the natural development of the Russian people. This gap was felt for a long time already' [Collection of Works Related to the History of the Golden Horde, 1884, c. 5]. V. Tiesenhausen was planning to add works of Persian, Tatar and Turk writers into the second volume the abstracts with further publication of historical, geographical and other comments, required for both volumes [Ibid., c. 15]. However, this work, which contained information from Persian works, was unfortunately left unfinished and unpublished. It was destined to see the light only sixty years after the death of the author, amended and edited by the prominent Soviet orientalist A. Romaskevich and S. Volin [Collection of Works Related to the History of the Golden Horde, 1941].

It is impossible to overestimate the great importance of the works of V. Tiesenhausen for science. 'Needless to say,' states the famous Soviet orientalist A. Yakubovsky, 'how gratefully

the work was accepted by all those who in one way or another are interested in the history of the Golden Horde. The years following the publication of the work have shown how much we needed this book. Our historical works often contain references to it. Glancing over the works of more than one hundred years of Russian and West European scientists about this big and complex

issue, we have to admit that in terms of cultural heritage we shall especially appreciate the long-standing and painstaking research of the Russian researcher V. Tiesenhausen. At the moment, no historians, working on the history of the Golden Horde, can make do without the materials collected by V. Tiesenhausen' [Grekov, Yakubovsky, 1950, p. 78].

The famous Russian orientalist V. Bartold (1869–1930) played a crucial role in the study of the issues of Middle Age history of Middle Eastern countries. He was fully aware of the need to identify, study and introduce new eastern manuscripts, primarily Persian and Arab, into scientific circulation. Sources and their analysis were his credo. It is known that he was proficient in Arab, Persian and Turkic sources. A. Yakubovsky emphasized that 'V. Bartold was addressing the object of his research with methods of the most rigorous criticism of sources... In order to start the research, he had to collect a vast amount of factual material, most of which was totally new to science. The talent of V. Bartold, first of all, was reflected in finding this factual material and its critical processing. Experts are well aware of the exhaustiveness with which he could extract required information from primary sources' [Yakubovsky, 1974, p. 63]. Having made many interesting and valuable observations on the history of the Golden Horde based on the Arab, Persian and Turkic sources, V. Bartold, however, was generally pessimistic about the possibility of creating a generalized work on the

history of this state, believing that the source base was not enough. According to his opinion, the main task 'in the history of the East, like in other spheres of history', was a necessity to move from extensive to intensive research, from vast generalizations to the development of specialization and a thorough study of separate countries, peoples and ages based on primary sources' [Bartold, 1925, p. 161].

The numerous works of V. Bartold, written using a vast historiographic base, had an obvious advantage over works of other researchers of the East. He stood out through his use of rich and various factual materials from primary sources, his excellent knowledge of historical literature, a thorough study of separate facts, events, chronological dates, proper names and place-names in the context of weakly developed study techniques of eastern historical sources and methods of textual analysis at the time.

The enormity of materials which V. Bartold extracted from the primary sources boggles the imagination. In this regard, his most valuable fundamental work is 'Turkestan in the era of the Mongol invasion' [Bartold, 1963], in which he provided the first research on the issue of the formation of the Mongol state under the power of Chinggis Khan and the Mongol conquests in Middle Asia and Iran, as well as the history of the Chinggisid states. Historiographic works of V. Bartold couldn't help causing criticism from Soviet historians, accusing him of not only 'not being a Marxist', but also of idealizing the historical role of the Mongol Empire and certain rulers, including Chinggis Khan [Ali-Zade, 1956, p. 21; see also: Yakubovsky 1974]. The words of the honest Russian patriot V. Bartold that 'despite the devastation caused by the Mongol troops and despite the duties imposed by baskaks, the period of the Mongol sovereignty was marked by not only the beginning of the political rise of Russia, but also the further success of Russian culture' [Bartold, 1925, p. 171–172] led to particularly angry reactions from these historians.

The topic was also studied in Tatar historical science. The works of the outstanding Tatar scientist Shigabuddin Marjani (1818–1889) are of the greatest conceptual accuracy and sci-

entific character. In his works, developed based on an analysis of eastern (Arab and Persian) sources, he studied the political history of the Ulus of Jochi, described the reigns of the khans, their genealogy and struggle for the khan's throne [Märjani, 1989]. This was the first truly scientific work on the history of the Tatars, and comprised a set of Arab, Persian and Chagatai sources on the history of the Bulgars, Khazars, Bashkirs and other Turkic peoples. Having a good command of classical eastern languages, Sh. Marjani not only read the works of eastern historians and travelers in the original, the majority of which he had found and read while studying in Bukhara and Samarkand, but represented them in a form of linked history of the past of the Tatars. In his conception, the history of the Tatars in the period of the Ulus of Jochi is the most important stage in their history, the origins of which go back to the Turkic-Tatar states of the past (for the concept of Sh. Marjani, see: [Schamiloglu, 1990]). Even though in general the historiographic activity of Sh. Marjani is highly evaluated in the historical science, it is regrettable that his name is not popular enough in Russian Oriental Studies.

The direction that was established by Sh. Marjani in Tatar historiography was continued by his students and followers. Building on its traditions, Tatar historians mainly focused on political history, the lives of the khans of the Jochid Ulus and other Tatar khanates. Of special note are the works of R. Fakhretdin [Fekhretidinev, 1993; Fekhretdin, 1996; 1999]; Kh. Atlasi [1911; 1920; 1992], G. Äxmärev [Äxmärev, 2000], etc. On the theoretical level, these works were within the framework of understanding the place of the Golden Horde in Turkic-wide Muslim history; they offered quite limited possibilities for serious historiographic analysis and wide generalization. However, these works revived and scientifically formulated the system of thought about the history of Jochid Ulus as an important and integral part of the history of the Tatars and the period of their independent development. The works of the mentioned historians contained an idea about the Golden Horde as a developed state with a rich history and culture, though not without a certain level of idealization [Fekhretdin, 1996].

R. Fakhretdinov

G. Gubaydullin

Kh. Atlasi

Unfortunately, such understandings of the past by Tatar historians were interrupted in the Soviet period and preserved just in emigration, in Turkey. Here, it continued to further develop in the works of A.-Z. Validi (Togan) [Velidi, 1992], G. Battal (Taimas) [1996], G. Iskhaki [1991], A. Kurat [Kurat, 1937; 1940], B. Ishboldin [2005], etc. Many of them, especially A. Validi and A. Kurat, had a good historiographic background and a broad knowledge in the sphere of history. However, they weren't trying to create a complete history of the Jochid Ulus, assuming that the main impediment was the lack of new sources for such a generalization.

Considerable interest in the history of the Horde emerged in the 20s–30s in the 20th century. It was associated with the growth of national identity, the revival of the statehood and culture of the peoples of Russia and the policy of exposing the colonialist intentions of tsarism, which was greatly encouraged by the works of the militant historian-Marxist M. Pokrovsky, who opposed the dominant Russian historiographic 'theory of continuous struggle of the Forest against the Steppe' and stressed the significant influence of the culture of the Horde on Rus' [Pokrovsky, 1925, p. 39; 1933, p. 188]. The expansion of archaeological works at Golden Horde sites of the 13–15th centuries in the Volga Region played a major role in deepening the ideas about the Ulus of Jochi. Magnificent examples of monumental architecture and material culture discovered there, first of all, as a result of the work of F. Ballod

[Ballod, 1923a; 1923b; 1924; Ballod, 1926], had completely changed traditional views of historians on the 'nomadic' life of the Horde. A number of works appeared in which authors tried to reflect on the new data and objectively evaluate the place of the Golden Horde in world history [see: Ballod, 1924; Yakubovsky, 1929, p. 123–159; Savich, 1936, p. 37–49].

The level of works of Tatar historians markedly increased, among which stood out G. Gubaydullin (G. Gaziz) [1923; 1925; 1927; 1928; 1994; Gobeidullin, 2002], J. Validi [1923] and A. Rakhim [1930]. These works, continuing the traditions of Tatar historiography, added into it the scientific analysis and knowledge of works of Russian and foreign historians. Their historical theories, based on the dominant Marxist class theory of the time, contributed to understanding the nature of the Golden Horde as a feudal state, and also its important role in the formation of the Tatar people, which was clearly stated in one paragraph of a project work by G. Gubaydullin: 'A new period commenced in the history of the Tatars following the arrival of the Mongols in Eastern Europe. It was marked by: 1) formation of the Tatar people; 2) the beginning of the establishment of the feudal socio-economic formation of the Tatars' [Gubaydullin, 1994, p. 55–56].

In this period, the necessity of combining the efforts of historians-Russianists and orientalists was identified. A fairly successful attempt of such association was made in the combined work 'The Golden Horde' (1941) by B.

Grekov and A. Yakubovsky. According to the authors, the aim of the work was to 'fulfill, finally, the old debt and write the unwritten history of the Golden Horde', because it is impossible to understand the history of the Tatar and Crimean Autonomous Soviet Republics without the Golden Horde. In their past, the Tatars, now living in these republics, were closely associated with the Golden Horde, both politically and, mainly, culturally' [Grekov, Yakubovsky, 1941, p. 8]. In this work, the authors, using various sources, provided the first coherent narration of the history of the Ulus of Jochi in the period of its formation and prosperity, describing its economy and political history. The conclusion of the authors was that 'the Golden Horde is not only nomadic, but also a settled community with various ethnic content..', which was based on the results of archaeological excavations in cities in the Lower Volga Region and Aral Sea Region, and was of great importance for a realistic assessment of the historical importance of this state [Ibid., p. 76]. However, the former traditions of Russian historiography had their effect, which was especially obvious in the chapter written by B. Grekov, which stressed the special mission of Russia in 'rescuing Europe from the invasion of the Tatar hordes' and vividly described the sufferings of Russians under the 'Tatar yoke', even though it was also stating that 'it is impossible to study the history of the Golden Horde by focusing on the extent it was a "terror and scourge" for the history of Russia' [Ibid., p. 7].

Unfortunately, this experience didn't become the beginning of a vast historiographic tradition. On the contrary, we can say that it marked the ending of a stage, when Soviet science allowed discussions and welcomed new approaches to the topic. Later, this tradition was substituted by uniformity and unanimity in the negative assessment of the role and importance of the Golden Horde in the history of the peoples of the USSR. One of the first such works was the book of A. Nasonov "The Mongols and Rus'" (1940). Established as a kind of counterweight to emigrant and European his-

G. Vernadsky

A. Yakubovsky

torical literature, it reviewed the 'history of Tatar policy in Rus' in detail', trying to bolster the former mythologema of 'the Tatar yoke' with facts.

Another conception of Golden Horde history was extensively developed at the same time. It occurred in the pre-revolutionary period, but gained the most popularity among emigration figures in the 20s of the 20th century. Its key idea was that different peoples within united Russia—'the Eurasian world'—share a particular affinity (even having some political contradictions) and a community of historical destinies. Historical views of Eurasians—among them there were such bright philosophers, historians and philologists as N. Trubetskoy, P. Savitsky, G. Vernadsky, E. Khara-Davan, etc.—were based on the idea of the special mission of Russia. They assumed that the fates of the peoples of Eurasia proceeded apart from the fates of the peoples of Europe and Asia. They distinguished themselves from Slavophiles, recognizing that Turkic and Finno-Ugric peoples played a major role in the history of Russia, while the Russian nation took up the initiative of combining multilingual ethnoses into a 'single multinational nation'—Eurasians and the unification of Eurasia into single state—Russia. This was clearly formulated by N. Trubetskoy: 'the national substrate of the state that was formerly called the Russian Empire and is now called the USSR can only be the totality of peoples inhabiting this state, considered as a particular multinational nation, and as such having its own nationalism' [Trubetskoy, 1993a, p. 95]. Accordingly,

the culture of this nation 'is neither European, nor Asian, neither an amalgamation, nor a mechanical combination of elements of that and others... It shall be opposed to the cultures of Europe and Asia as a middle Eurasian culture' [Eurasianism, 1992, p. 375]. However, the views of Eurasianists aren't limited by these representations. The main contradiction of historical theories and ideologies of Eurasianism, subtly worded by N. Berdyaev and other opponents, was that they considered the church and Orthodoxy to be the basis of Russian culture ('unity of itself in the kingdom of God') [Berdyaev, 1993, p. 292–300; Florovsky, 1993, p. 237–265]. There wouldn't have been innovation or originality in the idea if the Eurasianists hadn't subsequently announced that Orthodoxy was the focus and purpose of the entire Eurasian culture. They declared Orthodoxy to be a truly universal religion and the only true and infallible expression of Christianity, and 'everything outside of it—either paganism, heresy or schism' [Eurasianism, 1992, p. 362].

Furthermore, the study of Eurasian history was focused on researching the 'Asian' or 'Tur-an' 'element' in Russian culture. Eurasianists considered the Golden Horde to be an inseparable unity of heterogeneous elements and a special geographical world, including Rus' and the Steppe, that was created as a result of the activities of Chinggis Khan and his heirs, with ongoing complicated processes inside ('rhythms of rise and depression'). They paid much attention to the history of Rus' in the period of the Golden Horde—'Tatarschina' and its role in the fate of Russia [Vernadsky, 1927]. According to P. Savitsky, 'there wouldn't have been Russia without Tatarschina' [Savitsky, 1993, p. 123]. They were all trying to prove that this empire (the Golden Horde) was a phenomenon of the global order that largely determined the further course of events in the whole of Eurasia, including Eastern Europe. 'An example of the Mongol-Tatar statehood,' (of Chinggis Khan and his successors) stated P. Savitsky, 'that managed to take control and rule a huge part of the Old World for a certain historical period, certainly, played a big and positive role in the formation of the great Russian statehood' [Savitsky, 1993a, p. 101]. Similar views of

Eurasianists and their followers had and have special attraction for non-Russian intellectuals.

This line of thought, undoubtedly, enriched historiography and encouraged more intensive study of the Chinggis Khan age [Trubetskoy, 1925; Khara-Davan, 1991], the Golden Horde period [Vernadsky, 1927] and Eurasian history [Vernadsky, 1934]. For western science, thanks to the project work of G. Vernadsky 'The Mongols and Russia' [Vernadsky, 1953; Vernadsky, 1997], this conception largely became determinative in the study of the history of Russia in the Middle Ages. However, conceptions of Eurasianists were never recognized by Soviet historiography (with a few exceptions, since the 1970s). Furthermore, their theories were called 'idealistic' and 'praising the strong personality', while their authors were called 'pseudo-historians of Russia' [Merpert, Pashuto, Cherepnin, 1962, p. 75].

Meanwhile, the ideas of Eurasianists about the steppe region of Eurasia as a consolidated historical-cultural region were recognized and found followers in western historiography [see: d'Osson, 1937]. Significant development of this topic was the political history of the Eurasian steppes, described in the monograph of R. Grousset 'The Empire of the Steppes' [Grousset, 1939; 1970]. It paid considerable attention to the history of the empire of Chinggis Khan and his heirs. Excellent knowledge of historical sources and literature allowed the author to draw a picture of the past of Eurasia on a vast historical and geographical background.

Continuation of the classical oriental studies tradition in the study of medieval eastern communities was a special focus point in European historiography. The most important of these is the work by a famous German orientalist B. Spuler, 'The Golden Horde' [Spuler, 1943]. In the work, relying on a wide range of eastern sources and partially information from Russian chronicles, he provided a complete description of Golden Horde history starting from the year that the Mongols arrived to Europe in 1223 and up until the Golden Horde defeat in 1502. The most important elements for the development of the topic were the consistent descriptions of the internal structure of the Golden Horde: the territory, state institutions, law, military

science and culture, including science and art, and also such specific issues as the history of dress and food. We can say that this work was and still is unrivaled in the scope of tasks and subjects of problems raised. It is important to stress that in contrast to the usual practice of Russian works, it didn't contain a separate chapter narrating the relationship of the Golden Horde khans with the Russian princes. This, in particular, combined with accusations that the author is new to Russian chronicles and pays insufficient attention to the pattern of the Golden Horde collapse after the heroic struggle of conquered peoples, which became the main point of criticism of the work in Soviet historiography (see: [Merpert, Pashuto, 1955, p. 180–186]). B. Spuler's monograph greatly impacted the entire western historiography; there isn't any work on the medieval history of Eurasia that wouldn't contain a reference to it. But in the Soviet Union, if it was mentioned, it was mentioned only negatively, even when the authors didn't read the work itself, which was kept under special guard in central libraries.

This is not a coincidence. Other assessment approaches of Golden Horde history entrenched in the Soviet historical science. They began to appear at the end of the 1930s, when, following the death of M. Pokrovsky, there was a wave of unbridled criticism of his views, which were labelled 'anti-historian', while he and his followers were called a 'despicable gang of fascist agents' (see: [Against historical conception, 1939]). At the same time, any attempts to highlight the positive points and results in the formation of the Ulus of Jochi were condemned; any signs of condemnation of the imperial, messianic claims of Russia were suppressed. Following the 'anti-Pokrovsky' campaign and due to the deployment of the struggle against 'bourgeois nationalism', this strengthened criticism of the history of the Ulus of Jochi.

The final verdict on the history was delivered in a notorious decree of the Central Committee of the All-Union Communist Party (of the Bolsheviks) on 9 August 1944, which sharply censured the 'embellishment of the

R. Grousset

B. Spuler

Golden Horde and khan-feudal epic "Edigu" [About condition and measures, 1954, p. 527–529]. It also issued on its base the decree of the Tatar Oblast committee of the All-Union Communist Party (of the Bolsheviks) on 10 October 1944, depicting the Golden Horde as a barbarian state, that existed 'only by means of violence and plundering conquered peoples', hampering the 'progressive development of the hard-working and freedom-loving Russian people' (see: [Izmaylov, Gibadullina, 1996, p. 96–114]). Carrying out the decision of the Central Committee of the All-Union Communist Party and bureau of the Tatar Oblast Committee, historians had to radically change the direction of their research. Since that time it became impossible to mention the Ulus of Jochi and its cultural achievements in a positive light, not only because of strong criticism, but also because of the danger of political repressions. In Tatarstan, the history of the Golden Horde was actually directly suppressed, and any research in this direction was frozen for almost three decades. The gaping breach in the medieval history of the Tatars was filled by 'local Bulgar roots', which were enshrined by a special 'scientific session about the origin of the Kazan Tatars' (25–26 April 1946). Since that time, in the history of the Tatars, the Ulus of Jochi was considered to be an external phenomenon, and the medieval state itself was declared 'a predatory, parasitic entity', that lived only by plundering conquered peoples and expectedly fell because of the heroic struggle of Russians for independence. A characteristic passage from a speech of M. Tikhomirov at the defense of

the dissertation of H. Gimadi in 1949, when he evaluated the Golden Horde was: 'Nobody denies the importance of the Golden Horde as a big state, but we can not forget that the role of the conquerors—the Mongols and the Golden Horde khans—was quite negative'. Later, indicating the desolation of the Volga Region in the 15–16th centuries, he stresses the following: 'It seems very important to me and allows us to get rid of the old ideas that the Golden Horde was some kind of state that created new values. Apparently, we should speak more about the sad fate of those countries that were directly submitted to the Golden Horde...' [Tikhomirov, 1973, p. 396].

This is the way in which the internal history of the Horde, its relationships with Russian principalities and neighbor states was presented on the pages of books of that time, including the revised work of B. Grekov and A. Yakubovsky 'The Golden Horde and its dissolution' (1950). In fact, they restored not only the traditions of 'the state school' of Russian historiography, but also the church-imperial myths of the 16–17th centuries. However, unfortunately, this conception of the Ulus of Jochi history became dominant and still determines approaches to it.

Of course, there was a diversity of opinions in Russian historical science. After the mid-1950s, during the period of the 'thaw', there were signs of the complication of approaches to the topic. The interesting work of M. Safargaliev 'Dissolution of the Golden Horde' (1960) was published at the time, which, in spite of the usual curses towards the aggressive Horde (without them at that time the book wouldn't have been published at all), also provided a detailed analysis of the political events in the Ulus of Jochi from the end of 14th century to the beginning of the 15th century. However, this work was a rare exception among many books and articles of V. Pashuto [1956; 1977], L. Cherepnina [1958; 1977]; V. Kargalov [1966; 1967; 1980], V. Kuchkin [1974; 1980; 1984; 1991; 1995], V. Egorov [1980; 1985], V. Nazarova [1978; 1983], in which the traditional ideas of 'the state school' were developed about the eternal hostility of nomads to the Slavs ('the struggle of the Forest with the

Steppe'), about the sufferings and distresses of Rus' under the 'Tatar yoke' and its disastrous consequences for the future of the country, and about the civilizing role of Russia towards the people of the Volga Region, the annexation of which, following bloody wars, was a natural ending of the righteous fight against the 'Tatar yoke'. In a political sense, this historical conception served for the justification of the political theory of the 'elder brother'—the leading role of the Russian people among other peoples of the USSR—one of the ideological pillars of the imperial conscience in the 'Kremlin empire'. History books, beginning with reading books for junior classes in middle school and up to higher education books, served for the final consolidation of these mythologems in the mass consciousness.

The works of Tatar Soviet historians are adjacent to the same direction. Its representatives—H. Gimadi [1949; 1951; 1954; 1955], A. Khalikov [1978; 1985; 1989; 1992; 1994], S. Alishev [1985; 1995], and partially R. Fakhrutdinov [1984] were trying to explain all the complex historical processes in the Golden Horde of the 13–15th centuries by the simple formulas of 'the Mongol conquest of Bulgaria' and the 'fight of its people for liberation'. The specific point of this conception was the rejection of the ethnonym 'Tatars', which, according to their opinion, was imposed on Bulgars later (according to some theories in the 1920s), and ignorance of integrative ethno-cultural processes inside the Ulus of Jochi, while considering its history only as an external factor that hadn't played a determinative role in the history of the Tatars.

Under the heavy pressure of the command-administrative party-Soviet system and its censorship there could hardly be any other type of research in the regions, but this system still had its loopholes in the forbidden history of the Ulus of Jochi—special research in the area of numismatics, archaeology and source studies. These fields of science gradually managed to break away from censorship and create scientific accounts of the Golden Horde, letting themselves step away from the straight scheme of the 'state school'. In the 1970–1980s, this approach centered around archaeological studies

A. Khalikov

G. Fedorov-Davydov

A. Smirnov

of the remains from the ancient towns of the Lower Volga Region. It occurred as a result of the works of

A. Smirnov, G. Fedorov-Davydov, V. Egorov, M. Poluboyarinova, T. Guseva, A. Muhammadiev, N. Bulatov, and their students and colleagues who had been conducting archaeological studies in the Lower Volga Region for many years. The accumulated material and new approaches to its interpretation initiated a comprehensive study of the history of the Ulus of Jochi, including its social system, different aspects of its material and spiritual culture, numismatics, historical geography, and military science. Fedorov-Davydov significantly contributed to the new approaches to Golden Horde studies. He not only held and managed the yearly extensive excavations of the Golden Horde cities in the Volga Region [see: Fedorov-Davydov, 1994], but also presented its culture as it comes before a researcher through archaeological remains—bright, rather eclectic, and magnificent. His articles covering different aspects of the Golden Horde internal history were especially important to further research in the field of the history of the Ulus of Jochi [Fedorov-Davydov, 1969; 1970] and resulted in a monograph that summed up a hundred years of studies of its social system [Fedorov-Davydov, 1973]. Here, for the first time in Russian historiography, the author fully characterized the state and social structure of the Ulus of Jochi in its historical development, and traced the establishment and evolution of government

institutions and their terminology. A subtle scientific analysis and large source base let him formulate theses and conclusions which were much deeper than in previous historiography. In general one can say that papers by G. Fedorov-Davydov put a new spin in world science studies of the Golden Horde and proposed an advanced comprehension of it as a complicated medieval state. These articles were highly respected and recognized in academic circles in the USSR, as well as Europe, which is proved by their frequent publications in foreign languages [Fedorov-Davydov, 1972; Fedorov-Davydov, 1984; Fedorov-Davydov, 1984].

But despite the clear progress in posing and solving a set of problems, all these researchers stayed within the context of traditional conceptions. They commonly defined the Golden Horde as 'parasitic nomadic state' and were keen to declare the cities and urban culture in the Volga Region as an alien formation in 'the sea of the nomadic hordes', which led to the idea that they 'were built by Russian captives and by Russian silver'. While the works and discoveries made by G. Fedorov-Davydov belonged to the future, then it is obvious that his views were from the past. 'Our negative definition of the Golden Horde as a parasitic state,' as he summed up one of the results of a historical and cultural study of the state, 'does not cancel the necessity to study its fascinating syncretic culture created by its conquered people' [Fedorov-Davydov, 1991b, p. 81]. Such a conclusion, which did not follow his own research

L. Gumilyov

H. Göckenjan

or the presented material, was increasingly frequently proclaimed among his students and followers. It is no surprise that this trend has lately found itself in crisis; it is increasingly becoming intertwined with concepts of 'sovereign' Russian historiography (see for example: [Egorov, 1990]).

There were not many works outside of the framework of this tradition. The original works of L. Gumilyov are a notable exception. They presented a revival of Eurasian ideas in the USSR, which were under an unofficial taboo at the time. The most important among them were 'Searching for an Imaginary Kingdom' (1970) and 'Ancient Rus' and the Great Steppe' (1989), which not only broke through the monopoly of the official scientific interpretation of Golden Horde history, and showed the possibility of other interpretations, but also rejected current political evaluations imposed on the past in a well-argued and consistent manner. This explains why the works of the 'last Eurasian', not without certain mistakes and conceptual flaws (especially in analyzing the sources and ethnogenesis theory), caused unconcealed hatred from the academic scientific milieu on the part of official historiography (especially by B. Rybakov, S. Pletneva, V. Egorov, V. Kuchkin, A. Kuzmin).

New approaches to the subject approved by L. Gumilyov, as well as works written by Eastern scholars, source-study experts, and archaeologists played an important role in the gradual revival of studies on the history of the

Ulus of Jochi in Tatarstan. The process of studying the history and culture of this medieval Tatar state was prohibited and distorted by official science in the 1930s–1960s, while in the 1970s–1980s, studies of specific problems began, such as the social and ethnic history of the Tatars [Muhamedyarov, 1968], Tatar source studies [Usmanov, 1972; 1979], and numismatics [Muhamadiev, 1983; 1995]. They emphasized the important role of the Golden Horde period in the history of all the Turkic

peoples in Eurasia whose integral history is impossible to imagine without studying the culture of the period. One can consider the words written by M. Usmanov as the keynote of the new direction, which was implicitly forcing itself through the existing taboos and negative opinions: 'Even when considering all the disaffection of some authors towards the Golden Horde epoch in history, it seems hard to cross out a period of three hundred years from the past of the many peoples of the USSR, as that socio-politically complex period is when the basis for many Turkic nations was laid, or relaid' [Usmanov, 1972, p. 64]. Nevertheless, because of the specific nature of the mentioned scientific disciplines and their indirect influence on historical research, this direction stayed in the background, and its representatives did not, or could not, create synthesized reports on the history of the Ulus of Jochi in view of the specific nature of their sources.

In the 1970–1980s, interest in the history of Russia was quickly developing, and thus, in such an important period as the history of the Golden Horde. In the papers of these years, as a rule, the ideas contained in the book 'The Mongols and Russia' by G. Vernadsky (1953) were further developed. Almost all researchers on the medieval Rus' were under its influence, like Y. Pelenski [Pelenski, 1974], J. Fennel [1989], D. Ostrowski [Ostrowski, 1989; 1998] and others. Along with this, Eurasian views are being reconsidered in recent years. Papers written by Ch. Halperin are especially significant in this

regard [Halperin, 1985; 1986; 2004, p. 131–144]. At the same time, an oriental direction was developing in western science; its representatives chose the Mongol conquests as the main topic for their research [Saunders, 1971; Boyle, 1977; Allsen, 1983; 1987–1991; Ratchnevsky, 1991; Göckenjan, 1991; 2000; Zimonyi, 1993, p. 86–97; Zimonyi, 1992/3; Allsen, 2003; Weatherford, 2005], as well as the internal system of the Chinggisid state [Allsen, 1981; 1985; 1987; Golden, 1992a].

In general, one can say that western science achieved obvious successes as it advanced not only in research on the established of Chinggis Khan's Empire, but also on the development of the whole range of problems of its functioning and evolution in the uluses, including the Ulus of Jochi. A tendency to consider power structures in the Ulus of Jochi in terms of Turkic traditions is noticeable [Schamiloglu, 1984, p. 283–297; 1992, p. 81–93], as is the tendency to estimate the effect of the Horde's rule in Rus' more negatively [Halperin, 1985], and to believe the Golden Horde state to be a unique historical event. Except for generalizing works, separate research appeared where different sides of the history and culture of the Golden Horde are more deeply studied, such as the process of Islamization [DeWeese, 1994].

During the last decade, when the party-organisation and ideological support backing of official science failed, the self-consciousness of the Turkic peoples briefly rose, and it became possible to re-evaluate the accumulated historical material and draw out ways of overcoming both the Russian-Soviet 'powerful' school of historiography and conventional Eurasian theories. This gives an opportunity to both discard all pseudo-scientific views of the Golden Horde as a 'parasitic state' and to avoid its idealisation as a peaceful symbiosis of the 'Forest and Steppe.'

Now it seems timely to start an elaboration of a new paradigm of history of the Jochi Ulus

on the basis of a critical interpretation of the sources and papers written by predecessors. Therefore, one should note the positive trends that have emerged in Russian science since papers audited by source studies and free from ideology appeared, which described the history of the Mongol invasions [Khrustalyov, 2004; Khrapachevsky, 2004], the complex relations between Russian principalities (above all in Moscow) and the Horde from an objective perspective [Gorsky, 1996; 2000; 2004], and the history of the formation and development of nationhood in the Chinggisid Empire and the Jochid Ulus [Trepavlov, 1993; Sultanov, 2001; 2006; Pochekeyev, 2006].

Thus, historiographical surveys show that a large number and variety of historiographical materials covering the history and culture of the Jochid Ulus have been accumulated over the last two hundred years. Works of several generations of Russian and foreign researchers have led to considerable successes in the development of this field. The successes of the researchers could have been even greater if the history of the state had not been coloured by clashes of political interests from the very birth of historical science in Russia. Especially tough political pressure was exerted on historical science in the period of the 1940–80s when there was an attempt to erase the history of the Golden Horde out of the Tatar people's memory. For the last fifteen years there has been a boom of interest in the topic, leading to both important discoveries and new research vectors. Literature reviews show that historiography gradually abandoned the former mythologems and found new approaches to the topic. This is what leads us to believe that the time has come for a deeper study of various topics and trends, a comprehensive approach to discoveries, a systematisation and analysis of various sources, and the formulation of exhaustive works on the history and culture of the Jochid Ulus.

II. Sources on the history of the Jochid Ulus

1. General comments

Information on the history of the Jochid Ulus is very diverse and scattered across numerous multilingual sources. Its geography reflects the fact that the Jochid Ulus was a world empire and played a dominant role in the fates of many peoples in the Old World for a long while. Basic facts concerning the political events of the 13–beginning of the 15th centuries, including wars, ambassadors, divisions of possessions, and the reign of sovereigns, are contained in Chinese dynastic histories, Russian medieval chronicles, the notes of West European chroniclers, papers of Arab-Persian historians and geographers, travel notes of Catholic missionaries, and Armenian histories. One can draw from these sources important and significantly unique information on the political, military history, and culture of the Jochid Ulus. Analysis of this information is complicated by the fact that it is in one way or another tendentious and reflects views on certain political events of neighbours and often even opponents of the Tatar state.

Not only do they contain gaps and distortions concerning real events, which are to some extent typical for all medieval sources, but they are also incomplete in their nature because with a few exceptions they give very fragmentary information by reporting solely military-diplomatic events. The incompleteness and discreteness of this information make a complex analysis of the political history of the Jochid Ulus more difficult, not to mention an understanding of the deep sociopolitical processes taking place in Tatar society itself.

And it becomes even more difficult to obtain information from foreign sources because original Golden Horde historical essays, reflecting an integral picture of its history, did not survive to the present day. Exceptions are Turk-Tatar historical works of the 15–17th centuries, such as the continuation of the 'Compendium of Chronicles' by Rashid al-Din and 'Daftar-i Chinggis-name.' Some information about the Tatar view on history is contained in folk sources, particularly in the Tatar epic 'Edigu.'

Acts granted by the khans and the rulers of the Jochid Ulus can compensate for the lack of authentic and integral historical chronicles as they serve as the most important material on the social history and legal culture of the Jochid Ulus. Their special importance is that they are unique veracious documents among the official ones preserved from this medieval state.

Information about the trade and diplomatic contacts of the rulers of various domains in the Jochid Ulus with Italian cities-states, like Genoa and Venice, constitutes one more group of sources. They preserved unique information on the nature of trade, its organisation and legal grounds, the peculiarities of commodity-monetary relations, and mutual payments between Italian middle-men, their Golden Horde contractors, and authorities of the Jochid Ulus. They represent from a different side the nature of international trade in the Black Sea and Mediterranean basin, the place and role the Empire of the Jochids in this trade.

Epitaphic records from the Islamic regions of the Jochid Ulus, like the Middle Volga Region, Crimea, and Aral Sea Region, constitute a special group of the written sources.

Besides the narrative sources, there is an enormous collection of material sources which are a result of years-long archaeological studies. Material accumulated by mainly Russian specialists allows for the formation of more objective insight into the culture and life of the Golden Horde population, the character of its cities, and urban civilisation.

The complex of various sources providing information on the Jochid Ulus represents the most important and unique material that allows for the reconstruction of the history of this medieval state, its political, diplomatic, and socio-economic history, helping to reveal pages from the medieval past of the Tatar people.

2. State acts*

In the absence of a full and coherent history of the Jochid Ulus, samples of official acts

* Co-authored by M. Usmanov.

of this state become of key importance. They can be divided into two types, such as messages and yarliqs.

Messages (or *bitigs*) include letters from the Tatar khans to other independent monarchs as well as letters from the ulug karachibeks, the beks, and the murzas to other rulers or to foreign sovereigns.

The most important and informative sources are the *yarliqs* (from the Turkic *jarlyk*, from *jarlykamak*—'to rule, order, show mercy')—that is, formal charters (acts) issued to the subject rulers, civil and religious nobility as well as messages to neighbouring rulers. Granted yarliqs include tarkhan, suyural, privileged (including ones given to the Russian metropolitans), serving (including ones issued to the Russian princes providing them with the ownership right for their principalities), protections, and so on. The most well known among them are the tarkhan, while those less studied are the suyural and other yarliqs.

'Yarliqs-letters' (to real or fictitious vassals) and oath charters (*shart*-name—from Persian *shart* is 'an oath'), which are various types of diplomatic messages, are assigned to a special type of yarliqs. Only an insignificant part of the yarliqs of the Jochid Ulus khans (in total three) remained in the Turkic original. They contain much material concerning the public-political system, administrative and tax systems, the history of writing tradition, as well as the literary language and culture of the Jochid Ulus.

Yarliqs dating back to the 14–16th centuries were first published by I. Berezin [Berezin, 1850; 1851; 1852] at a time when scientific turkology experienced a fledging period, and textual studies of the materials in the Turkic language were making only their first steps, which could not but impact their accuracy and completeness. Nevertheless, he was the first, along with V. Grigoriev [Grigoriev, 1842], to turn directly to the study of yarliqs as linguistic and historical sources. Later many gaps in the first publications were specified and corrected in the works of V. Radlov [Radloff, 1889, pp. 1–40] and A. Samoylovich [Samoylovich, 1918, pp. 1109–1124; 1927, pp. 141–

144]. Since the 1840s state acts of the Jochid Ulus from Italian archives were gradually introduced into academic use.

Interest in the study of the Golden Horde yarliqs noticeably increased after M. Priselkov published the collection of yarliqs for Russian metropolitans [Priselkov, 1916], and A. Zimin corrected and supplemented this study [Zimin, 1962]. The publication of yarliqs of the rulers of the Jochid Ulus dated back to the 15–17th centuries from the collection of the Topkapı Palace by A. Kurat [Kurat, 1940] noticeably expanded the source base. Yarliqs of the Golden Horde rulers to the orthodox clergy and official documents from the Venice archives [Grigoryev, 1978; 2004; the Grigoryevs, 2002] were subject to a new survey.

The expansion of the source study base allowed giving systematised source study and historical analysis of the letters patent of the Jochid Ulus, of all the records management culture in this state and the post-Golden Horde Tatar Khanates [Usmanov, 1979]. All the information concerning the archaeography, palaeography, sphragistics, and diplomatics of granted yarliqs and other varieties of official acts proves that Turk-Tatar records management of the 13–16th centuries achieved significant development and was in line with the general trends of the written-clerical culture of the medieval states of the Old World.

3. Chinese and Mongolian sources*

The most important place in the study of the initial history of the Chinggis Khan Empire and his closest descendants and political events taking place during this period belongs to Mongolian and Chinese sources. They retained unique facts on Chinggis Khan's biography, his military campaigns, and on the tribal structure, military-administrative, and socio-tribal system of the emerging Mongol state. Information about the campaigns of Chinggis Khan and his military leaders to the west, the gradual formation of the Jochid Ulus, and peculiarities of its tribal structure is of special interest.

* Co-authored by Chao Chu Chang.

Horseman and his horse. Fragment of the picture 'Camp of the Tatar cavalry.' Picture on silk. 13th century. China. Yuan Dynasty. Guimet Museum, Paris

'The Secret History of the Mongols,' a historical literary record of Mongolian medieval culture of the 13th century ('Mongolyn nuuts tovchoo' or 'Mongyol-un niyuca tobčiyān,' the Chinese translation is 'Yuáncháo bīshǐ'), is the most important source concerning the early history of the Mongol Empire. The possible original name is 'Chingiz Kagan khudzhaur' ('Origin/Genealogy of Chinggis Khan'). Its author (or authors) is unknown, but it is obvious that it was created at the court of the great khans for the actions of the 'golden clan' to be eternalised. The main ideological orientation of the tales is to justify the unification of all Turkic-Mongol tribes in the Great Steppe and to praise Chinggis Khan as the creator of a great empire. The content can be divided into three parts: 1) a genealogy of Chinggis Khan's ancestors; 2) a legendary tale of his life; and 3) a brief tale about his son and successor Ögedei. The first part recounts the history of Mongolia through the most ancient records of the pre-literate tradition, which are myths, legends, and tales. In the second and third parts of the epic are revealed the main theme, while the legends and the myths are replaced by more trustworthy historical reports, perhaps oral literature and documents from the khan's chancellery. Although the narrative is of an epic character, it consists of documentary materials. In this part of the tale a detailed description of the domestic and foreign policy

development of the emerging empire is given: the forming socio-clan hierarchy, bureaucracy, military structure, diplomatic negotiations, the intertribal wars, wars with neighbours, etc. [Kozin, 1941; Khamidullin, 2002, pp. 51–62].

The text was written in 1240 and was later revised in 1252 or 1264 [Rachewiltz, 1965, pp. 185–206]. The Mongolian text, allegedly written using the Uighur script, was transcribed with the use of Chinese characters in the latter half of the 14th century. That was also when an abridged free translation into Chinese was prepared ('Yuan-Chao Bi-Shi'—'The Secret History of the Yuan Dynasty') [Yuan-Chao Bi-Shi, 1962; The Secret History, 1982].

A revised version of 'The Secret History of the Mongols,' transformed into a learning manual for teaching those Chinese who wanted to learn the Mongolian language, was completed and widely used during the reign of the Ming Dynasty (1368–1644). Herewith, 'The Secret History' was included in the collection of works named 'Hua-ii ii-iyu,' which comprised a range of Mongolian documents and the dictionary. Later in 17th century 'The Secret History' was broadly used as a basis for the epic tale 'Altan tobchi' ('Golden Summary') [Lubsan Danzan, 1973; Neklyudov, 1984].

'Yuan-Shi' ('The History of the Yuan (Dynasty)') is a dynastic history representing a collection of materials on the genealogy and military and diplomatic history of the Yuan Dynasty (1279–1368). It was completed in 1369 by a group of 16 officials after the Mongol Empire collapsed and the accession of the Ming Dynasty, a new Chinese dynasty. The work is comprised of 210 juan (chapters) and divided into 4 expansive parts: 'Basic annals of emperors' (juan 1–47), 'Descriptions' (juan 48–105), 'Genealogical tables' (juan 106–113), and 'Biographies' (juan 114–210). 'Yuan-Shi' included materials of the official dynastic history of the Yuan as well as numerous original documents from different state archives. It can be said that this is an encyclopedia of the history, genealogy, and records management of the Yuan dynasty. Different information on the history of the Great Khan's Ulus (the

Yuan Empire) as well as on his contacts with the Jochid Ulus, including diplomatic and dynastic, is of interest. It also contains the biographies of prominent military leaders and administrators, descendants from different tribes and the peoples of the empire, including the Tatars, Kipchaks, Ases [Kychanov, 2002; Chao Chu Cheng, 2002; Khamidullin, 2002, pp. 30–33].

It is recognised that the text of 'Yuan-Shi' has a range of inaccuracies and mistakes in the reflection of different information, names, and biographical facts. For instance, distortion in the spelling of Turkic and Mongol names occurs often, biographies of one and the same figure can be provided twice with varying changes, etc. Nevertheless, it is an extremely important and unique work and a source of original materials. In particular, it specifies that Turkic-Mongol traditions were preserved at the court of Khan Khubilai and his successors, such as the four ruling clans at court, organisation of roundup hunting, and the constant shifting of the khan's headquarters between Shang-Du (Kaiping) and Khanbaliq (Beijing), etc.

This text was repeatedly published in China, the earliest publication being a woodcut dated 1370. A sufficiently shortened Russian translation of the text was for the first time published in 1829 by the famous missionary and sinologist N. Bichurin (Father Iakinf) [Bichurin, 1829]. Partial materials from 'Yuan-Shi' (biographies of Chinggis Khan and his supporters) were published by R. Khrapachevsky [Khrapachevsky, 2004, pp. 432–540].

'Hei Da Shi Lue' ('Short Notes on the Black Tatars') written by Peng Daya and Xu Ting is notes of two Chinese travellers who went to Mongolia to the court of Ögedei as members of the Southern Song diplomatic missions in 1233–1235. 'Hei Da Shi Lue' bears a date of 27 April 1237. It provides detailed information on the ethnography of the steppe population as well as a serious political account. The authors reflected many facts that failed to be specified by their predecessors [Lin Kyun-i, Munkayev, 1960].

It is worth mentioning another source—**'The Note on Travels to the West of Qiu**

Chang-Chun' (**'Chang-Chun-chen-jen si-yujie'**)—dedicated to the journey of the Taoist preacher Qiu Chuji (1148–1227) to Central Asia during Chinggis Khan's western campaign in 1219–1225. This work, with information about the Mongols and Chinggis Khan, was popular in China [Kafarov, 1866; Bretschneider, 1967; Khamidullin, 2002, pp. 43–45].

'Meng-Da Bei-Lu' ('The Complete Description of the Mongol-Tatars') by Zhao Hun is the work of a Southern Song ambassador, who in 1221 visited the headquarter of Muqali, the Mongol commander of the troops in the North China. 'Meng-Da Bei-Lu' bears a date of 12 February 1222 and consists of 17 chapters. Despite the fact that Zhao Hun's work is merely a small story, according to N. Munkuyev, 'it concisely represents all spheres of the Mongols' life, and in this sense the description is 'complete' [Meng-Da Bei-Lu, 1975; Scythian History, 2001, pp. 97–110; Khamidullin, 2002, pp. 36–39].

There is also a whole range of other sources of the 14th century, which reflect the history, culture, and state and legal system of the Turkic-Mongol states, primarily of the Great Khan's Ulus (the Yuan Empire). Among them it is worth mentioning **'Jing Shi Da Dang' ('Encyclopedic Work on State Acts')** written by Ji Yu (1272–1348) in 1331 and dedicated to a detailed description of the different administrative and state institutions of the Yuan Empire. The text survived to the present day only partially. Another collection of works is **'Go-chao wang-lei' ('Examples of Works of the Ruling Dynasty')** composed in 1334. It consists of 70 chapters and includes various genres of literary compositions and documents, written by different authors from the time of Khan Ögedei to the reign of Emperor Jen-tsung (Buyantu): poems, odes, reports, epigraphs, etc. Overall there were approximately 800 different compositions. Another less known work is **'Tsje Geng Lu' ('Notes Taken between Plowing Works')**, which is the personal notes of Tao tsung-i about social relations in the Yuan Dynasty epoch. It contains much information on the history, state and law, people's customs, crafts and art and furthermore provides information about

72 Mongol and 31 Turkic tribes. Unfortunately, the above-mentioned and other sources, important for the ethnocultural history of Turkic-Mongol tribes as well as for the comparative study of state institutions and clannish system of the Mongol-Tatar States, have not been translated into Russian and remain inaccessible for national science.

4. Works of Oriental (Arabic, Persian, and Turkic) historians, geographers, and travellers

Alsu Arslanova

Arabic sources. The reviewed sources are functionally divided into a range of separate major categories, out of which we can distinguish memorial, historic, and geographical works, collections of documents, encyclopedic works, etc.

Shihab al-Din Muhammad ibn Ahmad ibn Ali ibn Muhammad al-Nasawi (died 647/1249–50) was a witness of the Mongol invasion into Middle Asia and one of the supporters (personal secretary) of the last representative of the Khwarezm Shah Dynasty—Jalal ad-Din. In 1241/42, ten years after Khwarezm Shah's death, he wrote his famous work 'Sirat al-Sultan Jalāl ad-Din Mingburnu' ('Biography of Sultan Jalal ad-Din Mingburnu') filled with enmity to conquerors dedicated to the description of the reign and campaigns of his patron and the events occurred in 1218–1231 and connected to Chinggis Khan's invasion. While outlining the events, Nasawi settled on the stories of participants and witnesses of the events—Jalal ad-Din's senior officials. It is a piece of memorial literature, and the author aimed at a full reflection of information and the sequence of events up to the time of his writing. In 1891–1895 this work was published in Paris in two volumes [History of Iran, 1958, p. 165]. In 1996 Z. Buniyatov published its critical text and translation [an-Nasawi, 1996; Khamidullin, 2002, pp. 25–30, 233–282].

Another witness of the Mongol invasion was Izz ad-Din Abu-l-Khasan Ali al-Jaziri, commonly known as Ibn al-Athir [556–632/1160–1234], a prominent Arabic historian,

who prepared a voluminous work on the world history of the caliphate and Islamic states and on related spheres 'Kitab al-Kamil fi't Tarikh' ('The Book about Perfection in Terms of History'). The 11th volume of the book provides a vivid story on the Mongol troops invasion, full of genuine drama. The chronicle is extremely important for studying the history of the Mongol invasion, even though it was written on the basis of the questioning of witnesses and rumours [Lane, 2003, p. 13]. Abstracts from the work were published in the first volume of 'The Collection of Materials Related to the History of the Golden Horde' by V. Tiesenhausen [1884] (see also: [Golden Horde in Sources, 2003]).

When Baghdad was conquered by the Mongols in 1258, the political and religious centre was shifted to Egypt. This new environment was favourable for the development of the historiography, namely of the encyclopedic genre, 'a specific type of descriptive work that pays great attention to historic and geographic data. Encyclopedias were written by distinguished officials who created their works as manuals in all spheres of knowledge aimed at the successful execution of administrative tasks. As the authors were well aware of the peculiarities of the service in sultan administration, they used extensively archival materials, which made their works distinguished sources of contemporary political history of not only the Islamic states but also of other lands. Close links to the rulers of the Golden Horde contributed to the fact that information about this state and its adjoining regions became known in Egypt...' [Kononova, 1991, pp. 72–73].

Another work in this group of sources is the work of Rukn al-Din Baybars al-Mansuri (645–725/1245–1325), which became a source for succeeding compilers. The author used to be a slave of al-Malik al-Mansur but made himself a military career during the reign of Sultan an-Nasir ibn Qala'un. He managed to secure a high government position—in 710/1310 he was designated vicegerent [na'ib] of Egypt. 'He went down in the history of Arabic literature as a historian, the author of a history of Islam in 11 volumes under the name

'Zubdat al-fikra fi ta'rih al-hijrah' ('The Creams of Reflection about the History of Hijrah'), which covered the events up to 724/1324. The major sources of his work were the following: the work of Ibn al-Athir, an Arabic historian of the latter half of the 12–first half of the 13th centuries; management materials, to which Baybars, being an administrative figure, had access; and the rich personal recollections of the author' [Ibid.]. There is no critical edition of his work.

An-Nuwayri (677–732/1279–1332) was a descendant of an Egyptian official and also a major governmental figure. 'For some time he was a commander of troops in Tripoli, subsequently he was a chief clerk in different Egyptian provinces. He was patronised by Sultan an-Nasir, to whom an-Nuwayri dedicated his work 'Nihayat al-arab fi funūn al-adab' ('The Ultimate Ambition in the Arts of Erudition'). Almost the half of the encyclopedia is occupied by its fifth division [fann] on history where the events up to 731/1331 are reflected. Thanks to a large number of preserved copies, an-Nuwayri's encyclopedia, especially its historic part, caught the eye of European scholars as early as the 18th century... Abstracts regarding the history of the Golden Horde were included in Tiesenhhausen's edition' [Ibid.]. According to scholars, the historic part shows complete dependence on the preceding historiography, except for the chapter dedicated to the Mamluk Dynasties, which contains new material.

The information of the two aforementioned authors (or their sources) was repeated, though with sufficient summarisation, by Veli ad-Din Abd ar-Rahman Abu Zeyd al-Maliki al-Hadrāmi ibn Khaldun (733–809/1332–1406) in his historic work 'Kitab al-'ibar...' ('The Book of Lessons on History of the Arabs, Persians, Berbers, and Peoples Living on Their Land') finished in 1378–1406 and published in 7 volumes in Bulak (Cairo, 1867). This author had the opportunity to use official documents as for a long period he was the supreme qadi of Mamluk Sultans.

Al-'Umari (701–750/1301–1349) was less dependent on his predecessors and more original in writing his encyclopedia. His father was

a clerk in the Egyptian Chancellery. He was a judge and secretary of state during an-Nasir's ruling. The major work of this historian is the encyclopedia 'Masalik al-absar fi mamalik al-amsar' ('Ways of Views on States with Major Centres'), the first volume of which was published in 1924 in Cairo. 'Al-'Umari's work consists of two parts (kisms), the first of which is dedicated to lands, and the second, to their inhabitants. The second division of the first part consists of 15 chapters, one of which provides a characteristic of Chinggis Khan's state... Analysis of separate parts of the composition showed that al-'Umari's sources of information were rather comprehensive, and alongside books and documents in the state archives, to which he had access as a prominent state official, he also used stories of witnesses' [Ibid., p. 76]. Herewith, 30 people were included in the list of informers on the topic of territories, making up the Mongol Empire [Ibid.]. Separate abstracts from this work were published in the first volume of V. Tiesenhhausen's 'Collection of works' [1884] [see also [Kamal, 1937, IV, facs.II; al-Omari, 1927; Das mongolische Weltreich, 1968; Istoriya Kazaxstana, 2005, text: pp. 547–569, translation: pp. 169–189].

Reference books, reflecting the relations of the Golden Horde with Eastern and Central Europe, represent another group of Arabic sources. They were prepared for diplomatic correspondence, the examples of such books are the following: al-'Umari's 'Al-Ta'rīf bi al-muṣṭalaḥ ash-sharīf' ('Introduction to Accepted Grand Style') and al-Kalkashandi's (756–821/1355–1418) 'Subh al-a'sha fi sina'at al-insha' ('Dawn for the Weak-Sighted in the Art of Writing'). The latter was working on his book from the 1390s till his death. He borrowed much information from Abu'l-Fida's and especially al-'Umari's compositions.

The next category of Arabic sources is represented by profusive materials on history: 'regarding diplomatic relations, different figures of the Golden Horde, and events relevant to Cairo, especially the events in Crimea (the relations with the Golden Horde were carried out via Crimea) and the Horde's capital. As a rule, this information was provided by

diplomatic officials, merchants, and Islamic religious figures. Many of them moved from place to place...' [Polyak, 1964, p. 32].

One of the interesting written sources of Medieval Arabic geographic literature is 'The Travels' by Abu 'Abd al-Lāh Muḥammad ibn 'Abd al-Lāh l-Lawāfī ṭ-Ṭanḡī or simply Ibn Battuta (1304–1377). This prominent traveller visited all the Islamic states. Initially he wanted to carry out the Hajj. In this regard he left Tangier, went to the North Africa, visited Jerusalem, Palestine, Syria, Medina, Mecca, wandered in Iraq, Yemen, and India, and then went to China via Tavalisi [Materials on the History of Middle and Central Asia, 1988, p. 132]. Twice he visited the north-west of the Black Sea Area: first he went from Astrakhan to Constantinople with a caravan of Andronikos's III daughter and Khan Öz Beg's wife; later he came back to the Golden Horde. Descriptions of his adventures in the 'rihla' genre were reflected in the fact-based work 'Tuhfat an-nuzzar fi gara 'ib alamsar wa-'aga 'ib al-asfar' ('A Gift to Those Dreaming of the Miracles of Cities and Wonders of Travels'), which is a literary adaptation of Ibn Battuta's stories. The recollections were written down many years after the trip. 'Ibn Battuta dwelled in Fez after his travels, and it is believed that Sultan Abu 'Inan, the ruler of Fez (749–759/1348–1358), initiated the works on the book. Abu 'Inan ordered Ibn Juzaya, who was his clerk, to write down the traveller's stories. The editor needed only three months to complete his work, and in February 757/1356 the book was finished' [Konovalova, 1991, p. 78]. The book is special as it combines actual facts and a 'fantastical approach,' which means a large number of legends concerning the lives of the saints and miracles performed by Sufi sheikhs [Ibragimov, 1975, pp. 13–14]. Fragments from Ibn Battuta's work were published in the first volume of V. Tiesenhausen's 'Collection of works' (see also: [From the Depths of the Centuries, 2000, pp. 186–201]).

Persian historiography. After the Mongol invasion of Iran and the first three–four decades of decay, a period of cultural stabilisation and the development of some spheres of knowledge began. In particular, in the

middle of the 13–14th centuries historiography reached high levels of developments in the Ilkhanate. 'Cultural revival in the epoch was facilitated by the further growth of feudal relations and intensification of economic relations, especially in the sphere of Mediterranean-Asian trade. Creation of the vast Mongol Empire and the Crusades stimulated broadening of horizon for Persian historians. Mongol Khans were interested in glorifying their reign, so they patronised historians and poets' [Agadzhanov, 1969, p. 28].

That is why it is clear and justified that historians paid great attention to Medieval Persian historiography as in the 13–14th centuries it was in a state of powerful uprise and heyday, when the Persian language crowded Arabic and began to prevail in the historical literature of the Middle East, namely in the spheres of Persian-Turkic culture [Gibb, 1960, p. 138; Khatibi, 1985, p. 6]. The fact that the Mongols overthrew the Abbasid Caliphate, which resulted in the serious weakening of positions of Arabic language and decreased its reputation, also contributed to the process [The Cambridge History of Iran, 1968, 5, pp. 62–63].

The academician V. Bartold called this sharp ascent of the Persian language in Persian historiography, which became a dominant literary tool not only in Persia but also in Turkey, Central Asia, and Islamic India, 'a golden age of Persian historiography' [Bartold, 1971, VII, p. 282; in this regard see also: History of Iran, 1958, p. 164; Ripka, 1970, p. 239; Novoseltsev, 1989, p. 222; Bertels, 1948, V, p. 218; Djuwayni, 1963, pp. 110–120].

D. Morgan believed that if one can complain about the quality of works, 'as far as the quantity is concerned, there are no doubts that the material is abundant. Its important not only to Persia as Persian sources contributed to the whole Mongol empire in general' [Morgan, 1982, p. 125].

The Mongol Khans themselves actively contributed to the powerful rise of Persian historiography as they were deeply interested in an official justification of their right to rule in such ancient and culturally advanced countries as Iran, Middle Asia, etc. [Pertrushevsky,

1949, p. 7]. They did everything to ensure that Persian historiography successfully played its role and became a means of achieving the set goal [Spuler, 1922, p. 131]. It goes without saying that these powerful rulers and their administrators had the advantages of access to information. They had all the required Mongol chronicles and documents. They acquired important information from first-hand participants and witnesses of the events that happened during Chinggis Khan's and his successors' reign [Bira, 1978, p. 117]. Such favourable conditions helped a range of Persian historians to sufficiently broaden their horizon and use the priceless data in their research. Herewith, as it was noted by a specialist in Chinese and Mongol sources E. Bretschneider, the latter 'never provide such detailed, clear, and comprehensive descriptions as enlightened Persian historiographers do on the same topic' [Bretschneider, 1876, p. 90].

However, due to actual circumstances Persian historians, unfortunately, were opposed to the Jochid Ulus as they were linked by political orientation to the Houses of Hulagu and of Timurids. They had no opportunity to personally visit Jochid Ulus, and, as is stated by M. Safargaliev, 'they drew inspiration from second-hand materials, wrote according to information provided by deserters who were not close to court. That is why we can find a lot of incorrect dates, names, and facts of the Golden Horde's history in the works of Persian authors' [Safargaliev, 1960, p. 14]. Still Persian sources in particular provide coherent, factual material on the history of the Jochid Ulus.

All in all, it was in the Mongol period when historic literature in Iran left behind similar literature of the previous period, both in terms of volume and quality, and 'became one of the best things created by all Islamic peoples' [Rypka, 1968a, p. 622]. J. A. Toynbee wrote that 'this period, in comparison to previous and subsequent ages, gave birth to distinguished Persian historians... The prevalence of historians in the Ilkhanate period was critical' [Toynbee, 1963, pp. 69–70].

Passages from Persian narrative sources are available thanks to the second volume of V. Tiesenhausen's 'Collection of Works

Related to the History of the Golden Horde' published in 1941. Biographies and works of many Persian authors are analysed in detail in many studies, and a large amount of facts can be picked up in encyclopedias and reference books.

The earliest author, being also the only historian unfriendly to the Mongols, was Minhaj (ad-Din) Abu Umar Usman b. Siraj (ad-Din) Muhammad Juzjani (born approx. 589/1193). Fleeing from the Mongol invasion, Juzjani ran to India, where he continued to live till his death. His work, the 'Tabakat-i Nasiri' ('Nasir's Categories'), was written in approximately 657/1259 and completely finished in 659/1261. It was dedicated to the Indian Sultan Nasir-ud-Din Mahmud-Shah I, and it belongs to a type of universal histories, typical for Persian historic works, beginning from the creation of the world to the author's time. This work provides a detailed description of the invasion of Chinggis Khan's troops of Khorasan. However, it is believed that Juzjani's information is not trustworthy as the accounts of the Golden Horde could reach India, where he lived, only in rumours and through the stories of merchants and travellers [Bartold, 1973, p. 341; Stori, 1972, pp. 294–295; Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1941, p. 13].

Some Persian historians served the Mongol Khans and wrote their works as per their orders.

One of the earliest Persian historic works is the famous work of Ala ad-Din Ata Malek Juwayni (623–682/1226–1283) the 'Tarikh-i Jahān-gushā' ('The History of the World Conqueror'). For a long period of time the author served the Mongol Khans and was a governor of Baghdad, Iraq, and Khuzestan. Due to their enemies' intrigues, Juwayni was repeatedly persecuted by the Khans, and as a result he died on 6 March 1283.

The 'Tarikh-i Jahān-gushā' was started in 650 or 651/1252–53 and completed in 658/1260. Juwayni began his work in the period from 1252 to 1260 in the Mongol Empire's capital—Karakorum—and continued his work when he was elected governor of Baghdad. Therefore, it is the earliest of Per-

Sultan Öljaitü on his throne. Illustration for Rashid al-Din's manuscript. Delhi Sultanate

sian sources that was created on the basis of the personal impressions of the author or of trustworthy, reliable data, and it is the most valuable of accounts. Even though Juwayni was not a witness of the first Mongol invasions, he began his work with a description of the events of the early Mongol period thanks to the fact that he had access to rich sources from Mongolia. He visited Mongolia several times (he accompanied Argun, a ruler of the country) and gathered profound materials.

The 'Tarikh-i Jahān-gushā' is a history of the Mongols beginning with the rise of Chinggis Khan to Hulagu Khan's expedition against the Ismailis in 1256. It consists of a preface, an introduction, and three chapters, namely 1) the Mongols and their conquests up to the events which followed Güyük's death, including the history of Jochi's and Chagatai's descendants; 2) the Khwarezm Shahs and Mongol rulers of

Khorasan up to 1258; 3) continuance of the history of the Mongols up to victory over the Ismailis of Alamut. It goes without saying that the first volume is of great interest to us as it provides valuable information on the history of the Mongol invasions in Eastern Europe. Juwayni used his own information, which he obtained as a witness, as well as the accounts of contemporaries. Besides, he had access to official documents. His prominent work to a certain extent became the basis and example for all subsequent historians because borrowing, as a usual creative method, was wide-spread in those times. These borrowings were not reprehensible and even were a kind of literary canon [Piriyev, 1988, p. 197]. For instance, Juvayni's composition was used by Rashid al-Din and Wassaf, and via their works it was used by almost every later Persian, Arabic, or Turkish historian, who frequently literally repeated Juvani's account.

In the 14th century Persian historiography achieves a standout success. The 'Jāmi' al-tawārīkh' ('Compendium of Chronicles') is a grand composition of a major official serving Ghazan Khan and a great historian called Rashid-al-Din Faḍlullāh ibn Imad ad-Daula Abi-l-Hayr al-Hamadani (approx. 645–718/1247/48–1318). He was a medical scientist, a Sunni theologian, and a major political figure. Being a well-educated person, he spoke Persian, Arabic, Yiddish, Mongolian, and some European languages [Brown, 1951, pp. 62–63]. During the reign of Mongol rulers in Iran many non-Persians (especially in the early Mongol period) were assigned to supreme posts, and Rashid al-Din was also subsequently appointed to a range of high posts. In addition, he was the court physician of Mongol Sultan Abaqa Khan and used his great influence on the latter. During Ghazan Khan's reign (1295–1304) his achievements were marked, and he was appointed vizier in 1298. Being the vizier, he carried out financial reform, which regulated the financial system of the Hulaguids. He continued to remain in this post during the reign of Öljaitü Khan (704–716/1304–1316); moreover, he managed to get several signs of trust and benevolence from him.

Departure of a Mongol sultan. Miniature. Iran.
Beginning of the 14th century.

During the reign of Abu Sa'id Bahadur Khan, due to his enemies' intrigues, he was removed from the post and later executed in Tabriz on 18 July 1318, being accused of poisoning Öljaitü Khan [Stori, 1972, p. 301].

Rashid al-Din's major work, the 'Jāmi' al-Tawārīkh,' is 'a unique work in the world literature in the sense of idea performance' [Petrushevsky, 1952, p. 7]. It was begun as per the order of Ghazan Khan in 1300/01. E. G. Brown, giving characteristics to a grand idea of Ghazan Khan, wrote the following: 'Foreseeing that, despite their real superiority, they (the Mongols—A.A.) would be gradually pressed out by the Persians, he wanted to leave his descendants a monument to their achievements in the form of a trustworthy description of the history of conquest written in the Persian language. In order to fulfill this great task, he selected (and this choice could not have been better) Rashid al-Din, who had access to all the state archives and help of all those people who were experts in history of the Mongols' [Brown, 1951, p. 72]. Additionally, Rashid al-Din could use a lot of money allocated for these purposes. In general, the 'Jāmi' al-Tawārīkh' is a broad historic encyclopedia, and, according to V. Bartold, no people in Asia or Europe in medieval times could boast of having an encyclopedia like that as it was 'the last word in Persian historiography of the beginning of the 14th century' [Bartold, 1963, p. 769].

It is possible that with this work Ghazan Khan wanted to demonstrate his own wisdom. 'One person could not do this great work of such a grand idea. That is why Rashid al-Din attracted experts in the languages and history of separate peoples; there were two Persians, two Chinese, a Hindu from Kashmir, and apparently a French Catholic monk among them' [History of Iran, 1958, p. 168]. However, Rashid al-Din remained the main theorist, author, and editor. After his patron's execution, one of Rashid al-Din's employees, Abdullah Qashani, tried to accuse the vizier of plagiarism and claim his authorship of the grand historic work. He prepared his own work called the 'Tarikh-i Öljaitü Khan' ('History of Öljaitü Khan'), which was never published [Ibid., p. 169].

Sultan Gazan-Khan orders vizir Rashid al-Din to compile 'The Compendium of Chronicles.'
Illustration for Rashid al-Din's manuscript.
Delhi Sultanate

The main message of the 'Compendium of Chronicles' is that the history of the Arabs and Iranians is simply one of the rivers falling into a huge sea of the history of humankind. That is why the 'Jāmi' al-tawārīkh' pays great attention to the history of many peoples, from the Far East to Western Europe. The author placed notable value on Mongol and Turkic tribes, including the Oghuz tribes' [Agadzhanov, 1969, p. 29]. I. Petrushevsky noted that it would be more right to translate the name of the work as the 'Collection of Stories' because this work represents a completely new stage in historiography in comparison to the preceding types of chronicles.

The 'Jāmi' al-tawārīkh' is a composition that includes the universal history of the world from ancient times till 1303/04, and initially it was divided into three and then four volumes: 1) The 'Ta'rikh-i Ghazānī' is a tale of Turkic and Mongol tribes; 2) The history of Öljaitü and the universal history of the world; 3) The 'Shu'ab-i panjganah' is genealogies of the ruling dynasties of the 'five peoples': the Turks and Mongols, Muslims [Arabs], Jews, Franks, and Chinese; 4) The 'Suwar al-akalim' (this volume was the third in the first edition of the book up to 1306/07) is a geographical description of the world with descriptions of roads and postal units of the Mongol Empire [Story, 1972, p. 306]. The first volume is the most interesting for us. It consists of an introduction, containing a review of the Turkic and Mongol tribes, their division, genealogies and legends, the history of Chinggis Khan and his descendants, who ruled in Eastern Europe, Middle Asia, China, and Iran. This volume still remains a unique and unequaled historical monument, which provides important data for different researchers-historians [Falina, 1989, p. 156]. It is a distinguished work in the sense of the formation of a 'world history' genre, and in this regard it became 'the greatest achievement of Islamic historiography of the Middle Ages' [Novoseltsev, 1989, p. 228] because it raised the question of existence of the five world peoples many years before the creation of so-called 'world histories' in Western Europe—that is, it embraced the whole culturally advanced world of that period from

Western Europe to India and China [Bartold, 1977, p. 262]. It is important to say that as late as the 19th century European historians reduced the history of the world only to the history of Europe.

Apart from Juwayni, Rashid al-Din referred to Ghazan Khan as a first-hand source for historic information. He also used oral stories of the representatives of the Mongol aristocracy. First of all, the work of Pulad Ching-sang, a representative of the Great Khan at the court of the Hulaguids, was greatly important. In order to write the history of Chinggis Khan's conquests, Rashid al-Din used Juwayni's work and information provided by some local scholars, who held major posts and served Mongol Khans.

While preparing his work, Rashid al-Din definitely used Mongol sources. At his disposal he had the 'Altan Debter' ('Golden Book'), which is now lost. This work of a Persian historian became the major source for almost every subsequent compiler [Bartold, 1963, pp. 92–96; 1973, pp. 270–310; Petrushevsky, 1952, pp. 7–38; Story, 1972, pp. 301–322; Collection of Works Related to the History of the Golden Horde, 1941, pp. 27–29] (see publications of the 'Compendium of Chronicles': [Histoire des Mongols de la Perse, 1836; Djamī el-tevarikh, 1911; Geschichte des Gazanhan's, 1940; Ta'rih-i-mubarak-i-Gazani, 1941; Rashid al-Din, 1858/1861; 1868; 1888; 1946; 1952; 1957; 1960; 1965; 2002]).

The historic chronicle 'Kitab tajziyat al-amsar wa tazjiyat al-a'sar' ('The Allocation of Cities and the Propulsion of Epochs'), better known under the name 'Tarikh-i Wassaf,' was written in 1312 by Sharaf al-Din Abdallah ibn Izz al-Din Faḍlallah Shīrāzī, also known as Wassaf al-Hazrat (which is a title meaning 'Court Panegyrist') (663–735/1264/65–1334/35). The author served as a financial official and was patronised by Rashid al-Din. Wassaf started writing his work as a continuation of Juwayni's chronicles, where he reflected the events in 1257–1328 from Hulagu Khan's reign to Abu Sa'id's. In general, Wassaf added all three shortened volumes of the 'Tarikh-i Jahān-gushā' to the end of the fourth volume of his book, which, as it

was explained by the author, is an addition to the 'Jahān-gushā.' Due to the fact that he had access to the state archives, he managed to provide many new facts. The fifth part of the 'Tarikh-i Wassaf,' composed approximately in 728/1328, has a review of the history of Chinggis Khan, the Jochids, and Chagataids and also contains a continuation of the history of the Hulaguid Dynasty up to 723/1323. V. Bartold noted that in this part Wassaf relied on the work of Rashid al-Din and sometimes told some events, which had already been told, differently. Apart from Juwayni and Rashid al-Din, Wassaf used oral tradition and stories of the witnesses as his sources. [Ripka, 1970, p. 294; Morgan, 1982, p. 624; Bartold, 1963, pp. 96–97; Story, 1972, pp. 769–775; Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1941, p. 80; Polyakova, 1978, p. 45]. However, 'his usage of it (the source—A. A.) was hampered by declamatory narration, flowers of speech, and eloquent language with numerous metaphors and other poetical images, allegories, chronograms, wordplays, poetic riddles, etc. Herewith, the content was subdued to the literary form' [Istoriya Irana, 1958, p. 170].

Ḥamdallāh Ibn Abi Bakr Ibn Ahmad Ibn Nasr Mustawfī al-Qazvīnī (born approx. 680/1281–1282) can also be considered a historian of the Mongol Epoch. He descended from an ancient and respected family of a mustawfi, was a close friend of Rashid al-Din, and enjoyed his benevolence. Approximately in 1311 a famous vizier ordered him to control the finances of Qazvin and several regions of Iran. Ḥamdallāh al-Qazvīnī became famous thanks to his work similar to 'universal histories' called the 'Tarikh e Guzida' ('Selected History'), which was finished in 730/1329–30 and was dedicated to hoja Ghiyah al-Din Muhammad, Rashid al-Din's son and his successor. This work is mainly based on the 'Jāmi' al-tawārīkh' by Rashid al-Din, it is an imitation of Rashid al-Din's work and consists of an introduction, six parts, and a conclusion. Later the narration was continued till 742/1341–42 by the author, and his son Zayn ad-Din wrote an addition to his father's work where he described as a witness the events

Miniature to Sharaf ad-Din Ali Yazdi's book
'Zafar-name'/'Book of Victories.' 1620s.
Transoxania

that took place in Iran in 742–794/1341–42—1391–92 till Tamerlane's conquest. Many subsequent compilers used the data provided in this addition [Bartold, 1977, pp. 98–100; Stori, 1972, pp. 327–334; Petrushevsky, 1937, pp. 873–920; Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1941, pp. 90–91; Materialy' po istorii turkmen i Turkmenii, 1939, pp. 54–55].

Historians of the 15th century provide an important block of materials on the Golden Horde's history in the period of the end of the 14–beginning of the 15th centuries. The earliest and fullest official history of Tamerlane, which survived to the present day and was written during his life and as per his order, is the 'Zafar-nama' ('Book of Victories'). It was composed in 806/1404 by Nizam ad-Din Abd-al-Vasi Shami. The author used an already existing detailed description of the Indian campaign headed by Tamerlane of Giyas ad-Din Ali (written in the period from 1399 to 1403) as well as official documentation and oral messages of parties involved, primarily of Tamerlane himself. Nizam ad-Din Shami's work was used by almost all successive historians, beginning with Hafiz-i Abru [Bartold, 1963, I, pp. 101–102; 1973, pp. 74–97; Story, 1972, pp. 787–791; Collection of Works Related to the History of the Golden Horde, 1941, pp. 104–105; Materials on the History of the Turkmen and Turkmenia, 1939, p. 57; Yakubovsky, 1946, p. 43].

The name of Tamerlane's grandson—Ulugbek—is connected to an historic work that did not survive to the present day in full, the 'Tarikh-i arba' ulus' ('The History of Four Ulus-es') (written no later than 1425). Currently we know of about 4 copies of the book's shortened edition called the 'Ulus-i arba'i Ching-gisi' ('The Four Ulus-es of the Chinggisisds'). According to B. Akhmedov, this work was written by several authors under the direction of a mirza, and later it became a source for a group of historic works. It was actively used by Hondemir, Sharaf ad-Din Ali Yazdi, and the author of the 'Tawarikh-i guzide-yi nusrat-name' [Akhmedov, 1979, pp. 29–36; Akhmedov and others, 1994, p. 3; Bartold, 1964, II, part 2, p. 142]. There is a known English translation of the shortened edition [The Shajarat ul-Atrak, 1838].

Sharaf ad-Din Ali Yazdi (who died in 858/1454) was a famous scholar, who lived in Tamerlane's epoch and had a career as a courtier, a scientist, and a writer at Shakhrukh's court. His well-known chronicle the 'Zafar-nama' was written as per the order of Ibrahim Sultan, Shakhrukh's son, and was completed in 828/1424–25. It is the history of Tamerlane and Khalil Sultan. He used the work of Nizam ad-Din Shami enhanced with the data borrowed from a range of other sources, which did not survive to the present day, including the 'Tarikh-i Hani,' chronicles in verse in Turkic language and with the Uighur cursive. He also used Ghiyas al-Din Ali's work but managed to retrieve more facts from it than his predecessor Nizam ad-Din Shami; moreover, he referred to the oral tales of his contemporaries and participants in Tamerlane's campaigns [Bartold, 1963, pp. 102–103; Story, 1972, pp. 797–807; Collection of Works Related to the History of the Golden Horde, 1941, pp. 144–145; Materials on the History of the Turkmen and Turkmenia, 1939, p. 58].

Among the chronicles of Tamerlane's epoch the so-called 'Anonyme of Iskandar' (composed in 1414) stands out separately. Another range of sources is connected to this work on universal history dedicated to Iskandar (the Timurid prince), Omar Sheikh's son, who controlled Fars and Isfahan. The manu-

script was unnamed, and initially V. Bartold called it the 'Anonyme of Iskandar' because it was written for Prince Iskandar—Tamerlane's grandson. Subsequently, V. Bartold also discovered that Mu'in ad-Din Natanzi was the author of the work. While describing the early period of Mongol sovereignty, he referred to Rashid al-Din's work as a source and copied it almost word by word. While describing the latter half of the Mongol period and the history of Tamerlane, he referred to some sources, which have not survived to the present day but which helped him to derive many valuable facts. These sources differ from those used by Nizam ad-Din Shami and Saharaf ad-Din Ali Yazdi. Apparently, the major source of the 'Anonyme of Iskandar' was written in Turkic and was unknown to the above-mentioned historians. Hafiz-i Abru used the same source, but he was completely independent in his research as he provided details not mentioned by his colleague [Bartold, 1963, pp. 101–102; 1973, pp. 115–116, pp. 491–504; Story, 1972, pp. 339–341; Umnyakov, 1976, p. 45; Collection of Works Related to the History of the Golden Horde, 1941, pp. 126–127]. There are many Turkic and Mongolian words in Natanzi's book, so the influence of the nomadic Turkic-speaking environment on his work is clear. Natanzi described the military and diplomatic history of the Mongol states and Tamerlane's Empire [History of Iran, 1958, p. 212].

Shihab ad-Din Abdallah Ibn Lutfallah al-Hafi, a major Persian-speaking historiographer, known under his pen-name Hafiz-i Abru (died in 833/1430), served Tamerlane and subsequently his son Sultan Shakhrukh (807–850/1405–1447). In 820/1417 he started working on a grand compilatory collection of historic works called the 'Majmu'a.' This work included a translation of Tabari into Persian [10th century], Rashid al-Din's composition, and the 'Zafar-nama' by Nizam ad-Din Shami. In order to fill in the blank spaces between those works, he wrote several additions, including a continuation to Rashid al-Din's work covering the events up to 795/1393, a continuation to Nizam ad-Din Shami's work up to 819/1416–1417. In 826/1423 he started writing a historic work in four volumes—'Majma

al-tawarikh-i sultaniye' ('Collection of chronicles (dedicated to) the Sultan'), which he finished in 830/1427. The fourth volume—'Zubdat at-tawarikh-i Baysunguri' ('Baysungur's Creams of Chronicles')—consists of two parts: the first one is dedicated to the history of Tamerlane's reign, while the second is the history of Shakhrukh's reign (up to 830/1427). This work involved all the above-mentioned books with some additions from sources that did not survive to the present day, namely from a chronicle also used by 'Anonyme of Iskandar.' This second work of Hafiz-i Abru (in a shortened edition) as well as Sharaf ad-Din Ali Yazdi's work became the first part of Abd ar-Razzak Samarkandi's book [Bartold, 1963, pp. 101–102; 1977, pp. 79–97; Story, 1972, pp. 787–791; Materials on the History of the Turkmen and Turkmenia, 1939, p. 57; Collection of Works Related to the History of the Golden Horde, 1941, pp. 104–105]. Hafiz-i Abru's works are precise and laconic, written in a simple language, and are full of socio-economic data.

The 'Matla al-sa'dayn wa majma'al-bahrayn' ('The Rise of the Two Happy Stars and the Junction of the Two Seas') is a work composed by Kamal ad-Din 'Abd al-Razzaq ibn Mavlan Jalal ad-Din Ishaq Samarqandi (816–887/1413–1482/83). It was written in the period 872–875/1467–68—1470–71. In 875/1470 'Abd al-Razzaq Samarqandi continued his work and added descriptions of the events that took place in Safara [August 1470]. He got his nisba 'Samarqandi' because he spent almost all his life in Samarkand, where his father was a qadi and imam in Shakhrukh's headquarters. In 857/1463 Sultan Abu Sa'id (855–873/1451–1469), a Timurid, appointed him as sheikh in the dervish residence (lodge) of Shakhrukh in Herat. He died in this city in 887/1482. Like many of his contemporaries, he enjoyed the benevolence of Mir 'Alī Shīr Navā'ī (844–906/1441–1501) [Materials on the History of Middle and Central Asia, 1988, p. 171]. The chronicle covers a period of 170 years and tells the history of the Mongols, Tamerlane, and the Timurids beginning from 704/1304–05 to 875/1470–71. The main events are ordered by year, and the chronicle

consists of two volumes (kisms or daftar) almost equal in size. When it comes to describing the events up to 830/1426, the work is completely based on the work of Hafiz-i Abru the 'Zubdat al-Tawarikh' and, via his work, on Nizam ad-Din Shami's book. However, the end of 'Abd al-Razzaq's composition is individually written. It goes without saying that what he wrote as a witness and participant of the events is a first-hand source and is used by all his successors [Bartold, 1963, p. 105; Story, 1972, pp. 820–828; Collection of Works Related to the History of the Golden Horde, 1941, pp. 190–201; Materials on the History of the Turkmen and Turkmenia, 1939, p. 59].

The data, provided in the afore-mentioned 'Anonyme of Iskandar,' was used by later authors—Ahmad Ibn Muhammad Ibn 'Abd al-Ghafur al-Qazwini, known as Qazi Ahmad al-Ghaffari (920–975/1515–1567/68), who wrote a grand compilation on the universal history, the 'Nusah-i Jahanara' ('Lists of the Marshaller of the World'), started in 930–984/1524–1576 and finished in 972/1564–65, and Hayder Ibn 'Ali Husseini Razi (biography unknown), who wrote a composition on universal history the 'Tarikh-i Haydari' ('Hayder's History') or, as it is sometimes called, the 'Zubdat al-Tawarikh' or the 'Majlis al-Tawarikh' (started in 1020/1611–12 and finished in 1028/1618–19) [Bartold, 1693, p. 84; Collection of Works Related to the History of the Golden Horde, 1941, p. 213].

Turkic sources. The 'Chinggis-name,' an original work by Ötemish Hajji, plays an important role in the study of different problems of medieval history. This is the only literary monument, written in the Khiva Khanate in the 16th century, which survived to the present day. It covers the period of Chinggis Khan's and the Chinggisids' reign [13–14th centuries] and contains information about the Golden Horde's Khans, from Batu Khan to Tokhtamysh Khan's early ruling [Ötemish Hajji, 1992, p. 6]. However, as it becomes clear from the introduction, the author intended to write the work up until the time contemporary to himself. This text was written as per the order of Ishsultan (killed in 965/1558), a Shaybanid, in the first half of the 16th century.

ry. The author of the work—Ötemish Hajji—a descendant from a powerful family, served Ilbars-Khan (918–931/1512–1525), one of Öz Beg conquerors of Khwarezm, as palace clerk. He wrote his work mostly on the basis of legends and oral information. V. Bartold wrote the following: 'Reading historic materials, the author could find only the names of several Khans without any details of their ruling; moreover, most of the Khans were not named. In this regard, he collected legends about old times; then he 'weighed them on the scales of sense' and rejected those which could not withstand any critics. Soon he became famous as an expert in legends; if there were any complications in any collection about old leaders, he would be the one to resolve them' [Bartold, 1973, VIII, p. 165]. Among his informers were those who knew many legends—travellers, distinguished officials, khans (Ilbars Khan was one of the last ones mentioned). The author himself travelled a lot in Khwarezm and the southern regions of the Golden Horde, the regions around the Caspian Sea, and in the Lower Volga Region. He described many events as a witness. His data about Shiban and his descendants, who came to power after Berbidek's death (1357–1361), is of great importance.

Among sources in Turkic, which fully reflected the Jochid historic tradition (historic tradition of the Golden Horde period), it is worth mentioning an anonymous text—the 'Tawarikh-i guzide-yi nusrat-name' ('Selected Stories of the Book of Victories') (written in 1502–1504). It was dedicated to the biography of Muhammad Shaybani (1451–1510), an Öz Beg Khan, and it is considered to be the central work of the Shaybanid group of sources. The work contains data on the socio-economic relations, tribal relations of nomads of the Eastern Desht-i Qipchaq, etc. The author used sources in Mongolian, Persian, and Turkic.

The 'Daftar-i Chinggis-name' ('Book about Chinggis'). It's an anonymous Tatar historic and publicistic work, which dates back to the end of the 17th century. It consists of three chapters-dastans, providing information on Edigey's genealogy, listing the headquarters of the Khans, etc. The first two dastans tell

about Chinggis Khan and Tamerlane. Apparently, this source contains reminiscences from old Turkic, early Mongol, and Jochid historiographies.

5. Russian sources

Iskander Izmaylov

Chronicles contain the most important and systematised year by year materials on the Golden Horde's history and its political relationships with Russian principalities in the 13–15th centuries. Even though they are short and sometimes controversial, they are irreplaceable, and sometimes the only sources of information about the past. The closer the date of creation to the events reflected in a chronicle, the more valuable it is. It goes without saying that contemporaneity of a source does not guarantee its trustworthiness. It is not rare when an author, writing several years after an event, was more tendentious and aware of the event than his closest contemporary. But if the time lapse between the event and its reflection in the source is critical, if it exceeded the time of life of a generation, in order to use the materials of the source, it is required to prove that a later author had access to an earlier manuscript. That is why it is complicated to analyse and use the data provided in chronicles, ensure the actuality of collections, study their content, and find out their time of creation. Herewith, it is extremely important to distinguish chronicles on the basis of the degree of their candor, unravel the degree of their trustworthiness, and estimate the proportion of official data and independent facts [Lurie, 1985, pp. 61–68].

The history, textology, and source study of Russian chronicle writing in the 13–15th centuries were studied rather well in the works of several generations of historians and textual critics (the most important of them are the following: see [Shakhmatov, 1938; Likhachev, 1983; Priselkov, 1996; Nasonov, 1969; Lurie, 1976; 1985, pp. 190–205; Kloss, 1980; Muravyeva, 1983; 1991; 1998]).

In comparison to previous periods, Russian chronicle writing in the 13–15th centuries contains a whole range of differences. In

many ways it is explained by the establishment of the idea of All-Russian chronicle writing as well as by traces of the ideological and political fight for actual issues of the development of the Rus'.

One of the most significant sources for studying this period and stage of chronicle writing is southern Russian chronicles, primarily, **the Galitsian-Volynian chronicle** [Complete Collection of Russian Chronicles, 2; Galitsian-Volynian Chronicle, 2005]. This chronicle, which covers events from 1201 to 1292, was created in several steps. Currently it is believed that the text of the chronicle was divided into two parts—the Chronicle of Daniil Galitsky (1201–1265) and the Volynian chronicle (1266–1290) [Galitsian-Volynian Chronicle, 2005, pp. 30–60]. A characteristic feature of this chronicle is the absence of weather reports, traditional for old Russian chronicles. Another important feature is its secular nature. In this regard there is every reason to call it a princely chronicle. The authors of the chronicle amplified its text with various documents from princely archives and personal notes. The main goal of the authors was to describe princes and their deeds related to ups and downs in internal and external policies of the principality. M. Priselkov believed that the most important task of the authors of the Volynian chronicle was to justify Prince Yuri Lvovich's right to succession and the residency of the metropolitan in his principality and not in north-eastern principalities, and, correspondingly, to the Galich supremacy over all of Russia. Detailed descriptions of historic events, related to the Mongol invasion (The Battle on the Kalka River in 1223, Batu's campaign against Southern Rus' in 1240), and the episodes of military and political cooperation of the Principality of Galicia-Volhynia with the Jochid Ulus in the latter half of the 13th century are of special interest.

The beginning of the 14th century is also marked by the creation of other chronicles, which aspired to review the history of all Russian lands, but in fact in many ways they were focused mainly on the events that took place in the north-east of Rus'. The most important topics of these works were the relations be-

tween princes during their fight for the Grand Principality and the Golden Horde's policy in Rus'.

One of the earliest examples of such chronicles is **the Laurentian Chronicle** [Complete Collection of Russian Chronicles, 1]. Its sources are the chronicles of the Grand Principality of Vladimir written in the 13–14th centuries. The opening part of the chronicle was represented by 'The Tale of Bygone Years' and abstracts from the chronicles of the middle of the 12—the first third of the 13th centuries. Perhaps, the key chronicle was the chronicle of Grand Prince Yaroslav Vsevolodovich, written in 1239 in Rostov. Its main goal was to prove the historic leadership of Vladimir among the other princely centres as a counter to the ideological supremacy of Galitsian Princes and their chronicles. Another chronicle, which left a significant mark on the Laurentian Chronicle, was the chronicle of Grand Prince Dmitry Aleksandrovich, written in 1281 in Pereyaslavl, where the Grand Prince's court and the Metropolitan of Kiev and all Rus' were located at the time.

The strengthening of Tver, when Prince Mikhail Yaroslavich of Tver became Grand Prince of Vladimir, gave a new momentum to the development of north-eastern chronicle writing. This prince inspired the creation of the 1304 chronicle, which was a rewriting of the chronicle of the Grand Principality in the spirit of 'Tver' traditions with a clear anti-Tatar nature. Additions to this new chronicle were represented by weather reports, and they had been apparently written down in Tver from the end of the 13th century. Being an overall Russian chronicle, it also included news from Novgorod, Ryazan, Smolensk, and the south of Russia. Subsequently, this chronicle became a major source for the Laurentian Chronicle, which survived to the present day in the copy of 1377. This chronicle was continued by new general Russian chronicles, also written in Tver in 1318 and 1327. Their passages are preserved as parts of later Moscow chronicles (the Trinity Chronicle and the Chronicles of Simeon), even though all Tver news was presented in the spirit of Moscow traditions. Besides, traces of Tver chroni-

cle writing can be noticed in the Rogozhsky Chronicler. As these chronicles were repeatedly rewritten, the volume of materials on the topic of relations between Russian Principalities and the Jochid Ulus's khans is rather small, whereas the descriptions are lapidary.

The next step in the development of an overall Russian chronicle writing tradition was linked to strengthening the role and power of Moscow and Ivan Kalita's Great Principality. Approximately in 1389 the '**Great Russian Chronicler**' was created at his court. Only small passages of this chronicle survived to the present day. M. Priselkov believed that the creator of the Trinity Parchment Chronicle referred to its materials. This chronicle was rather hypothetical and contained materials of different origin, which had been rewritten and significantly edited.

An increase in the Church's role in the internal affairs of the country and the Metropolitan of Kiev and All Rus' Cyprian's influence in the context of his confrontation with Dmitry Ivanovich Donskoy, Prince of Moscow, gave new momentum to the development of a general Russian chronicle writing. According to the authors, this chronicle, based on the 1304 chronicle, should have reflected the history of Russian lands, which had been a part of the Russian metropolis since ancient times, and should have taken into account all local traditions of chronicle writing. The text of the chronicle was more fully reflected in **the Trinity Chronicle** of the beginning of the 15th century (it is possible that the text of the 1408 chronicle was directly narrated in this chronicle) and a range of other chronicles. The manuscript of the Trinity Chronicle was burnt in the 1812 Fire of Moscow, and its text was restored by M. Priselkov thanks to certain extracts taken from the chronicle by N. Karamzin and some other chronicles of similar content [Priselkov, 1950].

In the first half of the 15th century, in an environment of internal strife between Dmitry Donskoy's heirs, the centre of Russian chronicle writing moved to Tver, where in the 1430s (or, as per Ya. Lurie, in 1412] a new version of the 1408 chronicle was created. It was directly reflected in **the Rogozhsky Chronicler**

[Complete Collection of Russian Chronicles, 15], **the Nikon Chronicle** [Complete Collection of Russian Chronicles, 9–14], and also in **the Simeon Chronicle** [Complete Collection of Russian Chronicles, 18]. Differences in the texts of the above-mentioned chronicles can be specifically noted after the entry of 1390.

Along with Russian chronicles represented by the above-mentioned ones, there were also local chronicles finding reflection, for instance, in Novgorod and Pskov chronicle writing. Pskov chronicles included a range of copies gathered in **the First Pskov** (initially describing events up to 1469), **the Second Pskov** (describing events up to 1486), and **the Third Pskov** (describing events after the 15th century) **chronicles** [Pskov Chronicle, 1941–1955]. According to A. Nasonov and Ya. Lurie, they were based on one and the same protograph.

The Trinity Chronicle is followed by the so-called Novgorod-Sofia Chronicle svod, reflected in **the Fourth Novgorod chronicle**, the similar **Karamzin's Novgorod chronicle**, and **the First Sofia chronicle** [Complete Collection of Russian Chronicles, 4; 6; 5; pp. 81–275; 42]. The texts of the Fourth Novgorod and the First Sofia chronicles are the same up to 1418, while the text of the article on 1425 is similar to the First Sofia and Karamzin's Novgorod chronicles. A. Shakhmatov's assumption that the Novgorod-Sofia Chronicle svod was preceded by an earlier source—the 1418–1421 Metropolitan Chronicle (the so-called 1448 'Photius's Polychron')—was erroneous: the chronicles, which were considered by A. Shakhmatov a reflection of Photius's work, independent from the Novgorod-Sofia Chronicle svod, in fact were not based on this hypothetical monument. They were based on chronicle writing of the end of the 15–beginning of the 16th centuries [see: Lurie, 1976, pp. 67–121]. A. Shakhmatov proposed that the chronicle svod was written in 1448, but this idea was based not on data analysis but on the interpretation of one message which was clearly incorrect. Even though he subsequently abandoned this dating, this mistake is sometimes repeated in historic works. In order to determine the date when the Novgorod-So-

fia Chronicle svod was written, we need to remember that this svod, being a general source for the First Sofia, Karamzin's Novgorod, and the Fourth Novgorod chronicles, preceded the first version of the Fourth Novgorod chronicle prepared in 1437. Apparently, the Novgorod-Sofia Chronicle svod was created in the 1430s [Shakhmatov, 1938, p. 366; Lurie, 1976, pp. 108–117; Bobrov, 1976, p. 10]. The text of the First Sofia chronicle (the older version) covers the events up to 1418 [Complete Collection of Russian Chronicles, 6]. This chronicle was reflected in **the Moscow Academic Chronicle** [Complete Collection of Russian Chronicles, 1, 1928] and in its own shortened edition of the latter half of the 15th century [Nasonov, 1955]. This chronicle contains a range of unique facts concerning the end of the 13th century.

The new chronicle is a radical revision (with the use of Tver, Suzdal, Novgorod, and other chronicle materials) of the 1408 chronicle svod. It also held an overall Russian nature and originated from the Metropolitan environment. According to A. Shakhmatov, it was written in 1448 in Moscow in connection with the election of the new Metropolitan Jonah. The idea of the vital unity of the Rus', including the unification of Rostov, Suzdal, Tver, Novgorod, and Pskov, headed by Moscow, which was required to fight back the 'foul' Tatars, served as an ideological keynote of the chronicle svod. This chronicle svod expressed for the first time a general Russian narration of the events that took place in the past and present, although it still underlined the supreme role of Moscow as historic centre.

The I Sofia chronicle in its turn served as a major source for the Chronicle Writing of the Grand Principality of Moscow and was reflected in various versions of **the Nikanor Chronicle** [Complete Collection of Russian Chronicles, 27] and **the Vologda-Perm** [1472] [Complete Collection of Russian Chronicles, 26] **chronicles**, the '**Chronicler from 72 languages**' [1497 and 1477 [passage]] [Complete Collection of Russian Chronicles, 28], **the Moscow Chronicle svod** [1479, beginning and end of the 1490s] [Complete Collection of Russian Chronicles, 25], and chronicles of the

16th century, including **the Voskresenskaya ['Resurrection'] Chronicle** [Complete Collection of Russian Chronicles, 7–8] and **the Nikon chronicle**.

Alongside the Chronicle writing of the Grand Principality in the 15th century, there was an independent Russian chronicle writing tradition, represented by **the Yermolin chronicle** [Complete Collection of Russian Chronicles, 23] and other chronicles similar to it (they reflected the Northern chronicle svod of the beginning of the 1470s and most likely were written in the Kirillo-Belozersky monastery)—that is, **the Typographic chronicle** (Rostov chronicle svod of the 1480s) [Complete Collection of Russian Chronicles, 20], **the Second Sofia chronicle** [Complete Collection of Russian Chronicles, 5; 6], **the Lviv chronicle** (1518, based on the church chronicle svod of the 1480s) [Complete Collection of Russian Chronicles, 20], etc. These chronicles are of special interest because they preserved their independence from the official historiography in narration of various events, in the description of political struggles and relations between the Grand Princes of Moscow and the Golden Horde and Tatar Khans.

Some chronicles of the 16–17th centuries contain unique facts concerning relations with the Golden Horde khans in the 14–15th centuries. These are Tver accounts, specified in the **Tver collection** [Complete Collection of Russian Chronicles, 15] and the so-called **Museum Passage** [Nasonov, 1958], separate notes from the Nikon and Voskresenskaya chronicles, the **Ustyug Chronicles** [Complete Collection of Russian Chronicles, 37], etc.

The Chronicle Writing of Novgorod at the end of the 13–the first half of the 15th centuries is represented by the **First Novgorod chronicle of the older and newest recensions** [Complete Collection of Russian Chronicles, 3; First Novgorod Chronicle, 1950]. The older recension narrates up to the 1330s, while the newest, up to 1340s. The Novgorod chronicle of the beginning of the 15th century, reflected in the First Novgorod chronicle of the newest recension, was also used in the composition of the protograph for the Fourth Novgorod and the First Sofia chronicles.

Guyuk is elected Great Khagan.

We have to mark the existence of a specific Belarus-Lithuania chronicle writing, which reflected both Russian events and original facts on the relations between the Grand Duchy of Lithuania and the Golden Horde as well as with its conquered Russian principalities. The formation of this chronicle writing is connected with the traditions of early Russian chronicles represented by various copies of the Trinity Chronicle and the Chronicle of Simeon. The **First Belarus Chronicle** is represented by the Nikiforov, Supraśl, Slutsk, and Academical copies. This complicated collection of chronicles contains both borrowings from the Fourth Novgorod, the First Sofia, and Trinity Chronicles and regional data [Complete Collection of Russian Chronicles, 17; 35]. Belarus-Lithuanian chronicle writing found its further development in the **Bychowiec Chronicle** (middle of the 16th century) and the **Lithuanian and Samogitian Chronicle** [Complete Collection of Russian Chronicles, 32; Bychowiec Chronicle, 1966].

Apart from chronicles, there are some other written monuments of Russian Medieval literature (some of them have survived to the present day—completely or partially—as parts of chronicles), which contain direct or indirect materials about the Jochid Ulus and its relations with Russian Principalities. It is worth enumerating several of them: **'The Tale**

Mikhail of Tver' (from the 1520s) [Kuchkin, 1999], **'The Life of Metropolitan Peter'** (1327) [Makary, 1995; Kuchkin, 1962], **'The Life of Metropolitan Alexey'** (first short edition: the end of the 14th century; second edition, the middle of the 15th century) [Complete Collection of Russian Chronicles, 15, 1965, clmn. 121–124; 18, pp. 119–121; 25, pp. 194–196], **'The Life of Sergey Radonezhsky'** (1418) [Kloss, 1998, pp. 285–341; Literary Monuments of Ancient Rus', 1981, pp. 256–429], etc.

They preserved unique materials on the culture, diplomatic decorum, and several other spheres of relations between the Jochid Ulus's khans and Russian Princes. The ideological background of these works and the increase in anti-Tatar and anti-Islamic movements in the 14th century are of special interest.

Authors of numerous 'peregrinations,' or diary notes, of Russian merchants and pilgrims who travelled to sacred places are of special interest as they preserved unique data on the Jochid Ulus's historical geography and its trading routes. Among them we should name **'A Journey Beyond the Three Seas' by Afanasiy Nikitin** [Maletov, 2005].

Taking into account relations between the Golden Horde and Russian Principalities, one cannot but mention such an important topic for discussion as the 1380 Battle of Kulikovo and sources from that period. This battle was described in a whole range of old Russian sources: in chronicle-based tales—a short one (as part of the Rogozhsky Chronicle, the Chronicles of Simeon, and the Moscow Academic Chronicle) and a long one (in the First Sofia and the Fourth Novgorod Chronicles), in the poetic tale 'Zadonshchina', in the epic 'Story of the Mamai Battle,' as well as in the lives of Dmitry Ivanovich and Sergey Radonezhsky. The earliest and most reliable among them is a short tale, which was written at the end of 14—beginning

of the 15th centuries. Its long version was written in the middle of the 15th century. It is impossible to determine the exact time of creation of the '**Zadonshchina**' (the end of the 14–beginning of the 15th centuries), but it is clear that it was created after '**The Tale of Igor's Campaign**' had been processed, and additional chronicle material had been added (A. Zimin, however, believes that it was *visa versa* [Zimin, 2006]). 'The Story of the Mamai Battle' appeared in the end of the 15th century to the 1520–30s, and it is a military tale with plenty of legendary additions

to the chronicle, which brings to mind medieval novels on knights (the fight of bogatyr before the battle; the commander who dressed like an ordinary soldier; the ambush regiment) ['Tale of Igor's Campaign' and Written Sources of the Kulikovo Cycle, 1966, pp. 535–556; Legends and Tales about the Battle of Kulikovo, 1982; Andrianova-Perets, 1947; Kuchkin, 1985; Gorsky, 1992; Zimin, 2006].

6. West-European and East-European Latin sources

Iskander Izmaylov

Written sources of European origin contain various information concerning daily life, the economy, warfare, internal political environment, and international relations of the Jochid Ulus. These accounts are as diverse as they are numerous. Rarely can we find grand compositions fully dedicated to the history of the Mongols and their conquests, which is characteristic for descriptions of the travels of merchants or different diplomatic missions to the Great Khan's court. More often such accounts are represented by selected facts in large texts, throwing light on the geography or universal history from 'the beginning of time,' or sometimes by agreements, which fixed trading operations and court rulings. This is particularly

Tatar wagons. Engraving for the first edition of W. Rubruck's book. 1735.

true for the archives of trading houses in Genoa or Venice, which ran their business in the Northern Black Sea Region.

Descriptions of diplomatic missions from the Papal Curia and Royal Houses of Europe to Karakorum to the Great Khan of the Mongols can be considered among those detailed and grand works, which preserve facts on the different spheres of life in the Jochid Ulus, especially in its early period [middle–latter half of the 13th century].

First among them should be the materials of the 1245 Franciscan mission to Mongolia. This mission, sent by Pope Innocent IV, was tasked with the delivery of a letter addressed to the Great Khan of the Mongols to determine his intentions towards Europe and, if possible, his conversion to Catholicism. The motive for the intensive exchange of diplomatic missions between the Mongol Khan and the Pope was the fact that a part of the Mongol Khans were Christian-Nestorians. Additionally, it was inspired by the legendary and hyperbolic news concerning the state of 'Presbyter John,' allegedly located in the depth of Asia and ready to help the Christians of Europe and the Holy Land in order to eliminate the threat of Muslim pressure. That is why the Franciscan mission included Giovanni da Pian del Carpine, born in Perugia, and two Brothers—Benedict

from Poland and Stephan from Bohemia. The latter had to turn back during the trip and managed to reach only Kiev. Only Brother Benedict from Poland accompanied Friar Giovanni everywhere, he became his 'comrade in struggles and strifes' and a translator. Evidently, we should thank him for the success of the mission and for recording a large number of unique facts on the Mongols, their traditions, and history of conquest because he spoke the Kipchak language fluently and carried out all clerical duties. The mission, which had diplomatic and reconnaissance goals, set off from Lion on 16 April 1245 and returned during the autumn of 1247. During these two years of travels in Eastern Europe they visited many countries and lands and recorded many stories concerning past and recent events. When they came home, in November 1247, Friar Giovanni prepared a report, and later, being appointed the Archbishop of Antivari, he prepared another edition of his work not long before his death (in 1248 or 1252). The description of the travel itself is similar to diary notes but contains numerous and extensive information concerning the history and geography of different countries of Central Asia, about the state structure of Mongolia, its religion, about the customs of its populations, the Chinggisids' genealogy, etc.

It is believed that it survived to the present day in two texts. First of all, this is the report by **Giovanni da Pian del Carpine**, which he called the '**Liber Tartarorum**' ('**The Book about Tartars**'), which was called by a scribe of the 14th century 'The History of the Mongols Whom We Call the Tartars,' and this name was used in the subsequent historiography. The second version of the report, which was written by Benedict, the companion of Giovanni da Pian del Carpine, was rewritten with reductions in 1247 by **Friar C. de Bridia**, a member of his own order, who called it the '**Historia Tartarorum**' ('**The History of the Tartars**'). Later this text was rewritten and revised by Simon of St. Quentin, who was a member of one of the subsequent missions to the Mongols. In the middle of the 13th century the encyclopedist Vincent of Beauvais (died in 1264) included the report by Giovanni da Pian

del Carpine, once again edited and updated, into the 4-volume division of the '**Speculum Maius**.' According to modern scholars [Christian World, 2002, p. 27], despite the fact that these two reports are very much alike, there are some visible differences between them, which can be accounted for by the fact that Friar Giovanni was an official reporter, whereas Friar Benedict wrote a mystified and mythologised version of his report.

The aforementioned texts were repeatedly translated into European languages (see the fullest editions: (Beazley, 1903; de Saint-Quentin, 1965)). The fullest version of Giovanni da Pian del Carpine's work was translated into Russian by A. Malein [Giovanni da Pian del Carpine, 1911; 2-nd edition.: Puteshestviya, 1957], whereas C. de Bridia's text was translated by S. Aksenov and A. Yurchenko [Christian World, 2002].

Several years after Giovanni da Pian del Carpine's return another mission was sent to the Great Khan's court in Mongolia. This time it was headed by William of Rubruck (Guillaume, Willem), a Franciscan Minorite (1215 or 1220—ca. 1270), who came from the Flemish Region and had taken part in the sixth Crusade. The mission was sent in 1253 by the French King Louis IX (Saint Louis) in order to conclude an alliance with the Mongols against the Muslims in the Middle East. The mission started from the Crimean port of Soldaia, from where it moved on to Sartaq and Batu's headquarters, and then travelled to Karakorum, where it gained an audience with the Great Khan Möngke. It ended with its return to France via Asia Minor. On returning to his homeland, William of Rubruck prepared a detailed description of his travels—that is, '**The Journey to the Eastern Parts of the World by Friar William of Rubruck in the Year of Grace 1253**.' Being educated and well-prepared for travelling, Friar William was evidently well aware of the reports by previous missions and of diplomatic correspondence, and he was able to provide a description of the countries and lands he had seen, which was more significant both in volume and content. His description of the Lower Volga Region in the 1250s and the features

of the relations between leaders of the Jochid Ulus and the Great Khans of Mongolia are of special interest. The text of 'The Journey' has been published several times in different European languages [Beazley, 1903; Göckengün, Sweeney, 1985]. There is also a Russian translation by A. Malein [William of Rubruck, 1911; 2nd edition: Puteshestviya, 1957; see also: Khamidullin, 2002, pp. 48–50; History of 'the Scythians,' 2001, pp. 127–136].

Among other missions and travels, it is worth mentioning one headed by Simon of St. Quentin, who travelled to the Middle East and Transcaucasia in the middle of the 13th century. In his commentaries he also used the reports received from another mission headed by Friar Ascelin, a Dominican. All these reports survive to the present day thanks to the fact that they were included in the encyclopaedia of Vincent of Beauvais. A large number of facts, especially the materials of Ascelin's mission concerning his visit to the Great Khan Güyük's headquarters and information on expeditions to Hungary, are unique. This text has been published in European languages [de Saint-Quentin, 1965], and recently part of it was published in Russian. The translation into Russian was prepared by N. Gorelov [Book of Travels, 2006, pp. 81–116].

Among the diplomatic missions, which visited the Jochid Ulus in the middle of the 13th century, the travels of the Venetian Marco Polo merit a special description. Together with his uncle and father he set off in 1271 on a journey to the court of the Great Kublai Khan, and they travelled for three and a half years (1271–1274). Thanks to their diplomatic credentials and a message from Pope Gregory X they were hired for service in Khanbaliq, the capital of the Yuan Empire, where they served for 17 years. During this period Marco studied Mongolian and also learned how to read several other languages and writing systems (Arabic, Syriac, Uighur, and Mongolian scripts), which allowed him to advance successfully in the service, while fulfilling various special instructions of the Great Khan. Being a high ranking official, he was well aware of the political environment in the Empire and privy to many secret issues re-

lating to military measures against Japan and Countries of the South-East Asia. Even Polo's return to his homeland from 1292–1295 was connected with a special diplomatic errand for the Emperor. Marco Polo was charged with delivering a female relative of the Great Khan to Ilkhan Argun. As soon as Marco Polo returned to Venice, he started active participation in the city's political life. In 1296 (or 1297) he took part in an unsuccessful war against Genoa and was taken prisoner. While in a Genoese prison, he asked a fellow inmate, Rusticiano, to write down his stories and told him everything in detail. These stories told by **Marco Polo** provided the basis for the **'Book of the Marvels of the World'** or **'Description of the World.'** The only manuscript of this work to survive, which is held in the National Library of France [Pauthier, 1865], became the basis for the main publications in European languages. At the same time, this original version has been repeated and supplemented by numerous other notes because up to his death in 1324 Marco Polo continued telling people about his peregrinations and perhaps making notes about them. More than 80 copies of 'The Description of the World' survive to the present day. Apart from Rusticiano's manuscript, other manuscripts of independent importance are the following: the first one was apparently looked through and handed over by Marco Polo to the French knight Thibaut de Sepoy in 1307, and the second is a printed edition of 1559 by Giovanni Ramusio, which originated from one of the lost Latin original versions of the 14th century [Magidovich, 1955]. For this reason Rusticiano's text is usually supplemented by other sources [Moule, Pellio, 1938; Minayev, 1902; Book of Marco Polo, 1955; see also: Khamidullin, 1998, pp. 64–66; History of the Scythians, 2001, pp. 137–142]. The Book of Marco Polo is one of those Medieval writings which have had a huge impact in forming European impressions of Asia. Marco Polo's first-hand accounts of the countries and peoples living in the Jochid Ulus and also about military and political events of the end of the 13th century (especially the wars between Khan Tokhta and Nogai) are original and in many ways unique.

Diplomatic and missionary travels of Europeans continued after Marco Polo, but unfortunately few of them provided any description of the Jochid Ulus [see: Posle Marko Polo, 1968; Kniga stranstvij, 2006].

The European Mediterranean powers increased their diplomatic activity against the backdrop of the events at the end of 14–beginning of the 15th centuries, the strengthening of the Turkish threat against the Byzantine Empire and Balkan countries, Emir Timur's campaign against the Jochid Ulus, and his conquest of the Middle East. One of the most important results of all this was the exchange of diplomatic missions between Tamerlane and European governments, who wanted to make an alliance against the Turks. One such mission was the Castilian embassy, which left its mark if not in the history of Mediterranean diplomacy but in the historico-geographical description of the countries of Central Asia by Europeans. This is because the detailed travel notes of the head of the embassy Ruy González de Clavijo, who entitled his work **'Narrative of the Embassy of Ruy Gonzalez de Clavijo to the Court of Tamerlane (1403–1406),'** survive to this day and provide a detailed itinerary of his journey from the shores of Spain to Samarkand. The work gives information about cities, peoples, their ways of life, and so on. It also provides unique insights into the arrangement of Tamerlane's court and on the complicated ethnocultural situation in Middle Asia as well as on the complex diplomatic relations of this Middle Asian ruler with the Golden Horde khans. The text of 'The Narrative' survived in two manuscripts and was published again in the middle of the 16th century. The text has been translated into European languages [Clavijo, 1928; Embajada a Tamorlan, 1943] and into Russian [Clavijo, 1881; 1990].

Another informative source on the history of the Jochi Ulus in the 15th century is **'The Bondage and Travels of Johann Schiltberger, a Native of Bavaria, in Europe, Asia, and Africa, 1396–1427'** by Johann (Hans) Schiltberger. Similar to the materials of other travels, this work gives us an opportunity to learn about the recollections left for the descendants of a Bavarian soldier, who was captured by

the Turks in 1396 after the Crusaders had been defeated by Sultan Bayezid and remained a prisoner till 1427. During his 30 years as a prisoner, Johann Schiltberger together with his various masters visited many European and Asian countries. For instance, he visited the court of karachi-bek Edigu in Circassia and other regions of the North Caucasus, Crimea, Astrakhan Krai, and even Siberia. For a long time the often fantastic and exaggerated materials in 'The Bondage and Travels' were considered to be an unreliable source, but—if treated critically—they can provide valuable facts about the history of the Jochid Ulus in a period of crisis for this state. The text of 'The Bondage and Travels' by J. Schiltberger has been known to scholarly circles for a long time. There is a Russian translation of the text with an extensive commentary by F. Brun [Puteshestviya Ivana Shiltbergera, 1867; re-edition, see Schiltberger, 1984; see also: Iz glubiny' stoletij, 2000, pp. 209–214].

Another group of materials, which contains information about conquests of the Mongols and the history and geography of the Jochid Ulus, has been preserved in European sources of universal history. One of the most authoritative sources of the 13th century is **'The Chronica Majora' by Matthew Paris**. Matthew was a Benedictine monk living in the Abbey of St Albans (Hertfordshire), and apparently he had access to the most important world news and events and used different archive materials, including Royal diplomatic correspondence and works of his predecessors. In accordance with the traditions of the genre, the author wrote down the history from the creation of the world. The beginning of his work was based on a revised chronicle written by Roger of Wendover. However, he corrected, amended (starting from 1200), and continued Roger's work up to 1259, adding a collection of documents as a supplement. The work provided materials on the conquests in Eastern and Central Europe, a collection of originals (messages, letters, and reports), detailing the Mongol invasion, for example, a record of a speech by hegumen Peter from one of the monasteries near Kiev, which are of special interest for those studying the history

of the Mongol conquests. The chronicle has been published repeatedly in Latin and modern European languages [Matth. Paris., 1872–1883; Matthew Paris's, 1852–1854]. Passages from it, relating to the history of Eastern Europe, have been published in Russian [Matuzova, 1979, pp. 107–171].

Another important source about the 13th century is a historic and geographic work of **Roger Bacon** called '**Opus Majus**.' Its author was a prominent medieval encyclopaedist, who created it in the 1260s. His main sources were the works of his predecessors and handwritten materials, in particular, the reports of the monks *Pian del Carpine* and *Guillaume de Rubruck*, his contemporaries. However, the author did not use these materials word for word but revised them within the framework of his own concept. Of especial merit is the fact that Bacon used materials and reports which only became accessible to scholars many centuries later. So great was the authority of his work that it had a decisive influence on all subsequent medieval European historiography, partially perceived by the authors of the early modern period, and modified geographic notions of Eastern Europe, of the customs and life of the Tatars, etc. Bacon's work was one of the most popular compositions, and it has been published in European languages on several occasions [Bridges, 1897–1900; Burke, 1928]. Some fragments of the work, regarding the history of Eastern Europe, have also been published in Russian [Matuzova, 1979, pp. 191–234].

Some original and interesting facts about the Mongol invasion and military and political events, which took place in Eastern Europe in the latter half of the 13th century, can be found in Polish chronicles written in Latin. Arguably the most important of them is '**The Chronicle of Greater Poland**' ('**Chronica magna seu longa polonorum seu lechitarum**'), written from the end of the 13–beginning of the 14th centuries by a representative of the priesthood linked to the Poznań capitulary. It is one of the major works of history by Polish authors, the first half of which ('from the creation of the world' to 1202) is based on the traditions of the Polish chronicles of

the 11–13th centuries, primarily on the works of *Wincenty Kadłubek*. The second half (the narration continues up to 1271), which is self-standing, gives a detailed history of Poland, notably the marches of the *Jochid Ulus* khans against Lesser Poland and Silesia. 'The Chronicle of Greater Poland,' which became one of the key stages in the development of Polish historiography, has been repeatedly studied and published [Chronica, 1970]. Some passages of the work, regarding the history of Eastern Europe, have also been published in Russian [Velikaya xronika, 1987].

Syriac sources (see: *History of Mar Yabalahi*, 1958) and works of clerical historians of the Middle East have preserved some interesting and in many ways unique facts about the *Jochid Ulus*. An example of such clerical works is the '**Libellus de Notitia Orbis**' by **Johannes de Galonifontibus**, who wrote it in 1404. In 1377 this Dominican monk was designated Bishop of *Nakhchivan* by Pope Gregory XI. He spent all his adult life in Eastern episcopates, and the apex of his career came in 1398 with his designation as Archbishop of *Sultaniya*. During that time he took part in several diplomatic missions to Europe, Transcaucasian countries, and the Middle East, and in particular he visited the court of *Emir Timur*, from whom he delivered letters to *Charles VI*, the King of France, and to other European monarchs in 1403. Later in 1410 *Johannes* was designated Archbishop of *Khanbaliq*, and his episcopate, the centre of which was located in the Crimea, took in the entire territory of the *Jochid Ulus* and Central Asia. Being well-educated and well-informed, in 1404 Brother *Johannes* completed an ecclesiastical history, in which he paid great attention to Islam and Muslim peoples, the Tatars in particular. Its manuscript was found in 1936 in the University Library of Graz and was published by *A. Kern* [Kern, 1938]. Those passages of the text that treat of the history of Transcaucasia and the North Caucasus were amended in accordance with other copies of the work and were published by *L. Tardy* [Tardy, 1978, pp. 83–111] and translated into Russian [Galonifontibus, 1980].

Portolan of the Pizzigani brothers. 1367.

Another group of sources is related to trading enterprises of Italian merchants in the Northern Black Sea Region. This group includes portolans: maps, pilot charts, nautical reference books, trading and notarial instruments signed by Italian merchants, and court cases relating to voyages in the Black Sea and commercial affairs. A Genoese portolan from the end of the 13th century is considered to be the earliest evidence of voyages by the Italians to the Black Sea Region in the Jochid Ulus period. Subsequently, the number of such sources greatly increased. Unfortunately, only a small number of them survive to the present day, but they still allow us to study the features of navigation and the trading system in the Northern Black Sea Region and the relations between the Genoese and Venetian colonies and the Jochid Ulus authorities (for the history of Italian colonies in the Northern Black Sea Region and a review of the sources see: [Skrzhinskaya, 1971, pp. 29–85; Konovalova, 1988; Black

Sea Region in the Middle Ages, 1991; Karpov, 1994; 2000]).

7. Armenian sources

The Armenian written tradition has preserved some original and informative facts about the history of the Jochid Ulus. Armenian chroniclers wrote mostly about the history of the Armenians and about religious matters, but at the same time when they described events, which in one way or another were related to these central themes, they also described the history of the neighbouring peoples or important political events. From the beginning of the 13th century they all to a greater or lesser extent touched on the topic of the Mongol invasion of Western Asia and Transcaucasia as well as the battles between the Jochid Ulus Khans and the Hulaguids.

Among the historians of the 13th century we must pay especial attention to **Kirakos of Gandzak** and his seminal work 'The Histo-

ry of Armenia' (1200–1271). He was born in Gandzak, obtained a splendid education in a monastery, and was later caught up in a whirlpool of events linked to the wars of the Mongols against Jalal ad-Din, the Georgian-Armenian Princes, and the Anatolian Turks. His works were based on literature of the past, stories of witnesses, and personal experiences. It consists of two parts. The first part is a compilation of materials gathered by previous historians. The author narrates events from the ecclesiastical history of Armenia, the life of the Catholicoi, and political events of the past. The second part covers the events starting from the reign of Prince Levon (1197) up to 1265, which he describes from the point of view of a contemporary and witness. A significant part of the narration is dedicated to religious, military, and political affairs, such as the Mongol invasion of Transcaucasia, the way of life, religion and traditions of the Mongols, and their relations with the Armenian Cilicia State. Kirakos of Gandzak's work is truly not only a masterpiece of Armenian historiography but also a priceless source of materials about the tumultuous events connected with the Mongol invasion of Transcaucasia and Asia Minor. His work has been translated into Russian [Gandzaketsi, 1976].

Another work which merits attention is the **'Historical Compilation' of Vardan Arewelts'i (Vardan the Great)**. He was one of the distinguished scholars, travellers, and activists of the Armenian church (a vardapet). He was born in the early 13th century, travelled a great deal in the Middle East and Transcaucasia, and was involved in education and enlightening activity. In the early 40s (up to 1245) he stayed at the court of Tsar Hethum and was abreast of political events of that time. He wrote a lot and was a recognised author of theological works, spiritual songs, and other compositions. His most significant work is the 'Historical Compilation,' where he set forth history 'from the creation of the world' up to his times (up to 1267). Just like the work of Kirakos of Gandzak, it was in many ways a compilation based on written materials of many authors, both Armenian and Greek. However, Vardan expressed his own ideas and

stories of witnesses when he described the events of his own time. For instance, he provided a detailed narration about the Mongol campaign and described his visit to Hulagu Khan, who received him in 1264 with great honour. Vardan's work has been translated into different languages several times [Vardan Velokij, 1861; Armyanskie istochniki o mongolax, 1962].

Among other sources we should note the works of **Smbat Sparapet (the Constable)**, primarily his **'Chronicle.'** Smbat Sparapet was a major political figure, diplomat, military leader, and man of letters. He was a descendant of the Hetoumids, who reigned in Cilician Armenia from 1226, and King Hetoum I was his brother. On several occasions he successfully commanded troops in wars against the Anatolian Turks and died in a battle with the Egyptian Sultan Baybars (1276). He frequently headed diplomatic missions and took part in negotiations with neighbouring countries, but his mission in 1246 to the court of the Great Khan Güyük in Karakorum (for details see: [Osipyan, 2007, pp. 129–153]) is the most famous one. In the course of this visit he managed to obtain the Great Khan's support and concluded the Armenian-Mongol Treaty, which came into force after Tsar Hetoum's visit (1254) to the new Great Khan Möngke. Smbat Sparapet accompanied Tsar Hetoum I in this mission. His literary legacy is also significant, and among his works are: the text of 'The Legal Code,' letters to several state officials and his historic 'Chronicle' (1272). Apart from its traditional summary part, it contains some interesting material on the history of international relations in the Middle East, customs, religion, and way of life of the Mongols, several aspects of internecine political struggles during the Great Khan elections (Güyük's election in 1246, Möngke's election in 1251). Historians took note of Smbat's work in the middle of the 19th century, and since then this work has frequently been published in Russian and in the West [Smbat Sparapet, 1974] (see also [Armenian Sources about the Mongols, 1962]).

In the 14–15th centuries Armenian statehood suffered a period of decline, whereas

Gravestone from Bulgar. 1309.

Transcaucasia and Middle Asia often became the arena for bloody wars and conquests. Armenian culture was also in decay, and this could not but influence historiography. The major historical work of the period is **'The History' by Thomas of Metsoph (Thovma Metsobetsi)**. This author was born in about 1370 into an eminent family. From his youth he devoted his life to the church and spent almost all his life in the monastery of Metsob. His historic work is a chronicle of events which he narrated from the top of his head, sometimes with repetitions and additions. His narration begins with the first invasion of emir Timur in Transcaucasia (1387) and continues with the history of his wars and the wars of his descendants in different regions of the Middle and Near East, Middle Asia, and Eastern Europe up to 1446. Being a contemporary of these events, he also used the tales of eye-witnesses and different hand-written materials from the monasterial library. Thomas's work

came to light a long time ago, and it has been translated into Russian [Thomas of Metsoph, 1957].

8. Cartographic sources*

One of the most crucial sources about the Jochid Ulus is Italian portolans (portulan charts) (from Italian portolano)—they are navigational maps based on compass directions with an indication of various coastal, more rarely continental, territories. This word was also used for written guides used for maps, which were simplified prototypes of modern pilot charts. Portolans appeared in Mediterranean countries approximately in the middle of the 13th century, and in 1270 such maps were mentioned for the first time [Volkov, 2001, pp. 600–607]. Unlike round monasterial maps of the world, peopled with mythological figures, portolans had linear scales, and their entire surfaces were criss-crossed with rhumb lines, set out radially from the centre of the map along spool winds or compass points. For that reason these maps are also called rhumb line maps. Their accuracy in depicting marine coastlines was quite high within the customary scale 1:6 million. There are no coordinates on these maps, but the Mediterranean and Black Seas are shown in the Mercator projection more precisely than the eponymous Mercator world map of 1569 [The history of cartography, 1987, pp. 385–386]. Conventionally, maritime maps can be divided into three types: 'Italian,' 'Catalan,' and 'Mixed.' 'Catalan' and 'Mixed' types of map are more suitable for describing territories remote from the shore line, where river flows are not limited by estuaries, and images of the most important cities, mountains, leaders, and caravans are shown on land. However, the accuracy in depicting such places falls off rapidly, because the main advantages of surveying from aboard ship are lost. In these cases cartographers could only define the latitude of the point as per the pole longitude and verbal information about directions and distances between the objects as well as their

* Co-authored by I. Volkov.

sequence along rivers and trade routes. In this case deviation of scales is particularly high, as usually people did not use portolan miles (approximately 1230 m) in verbal descriptions. During production of 'expanded portolans' in later times data from ancient geography was used for depiction of remote plots of land.

Maritime maps have no direct sources in Ancient, Medieval European, or even more, Arabic cartography apart from basic common features [ibid., pp. 380–384]. They appeared as a result of single surveys of separate basins and their subsequent aggregation. Traditionally, it is believed that the oldest surviving copy of a portolan is the 'Carta Pisana' of about 1300, which showed at least part of the Black Sea, but unfortunately this particular part of the parchment has almost completely rotted [ibid., p. 377; Harvey, 1991, pp. 39–41, Fig.30]. At the same time, the high definition and developed style of this map force researchers to assume that possibly it was based on a previous tradition and systematised geographical data. No less popular is the evidence that in 1270 Saint Louis IX was given a portolan during his Crusade voyage to the shores of Africa, which is considered to be the conventional date for the start of the portolan epoch in the history of cartography [The history of cartography, 1987, pp. 380, 439; Harvey, 1991, p. 39]. Dozens of surviving hand-written portolans were made during the 14–15th centuries: approximately 30 maps and atlases are dated to the 14th century, and approximately 150 are dated to the 15th century [The history of cartography, 1987, p. 390; Campbell, 1986, p. 69]. In the 16th century the copying of previous prototypes continued, and sometimes they managed to compensate for the lack of surviving hand-written maps from the earlier period.

The Pizzigani (1367) and Abraham Cresques (1375, the so-called 'Catalan Atlas') maps are examples of the depiction of the Golden Horde's inland territory [Brun, 1873; Bagrow, 1956]. Their most scrupulous analysis in Russian scholarship was carried out in the latter half of the 19th century by F. Brun, an Odessan historian [1872; 1879–1880], and more recently by the historian I. Fomenko [Fomenko, 2007].

Jar with a stamped ornament. Sarai.
14th century.

There is a series of surviving maps dated the 15–16th centuries, which reflect the heyday of the Golden Horde's cities. Portolans depicting the Caspian Sea coastline, whose accuracy was only excelled in the 18th century, contain extremely important information. They have been reviewed in Russian historiography only in part. These maps were rarely duplicated in the Middle Ages. L. Bagrow has suggested that this was caused by the secrecy of the Italians' information about the steppes [Bagrow, 1956, p. 8]. It seems more probable that the Caspian basin and the Lower Volga Region were not at the centre of Italian interest because they were remote from their region and traditional trading activity. Evidently, the earliest of this series is a portolan from Hvar (Lesina) [Goldschmidt, 1944, pp. 272–278; Bagrow, 1956, p. 8]. It belongs to the 'Mixed' type, and it defies accurate dating, although it is a part of Ptolemy's edition of the 16th century. The closest analogues of the compass rose date back to the first half of the 15th century. Judging by the rhumb lines and reasonable orthography, it might be per-

Painted bowls. 13–14th centuries. Jochid Ulus
(According to G. Fedorov-Davydov)

haps the closest to the survey copy. There are also two portolans of the Caspian Sea, which belong to the 'Italian' type. They were kept in the British Library (part of Egerton's atlas collection, 78 and 2803) [Bagrow, 1956, pp. 8–9, Fig. 5]. Both of them are conventionally dated to the end of the 15–first half of the 16 centuries (the second map is older) and contain information about numerous cities in the Lower Volga Region. However, because these maps have repeatedly been copied, they show some discrepancies and inaccuracies.

There are three surviving maps of the 'Catalan' type dated the 15–16th centuries, which show the coastline and cities of the Golden Horde in accordance with surveys of the 14th century as well as a significantly greater number of settlements in the steppes in comparison to the first portolans. All these maps were made in the workshop of a famous Venetian cartographer Fra Mauro. Apart from the correct location of the Caspian Sea, all of them show a unified manner of depicting objects. Evidently, all of them reflected older geographical data since the real situation in the Volga Region in the 15–16th centuries was completely different.

A map which was copied earlier than the others (approximately in 1450) is an anonymous map under the conventional name 'Borgia-5' from the Vatican Library [Almagia, 1944, tav. XIII; Bagrow, 1956, p. 8, Fig. 3b; Winter, 1962]. Even though its northern part has been cut off, it clearly depicts Middle Asian and North Caucasian lands owned by the Jochid dynasty. Atlas sheets made in 1556 by Angelo Freducci, which show the Golden Horde's territory, arise from even older proto-graphs from the same workshop. These folios are stored in the Public Library of Mantua [Caraci, 1953, p. 31, Fig.].

Finally, the fullest idea of the Ulus territory can be derived from the 1460 (1459) world map of Fra Mauro [Gasparrini, 1954; Fomenko, 2007, p. 51, Fig. 7]. Because of its type, it is not a portolan but a more archaic round clerical map of the world. However, sea maps, including the very latest, regional charts, and descriptive compositions available at that time as well as oral data from numerous informants were used for its creation. Further, its style of depiction is reminiscent of the 'Catalan' portolans. Initially, this outstanding map was created in 1459 to the order of the Portuguese King Alfonso V. Andrea Bianco, who occupied important positions in Venetian fleet, was the major co-author. The completed map was soon mislaid in Portugal, but Bianco managed to make a copy, which survives to the present day. The work on the copy was finished in 1460, when Fra Mauro had already died [Gasparrini, 1954, p. 11; The history of cartography, 1987, pl.18; Harvey, 1991, p. 69].

There are also many unpublished maps or maps published with a definition inadequate for reading, or in fragments, so that the whole territory of the Jochid Ulus is not shown on one map. The information on these maps can significantly change the idea of the geography of the state, but this requires a critical approach and the desire to justify the location of each point on a modern map.

9. Epigraphic inscriptions

Epigraphic inscriptions found on the territory of the Jochid Ulus, which are dated to

the end of the 13–15th centuries, are unique documentary sources and contain the richest linguistic materials as well as information about the material and spiritual cultures. Unfortunately, the epigraphic inscriptions located in different regions of the Golden Horde have been studied unequally and inadequately. There is some unsystematised information about the presence of tombstones in Crimea, Transnistria, and the Lower Volga Region.

Scholars have studied epitaphic inscriptions from the territory of the Volga-Urals Region quite well. The history of their rigorous study started in 1722, when Peter I visited Bulgar and ordered the making of copies from Islamic tombstones. The first scholarly publication of the texts of three monuments was made in 1863 [Feyzkhanov, 1863]. Thanks to the works of S. Malov [1947; 1948], N. Kalinin [1948], and G. Yusupov [1960], in the 1940–1960s, the major stones were identified, a catalogue of monuments was compiled, and a linguistic description of the epitaphs was made. Later in 1970–1980s the range of sources was significantly increased, while their linguistic description was clarified, which made it possible to refer to the existence of a supradialectal variant of the language for tombstones, which in the mid–14th century was suppressed by a widely diffused Koine, based on Volga Turki [Khakimzyanov, 1978; 1987]. The selected area of tombstones included the territory from the Samara Bend to the Cheptsa River basin, and from the Sura River Region to the Iks-Belsk Interfluve. This territory has revealed several schools of stone carving, or cultural and historical groups which have distinctive features (irrespective of their dialectal and language peculiarities) in stone design, choice of formula, etc. Generalising a significant volume of data has enabled the discovery that the tradition of erecting tombstones with epitaphs appeared in the period when Bulgar lands became part of the Jochid Ulus. Such epitaphic records indicate the defining role of Islam and Quranic texts in the people's spiritual culture. Moreover, they show that the special features of the ethnosocial development of the region were also maintained for several centuries [Mukhamet-

shin, Khakimzyanov, 1987; Mukhametshin, 2004].

10. Material sources

Material sources are extremely important in studying many questions in the Jochid Ulus history and culture. Archaeology plays a leading role in their examination as it gathers, systematises, and analyses material sources in order to obtain historical information.

The study of Medieval Eurasian monuments has rich traditions. However, the fully-fledged study of the Golden Horde monuments as a comprehensive historical and archaeological process has only recently begun. Archaeological monuments of the Jochid Ulus were for the first time discovered and examined in the middle of the 19–beginning of the 20th centuries in the works of A. Terechenko [1850] and A. Spitsin [1906; 1909; 1927]. In the 1920–1950s several attempts were made to begin results-oriented archaeological researches of the Golden Horde cities and summarise the materials acquired [Ballod, 1923a; Ballod, 1926; Yakubovsky, 1932; Smirnov, 1951]. However, for numerous political reasons, these works were not continued, and large-scale digs of the Golden Horde monuments have almost completely stopped. Researchers have put a greater emphasis on the digs in Russian cities that suffered or were destroyed during the Mongol invasion. They have also paid great attention to the negative consequences of the invasion for culture and crafts of Russian cities.

A new stage in studying of the Golden Horde culture started at the beginning of the 1960s, when A. Smirnov and his students and colleagues marked out planned, systematic, and comprehensive research of the Jochid Ulus monuments and, primarily, ancient cities [Smirnov, Fedorov-Davydov, 1959]. Carried out in the 1960–1990s by G. Fedorov-Davydov [1966; 1976; 1994; Fedorov-Davydov, 1984], N. Vakturskaya [1959; 1963], A. Mukhamadiyev [1983], V. Yegorov [1970; 1980; 1985], I. Vayner [1967], A. Alikhova [1973; 1976], M. Poluboyarinova [1978; 1991], V. Dvornichenko, N. Bulatov [1976], L. Noskova [1976], S.

Mikhalchenko [1973], T. Guseva [1985], N. Busyatskaya [1976], R. Fakhrutdinov [1975], L. Galkin [1963; 1975; 1984], E. Rtveladze [1972], A. Kravchenko [1986], M. Kydyrnayazov [1989], L. Yablonsky [1987; 1987a; 2001; 2004], K. Baypakov and L. Yerzakovich [Akishev, Baypakov, Yerzakovich, 1987; Baypakov, 1990], L. Nedashkovsky [2000; Nedashkovsky, 2004], E. Zlivinskaya [1989; 1991], A. Burkhanov [2003; 2005], S. Valiulina [2002], V. Ivanov and V. Kriger [1987], M. Kramarovsky [2001], P. Byrnya [Polevoy, Byrnya, 1974], and others (see also: [Medieval Monuments of the Volga Region, 1976; Cities of the Volga Region in the Middle Ages, 1974; City of Bulgar. Outlines of Craft Activity, 1988; City of Bulgar. Craft of Metallurgists, Blacksmiths, Foundrymen, 1996; City of Bulgar. Monumental Construction, Architecture, Beautification, 2001; Treasures of Sarmatian Leaders and Ancient cities of the Volga Region, 1989; Medieval Monuments of the Volga Region, 1976; Steppes of Eurasia in the Middle Ages, 1981; Feudal Tauris, 1974]), archaeological excavations facilitated the discovery and study of numerous monuments of the Golden Horde culture as well as to identification and systematisation of a large number of archaeological findings, which allowed the creation of a full idea of the creation, development, and features of the Jochid Ulus culture. They have raised doubts about a whole range of historic clichés concerning the 'parasitic' nature of the Jochid Ulus statehood, the underdevelopment of its urban civilisation, and the subsidiary nature of the material and spiritual cultures.

The archaeological culture of the 13–15th centuries, which unites monuments in Eastern Europe and North-Western Asia, can be called the archaeological culture of the Golden Horde in accordance with the name of the state within which it arose and developed.

Areas of continuous settlement are especially rich in archaeological monuments (the Volga Region, Crimea, the Aral Sea Region, Transnistria, Dnieper River Region and the foothills of the North Caucasus). In these regions ancient towns, settlements, burial sites, separate graves and sepulchres (mausoleums,

tombstones, etc.), and hoards of artefacts and coins have been discovered and studied. There are more than 100 archaeological sites, among which we can distinguish the remains of major medieval cities of Eurasia—Selitrennoe (presumably Sarai), Tsarevskoe (Sarai al-Jadid), Vodyanskoye (Beljamen), Uvekskoe (Ukek), Bolgarskoye (Bulgar), Belgorod Archaeological (Akkerman), Staroorkheyskoe (Shehr al-Jedid), Prikumskoye (Majar), Saraychikskoye (Saray-Jük), etc. They were usually surrounded by rural areas with dozens of ancient settlements and other monuments (burial sites, hoards, tombstones).

Scholars have found evidence of different burial ceremonies in sites throughout the territory of the Jochid Ulus. Along with burial mound rites with pagan elements (from the 13th to the middle of the 14th centuries, and in some regions (the Trans-Volga Region, the Northern Aral Sea Region) up to the end of the 14th century), there were also underground Muslim cemeteries (*mazars*) with semi-underground (*sagana*) and above-ground (*makbara*, *keshene*) mausoleums. Stone tomb monuments with epitaphic Arabographic inscriptions in Turkic (two dialects) and Arabic have been found in several regions (the Bulgar Ulus in the Middle Volga Region). In other regions—Crimea and the North Caucasus—there are well-known tombstones with epitaphs in Turkic and Arabic.

Yurts, dugouts, above-ground one-room (with wooden and rammed clay walls), and multi-room (made of adobe and burnt bricks) houses have been found in the settlements. A characteristic feature of the houses is the presence of ovens, kans (horizontal chimneys), and sufs (stove benches made of brick). There were also community buildings made of brick or white stone (mosques, ba-houses, mausoleums, madrasahs, etc.). As a rule, mosques were rectangular and had internal columns and portal entrances. In some cases scholars have found madrasahs (Crimea, the Volga Region) and dormitories for sufis and pilgrims (*khanaka*) constructed near mosques. Ba-houses were mostly cross-shaped and had systems of underfloor heating and water supply from artificial reservoirs. Walls of many

(especially multi-room) brick houses were coated with painted plaster, carved ganch (terracotta) and tiles made of composite white frit (or multicoloured glazed) materials, whereas floors were covered with stone tiles and bricks.

Cities had a complex district and mansion layout, and their key elements were major urban and suburban mansions (500–5000 sq. m) surrounded by walls. Behind the walls there were multi-room houses, separate living and utility structures, and water reservoirs (*hauzyi*), sometimes with fountains.

Archaeologists have found complicated hydro-technical structures (artificial lakes, dams, irrigation ditches) and underground (assembled from ceramic pipes) water-supply and sewerage systems. Economy: agriculture, semi-nomadic cattle breeding, fishing, community handicrafts: metallurgy, iron and bronze, pottery, glass-making, wood processing, construction, bone-carving, stone-cutting, jewellery and arms production, etc. (see corresponding divisions of the present edition).

The functioning of the Golden Horde culture is marked by the development of local and international trade with the countries of Central Asia and the Mediterranean region and commercialisation (self-minted coins, hoards of coins, articles of commerce from Eurasia).

The characteristic features of this culture are the following: grave-mound and subsurface burial sites, vast settlements of an urban type, round red pottery and kashin ceramics of different forms (jars, tea bowls, bowls, bottles, etc.) with multi-coloured designs (botanical, geometrical, zoomorphic, arabesque ornaments), metal-craft—decorations of women's dresses, household items (looking glass, locks), elements of military life (open-worked and flat belt sets, arms and harnesses, etc.) and ornamented bronze dishes, as well as self-minted coins.

According to researches by Russian archaeologists [Fedorov-Davydov, 1994; Kramarovsky, 2001], the Golden Horde culture started to develop in the latter half of the 13th century as a result of a mixture of local European (Bulgar-Muslim and Kipchak) and Central Asian (Khitan-Jurchen and Tatar-Uighur) traditions, when the Jochid state (development of cities, trade, Tatar elite) influenced the creation of a new imperial supra-ethnic culture, which in fact was the culture of the Tatar ethnosocial community. In this culture we can distinguish several local-regional (Bulgar, Khwarezm, Crimea, etc.) and social (urban, nomad) subcultures. In the 15–16th centuries this culture suffered a period of decay and the development of local territorial cultural variants.

Recently a whole range of specialist studies dedicated to different types and branches of the Jochid Ulus material culture has been carried out. It should be emphasised that it is important to make a comprehensive study of such elements of the Golden Horde culture as metal craft, ceramics, architecture and architectural decorations, glass-making and bone-carving.

All in all, we can say that the archaeological study of monuments of the Golden Horde culture has allowed us not only to reveal a diversity of materials in all the spheres of life of the mediaeval population but also to compare them with other materials and fill in the gaps, disclosing many facts from the history and culture of the Jochid Ulus which were previously unknown. It is especially important that the corpus of these sources grows every year, and the improvement of the accumulation, analysis, and systematisation of the sources will enable a more complete presentation of the development of the material and spiritual cultures of the medieval population of Northern Eurasia.

Section I

Central Asia and Eastern Europe in the 12–Beginning of the 13th Centuries

CHAPTER 1

The Nomadic World of Central Asia: the Turks and Early Mongols

Eugene Kychanov

By the 6th century CE, the nomadic world of Central Asia, which, in this case, is understood as the region stretching from Western Manchuria to the Altai and from the Siberian taiga to the borders of China, appears to modern science as a world that had gained linguistic certainty. Whereas scientists do not know for sure about the ethnic groups which earlier dominated Central Asia (Hsiung-nu, Xianbei, Ju-juan; it is assumed, that the former were proto-Turks, and the latter, proto-Mongols), from that time on this was the world of Turkic and Mongol peoples, except for the present day Xinjiang territory, which the Chinese called Xiyu, Western region, home to mostly Indo-Iranian language peoples. The Turkic world was the world of classic Turks and their kindred tribes, the Uighur and the Kyrgyz. They inhabited the central part of present-day Mongolian People's Republic and regions to the west of it. Eastern regions of the MPR and the adjacent region of Western Manchuria were once the world of the Shiwei, Xi, Kumo Xi, and Khitan Mongol peoples. The struggle for domination in Central Asia between Turks and Mongols became a general tendency in the history of the region. The Mongols moved west, driving the Turks out, and the Turkic-speaking peoples gradually relocated from the east to the west.

The name Turk appears in the first half of the 1st millennium CE as the name of the local Altai tribes, ruled by the leaders of the Ashina clan. In 534 the great Bumyn Yabgu became ruler of the Turks. In the north he conquered another Turkic-speaking people, the Oghuz, and in 551 was proclaimed Khagan of Turkic el. Muqan Khagan (ruled in 553–572), conquered the Kyrgyz along Yenisey and the Khitan. The latter case might be the first time the

Turkic-speaking world faced the world which was definitely Mongol-speaking. The ruler of the Khitan received the title of Irkin from the Turkic Khagan. On the cusp of the 7th and 8th centuries, the Khitan submitted to the Turks again, and their ruler received the title of Elteber from the Turkic Khagan. When the Turkic Khaganate grew weak, for a period of time the Khitan rulers were titled 'Khagan'. Other Mongol-language peoples living in the Kadirhan region of the Bolshoi Khingan Range were dependent on or subordinate to the Turks.

In the year 744, Turkic supremacy was supplanted by the Uighur. The Khitan accepted the Uighur as suzerain. The ruler of Khitan received a seal from the Uighur Khagan as a symbol of the authority granted to him. At the beginning of the 840s, a war broke out between the Uighur and the Khitan, where the Uighur were vanquished. This was the war where the Khitan supported the Kyrgyz. Uighur resistance continued on for several years. It is known that after suffering defeat, a portion of the Uighur went east. Relations between the Uighur and the Khitan later took on a peaceful character. Shulü, the wife of the first Khitan emperor Abaoji, was of Uighur descent.

The Khitan were the eastern and south-eastern neighbours of the Turkic peoples of Central Asia. Actually, the Mongols were a part of a group of tribes (peoples), called Shiwei in Chinese sources. The Shiwei, on the whole, can be considered as Mongol-speaking. The Chinese believed the Shiwei to be a 'special clan' of the Khitan. During the 6–8th centuries, the Shiwei were dependent upon the Turks and their western neighbours. The 'Shiwei Mongols' lived south of a river that flowed from Lake Julun; it was called either Wangjianhe ('Old History of the Tang Dynasty') or Shi-

jianhe ('New History of the Tang Dynasty') in Chinese sources. The Shiwei Mongols were the eastern neighbours of the Turks. The territory settled by the ancient Mongols is associated with the identification of those place names mentioned in the Tang histories. All researchers identify Lake Julun as modern day Lake Hulun-Hulun Nur, Dalai Nur (in the northern part of the Inner Mongolia Autonomous Region and the People's Republic of China). The lake is fed by the Kerulen River. The Wangjianhe—Shijianhe River flowing out of Lake Julun is the present day river Ergune. Japanese researcher Komai Yoshiaki identified the area inhabited by the Shiwei Mongols as the southern bank of the Amur River, west of the point where the Sungari River runs into the Amur [Komai Yoshiaki, 1961, pp. 329–330]. Another Japanese historian, Tamura Jitsuzo, came to the conclusion that the Mongols of the 6–7th centuries 'lived a nomadic life in the steppe region south of the Ergune River' [Tamura Jitsuzo, 1971, pp. 363–366]. The French academician L. Hambis wrote that 'the most ancient texts place the Mongols west of Nonni's upstream flow, perhaps, in the northern portion of the area located between the river and Lake Khelen, where the Ergune, the main part of the upper Amur, starts, and to the south of this river' [Hambis, 1970, p. 130].

Thus, the Mongol-speaking peoples (the Shiwei, Kumo Xi, Khitan) colonised the lands between the Turks in the west and the Tungus or Manchu in the east (the Mohe, the Balhae, and others). Shiwei's general subjection to the Turks explains why archaeologists discover Turkic elements in the archaeological cultures of the Amur.

When and how did Mongols migrate to the east and drive the Turks out of the Khalkha territory? The Mongolian legend telling us about Chinggis Khan's paternal ancestors traces his lineage to Bata-Chigan (Batachi)—the descendant of Dapple Wolf (Borte Chino) and Beauful Doe (Goa Maral). Wolf Borte Chino

Driving hunting. Miniature. Iran. 14th century

'was born at the pleasure of the Highest Heaven' [Kozin, 1941, p. 79]. In the legends about the origin of Turks, the primal forefather is either a she-wolf or a male wolf. Turks also have a legend about forefather Deer, Golden Horns. The Mongolian legend about the origin of Chinggis Khan's clan somewhat unifies these two legends (the wolf and the doe), indicating a deep connection between Turkic and Mongolian lore.

The husband and wife, Wolf and Doe moved west. As this legend reflects the factual Mongolian migration, this migration must have had a reason. Rashid al-Din assumed it was 'conflicts with other tribes'. 'Other tribes overtook the Mongols and perpetrated such slaughter that there was no more than two men and two women left alive. In fear of the enemy, these two families fled to an inaccessible region, which was surrounded by mountains and forests and had no road leading to it from any side, except for a narrow and heavy-going path, which could be traversed only with great difficulty... Among these mountains there was abundant grass and a healthy (in terms of climate) steppe. The name of this place was Er-genekon'. [Rashid al-Din, 1952, 1, 2, pp. 153–154]. It happened during the period of time

Mythical ancestors of Chinggis Khan. From the Timurid chronicles, 15th century. Topkapi museum, Istanbul

when Central Asia was dominated by the Uighur. Rashid al-Din points out that by the moment future Chinggis Khan was born (1154 or 1155), his clan had been 'around 400 years old' [Ibid., p. 8], so the migration happened in mid to late 8th century. Late Mongolian source provides us with the date of wolf and doe Batachi's son's birth: 786 [Baldanzhapov, 1970, p. 137]. Ergenekon is the area of the Ergune River and the Bolshoi Khingan Range. The names of two men who did not want to leave their home grounds and settled in Ergenekon were Nukuz and Kiyan. Rashid al-Din further explains that Kiyan was the name of a Mongolian tribe. The Mongols were a feeble people: 'as for the word Mongol, it was originally pronounced mungal, which means "powerless". The core of Mongolian tribes at the time consisted of the Kiyat. In Mongolian language, kiyan means "a great flow heading from mountains to a lowland", ravine, fast and powerful. As the Kiyat were valiant, brave and extremely courageous, this word was set to be their name. Kiyat is the plural of Kiyan. Those of their clan nearest to its beginnings were called Kiyat in ancient times' [Rashid al-Din, 1952, 1, 1, p. 154].

It was namely in Ergenekon where the ancestors of Mongols multiplied and gained strength. They became excellent smiths and experts in melting metals. This helped them to leave Ergenekon, which they had outgrown. The Kiyats and their ally tribes, according to legend, melted a mountain, mined a lot of iron, and there appeared a pass out of the Ergenekon gorge through the mountain. According

to Rashid al-Din, Borte Chino (Dapple Wolf), the anthropomorphous ancestor of Chinggis Khan's clan, was just one of those who left Ergenekon [Ibid.].

We should point out one more similarity between Turkic and Mongolian lore. The ancient Turks (*türk budun*) were good smiths, 'slave smiths', which worked for the Ju-juan. Chinggis Khan's ancestors were good smiths and metalworkers, and Chinggis Khan himself was called Temüjin, a smith.

When did the Mongols arrive in Mongolia, in Khalkha? Tamura Jitsuzo dates it to the late 10–early 11th centuries [Tamura Jitsuzo, 1973, pp. 6, 13]. L. Hambis wrote that the Mongols occupied the 'territories west of the Bolshoi Khingan to the region extending up to Lake Khelen, which flows into the Kerulen, and up to Buir Lake, the region occupied by the Tatars, who also inhabited the territories to the south', [Hambis, 1970, p. 131] without stating the date of the event.

In the pre-Mongol era, power in Central Mongolia was subsequently transferred from the Turks to the Uighur and from the Uighur to the Kyrgyz. The ancestors of the Mongols appear in Mongolia roughly at the moment Uighur rule was replaced by that of the Kyrgyz. After the Kyrgyz, there must have been some Tatar period, a sufficiently powerful period of Tatar dominance. That is because in the 11–12th centuries, or even from the middle of the 10th century, those inhabiting the territory of Mongolia become known as Tatars among their southern neighbours, the Chinese, which led to the worldwide popularity of this name. We find another convincing argument in Tangut sources, which call the whole population of Mongolia Tatars as well. Due to their 'extraordinary greatness and honourable position, other Turkic clans also became known under their name and are all called Tatars', just as in times of Rashid al-Din 'they (too) call themselves Mongols out of self-glorification' [Rashid al-Din, 1952, 1, 1, pp. 102–103].

The Tatars are mentioned in Turkic runic inscriptions from 732 to 760 [Klyashtorny, Sultanov, 2000, pp. 133–134]. Chinese author Wang Ming-zi wrote that in times past, the Khitans were shepherds for Uighur, and

Tatars herded cows for Uighur. The Tatars are mentioned as allies of the Uighur Khagan during the time of the defeat of the Uighur by the Kyrgyz. At the end of the 9th century, the Kyrgyz from the upper reaches of Et-sin Gol subjugated the Tatars, and the Tatars agreed to pay tribute. When the Gansu Uighur Kingdom emerged in the western part of present-day Gansu province, the Khitan and the Tatars began their struggle for superiority against the Uighur. Thus, it can be supposed that at least two Tatar enclaves existed in the 10–11th century: near Buir Lake, somewhere in the region of western Gansu; and to the north of that region.

When notifying the Song court of his acceptance of the imperial title in 1039, the Tangut emperor Yuan-Hao wrote that the Tibetans, Tatars, and Gansu Uighur had surrendered to him. This referred to the group of north-eastern Tibetans in the region of present-day Wuwei (Gansu), the Gansu and Suzhou Uighur Khanates, and the Tatars living to the north of the city of Suzhou and the Helan Mountains. Later, however, not a single Tangut document mentions the Tatars among the peoples living in the Tangut Great Xia state. The 11th century Chinese map of Great Xia three times refers to the Tatars as the northern neighbours of Xia, that is, in this case the map reflects the fact that the ethnonym 'Tatars' not only denoted the Tatars proper but was also a generalised name for the entire population of the territory of Mongolia. During the 11th century, in both the Turkic and Muslim habitats, as well as in China, all peoples living in Mongolia were called Tatars [Ibid]. Rashid al-Din indicates that due to the past strength of the Tatars, today (the beginning of the 14th century) 'in the land of the Kirghiz, the Kelars, the Bashkirs, in Desht-i Qipchaq, in the areas north of it... all Turkic tribes are called Tatars [Rashid al-Din, 1952, 1, 1, p. 103].

The scarcity of sources makes it difficult to answer the question of the Tatars' ethnic affiliation: were they a Turkic-speaking, Mongol-speaking, or mixed people? Traditionally, many consider that during the Khitan Liao dynasty's rule in the 10–11th centuries, Chinese sources mention the Tatars as Tszubu. Komai

Yoshiaki believed that Tszubu were not Tatars but rather Shato Turks [Komai Yoshiaki, 1961, pp. 342–354]. His assumption is supported by the sources from this time where the Tatars are quite often mentioned simultaneously with the Tszubu, so there were some differences between these peoples.

The period when the Mongols spread throughout Khalkha is probably late 10–early 11th centuries. While the paternal ancestors of Chinggis Khan were moving along the Onon river to Burkhan Khaldun (the Khentii Mountains), his maternal ancestors came from the Transbaikalia, from the Khor-Tumat land. His progenitress Alan Gua was a beautiful woman from a very noble clan. Rashid al-Din, who wrote his work in 1300–1311, suggested that Alan Gua had lived 300 years prior, in other words, in late 10–early 11th centuries [Rashid al-Din, 1952, 1, 1, p. 103]. The 18th century chronicle 'Altan Tobchi' even states the exact birth date of Chinggis Khan's direct ancestor, the fifth son of Alan Gua, Bodonchar: 970 [Baldanzhapov, 1970, p. 138].

The successful Mongolian advance to the west was helped by the emergence of the Khitan state in south-western Manchuria in the early 10th century. From August 916, Khitan Taizu Abaoji, having been enthroned as Emperor, launched several campaigns against neighbours to the west and north-west. 'His Majesty marched forth against the Turk, Tuhun (Xianbei), Dangxiang (Tangut)... and Shato peoples, and pacified them all. He took their rulers and families captive, a total of 57,600 people, seized more than 90 thousand pieces of armour and munitions. As for the valuables, goods, horses, cows and sheep, their numbers were countless' [Liao Shi, 1958, vol.1, p. 15]. Abaoji ordered to immortalise his victories in a stone stele with a description of his deeds, and also erase the old inscription from a stele of a Turkic Khagan and use it to describe his deeds and merits in Khitan, Turk, and Chinese writing. The Khitan campaigns into the depths of Central Asia put an end to Kyrgyz dominance and established a cover for the successful Mongol advance westward and the ousting of the Turkic population from Mongolia.

The Tatars of Chinese miniatures of the 13–14th centuries
(according to M. Gorelik)

During the migration process, the Mongols ousted and partially assimilated the Turkic-speaking peoples of Khalkha. Their migration was connected to a shift in economic activity: in steppe and forest-steppe conditions, Mongolian tribes switched to a nomadic animal husbandry economy, having adopted the centuries-long Turkic experience. In the Mongolian language there are native Mongolian names for only dog, horse, and pig, and those animals mentioned in Chinese sources describing the Shiwei economy. The Mongols borrowed the names for sheep, ox, camel, and mule from the Turks [Kyzlasov, 1975, p. 171].

Again we touch upon a very important historical (and nowadays political) question: which of the peoples mentioned in the sources of 11–12th century Mongolia should be considered as either Turks or Mongols? We cite several opinions. L. R. Kyzlasov thinks that the Tatars were Turks. Ilinchzhen (Irinchin), a Mongol and historian of the early Mongols from Inner Mongolia, considered the Khitan to be Mongols, the Shiwei to be Tatars, but also

the ancient original Mongols. He believed that Tszubu, mentioned during the time of the Khitans was then a common name for Mongols. As for the Keraites and the Naimans, according to him, they too were Mongols, but were ruled by Christianised Turkic nobles. White Tatars, the Onguts, are a mixed people comprised of Turks, Mongols, and Tanguts [Ilinchzhen, pp. 63–72]. Another historian from Inner Mongolia, Namuyun, supported the Turkisation of the Mongols during their migration. Their contacts with the Turks and the wide acceptance of the achievements of Turkic nomadic civilization by the Mongols. The Mongols assimilated a part of the Turks.

The Mongols in the 11th century were herders. Yeh Lung-li wrote: 'The Mongolian state. This state has no ruler to rule it, neither is the soil ploughed and sowed.

They hunt. They migrate once per season, chasing only water and grass. They eat only meat and kumis. That is all. They do not fight the Khitan but rather exchange oxen, rams, camels, horses, leather, and woolen items' [Yeh Lung-li, 1979, p. 304]. The Mongols obviously had rulers. Take, for example, Chinggis Khan's ancestors. They received the title Tutuk from the Khitan. Those who directly served Liao were appointed Ling Wen and Xiang Wen, border military commanders. Tatar rulers also received the title Tutuk from the Khitan. Not all Mongolian tribes were friendly with the Liao. The Merkits, a 'part of the Mongolian tribe', a 'large tribe' that had a 'very belligerent and powerful army' [Rashid al-Din, 1952, 1, 1, p. 114] was at war with the Khitans. In the year 1093, the Khitans launched a campaign against the Merkits and occupied some Merkit lands. The Merkit ruler, Khuluba asked to have these lands returned to him, and in reply he was attacked again the following year, in 1094. In 1102 the Khitans launched yet one more campaign against the Merkits.

The Merkits lived along the lower reaches of the Orkhon River and along Selenga. They seem to be the first to come to the territory of Mongolia. Chinese historians suppose that the Merkits were a mix of Mongols and Uighurs. In 1094 the Khitans also attacked the Jajirats. There was a Jajirat called Jamukha, Chinggis Khan's rival for rule of Mongolia. After all, the enmity of various tribes and the Khitan was not so deadly. When the Liao fell, destroyed by the Jurchens, the last member of the ruling house Liao Yelü Dashi was supported both by the Mongols and the Turks.

In the context of the Khalkha 'Turks—Mongols' problem, which has not been solved yet and is hardly solvable in the foreseeable future, an interesting question is the ethnic affiliation of Chinggis Khan's main rivals for unification of Mongolia: the Keraites and the Naimans. The Keraites nomadised south of the Kerulen River in the east and up to the Khangai Mountains in the west, along the lower reaches of the Tola and Orkhon rivers. Summer camps of the Kereit Khagan were set in Dalan-Daba near the Orkhon's riverhead and near Lake Guse-Nor. Winter camps were located along the Ongi River in the region of the present-day Arvaikheer city. According to Rashid al-Din, the Keraites were 'a Mongolian clan'. Modern Chinese authors think that the Keraites were the first of the Shiwei to leave for the west, lived together with the Turks and next to them, and were strongly affected by them. The highest ranks of the Keraites were Nestorian Christians. Liao Shi mentions Kereit rebellions in 1092 and 1100 led by their ruler Markus. Chinggis Khan's biographer Paul Ratchnevsky believed quite the opposite, that the Keraites were originally not Mongols but rather Turks (compare to the Kirei tribe among the Kirghiz and Kazakhs). At first, they lived along the Irtysh River and the Altai Mountains but were driven out by the Naimans. Retreating from the Naiman press to the east, they encountered Mongol-speaking tribes and rather soon became associated with the Mongols. The Keraites were at enmity with the Naimans and the Tatars. Their ulus included Mongols as well [Ratchnevsky, 1983, S. 3].

The western areas of Mongolia, Mongolian Altai were inhabited by the Naimans. Rashid al-Din wrote: 'Their customs and habits were similar to those of the Mongols'. In the 12th century, they were subservient to the Kara Khitan state the Western Liao. In the time of Chinggis Khan, they lead a nomadic life, roaming in the western regions to the rivers Irtysh and Aley and to the upper reaches of the Ob. In the north, they bordered the Kyrgyz (some Chinese scholars consider them part of the Kyrgyz). In the east, they bordered the Keraites; in the south their domain territories extended to the Black Irtysh [Yuáncháo mǐshǐ, 1986, p. 33]. P. Rachnevsky viewed the Naimans as a Turkic people, construing the word 'naiman' as the Mongolian name for the Turks 'Sekiz Oghuz', 'Eight Oghuzes'. The Naimans appeared in Altai after the rout of the Uighur Khaganate by the Kyrgyz. In the years of the Uighur Khaganate, they were subject to strong Uighur influence. Like the Keraites, the Naimans were Nestorian Christians. The Naiman ruler Tukusa is mentioned in Liao Shi under the year 1097. The modern Mongolian science is not inclined to view the Naimans as Turks. Chuluuny Dalai classifies the Naimans as 'the nomadic Oirats-Mongols' but acknowledges substantial Turkic-Uighur influence on them, particularly the fact of the use by the Naimans of the Uighur script. Neither he agrees with the opinion that the Naimans were a Mongolian tribe that spoke a Turkic language [Dalai, 1983, p. 151].

Thus, in the 9–11th centuries, the territory of Central Asia became an arena where Turkic ethnic groups were gradually supplanted by Mongol ethnic groups. That was a great event in the history of Asia, another routine migration of peoples, an event which eventually changed the ethnic picture of Central and Middle Asia and Eastern Europe. Among the Central Asian ethnic groups, the Turks, Uighurs, and the Kyrgyz were undoubtedly Turkic-speaking peoples, while the Khitan and Mongols belonged to the Mongolian-speaking group. As for other cases, there still remain many questions, mainly because of the lack of the records and sources. The Shiwei, from whose midst the Mongols descended, are rec-

ognized by researchers as Tatars, but whether the Tatars were a Turkic- or Mongolian-speaking people is unknown. The Tatars were the ethnic group, which were, by their neighbours' acknowledgement, the most powerful in Central Asia in the 10–11th centuries. It was for this reason that the Chinese, the Tangut, and adjacent Muslim peoples began to call the whole population of the Central Asia by the name Tatars. In such a situation researchers should always be careful to differentiate between the Tatars proper, at least as a people adversarial to the clan of Chinggis Khan, and the Tatars as the generalised name for the peoples of the Central Asia, that included both the Mongols and other Khalkha peoples. Because of the absence of reliable sources, researchers do not have one uniform opinion about the ethnic affiliation of the Naimans and Keraites in the 12–early 13th centuries, who were Chinggis Khan's chief rivals in the strife for the dom-

ination in the future Mongolia. No one knows whether they were Turks, Mongols, or ethnically mixed peoples.

In this situation, perhaps it can be more surely said that in the course of the advance of the Mongolian-speaking peoples on the territory of Central Asia, there took place a mutual cultural influence, acculturation, and the Mongols, while transiting to the nomadic way of life, borrowed a lot from the Turkic-speaking ethnic groups. Assimilation processes were under way along with this, resulting in the Mongolisation of those Turkic ethnic groups that had not migrated west. A part of these ethnic groups, if not totally, then to a large extent, were annihilated. There is nothing unusual in this. The demise of ethnic groups which suffered a defeat, acculturation, and assimilation phenomena are general universal processes of the disintegration of some ethnic groups and the advent of new ones.

CHAPTER 2

The States of Central Asia: From the Turks to the Mongols*Eugene Kychanov*

Before the appearance of Chinggis Khan on the international arena, the Turkic states had successively replaced one another on the territory of Central Asia: Turkic Khaganates, the states of the Uighurs and the Kyrgyz, Proto-Mongol states and related states: Liao of the Khitans, the Great Xia of the Tanguts, and Jin of the Jurchens.

The formation of statehood of various peoples passed through a number of common stages. Specific features were also present, for example, in the case of nomadic states. This does not mean that only amorphous communities, wherein the power was defined as 'chiefdom', and not early states existed in the nomadic world. By the time of Chinggis Khan's rule, the nomadic states had already existed for one and a half thousand years. The Turkic states had behind them the states of the Hsiung-nu, Tuyuhun, Ju-juan, etc.

All nomadic states, as any ancient or medieval states, had a charismatic ruler of a 'heavenly', divine origin. The ruler was a sovereign, that is, he governed the territory upon which his sovereignty extended. The ruling dynasty was the pinnacle of the social stratification of the society into the aristocracy, common people, and slaves. Poverty and wealth divided the society into the dominant class, whose representatives went to wars, commanded the troops and ruled the society, and the class of subordinates, who also fought in battles, pastured and tended livestock and were in service. Social differentiation, especially by the criterion of participation in wars, was sometimes indistinct, but common people, poor men paid 'the tax of blood', which, by the way, was not a specific attribute of only nomadic societies.

Turkic society was divided into the rich (bai), poor (chugai), free (bosh), and slaves (kul-kun). The free were subdivided into the noble (bek)

and common people, plain folks (kara-budun, budun). The Mongolian society had the rich (bayan) and the poor (yadagu huvun). Besides, the society had a division of slaves: male slaves (bogol), female slaves (inje). Free people consisted of noble, good people (syau huvun), and common people (karachu). The aristocracy was represented by 'natural khans' (tus kan).

The ruling clans (dynasties) of both the Turks and Mongols were of a 'heavenly' origin and enjoyed a special grace. For the Turkic Khagans that was the kut, a charismatic 'heaven sent' grace; for the Mongols, kyuchyu and su, also a 'heaven sent' charismatic grace.

The head of state, the Kagan-Khagan, ruled the people with the help of the law (Tore [Torah] for the Turks, Yasa for the Mongols). It is not known whether the Turks had written laws, though they had their own script, but Yasa was evidently already a written codified collection of laws since the time of Chinggis Khan's accession. Chinese tradition during the period of the Tang dynasty (7–9th centuries) compared Turkic statehood with that of the Hsiung-nu (Huns). According to Chinese tradition, it was considered that the title of Khagan was similar to the old Hsiung-nu title of Chanyu, while the title Katun of the Khagan's wife 'meant the same as the ancient huangdi', the title of a Chanyu's wife. In 696 when Khagan Mochuo routed the Khitans, the Tang Empress Wu Hou granted him the title of Chanyu. According to the conception of ancient Turks, the dynasty of Turkic Khagans emerged together with the formation of the sky and earth, together with the people, who lived in between the sky and earth. The people were governed and administered by Khagans. Khagans were 'born by the sky' and were 'sky-like'. A Khagan received in support from the sky a yarliq in order to govern by the will of the sky, a kuch to govern by the power and might of the

sky, and a bilig to govern by the wisdom of the sky [Mori Masao, 1967, p. 3]. The sky granted wisdom (bilge) and courage (ali) to Khagans. The whole dynasty, the whole 'house of the Khagan' (eb-Khagan) were in heavenly grace kut. Khagan's uncles and brothers, his nephews along the male line, that is, the grand dukes, held the title of Tegin. Besides the will of the sky, the Khagan dynasty was born by the will and power of earth and water. Per old Turkic perceptions, the people were not put aside. The people gave to the Khagan 'labours and forces' and granted to him el, the state. In his rule a Khagan was assisted by his administration. It was formed from his relatives of the masculine line, representatives of the allied tribes and begs. The begs were subdivided into those standing to the right of the Khagan and those who stood on the left side from the Khagan. The administrators were of two grades: Tarkhans of the highest grade and Buyruk of the lowest. The highest grade included Yabgu, Shads, Tegins, Eltebers, and Tutuks. The composition of Bayruks is not known. Khagan's immediate circle was comprised of his guard ('wolves'—böri).

It is difficult to differentiate the position (title) of Yabgu from the position (title) of Shad. These positions (titles) are considered to be of Iranian origin. Chinese historian Lin Gan compares them to the position of Xianwang (wise prince) of the Hsiung-nu and supposes that, unlike Shads, Yabgu more frequently became the rulers of the western regions of the Khaganate. This supposition is quite justifiable, because the Hsiung-nu did have eastern and western Xianwangs. Shads indeed most probably governed the eastern part of the Khaganate: sources provide the following formulations—the Shad commands 'the troops of the eastern headquarters', leads 'the army and people of the eastern side'. Shads collected taxes from people in accordance with the set tariffs.

An elteber was a vicegerent managing the affairs of the peoples subservient to the Khagan, who preserved their own government structure. Commensurable to the elteber title was the title of irkin. According to the conclusion of Mori Masao, a Japanese researcher of the ancient Turks, the leader of the people, who had ten and more thousand warriors, received

Male and female dresses of wealthy Mongols in the 13th century.
Reconstruction by M. Gorelik

the title of elteber, and the leader with less than ten thousand warriors was called irkin [Mori Masao, 1965, p. 55].

Tutuk was a Khagan's vicegerent delegated to govern the conquered peoples and to collect tributes and taxes from them in favour of the Khagan. It is known that a tutuk was sent to the conquered Khitans, three tutuks were forwarded to the Shiwei, and a Turkic tutuk was placed in each district of the Western Region. Tutuks 'supervised the subordinates' and 'collected taxes from them' on the territories of the non-Turkic population [Mori Masao, 1967, pp. 366–367].

A nomadic state traditionally was subdivided into the centre and left and right 'wings' (the Hsiung-nu, Wusun, Xianbei, with the Turks not being an exception either). The left wing corresponded to the East, and the right one to the West, provided that the Khagan was facing the South. That was specifically a Central Asian tradition, as the original Turkic orientation was different: the fore side was the East; the back side, the West; the right side, the South; and the left side, the North. An Uighur Khagan would sit in his golden tent facing the East. The line

of titles and positions in the Uighur Khaganate was similar to that of the Turks.

A Kyrgyz ruler subordinated to the Turks had the title of *elteber*, and when subordinate to the Uighurs, the title of *Irkin*. When the Uighurs were routed and the Kyrgyz Khaganate came into being, it apparently was subdivided in three parts, each being governed by a *tutuk*. Taxes were collected by the *tarkhans*. The troops were commanded by *senguns* (generals, of the Chinese *jiāngjūn*). *Zǎixiāngs* (*viziers*) were in charge of the central government administration, and heads of secretariats *Zhan-shi* handled the records management. Records management in the Kyrgyz Khaganate was conducted in the Uighur script.

In the 10–12th centuries, the Mongolian statehood was developed by the Khitans, and in the 11–12th centuries, by Khalkha uluses. At the turn of the 7th century, the Khitan ruler took the title of *khagan*. The Khitans, however, soon suffered a defeat, and their head had to be content with the title of *elteber*. Later the Khitan rulers became again titled *khagans*. In the 9th century, the Khitans had in use the title of *irkin*, but as an internal one. The father of Abaoji, the founder of the Liao state, bore the title (position) of *irkin*. Abaoji himself served as *irkin* under the Khagan Yaolian.

The Khitan *khagan* was 'appointed by the sky' and 'born of the earth' (sky is the masculine origin, earth is the feminine origin). Like the Central Asian *khagans*, during the ceremony of the ascent to power he was seated on felt and lifted up. The *khagan* reported to heaven about his ascent to power by a fire, a large bonfire. The highest administrative ruler in the Khitan state was called a *yuyue* (from the Uighur '*ogyut*'—adviser), and he was in charge of political and military affairs. The *Khagan* clan matters were handled by *tiin* (*tegin*). There existed positions of the supreme judge (*dilemadu*) and head of the secretariat (*lingya*). The treasury was supervised by *achzagechi* (key-keeper, a derivative from the Turkic '*achku*'—a key); public works, by *Dalin*. An important role was allocated to the *Khagan's* Guard, which was called 'the heart and stomach'. The Guard was stationed at the headquarters called *valudo*—horde. The Chinese translated the word 'horde' as 'headquarters (palace) pro-

tected by the Guard'. There were several hordes. During the rule of Emperor Shizong (988–1031), his horde was called Golden, that is, not taking into account the camp of the Uighur *Khagan*, who sat in a golden tent, what allowed N. Bichurin to translate the name of the headquarters as the Golden Horde, with the name of the Shizong *orda* '*Nyugu valudo*'—'Golden Horde'—being the first such name of the headquarters (one of the headquarters) of a ruler. From the first half of the 10th century, the Khitan statehood started being rather quickly sinicised.

The first Mongolian state *Khamag Mongol Ulus* (the state of all Mongols), *Da Menggu* Go in Chinese—the Great Mongol State—appeared in Khalkha in the middle of the 12th century. *Khabul Khan* was its ruler with the title *Khagan*. '*Khabul Khan* was in charge of all the Mongols... *Ambaghai Khagan* became in charge after *Khabul Khan*' [Kozin, 1941, pp. 84, 208]. *Ambaghai* bore the title of 'the all-people's *Khagan* and sovereign of the ulus'. Chinese records about the Great Mongol State appear after the reports on the war of 1135–1147 between the Mongols and the Jurchen state Jin. The Mongol ruler *Aolo* (*Hoelun*) *beile*, who is identified with *Khabul Khan*, under the peace treaty was recognized by the Jurchens as the sovereign of the Mongol state (*menfu guo zhu*). *Aolo*, however, was not content with the title 'sovereign of the state' (*guo zhu*) and within the boundaries of its state started to bear the title of Emperor (*Huangdi*). According to the Chinese custom, he took the motto of the reign *Tang-sin*—'the blossoming bestowed by heaven'. The Jurchens demanded from *Aolo* to renounce the emperor title and offered him a lower rank of *Go Wan*—'a prince of the state'. *Aolo* rejected this [Komai Yoshiaki, 1961, pp. 331–338]. The Jurchens tried to poison *Khabul Khan*. *Khamag Mongol Ulus* and his rulers were at enmity with the Tatars. The Tatars captured *Ambaghai Khagan*, *Khabul Khan's* successor, and handed him over to the Jurchens, who subjected him to a cruel execution. That became a starting point of even more irreconcilable feud between the Mongols and Tatars—the clan of the future *Chinggis Khan*, to which actually *Khabul Khan* and *Ambaghai Khagan* belonged, was by the testament of *Ambaghai Khagan* to avenge his death on the Tatars.

Tatar, Naiman, Kereit, Mongol, Merkit, and other uluses existed on the Khalkha territory in the 12th century. All of these large uluses were early state formations. At least in the 12th century, to the fore comes the specific feature of a nomadic state, meaning that an ulus was, first of all, the people, although all main uluses had their territories (nuntuk). As Turkic Khagans collected and united their el, so the Mongolian and other Khagans were also getting together and united their people in uluses, which basis was formed by the dominating ethnos. According to the 'Secret History of the Mongols', Kereit Wang Khan promised to Temüjin: 'I will unite your fragmented ulus'. A khagan was elected and put up on the throne by representatives of different tribes. The people in ulus were distributed among aimags, with aimags being military-administrative units capable of providing a hundred, thousand, tumen (ten thousand) warriors. A thousand called kuren was the main formation. Rashid al-Din reported: 'Kuren (term) has the following meaning: when many wagons and carts are placed in a circle and form a ring in the steppe, they are called a kuren. In that epoch, a thousand wagons positioned in this way were considered as one kuren' [Rashid al-Din, 1952, 1, 2, p. 18]. An ulus was governed by a 'natural khan', who had his power 'granted to him by heaven' and was elected, placed and raised to the throne by the noyons. Khagan had a council of his relatives and representatives of noblemen; the council participated in the discussions of the ulus matters. Khagan was surrounded by his retinue, his nukers, who were the same noyons and the noyons' sons and brothers. Khagan was protected by his guard—keshig. The Mongolian name for the guard was of Turkic origin, from the Turkic 'kazik'—'queue', which meant to serve by turns, in rotation. Special attention was paid to the night guard, to the turkhauts, also a Turkic term, from 'turkhak'—'night guard'. A thousand tunghauts were in service under the Kereit Wang Khan.

The nukers, keshigtens, turkhauts guarded the khagan's headquarters—aurug or horde. The guardsmen defined the location for the placement of the headquarters and aurug, guarded the khagan's yurts. A shift was three

days. Special protection was accorded to the Khagan's power symbols: the banners and drums. Men from the guards took care of the khagan's and aurug household, were responsible for the maintenance and use of yurts and carts and wagons, household utensils and cookware. The guardsmen were charged with the responsibility for migrations to other places, settlement at summer and winter camps, for the safety of the Khagan's livestock. Specific people could be in charge of sheep and horse herds, served as equerries-aktachins. Khagan's board was taken care of by bavurchins. Police function was performed by sword-bearers; elchis acted as couriers and envoys.

Large, strong uluses had their sovereign territory and borders, which were at least occasionally guarded. The Kereit Wang Khan perished in an accidental encounter with Naiman border patrol, guarding the Naiman ulus. The Tatars had 'the places of their nomadic roaming, encampment and yurts clearly defined'. The father of Chinggis Khan, Yesugei, 'every several months set out on campaigns to fight back Turkic tribes present in the vicinity of his ulus' [Rashid al-Din, 1952, 1, 1, p. 101; 1952, 1, 2, p. 75]. Records management in the Naiman ulus was conducted in the Uighur script. The Naiman and Kereit nobility adopted Nestorian Christianity. A khagan ruled on the basis of the law, which could be the norms of either the common or state law. The Secret History of the Mongols mentions 'The Great Truth' (Eke Tore).

Even before the establishment of the one Mongol state of Chinggis Khan, the Turkic and Mongol nomadic societies formed and developed the nomadic statehood, which their predecessors had had before in the Central Asia. That was the power, though closely connected with the people, which still stood above the people, the plain folks and slaves, the power, which reflected the interests of begs and noyons, of the dominant class, a public power embodied in the state mechanism of a certain system. The state of Chinggis Khan could not be born out of void. Like a settled rural community, governed collectively by its members, does not deny the existence of a monarchic state, the same way a nomadic ail, with its seeming primitiveness, fits in the structure of a nomadic state.

CHAPTER 3

Desht-i Qipchaq on the Eve of the Chinggis Khan Epoch

Aleksandr Kadyrbaev

The historical role of the Kipchaks, known in Rus' as the Polovtsians, in Byzantium and Europe as the Cumans, in China as the Qīnchá, later participating in the ethnogenesis of the modern Turkic peoples—the Nogais, Kazakhs, Bashkirs, Tatars, Karakalpaks, Kumyks, Karachays, Balkars, Uzbeks, Turkmen—was already defined back in the epoch preceding the conquests of Chinggis Khan. With all the commonness of ethno-political and social process on the vast expanses of Desht-i Qipchaq—the country or the steppe of the Kipchaks—the history of the tribal groups living on this territory at the beginning of the 2nd millennium CE was first of all connected with the nomadic alliances of the Kipchaks, which also included the Kangly. The name Desht-i Qipchaq appears in Islamic, that is, Persian-Arabic language sources since the 11th century. After the weakening of the Oghuz state in the first half of the 11th century, the Kipchaks gradually ousted the Oghuz from the steppes of present day Kazakhstan, while the tribes that remained there submitted to the Kipchaks and integrated with them. Having conquered the Oghuz lands in the basin of the middle and lower reaches of the Syr Darya, the steppes of the Aral and Caspian Sea Regions, the Kipchaks came right up to the northern borders of Khwarezm, at that time the centre of a huge state. Khwarezm Shah Altun Tash wrote in 1030 about the Kipchaks inhabiting the steppes adjacent to Khwarezm. At the end of the 11th century, the Kipchaks reached in the south the suburbs of Taraz, where they built fortification Kandjak Sangir [Al-Kashgari, 1963, 3, p. 444].

The eastern boundaries of the Kipchaks in the 11th century were the Irtysh right bank area and the slopes of the Altai mountains. The left bank is marked on the map of the Turkic scholar Mahmud al-Kashgari as the

habitation place of a Kipchak tribe the Yemeks, while the interfluvium of the Irtysh and Ob are shown as that of the Kai or the Uran tribe, from which some of the Kipchak khans descended [Akhinzhanov, 1973, pp. 59–70]. The northern borders of the Kipchaks lay through a forest-steppe zone, separating today the Kazakhstan steppes from the Western Siberia. The following words by Mahmud al-Kashgari give an idea about the Kipchaks western borders: 'Itil (Volga) is the name of a river in the Kipchaks country' [Al-Kashgari, 1960, 1, p. 103]. Arab scholars al-Bakri and al-Marwazi call the Kipchaks the northern neighbours of the Pechenegs [Chwolson, 1869, p. 49]. M. al-Kashgari also writes about their being neighbours [al-Kashgari, 1960, 1, p. 64]. Since the Pechenegs, prior to their migration to the Black Sea Region, lived in the steppes of the Aral Sea area, then in order to have them at the southern borders, the Kipchaks were to inhabit the lands of the Southern Urals. Yuanshi, a Chinese dynastic history of the 14th century, reports: 'Tutukha. His ancestors earlier, from the very beginning were a tribe dwelling northwards from Upin, by the Zhenglan River, nearby the Altai mountains. With (leader) Quychu they moved north-westwards to the mountains Yuyliboli. For this reason, (the word Yuyliboli) became the name of the clan. While calling their country, they say Qīnchá (Kipchak). Their lands lie at a distance of 30 thousand li from China...' [Yuanshi, 1958, Juan 128, p. (1486)27438].

It is definitely established that the initial location, where the Qinchak/Kipchaks migrated from to the Volga (Itil)–Ural (Yaik) interfluvium, was the Jairan valley (in Chinese Zhenglan River, in Mongolian Djerem-Keer) to the north of the river Lohamuren in the Inner Mongolia. The transcriptional spelling of the Anda-

han mountains corresponds to Altahan (Gold). The name 'Altahan' is fixed in the Mongolian chronicles Altan Tobchi. Their parallel Chinese name was 'Qinwei'—goldish, gilded. The Kipchaks' sojourn in the Altyndy-tau mountains, mentioned in the Kazakh epos, can be probably viewed as an indication of the above. The Upin region is another reference point. Its detailed historical and geographical characteristics are provided in the work Menggu yumu-ji when describing the Karqin (Harachin) aimag. The Upin district was spreading over both sides of the river Lokhamurzya (in Chinese Laoha-he), while the ruins of Upin town are situated in the locality Botaji.

The Altahan mountains are the Bolshoi Khingan Range to the north of the Loha-muren, the right tributary of the Sharamuren (Huangshui). At a distance, in the east from the Bolshoi Khingan, there lies the valley of the presently drainless river Dzeren, Djeran-Keer in the Mongolian epos. Thus, there is an understanding of the southern, eastern and western habitation bounds of the Kipchaks in their ancestral home in the Inner Mongolia. The Chinese historian Wang Guowei addressed the issue of the historical and geographical synonyms of the Golden (Goldish) mountains of this part of Asia and came to the conclusion that other traditional names of the Bolshoi Khingan included Jinshan (Golden mountains) and Kara-un-chidun (Black cart) [Zuev, 2001, pp. 419–422; Altan Tobchi, 1858, 4, pp. 148, 164, 174; Koblandy batyr, 1975, pp. 149, 151, 155, 310, 312, 316; Popov, 1895, pp. 12, 196; Wang Guowei, 1959, pp. 725–730].

Apparently, not all the Kipchaks went west. The supposition that some of the Kipchak clans stayed and lived among the Mongol tribes is confirmed in Yuanshi by the biography of the military commander Esenuhu, who is described as a descendant of a 'Mongol Kipchak clan' [Yuanshi, 1958, Juan 121, p. (2159)28111]. In the biography of Kangly Buhumu, it is reported that his grandfather Kairanbey (in Chinese Hailangbo) was in service of Tooril Wang Khan, the ruler of the Kereit ulus in the Northern Mongolia, in the valley of the river Tola and the middle reaches of the Orkhon River, and lived there on the eve

of the Chinggis Khan invasion, together with his family and clan, whose several thousand warriors-horsemen, similar to their leader, were in the Keraites service. The Yuanshi text says in this regards: 'Buhumu... His ancestors from generation to generation were noblemen of the Kangly tribe. His grandfather Hailangbo served the Kereit Wang Khan. When Wang Khan was killed (by the Mongols), Hailangbo left the family and, accompanied by several thousand horsemen, dashed away in the nor-westward direction... [Ibid., Juan 130, p. (1502)27454]. The facts noted in Yuanshi confirm the possibility to put under question the opinion, still being expressed in some research works, claiming that all the Turkic clans and tribes had already left Mongolia before the epoch of Chinggis Khan. This point of view is based on a mistaken assumption that the loss by the Turkic ruling elite of its dominant positions after their westward migration and arrival to this place of the Mongols equals to the demise of the ethnos. The real situation in the Central Asia, however, was much more complex and multi-faceted.

As for the Yuyliboli mountains, where the Kipchaks resettled from the Inner Mongolia, then in the opinion of German orientalist I. Marquart, they represent the foothills of the Southern Urals [Marquart, 1914, S. 114]. And according to French sinologist P. Pelliot, the word Yuyliboli is a Chinese transcription of the ethnic name of the Kipchak tribe Ilbari. P. Pelliot also supposes that the migration, described in Yuanshi, refers to the tribe of the Bayauts, who later became a part of the Kipchaks [Pelliot, 1920, Hambis, 1951, p. 107].

Persian sources confirm the information from Yuanshi, noting that the Kipchaks of the Ilbari tribe were living at that time in the area of the Ural mountains. I. Marquart and P. Pelliot, therefore, are quite right in their opinion, when, commenting on the above Chinese text, they localize the Yuyliboli mountains in the area of the Urals [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1941, p. 467].

By the end of the 11th century, the Kipchak tribes were occupying the steppes from the Irtysh to the Volga river, with some of

Kimak (1), Kyrgyz (2), and Kipchak (3) horsemen. Reconstruction by M. Gorelik

their groups having penetrated the Mangyshlak. Kipchak settlements were marked on the eastern coast of the Caspian Sea on the map by M. Kashgari. They were subjected to an attack by the Turks-Seljuks' Sultan Alp-Arslan during his campaign against Mangyshlak in 1065 [Materialy' po istorii turkmen i Turkmenii, 1939, p. 467]. Arab scholars al-Umari, Ibn Khaldun, and Ibn Arabshah give overall dimensions of the territory held by the Kipchak tribes [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1884, pp. 235, 378, 459].

By the middle of the 11th century, the Kipchaks had occupied the Black Sea Steppes. In ancient Russian sources this territory of the Kipchaks settlement acquired the name of the Pole Polovetskoe, and the Kipchaks were called the Polovtsians. The lands of the eastern Kipchaks—the Volga and Cis-Ural Regions, the Caspian and Aral Sea Region, Sary-Arka, and the Irtysh River Region—were called in the Persian-Arab language sources Desht-i Qipchaq, the term, which in the 12–14th cen-

turies also started to include the Black Sea region.

In the pre-Mongol period, five basic groups of Kipchak tribes finally formed in the middle of the 11–beginning of the 12th century: the Altai-Siberian, Kazakhstan-Ural (including the Volga-Urals), the Don (including the Ciscaucasian), the Dnieper (including the Crimean), the Danube (including the Balkans) groups [Klyashtorny, Sultanov, 1992, p. 117].

The Kipchak alliances were natural successors to the preceding state and ethno-political formations that had existed on the territory from the Irtysh to Dniester. They absorbed the ethnic groups and tribes that inhabited the region in the preceding centuries and became subordinate or vassal to the Kipchaks in the 11th century. The Yemeks were one of the ethnic components that joined the Kipchaks. They were a Turkic tribe and resided in the Irtysh area. In the 12th century, their individual groups migrated as a part of the Kipchaks to the Cis-Ural and Volga Region. The presence of the Kipchaks and Yemeks in this area is indicated by oriental sources, ancient Russian chronicles and the anthropological and toponymic data. Turkic tribes of the Bayandurs, Urans and Kangly affiliated with the Kipchaks. Close relationship between the Kipchaks and Kangly is unquestionable; Muslim scholars of the 12–early 13th centuries used the names of Kipchak and Kangly as synonyms. 'The Kangly are one of the great people of the Kipchaks', reported Mahmud al-Kashgari [Al-Kashgari, 1963, 3, p. 379]. In favour of this also stands the fact that various Muslim scholars submit contradictory data on the origin of Terken Khatun, the mother of Khwarezm Shah Muhammad, defeated by Chinggis Khan.

According to one statistic, it stemmed from the Kipchaks, while other reports name it from the Kangly, that is, the Kipchaks and Kangly were viewed as identical to one another [Pelliot, Hambis, 1951, pp. 96–97]. Juvayni, William of Rubruck and later N. A. Aristov and V. V. Bartold regarded the Kangly tribe as a part of the Kipchaks [Travels, 1957, p. 123]. The Juvayni's information does not produce an impression that the Kangly were subordinate to the Kipchaks. He states that 'Terken Kha-

tun stemmed from the Turkic tribes called the Kangly' (as cited in [Aristov, 1896, p. 407]). Following him, Abu al-Ghazi mentions the same. According to al-Nasawi, she belonged to the Bayauts, a Yemek branch, and it is additionally explained that the princesses, married off to the rulers of the Khwarezm Shahs state, were born Kipchaks, what is also upheld by Juzjani [al-Nasawi, 1973, p. 87; Tabakat-i-Nasir, 1881, 2, p. 240].

If one takes into account the political events of that time, then it should be noted that in the 12–early 13th centuries, the Kangly acted independently of the Kipchaks in their relations with other states and peoples (for example, with Khwarezm, the Kereit ulus, and the Mongol state of Chinggis Khan). This is in particular evidenced by Chinese sources, which do not equate them one to the other, not denying though their close links. For example, Yuanshi clearly places apart biographies of representatives of these tribes [Yuanshi, 1958, Juan 128, 133, 124, 138, 180, 136].

By the 11th century, the Kangly tribes nomadised to the north of the river Ili, in the area of the lower reaches of the Syr Darya and in the nor–eastern coastal Aral Sea Region. The chief headquarters of this part of the Kangly, the town of Karakurum, was situated in the Lower Syr Darya region. The Kangly also inhabited the areas in the east from the Urals and by the Irtysh [Rashid al-Din, 1952, 1, 1, pp. 136–137]. Giovanni da Pian del Carpine wrote about them as the eastern neighbors of the Kipchaks, while William of Rubruck trekked through the Kangly steppes in the eastern direction in 1253 [Puteshestviya, 1957, p. 72].

According to a number of scholars, the Kangly are an ancient ethnic group, whose origins are related to the state formation of Kanju [Bichurin, 1950, 2, pp. 150, 184–186, 229]. The ethnonym 'Kangly' as such appeared in Persian-Arabic sources as the result of the migration of Kipchak tribes to the Syr Darya banks between the 1st and 2nd millennium CE, where they collided with the Kangar-Pecheneg tribes. S. P. Tolstov considers the ethnonym a variant of 'Kangar', changed after part of the Pecheneg tribes had been assimilated by the

Kipchaks [Tolstov, 1943, p. 101]. The adoption of the name, first by the elite Kipchak clans, was representative of their aspiration to connect themselves to the genealogical tradition of the ancient tribes that had been living on the Syr Darya, thus justifying their right to these territories [Klyashtorny, 1964, p. 179].

It is curious that Chinese sources, in particular the 'Yuanshi', directly mention the relationship of succession between the Kangly and the more ancient population of the Syr Darya. 'The Kangli (Kangly) are those who were called Gao-che-go (the country of tall carts) in the Han epoch (260 BCE–220 CE) [Yuanshi, 1958, Juan 130, p. 1502 (27454)]. Persian chronicler of the Mongol epoch Rashid al-Din provided similar, though less complete, data on the Kangly. He mentioned them to have invented carts, or 'kangly' in Turkic, which determined their name. Both Rashid al-Din and the authors of 'Yuanshi' might have relied on the same source for information on the Kangly, to which the similarity of the data is attributable. The first time that the ethnonym 'Kangly' appeared in Chinese sources was in the Jurchen dynasty history—'Jin Shi'—between 1161 and 1190 in the context of the trip of Uighur merchants from Guz-or-do (on the Chu River) to the Jurchen emperor's camp [Jin Shi, 1958, Juan 121, p. 1100].

Chinese sources also provide geographical and ethnographic data. According to the 'Yuanshi', in Desht-i Kipchak 'valleys and steppes are even and wide; there are good grasses and bushes. The abundance of grass favours horse-breeding... The people of these places are pugnacious, courageous, and cold-blooded...' It also reports the Kipchaks to have been good at making kumis, a drink made of mare's milk: 'Kipchak Banduchar served at the court of Mongol khans. He was responsible for the herds of horses that belonged to the emperor (of the Mongols). He collected mare's milk and presented it (to the emperor). The milk was pure and tasted wonderful. It was called black mare's milk...' [Yuanshi, 1958, Juan 128, p. (1486)27438]. The Kipchaks also did handicrafts. The 'Yuanshi' mentions that 'the Kipchaks produce leather...' [ögel, 1964, S. 278].

Shortly before the era of Chinggis Khan, Desht-i Qipchaq witnessed the dissolution of clans and the establishment of early state relations. Clan leaders turned into clan noblemen; khan clans formed. 'Yuanshi' reports the following: 'Buhumu. His ancestors were noble people from the Kangly tribe from generation to generation...' [Yuanshi, 1958, Juan 130, p. (1502)27454]; 'Asanbuka is a descendant of a noble Kangly khan clan...' [Ibid., Juan 136, p. (1565)27517]. Chinese dynastic histories provide data which indicates directly that power was passed on from father to son in Desht-i Qipchaq: 'Quchu (Kuchug) brought into the world Somon, and Somon brought Inassa. (They) were rulers of the Kipchak state from generation to generation...' [Shaomin, 1936, 8, Juan 200]. As can be inferred from the further text of 'Yuanshi', Inassa was succeeded by his son Hulusuman, and Hulusuman by his son Banduchar. 'Xin Yuanshi' ('The New History of Yuan') also reports, 'Kundutai comes from the clan of Kipchak rulers. His father Kuchun was the head of a Kipchak tribe...' Thus, power inheritance was practiced in Desht-i Qipchaq, which is characteristic of nomadic states at their formation. Kipchak unions covered a certain territory and had borders: 'Xianzong (Möngke Khan) had been ordered to march his troops and was knocking at their (Kipchak) borders...' [Yuanshi, 1958, Juan 128, p. (1486)27438]. A biography of Kangly Asanbuka states that the wife of the Kangly ruler named Shanmetgumali, 'having crossed the borders of (the state of) Kangly and several more realms, reached the (Mongol) capital...' after the Mongols ravaged the Kangly state [Ibid., Juan 136, p. 27537(1565)].

It is also interesting to analyze Chinese political terms used to denote various forms of nomadic social organization, which have come down to us in Chinese dynastic histories. For instance, 'Yuanshi' constantly applies the term 'Go' ('State') to so 'significant tribal unions and the Naimans and the Keraites'. Rashid al-Din also wrote, '...the Naimans and the Keraites... each had a state' [Rashid al-Din, 1952, 1, 1, p. 75; Eschedy, 21 (1963), n. 3, p. 151]. It is well-known that the Naiman and Kereit tribal unions had complex social relations and

largely paved the way for the Mongol statehood. Thus, the fact that the same term 'Go' was applied to the tribal unions of the Kipchaks and the Kangly people is of great importance in terms of their social development. It should be noted that Kipchak and Kangly tribes established states in Central Asia back in the previous epoch. Dynasties of Kipchak and Kangly origins in various areas of Central Asia, for instance, Khwarezm, ruled local sedentary agricultural states, which favoured their adoption of the statehood tradition. To prove that the Kangly and Kipchak people had a certain level of social relations, Chinese sources report them to have professed the world religion of Islam. For instance, 'Yuanshi' and 'Xin Yuanshi' mention such names of Islamic origin, given to Kipchaks, as Kara Hoja, Hasan, and, given to Kangly people, Osman. Rashid al-Din provides a series of indirect evidence suggesting that the Kipchaks had a certain written tradition: 'Rashid... having corrected and criticized, scrutinized the accuracy of the evidence contained in the records, collected them, and put them in order... what is not told in the records in detail he shall learn from Chinese, Indian, Uighur, and Kipchak scholars and sages and from the noble' [Rashid al-Din, 1952, 1, 1, p. 67]. Therefore, the discussion on the application of the term 'Go' to the Kangly that arose around the Yuan historiography is of great importance. For instance, Chinese historian of the 20th century Tu Ji in his work 'Menuer Shiji' commented on and corrected a text from 'Yuanshi' which contains information on the Kangly. The text from 'Yuanshi' reads as follows: 'Ashabuhua (Asanbuka). He is a descendant of the Kangly khan clan (Kango wanzu). At the very beginning, when Taizu (Chinggis Khan) was crushing the Kangly, his grandmother Shanmetgumali became a widow. She had two sons. Their names were Chulü and Yaya. They all were minors. Since disorder reigned in the state (Go), the family was impoverished and had no support. She reached the palace (of the Mongol khan), having left the ruined state, though she had thought that she would not be able to get there. Once at night, several heavily loaded camels entered the camp unexpectedly. People tried to

make them go away, but they would not. They put the camels' load next to the camels. They brought them to the camp again at night. They expected to find somebody looking for camels to return them. They waited for over ten days. They never found anybody looking for them. Then they opened the bags. They contained very valuable things from the Western Land (that is, from the countries of Central and Western Asia). They were scared. Probably heaven wants to help us go eastward. Is this what we are to have? She drove the camels, on which she had put her sons, and... reached the capital. At that time Taizu (Chinggis Khan) died. His successor took the throne. She presented everything that she had. On the emperor's order, officials gave her a residence and an allowance from the treasury so that she could live. She lived for two years. Having found out that order had been restored in (her) state, she turned to the emperor, asking if she may return... Yaya, her son, was granted the title "Kan Go Wan" (khan of the Kangly state). He had six children. Among them, Ashabuhua was the most talented in state administration... He was granted the titled "Kan Go Gun" (prince of the Kangly state)... [Yuanshi, 1958, Juan 136, p. (1565)27617]. In his notes to the text, Tu Ji corrected the term 'Go' into 'Bu' ('tribe'), believing that the term 'Go' was inapplicable to the level of social relations that the Kangly and the Kipchaks had. However, the fact that Chinese historiographers had used clear terms to denote the level of development of neighbouring peoples indicates that he was wrong. For instance, 'Jiu Udaui Shi' contains a description of peoples directly reported to 'have no state, provinces, or commanders. So, there is nothing to write down about them' [Kychanov, 1968, p. 15; Tu Ji, 1934, Juan 120].

In this case, we can rely on the above-quoted text from 'Yuanshi' to infer that the Go clan was the noblest Kangly clan. 'They (the Chinese) name people so that everybody knows his grade and the limit (of his power) from his name...' [Rashid al-Din, 1952, 1, 1, p. 139]. The narrative about the caravan and Shanmetgumali's conversation with god suggests that her wealth was based on the nobility of her clan, which was marked, to quote 'The Se-

cret History of the Mongols', 'with a seal of heavenly descent,' representatives of which were khans according to the will of the Eternal Heaven and on its behalf [Kozin, 1941, §1, 187]. It is possible that the nomads of Desht-i Qipchaq had an idea of the khan as possessing power similar to that of the tsar.

Chinese sources contain data on the relations between the tribes of Desht-i Qipchaq and their eastern neighbours—the peoples of Central and Eastern Asia. For instance, the Kerait ulus, which has been mentioned above in Buhumu's biography in 'Yuanshi'. Reports by a number of other Chinese stories also suggest close connections between the Kangly and the Keraites. They represent a clearer tradition, similar to that reported by Rashid al-Din, and indicating genetic connections among the peoples. To prove it, the family of Kangly Buhumu is reported to be descendants of the Keraites [ögel, 1964, s. 86]. The report contained in 'Menuer Shiji' is even more concrete: 'The Keraites were the ancestors of the Kangly. The western tribes were called the Kangly, and the eastern the Keraites' [Tu Ji, 1934, Juan 20].

It can be assumed that the nomads of Central Asia had a stable genealogical tradition, according to which the Keraites were viewed as part of the Turkic circle of tribes.

According to V. V. Bartold, the Kipchaks and the Kangly lived in the domain of another large state formation of Central Asian nomads—the Naiman Ulus [Bartold, 1968, p. 6]. Rashid al-Din wrote, 'The Naiman tribes were nomadic; some lived in highly mountainous regions; some lived in plains. The places where they sat... the Bolshoi Altai... mountains: Elui Siras and Qoq Irdysh (the Blue Irtysh)—the Kangaly tribe also lived within the borders—Irtysh Muren, which is the Irtysh River...' [Rashid al-Din, 1952, 1, 1, p. 136–137]. Mahmud Kashgari reported that the Kipchak Kai, or Uran tribes also lived in the interfluvium of the Irtysh and Ob, to which 'some famous Kipchak khans belonged' [Kashgar, 1960, 1, p. 6].

'Yuanshi' provides data indicative of close relations of kinship between the Kangly and Naiman nobilities. For instance, the biography of Naiman Chaos (Shaosi) reads,

'Shaos from the Naimans. His great-grandfather Tayan (Dayan) was a ruler of a Naiman tribe. His grandfather Qushulan (Kuchlug)... Taizu (Chinggis Khan) crushed the tribe (of Kuchlug)... The latter fled to the Kara Khitan people, leaving behind his son... Bedein (Bede) was Shaosi's (Chaos's) son. While Shaosi was appeasing Jin, Bedei was living with his maternal grandmother, who was from the Kangly tribe...' [Yuanshi, 1958, Juan 121, p. (1433)27375]. Besides, Uighur travellers reported the Naimans to be related to the Kangly back in the latter half of the 12th century. Telling about what they had seen or heard on their way, they mentioned the tribes Nian Ba En (the Naimans) and Kangli (the Kangly) to live in the Altai Mountains [Jin Shi, 1958, Juan 121].

Thus, the sources report that part of the population of the Naiman and Kereit uluses was represented by Turkic-speaking Kipchaks and Kangly in the 11–12th centuries.

The Kipchaks and the Kangly stayed in contact with the ulus of the Mongolian-speaking Merkits, who had their camping grounds north of the Kereit ulus, on the Selenga River. Rashid al-Din mentioned Merkit ruler Kudu to have been killed when going to the Kipchaks after he had left the field of a battle against the Mongols.

The Merkits fought against Chinggis Khan many times. Another Persian historian, Juvayni, also reported the Merkits, whom Chinggis Khan had sent away from Mongolia and who were chased by Mongol troops, to have appeared in the Kipchak and Kangly country in 1218 [Rashid al-Din, 1952, 1, 1, p. 124; Bretschneider, 1910, p. 73]. The data contained in the biography of Kipchak Tutukh in 'Yuanshi' confirms and adds to the reports of Rashid al-Din and Juvayni: '...Taizu (Chinggis Khan) undertook a campaign against the Merkits. Their ruler Hodu (Kudu) fled to the Kipchaks. Inassu (the Kipchak ruler) accepted him. Taizu (Chinggis Khan) sent a messenger to say, 'Why did you hide the deer that I wanted to shoot? Bring him back immediately. I will inflict misfortune on you unless you agree.' Inassu replied, 'Even the thicket will grow thicker so that a sparrow escaping from a hawk can

stay alive. Am I worse than grass and trees?' Taizu (Chinggis Khan) then ordered that a campaign should be undertaken to punish him. Inassu was already old. There was no unity in the state (of the Kipchaks). Inassu's son, named Hulusuman, sent a messenger to express his subordination to Taizu. However, Xianzong (Möngke Khan) marched his troops off.' Another report in 'Yuanshi', contained in the biography of Mongol commander Subedei, attributes the pursuit of the Merkits to him and not to Khan Möngke: 'Fighting against the Merkits, (Subudai) crushed them within a single battle and captured two leaders... Their (Merkit) ruler Hodu fled to the Kipchaks; Subudai ran in pursuit of him. He fought against the Kipchaks and crushed them...' [Yuanshi, 1958, Juan 128, p. (1486) 27438; Juan 121, pp. (1413)27365–(1414)27366]. Finally, similar reports are contained in the Mongol source 'Yuan Chao Bi Shi' ('The Secret History of the Mongols'): 'Kuchlug Khan, having lost his ulus, decided to join Merkit Tokhtoa... Having approached them, Chinggis Khan initiated a battle... The Naimans and the Merkits fled. When crossing the Erdysh (Irtysh), they lost most of their people, who drowned. Having crossed the river, the Naimans and the Merkits with a small number of survivors took different roads...' Though not all the detail in the reports above are identical, they provide the same information on the most essential event—the escape of the Merkits to the Kipchaks and the Kangly. 'The Merkit sons of Tokhta, like the rest of the Merkits, headed for the Kangling people...' [Kozin, 1941, p. 210]. The fact that the Merkits fled to the Kipchaks and the Kangly is just more evidence that the Kipchak tribes had connections to the peoples living east of them.

The Kangly also maintained relations with the Jurchen Jin Empire, which covered the territory of present-day Manchuria and Inner Mongolia, as well as North China. For instance, Chinese sources mention the Kangly as Kang Li in the 12th century (1161–1189) in connection with a Kangly and Naiman embassy to the court of the Jin emperor [Jin Shi, 1958, Juan 121, p. 1100].

Thus, according to sources written in various languages, most importantly, Chinese dy-

nastic histories, the Kipchaks appeared in the vast territory of present-day Kazakhstan, in the Cis-Ural and Volga Regions in the 11th century after they migrated from their ancestral home, Inner Mongolia, to inhabit the Northern Caucasian and Black Sea Steppes up to the Carpathian Mountains before the end of the century. There were a lot of Kipchaks and Kangly in Khwarezm. Some remained in their ancestral home. The period is when the Kipchak and Kangly tribes consolidated to form relatively stable nomadic state-type unions in the territory of the Eurasian steppes from the Altai

Mountains to the Danube which were known as Desht-i Qipchaq in the 11–14th centuries, the traces of which remain in the ethnic memory of the territorial successor of the medieval Turkic tribes—the modern Turkic steppe peoples, such as the Nogais, the Kazakhs, the Bashkirs, the Crimean Tatars, whose entire clan and tribal structures contain Kipchak and Kangly clans. A certain ethno-cultural continuity is also present at the linguistic level as the languages of the above-mentioned steppe peoples and those of the Volga and Siberian Tatars belong to the Kipchak group of Turkic languages.

CHAPTER 4

Volga Bulgaria on the Eve of Batu Khan's Campaigns

Iskander Izmaylov

Following the famous Battle of the Kalka River, Subedei turned to the steppes of the Don River Region, from where he marched against the Bulgars in the autumn of 1223. According to Ibn al-Athir, the Mongols set off for Bulgaria in the Hijra year 620 (4.02.1223–23.01.1224). However, 'when the citizens of Bulgar found out that they were approaching, they lay several ambushes for them; they faced them and made them follow them to the ambush place, then took a rear attack, leaving them (the Tatars) in the middle; they blew their sword in every direction; many were slain and few survived. They say there were 4,000 of them. They went to Saqsin to return to their king Chinggis Khan, and the Kipchak land was free of them; their survivors returned to their land' [Collection of Works Related to the History of the Golden Horde; 1884, pp. 27–28]. The report is to some extent confirmed by another independent source. When Franciscan Friars from Hungary visited Bulgaria and the Magyars along its eastern border in 1237, the Hungarians told them that they had been fighting against the Tatars for fourteen years when they were able to subordinate them [Anninsky, 1940, p. 81; also see: Zimoni, 1993, pp. 87–89]. It can be inferred that the Bulgar troops included various detachments, in particular those of Cis-Ural Magyars.

According to T. Allsen [Allsen, 1983, p. 11], the Mongols were defeated because they were tired. However, the chronology of the campaign suggests that the Mongol troops attacked the Bulgars after a rest, in the late autumn. Therefore, their defeat resulted from a number of reasons, most importantly, the Bulgars' good tactics, choice of place and time of the battle, as well the readiness and durability of their troops.

Scholars disagree about the place of the battle greatly. It is traditionally believed to have taken place 'at the southern border of Bulgaria,

somewhere near the Samara Bend [Khalikov, 1978, p. 85; Khaliullin, 1995, p. 122].

However, in recent times, thanks to the archaeological research of G. N. Belorybkin, near the ancient town of Zolotarev [Belorybkin, 1988, pp. 82–87; 2001], there was yielded a set of discoveries that can shed light on the circumstances of the battle and its location.

The archaeological site of Zolotaryovka is, indeed, the southernmost part of the Bulgar domain in the Sura River Region, where several trade routes lay, in particular those leading to Ryazan, Kiev, the Lower Volga Region. The archaeological site, which is dated to the 11–1st third of the 13th century, is unique to Bulgar fortification as it is the only ancient town of a cape sort, with four rows of fosses and ramparts on the field side. Of greater interest is, however, the set of discoveries found in near vicinity of the ancient town, which includes arms (for instance, sabres with cuffs in the top one third of the blade), multi-purpose cut and thrust weapons (palms), fragments of horse harness and belt plates, which is indicative of their Central Asian and Far Eastern (as far as the Amur River Region) origin. It is clear that the set could have been formed and come to East Europe only with the troops of Subedei and Jebe. Even though certain aspects of the issue remain controversial, it is possible to say that the ancient town is the most probable place of the events of 1223. Such a unique set of discoveries could have only emerge following the crushing defeat of Subedei's troops, as the result of which the winners, who had also suffered heavy losses, were unable to collect all weapons, parts of military costumes, and horse munitions. Any attempts at attributing the discoveries to a detachment from Kirghizia that was presumably staying there results from a misunderstanding, misdating, and cultural and chronological confusion of complexes pertaining to different

periods [see Belorybkin, 2000, p. 138; Rudenko, 2001, p. 67].

The events of the late 1223 can be imagined as follows. Following a several months' rest, the Mongol troops marched against the Bulgars. However, the Bulgar commanders had learned from the Kipchaks' mistakes and did not intend to enter an open battle, though they were determined not to cede the strategic initiative to the enemy by letting it get deeper into the country. They made additional fortifications in a town in the bend of the Sura River (The ancient town of Zolotarev) during the summer of 1223 and apparently prepared ambushing locations. The tactic was characteristic of the Bulgar military art [Izmaylov, 1997; 2006a, pp. 361–367]. When the Mongol troops were engaged in besieging the town, the united Bulgar army surrounded them and began to exhaust them with short passages of arms. The Mongols were defeated in the following battle (or probably when part of Subedei's troops broke the siege) and, as the discoveries from Zolotaryovka area suggest, suffered grave losses there. From there they withdrew southward the Lower Volga Region and eventually returned home via Saqsin.

For the most far-sighted of Bulgar politicians, the threat of a new Mongol invasion became clear. The Bulgars relied on their peaceful relations with Rus' to take a number of measures to protect their borders in the south and south-east, to additionally fortify their cities [Khuzin, 1988, pp. 46–47].

The Mongol presence in Eastern Europe and the disaster on the Kalka River had a repercussion on the Russian-Bulgar border. Vladimir troops are known to have been reluctant to help southern Russian princes. It is entirely possible that they believed the campaign to be 'not their war' and tried to make use of the situation for their gain. Probably, they took advantage of the Bulgar forces being distracted in the south to break the peace treaty through hostile actions. Only the Bulgars' victory had a sobering effect on them and made the policy of Russian princes more reserved and less aggressive. However, the situation was far from peaceful. The chronicles do not report any large-scale anti-Bul-

gar campaigns in that period, but, apparently, minor raids and mutual attacks, during which prisoners were taken, continued.

The Russian-Bulgar tension heightened again in 1229. On the one side, there was an attempt at kindling anti-Muslim sentiment in Vladimir following the murder, whether real or alleged, of a Christian Abraham, 'of a people other than Russian.' He was allegedly killed by Bulgars for refusing to convert into Islam. A campaign for recognizing him as 'a new martyr' for the faith and reintering him in Vladimir broke out. After a year, in 1230, 'New Christian martyr Abraham was carried from the Bulgar land to the glorious city of Vladimir', where he was very soon canonized and declared a saint [Polnoe sobranie russkix letopisej, 1, p. 352; 15, p. 86]. The anti-Bulgar intention of the canonization and political campaign is obvious. It is entirely possible that it was meant to exert ideological pressure on the Bulgars against the backdrop of the 'local conflict' in Mordovia.

The land of the Mordvin tribes was an old source of tension between Bulgaria and the north-eastern Russian principalities. After Nizhny Novgorod was founded in 1221, Russian princes tried to establish their power over the Sura and Oka interfluvium, which caused a series of military conflicts with Mordvin small-scale princes, some of whom were supported by the Bulgars (see [Izmaylov, 2006b, pp. 375–376]).

The tension was resolved in the autumn of 1229, when 'the Bulgars bowed to Great Prince Yurgi and asked for peace after 6 years of war; they made peace and let their people in, and they accepted their people too; and they kissed the cross to them, and the Bulgars went to their army, the nobility and common people' [Priselkov, 1950, p. 311] (see a different text of a more recent chronicle [Polnoe sobranie russkix letopisej, 30, p. 87]).

The peace between Bulgaria and the Principality of Vladimir-Suzdal lasted until the Mongol invasion, when Khan Batu's troops inflicted a crushing defeat on both Bulgaria and Rus'. The Mongol pressure on the peoples of the Volga Region increased...

Section 2

The Mongol Invasions and the Establishment of the Chinggisid Empire

CHAPTER 1

Chinggis Khan and the Establishment of a United Mongol State

Eugene Kychanov

Temujin, who later became Chinggis Khan, was born in the Mid-12th century. The exact date of his birth is unknown. According to Rashid al-Din, it was 1155; according to 'The History of Yuan' ('Yuanshi'), it was 1162; the famous French sinologist P. Pelliot estimated it at 1167. The range is 12 years, or one cycle of the Central Asian calendar. His father, Yesugei Baghatur, was an ulus ruler; his mother Hoelun belonged to the Olkhunut tribe. Yesugei abducted her from the noble Merkit Yeke Chiledu, which caused the Merkits to persecute Temujin in his youth. Temujin was born when his father had just returned from another campaign against the Tatars, the main enemy of the ruling clan of Mongol Khagans. According to the legend, the boy was born with a blood clot in his hand. This is quite possible. However, it may be just another folklore narrative in the biography of Chinggis Khan in 'The Secret History of the Mongols.' The boy was born in Dulun-Boldaq district, the name of which is believed to have been preserved, 250 km from Nerchinsk, not far from the mouth of the Baldji River, a tributary of the Onon. Yesugei returned from the campaign with captives. The boy who was to become the future Chinggis Khan was named after one of them, the Tatar Temujin-uge. His ancestor Bodonchar, the fifth son of ancestress Alan Goa, who mysteriously had three children by a ray of light that entered her yurt through the smoke and thus entered her loins, could have been a son of Alan Goa's slave, apparently a Kyrgyz captive. Traits of Temujin's clan included fair (red) hair and light (blue, green) eyes as well as tall males. Temujin spent his childhood and youth near Burkhan Khaldun, in the present-day Khentii Mountains, where the Orkhon River has its source.

When he was nine years old, Temujin was betrothed to Borte, aged ten, from the Onggirat tribe. Yesugei took his son to the family of his wife-to-be and left him there as a temporary son-in-law, as was the ancient custom. He was poisoned by Tatars on his way back under unclear circumstances. Temujin was brought back to his mother after his father's death. Yesugei's ulus dissolved when he died, or more specifically, the Taichiud (Taijiud) tribe, related to Yesugei, came to power, while Yesugei's family was impoverished. Rashid al-Din dated the events at 1166.

Hoelun stayed with Yesugei's second wife and his four sons, two by her and two by the other wife, whose name was probably Ko'agchin. 'The Secret History' depicted the misfortunes of Temujin and his mother very vividly. However, P. Ratchnevsky believed the source to have deliberately over-dramatised the situation to show the rough life of Temujin as a teenager. At that time Temujin and his younger brother Hasar killed their consanguineous brother Behter, Ko'agchin's elder son. The episode is only present in 'The Secret History,' while other sources do not mention of it. After killing Behter, Temujin was recognised as the head of the family. Taichiud Targutai-Kiriltuh (the name suggests that he could have been a Christian named Cyril), who had succeeded to Yesugei as head of the ulus, naturally wanted to prevent the late Yesugei's family from growing stronger. He ordered that Temujin should be punished for murder under the ulus law. Targutai personally came to see Hoelun's family and demanded rendition of Temujin. Temujin managed to escape and hide in a thicket on a mountain top. The Taichiuds had to wait for fifteen days before hunger made Temujin come out of the woods. They put a heavy wooden

board, or kanga, around his neck and brought him to the Taichiud camp. Rashid al-Din does not mention that Temujin killed his brother and claims that the Merkits captured Temujin.

Temujin was able to escape from the Taichiuds. The story of Temujin's captivity and escape was widely known. According to Chinese diplomat Zhao Hun, Temujin was captured by Jurchens as a child and kept as a slave until he was able to escape after ten years [Men-da Bey-lu, 1975, p. 49]. Ratchnevsky calculated that Temujin was captured at the age of 15 [Ratchnevsky, 1983, p. 76].

After reaching maturity, Temujin married the girl to whom his deceased father had betrothed him. That was about the time when his general Mongol political activities began. Tooril Khagan, the ruler of the Kereit ulus, was Yesugei's sworn brother. Temujin went to Tooril Khagan's camp on the Tolu River, gave generous presents to him, and asked Tooril to help him to gather Temujin's ulus. The Merkits found out that they were negotiating and attacked Temujin's family unexpectedly. Temujin himself was able to hide, but the Merkits caught his wife Borte, who was probably pregnant. They gave her to Chilcher, the younger brother of Chiledu, from whom Yesugai once abducted Temujin's mother Hoelun as a concubine.

The birth of Temujin's first son Jochi was therefore shrouded in mystery. According to Rashid al-Din, the Merkits gave Borte, who was then pregnant, to Keraite Tooril Khagan, who gave her back to Temujin. She gave birth to Jochi on her way home; 'his name meant a child who was born unexpectedly' [Rashid al-Din, 1952, I, 1, p. 98]. According to 'The Secret History,' Temujin asked Tooril Khagan to help him to free Borte. Tooril agreed but allied with Jamukha, a sworn brother of Temujin as a child, who was the leader of most of the Mongols at that time. The Keraites provided two tumens (20,000 warriors), and Jamukha provided two more. It is unknown how many warriors Temujin had. In 1177–1178, when Temujin was 22–23 years old, the Keraites and the Mongols attacked the Merkits and crushed them. Temujin won Borte back. Borte gave birth to Jochi, and Temujin secretly doubted the origin of his firstborn until the end of his life, as he could

Chinggis Khan. Watercolour on silk.
China. 15th century

have been half Merkit. Temujin never forgave the Merkits for his disgrace and ordered that his troops should never take Merkit captives or spare their lives.

Relations of mutual dependence were established among three forces of the Mongol Steppe—Tooril Khagan, Jamukha, and Temujin—and expressed in terms of kinship. Tooril Khagan was considered to be the father; Temujin, his son; Tooril Khagan, elder brother; and Jamukha, the younger brother. As his patron's 'younger brother' and thus belonging to the same generation as him, Jamukha was superior to Temujin as the patron's 'son'—that is, a member of the younger generation. No mutual dependence was established between Jamukha and Temujin, and they remained sworn brothers.

The following three years is the most mysterious period of Temujin's life. Temujin and Jamukha decided to migrate together to symbolise the unity of a large part of the Mongols. This lasted for a year and a half, during which time Temujin was able to draw part of the Mongol noyans over to his side. This may be attributable to Temujin's higher personal virtues or

to fact that there was no direct representative of the house of Khabul Khagan—Ambaghai Khagan, while Temujin may have been a more noble indirect successor. In any case, part of Mongol noyans and part of the Mongol nobility elected Temujin as khan and gave him an ulus. When Temujin was declared khan, he received the title Chinggis Khan, meaning 'great among khans,' 'khan of khans' for the first time. Assuming that Temujin was born in 1155, he was 25 years old at that time. Rashid al-Din reported that the shaman Teb-Tengri invented the title for Temujin.

After becoming khan, Temujin set about ordering his ulus. In particular, he made his *nökürs*, or bodyguards, responsible for the khan's camp, migration, ulus economy, and army. Some sources report that Chinggis Khan soon had three tumens—that is, 30,000 warriors. In any case, he was soon able to thank Tooril Khagan properly by winning his ulus back for him after he had lost it because of a dispute with his younger brother.

Jamukha, who did not want Temujin to become more powerful, attacked his ulus. 'The Secret History' attributes the victory to Jamukha; and Rashid al-Din, to Chinggis Khan. The wars against Jamukha and other uluses were long. It is a second obscure period in the history of Chinggis Khan's rise to power and his struggle for leadership in Mongolia. Not all wars were successful for Chinggis Khan. Rashid al-Din's report is evasive: 'Chinggis Khan suffered various misfortunes... caused by his older and younger relatives, as well as the... Merkit, Tatar, and other tribes at that time. Tribes captured him many times, but he was able to free himself in various ways' [Rashid al-Din, 1952, I, 2, p. 248].

In the 1180s the Jurchen state Jin waged war against the Tatars as the nation was closest to the Jin borders and probably the strongest enemy in Mongolia. A policy of 'reducing the number of adults' was applied to the Tatars. In fact, Jin wanted to exterminate the Tatars. It was in the thick of the war against the Tatars that Chinggis Khan appeared. In 1196 the punitive Jin expeditionary force crushed the Tatars at the Kerulen River. Part of the Tatars fled to the Uldza River. The Jin rulers ordered Tooril

Khagan, a vassal to Jin, to embark on a joint anti-Tatar operation. He turned to Chinggis Khan for help. In the early summer of 1196 the joint army crushed the Tatars on the Uldza River. The Jin rulers rewarded Chinggis Khan with the title of *j'aut quri*, which is interpreted as a hundred commander. Tooril Khagan was titled Wang, or Ong, which is similar to prince. This is why more recent sources mention his name (title) Ong Khan, and the legend about a Christian ruler in Central Asia, Prester John.

After crushing part of the Tatars, Chinggis Khan settled accounts with one of his Mongol rivals—Sacha-beki of the Djurki tribe.

In 1198–1199 Ong Khan, Jamukha, and Chinggis Khan together defeated Naiman Buyuruk Khan and forced him into the area known as Kem in the upper reaches of the Yenisey. When the winners were returning, a Naiman army blocked their way. Night came, and each of the allies made a camp to begin the battle against the Naimans in the morning. However, the troops of Ong Khan and Jamukha left secretly at night, leaving Chinggis Khan face to face with the Naimans. The Naimans probably did not take Chinggis Khan seriously. At any rate, they chased the Keraites and ravaged Ong Khan's camps instead of attacking him. Ong Khan soon asked Chinggis Khan for help, which came in time. The Naiman attack was repelled. Ong Khan was so deeply moved by Chinggis Khan's gracious forgiveness of his treachery that he decided to adopt him, although he was already believed to be his son, to bequeath his ulus to him. The adoption ritual took place on the banks of the Tola River. Chinggis Khan wanted more; so he suggested that his eldest son Jochi should marry Ong Khan's daughter Sangum. Ong Khan's eldest son and the Kereit nobility were opposed to the marriage.

In 1200 Ong Khan and Chinggis Khan waged war against the Taichiuds and the Merkits. The battle against the Taichiuds was probably the first one in which Chinggis Khan personally participated. Chinggis Khan was wounded in the battle. When night fell, the Taichiuds fled the battlefield. They were pursued but not crushed. A coalition of different tribes and peoples formed in Mongolia in 1201 and established itself as an independent force op-

A Battle. Miniature. Iran. 14th century.

posed to Chinggis Khan and Ong Khan. The Tatars joined the coalition. At a kuriltai on the Gan River, a tributary of the Amur, Jamukha was elected head of the coalition with the title of gurkhan. The Naimans, headed by Tayan Khan, took a wait-and-see attitude.

In 1202 Chinggis Khan dealt a blow to the Chagan Tatars and the Anchi(Alchi) Tatars. It was the first time that he undertook a campaign against a powerful enemy on his own. The Tatars were defeated near Buir Nor Lake. Those who survived surrendered themselves as prisoners. Noble Tatar rulers were executed at once. The future of the rest was to be decided by a meeting of Chinggis Khan's relatives and *nökörs*. The meeting resolved to exterminate all male Tatars taller than a cart wheel, which was probably in accordance with the 'adult reduction' policy. According to Rashid al-Din, the punishment was more cruel—Chinggis Khan ordered that 'all Tatars should be beaten without leaving anyone alive to the set limit... women and small children were to be beaten to death, and pregnant women's stomachs were to be cut open to exterminate them completely' [Rashid al-Din, 1952, I, 1, p. 106].

While Chinggis Khan was fighting against the Tatars, Ong Khan crushed the Merkits. In 1201 or 1202—the exact date is unknown—Ong Khan and Chinggis Khan (this time together) defeated Jamukha's coalition. Either during the Kereit and Mongol campaign against him or later Jamukha decided that he could only succeed by driving a wedge between Ong Khan

and Chinggis Khan. He was able to agree on joint actions with Ong Khan's son Sangum. The Keraites and Jamukha's troops attacked Chinggis Khan. Even though he had been warned, it came unexpectedly. The Keraites turned out to be his main enemy; the cunning Jamukha was able to avoid fighting at the last moment. The Keraites crushed Chinggis Khan. Rashid al-Din even reported that if Sangum had not been wounded in the battle, Chinggis Khan would have 'faced the danger of complete loss.' A large part of Chinggis Khan's army left him; he was accompanied by several thousand people as he fled to Baljuna Lake, somewhere near the present-day Agin-Buryat Autonomous District, Chita Oblast. Chinggis Khan and the people who stayed loyal to him swore that they would never leave each other and drank muddy water from the lake to seal it. When Chinggis Khan did win, he rewarded these people in a special way.

Chinggis Khan began to negotiate with Ong Khan. He asked him, 'Why are you angry with me, my khan and father?' His message to Jamukha was harsher, 'You have separated me from my khan and father out of hatred!' Wanting to drive a wedge between Ong Khan and Sangum, he declared to Sangum that he wanted to become khan before his father even died. Sangum was quick to answer and told Chinggis Khan that he had never called his 'father and khan' anything other than old rascal. Sangum would not negotiate and declared, 'If we win, we will devour him. If he wins, he will devour

us!' [Kozin, 1941, pp. 134–136; Yuanshi, 1935, Juan 1, p. 66]. We must give credit to Sangum where it is due. He gave a very accurate account of the situation in Khalkha, although Chinggis Khan found himself in a difficult situation. Not all of his family supported him. In 1203 his uncles, Jajirat, Baarit, and Mangut noyans, along with Kutu Temur, the leader of the Tatars, formed another coalition against Ong Khan and Chinggis Khan. They decided to ally neither with Ong Khan nor with Chinggis Khan and to begin by attacking Ong Khan. However, Ong Khan's response was rapid. He attacked the new allies himself and 'plundered them.' While Ong Khan was carelessly celebrating the victory in the upper reaches of the Kerulen River, Chinggis Khan's troops attacked him. The Keraites suffered a heavy defeat. Ong Khan was able to break the Mongol blockade and escape with a group of warriors. He apparently ran away to the Naimans. However, he encountered a Naiman frontier sentry when crossing the border of the Naiman ulus and was killed, either intentionally or accidentally. It was Chinggis Khan's second crushing victory after the one over the Tatars. Now the Naimans and Jamukha's group were his only strong enemies. However, not all Mongols were willing to support Chinggis Khan.

The Naiman Ulus was weakened because its leader Tayan Khan had been at odds with his brother Buyurt Khan and his son Kuchlug. The Naimans were overconfident; they were not properly aware of Chinggis Khan or ready to fight. Jamukha proposed that Tayan-Khan should ally against Chinggis Khan but turned out to be unreliable. Tayan Khan proposed that the Onguds join him against Chinggis Khan, but the Onguds refused the alliance. The Ongud ruler also warned Chinggis Khan that Tayan Khan intended to attack him.

Before starting a campaign against the Naimans Chinggis Khan implemented a number of reforms in his ulus in 1204. His army was divided strictly into tens, hundreds, and thousands, and 140 of the best warriors formed Chinggis Khan's personal guard. A special thousand best warriors was obliged to fight 'before the eyes' of Chinggis Khan in battles and serve as his personal guard in peace time. Six

noyans were entrusted with the ulus's economy. The ulus administration system, which disrupted because of the Kereit attack in 1203, was thus restored.

In the summer of 1204 the Mongols and Chinggis Khan's allies attacked the Naimans. The battle against the Naimans is probably the only case where Chinggis Khan was recorded to have personally commanded the troops in the advance detachment. The battle was fierce. Tayan Khan fell. Only his son Kuchlug was able to escape with a small detachment. Chinggis Khan finished off the Naimans. What remained of them fled to Dasht-i Kipchak. Seeing Chinggis Khan's victory, most of the Mongols took the side of the stronger party. Jamukha was turned over by his people and executed (probably in 1205). Therefore, a reversal of fortune took place in only two years, taking into account the defeat of Chinggis Khan by the Keraites in 1203, and he was able to crush all his rivals in Khalkha.

The Great Kuriltai gathered at the headwater of the Onon River in the spring of 1206. They raised a white nine-bunchuk banner, in which they believed the spirit *Sulde*, the patron of Mongol warriors, lived. They 'gave Chinggis Khan the title of khan' ('The Secret History') at the Kuriltai, 'all wangs and officials presented the title of Emperor Chinggis to him together,' 'the great title Chinggis Khan was given to him, and shaman *Teb Tengri*, *Kokochu* affirmed the title' [Yuanshi, 1935, Juan 1, p. 8a; Rashid al-Din, 1952, I, 2, p. 150]. Chinggis Khan sat on a throne under a sunshade symbolising the emperor's power. As we saw above, he was confirmed with the title Chinggis Khan.

Thus, the struggle for a united Mongolia, which had lasted for almost twenty-five years, was over. Temujin turned out to be more gifted and luckier than his rivals, more flexible and resolute in action, although he was not very different from his rivals, whether Tatar, Merkit, Kereit, or Naiman Khagans, even if we take into account the favourable tone of all sources that have come down to us. We have no information on many events pertaining to the struggle; no sources report the Chinggis Khan deliberately and consistently set the goal of uniting Mongolia and fought for it.

CHAPTER 2

The Establishment of the Chinggisid Empire

Eugene Kychanov

On his way home from the Naiman campaign in 1205 Chinggis Khan attacked the westernmost areas of the Tangut state known as the Great Xia (982–1227).

The Tangut State was adjacent to Mongolia in the south-west. The border was not rigid along the southern margins of the Gobi and in the Nan Shan Mountains, although it was guarded by Tangut frontier sentries, who were expected to keep away migrants from Xia and robber bands from neighbouring Mongolia. Their relations with the Tatars, which was the Xia term for the population of Khalkha, were complicated. The government prohibited the export of weapons, armour, metals, coins, and some agricultural products to Khalkha. In spite of the restrictions, the internal Mongolian struggle forced members of various Mongol tribes to take shelter in Xia. Kereit ruler Ong Khan was one of them.

In 1205 Chinggis Khan's troops attacked Shazhou and Guazhou, which had a large Uighur population. The role of the Uighurs in the Naiman Ulus is well known. They were probably not only Uighurs from Turpan, and on a larger scale, Eastern Turkestan, but also those living in Xia. The purpose of the attack was not to separate the regions from Xia but to plunder them, probably specifically to take as many camels as possible, which is stated in 'Yuanshi': 'attacked,... robbed the people, and took away camels.' [Yuanshi, 1935, Juan 1, p. 8a]. According to Rashid al-Din, the Mongols 'occupied some...regions of Tangut and plundered them, and...turned back with an uncountable number of camels and cattle' [Rashid al-Din, 1952, I, 2, pp. 149–150]. Chinggis Khan himself was not involved in that Xia campaign. This proved that the Mongols were capable of fighting against settled people and besieging and conquering fortresses, although only small ones at that time.

Xia could have been a testing ground in preparation for a war against the main enemy, the Jurchen state of Jin. Chinggis Khan personally took part in the second campaign against Tangut (Xia). This time he attacked the northern and central regions of Tangur. After securing themselves in a fortress near the Helan Mountains, the Mongols kept plundering the nearby regions until the summer of 1208. The Tanguts were able to prevent the Mongols from moving farther into the country but failed to defeat them, and Chinggis Khan left for Mongolia carrying a lot of plunder.

In the same year 1207 the Mongols undertook a northward campaign against the so-called 'forest peoples'—the Oirat, Kyrgyz, and Tumat people. Chinggis Khan's eldest son Jochi commanded the troops. The 'forest peoples' surrendered to Chinggis Khan. Their ambassadors arrived with tribute and presented white hunting falcons, white horses, and white sabres to the khan. In turn, the Oirat rulers and their sons received Mongol princess Chaga as another wife.

Chinggis Khan was becoming increasingly active in foreign policy. In the late spring of 1209 he personally marched his troops against Tangut again. This time the Tanguts gave the Mongols a major battle, but their army, commanded by the successor to the throne, was defeated. Chinggis Khan marched his troops farther to the Xia capital Zhongxing (today's Yinchuan, Ningxia Hui Autonomous Region, PRC); the Tangut army halted the Mongol advance in a mountain pass in the Helan Mountains. The Tanguts won the first battle, and the Mongol army had to stop. The sides remained face to face throughout the summer. The heat prevented the Mongols, who were also expecting more troops to arrive from Mongolia, from mov-

ing any farther. Chinggis Khan took advantage of the favourable weather in autumn to continue his attack on the Xia capital. The Tanguts were crushed in the new battle, and some of their generals were taken prisoner. In October 1209 the siege of Zhongxing began. It was the first time that the Mongols had fought a large-scale siege war using advanced siege and defense techniques. It was there that the Mongols began to master the techniques by engaging local military experts and started to take actions that later became characteristic of them. The Mongols rounded up thousands and tens of thousands of locals and made them fetch soil, brushwood, and logs and fill trenches. They used them as a shield to protect them from arrows and stones shot by the besieged citizens. The Tangut court would rather die than give up. Having failed to take the city by storming, the Mongols decided to flood it. It was raining heavily. The Huang He River, smaller rivers, and irrigation channels were overflowing. The Mongols used local labour and those who

knew how the irrigation system worked to direct the water into the city. At first everything happened as they had expected. Water flooded the streets of the city and ruined clay houses and outbuildings. Xia secretly sent an embassy to Jin to ask for help. Both the Tanguts and the Jin court knew that Chinggis Khan, now that he had broken with the Jin, was preparing to wage war against the Jurchen people. The kuriltai discussed the issue. A large number of higher Jin officials suggested that the emperor should help Xia, trying to persuade him that the Mongols would attack Jin as soon as Xia fell. Relations between Xia and Jin were almost friendly until the 1190s; minor border incidents caused them to degrade later. The Jin emperor had just ascended the throne. He would not follow his subjects' advice, declaring, 'My state benefits from its enemies attacking each other!' He refused to help. The situation was critical in the besieged city. However, it was the Mongols who fell victim to their method of flooding the Xia capital. Water broke the dams around the city, flooding the Mongol camp. They had to give up the siege and start peace negotiations. The first prerequisite of peace according to Chinggis Khan was the Tanguts' obligation to keep from helping Jin when it attacked him. The Xia emperor had to promise to be Chinggis Khan's 'right hand.' The unreasonable step taken by the Jin emperor when he refused to help Xia at a critical moment to some extent determined the future fall of both Xia and Jin. The Chinese state of Southern Song could not ally with Jin. Chinggis Khan was right to expect that the Chinese would help him to destroy the Jurchen state. The negotiations between Chinggis Khan and the Xia emperor resulted in a peace treaty known as Heqin, under which Tangut princess Chahe became another wife of Chinggis Khan's.

Other neighbours of the Mongols were impressed by their victories over the Naimans, the Keraites, and the Tanguts. In 1209 the Uighurs submitted to Chinggis Khan of their own free will. Their ruler Idikut Barchuk wanted to be Chinggis Khan's fifth son and devote all his energy to serving him. When

Chinggis Khan returned to Mongolia from the Tangut campaign, he personally received the Uighur Idikut in his camp and married off his daughter Al Atunu (Yeli Khatun). The Karluk Turks also submitted to Chinggis Khan in 1211. Their ruler Arslan Khan wanted to put an end to their dependence on the Kara Khitan people. He killed the Kara Khitan vicegerent and submitted to the Mongols. The Kurluk ruler of the city of Olmaliq Wazdar wanted to do the same. Kuchlug, the son of the deceased Naiman Tayan Khan, who had escaped to the Kara Khitans, became the ruler of the Western Liao. After discovering Wazdar's intentions, he attacked Almalyk and took Wazdar prisoner. Mongol troops hurried to help the Karluks. Kuchlug killed Wazdar and left Almalyk. Wazdar's son became the ruler of Olmaliq, submitted to Chinggis Khan, and was given a wife from Chinggis Khan's house for his loyalty to the Mongols.

Thus, the situation in Central Asia and the Far East changed dramatically in favour of the Mongols in 1211. Chinggis Khan broke with Jin in 1209. Jin Emperor Wei Shao Wang, the one who refused to help the Tanguts, ascended the throne in 1209. He sent embassies to inform Chinggis Khan of his accession to the throne and demand that he confirm allegiance to Jin at once. According to the procedure, Chinggis Khan was to go down on his knees, and while kneeling, accept a decree on the enthronement of the new Jin emperor. When the ceremony was to take place, not only did Chinggis Khan refuse to kneel down in public, but he even spat in the direction where he believed the Jin capital Beijing to be, after which he mounted his horse and galloped away. It was in fact a declaration of war.

Chinggis Khan's Tangut campaign left Jin face to face with the Mongols. Chinggis Khan's house also had very old accounts to settle with Jin.

While waging war with Jin, Chinggis Khan had to secure himself within Mongolia. To this end, a regiment of 2,000 faithful warriors was formed 'to cover his rear lines to protect him from the Mongols, the Keraites, the Naimans, and others when he went to the Khitai country' [Rashid al-Din, 1952, I, 2, p. 163].

In the second month (15 February–16 March) of 1211 Chinggis Khan's troops crossed the Jin border in the south and southeast. Chinggis Khan commanded the troops during the first period of the Jin war from 1211 to 1216, while Jebe commanded the main forces. After conquering a number of border cities, the Mongols stopped all military action to let their horses have a rest and feed on pasture. The Jin emperor took advantage of the pause to send an ambassador to negotiate. However, the ambassador took the Mongol side. The main battle took place near the Yehuling Range, which protected the approaches to Beijing, the Middle Capital of Jin. The size of Chinggis Khan's army is unknown. Sources report that the Jin army numbered 300,000 people. It was defeated, and 'famous Khitai and Jurchen people were exterminated in the battle' [Rashid al-Din, 1952, I, 2, p. 167]. A second big battle took place near Beijing, at the frontier post of Juyong Guan. The Jin troops lost it, 'over 80,000 heads were severed' [Yuanshi, 1953, Juan 119, p. 2a]. In the ninth month (9 October–6 November) of 1211 the Mongols reached Beijing. The Jin defeats caused the Khitan people, whose state the Jurchens had destroyed almost a hundred years before, to rebel. Two years later, in 1213, the head of the Khitan rebellion, Yelu Luge, declared the Liao state restored.

Chinggis Khan spent the winter of 1211–1212 in Mongolia. In the spring of 1212 military action moved to the territory of today's Inner Mongolia. Along with Chinggis Khan, his sons Jochi, Ögedei, and Chagatai were involved in the campaign. Chinggis Khan participated in battle himself and was even slightly wounded by an arrow during the siege of one of the towns [Ibid., Juan 1, p. 9a]. The Mongols occupied all Jin territories north of the Huang He in 1213. Many Chinese took the side of Chinggis Khan. One of them, Shi Tianer, was promoted to head of a *tumen* and commanded a Chinese army. A palace coup took place in Beijing in August, when the emperor was killed. Hushahu, who initiated the plot, took his place. In the early 1214 Chinggis Khan came to the walls of Beijing personally, and negotiations took place. A truce was con-

Chinggis Khan in a battle. Miniature.
Iran. 1397–98.

cluded, and the daughter of the previously deposed Jin emperor was married off to Chinggis Khan. The truce lasted for a month until the Mongols conquered Beijing. Military actions continued until the autumn of 1215. According to 'Yuanshi,' the Mongols had occupied 862 walled Jin cities by that time [Ibid., p. 10a]. This could only have happened if the Chinese, Khitan, Bohay, and other non-Jurchen population of Jin largely took the Mongol side. In 1214 the Tanguts waged war against the Jin. The war lasted for ten years until 1224. It only hastened the ruin of both states.

In late 1215 the Mongols proposed peace to Jin on two conditions. First, the Jurchen people had to give up all land north of the Huang He. Second, the Jin emperor had to reduce his title to wang and rule the regions between the Huang He and the southern border of the Southern Song. The Jin emperor rejected the conditions.

Chinggis Khan returned from North China to his camp on the Kerulen River from in

1216. The Mongols did not develop the conquered territories or leave any garrisons in cities during the war of 1211–1216. They merely plundered and took prisoners when they needed to. In places where the population resisted strongly, they did not take prisoners but simply exterminated everyone. Their plunder was abundant. For instance, Chinggis Khan rewarded his commander Subedei with 'a cart of gold and silk' for conquering a Jin city.

Subedei also returned to Mongolia. Chinggis Khan instructed him to put an end to the Merkits in 1216. According to Rashid al-Din, 'no trace remained of the tribe' after the campaign [Rashid al-Din, 1952, I, 2, p. 178].

In the winter of 1217–1218, the Mongols besieged the Xia capital again. The siege dragged on again, and Chinggis Khan agreed to conclude a truce, provided that the Tanguts supplied troops for his westward campaign. Chinggis Khan understood after years of war against Jin that it was easier to use others for wars. The Tanguts refused to join the Mongols in their westward campaign. Chinggis Khan withdrew his troops from Xia, promising to settle accounts with the Tanguts on his way back from the west.

After his return from China Chinggis Khan decided to wage war against the Khwarezm Shah's state in the west. He realised that the war against Jin would take a long time. Muqali was instructed to continue it. By 1227—the year Chinggis Khan died—the Mongols had only conquered Shandong in North China. This was probably because most of the forces were engaged in the western campaign. At the time it began, Chinggis Khan's state bordered on the Kara Khitan Western Liao, the state of the Khwarezm Shahs, and the Kipchak steppes, or Dasht-i Kipchak, in the west. Kuchlug, who fled to the Kara Khitans following the Naiman defeat, at first was favoured by the Kara Khitan gurkhan, married his daughter, and even converted from Christianity to Buddhism. Kuchlug took advantage of the gurkhan's defeats by the Khwarezm Shah to dethrone him. As the head of the Western Liao, he introduced a policy of persecuting Muslims, which caused him to lose the support of most of the local population.

In 1216 part of the Merkits defeated by Subedei fled to the Kipchaks. Jochi was ordered to pursue them. When the Mongols caught up with and crushed the fleeing Merkits, the troops of the Khwarezm Shah on a campaign against the Kipchaks appeared there. Jochi was reluctant to fight against the Khwarezm Shah, but the latter declared that all non-believers would remain his enemies and forced the Mongols to fight. The battles continued for three days without any of the parties winning. The Mongols left the battlefield on the fourth day.

Inspired by his successful wars in Middle Asia, Khwarezm Shah Ala al-Din Muhammad was thinking about a campaign to China and Mongolia.

After learning that Chinggis Khan was conquering China, he sent an embassy to him. Chinggis Khan received the ambassadors in a friendly way and instructed them to send the following to the Khwarezm Shah: 'I am the ruler of the East; you are the ruler of the West.' He offered trade. Chinggis Khan's embassy in turn brought luxurious gifts. The ambassador said that the ruler of the East was prepared to treat the ruler of the West as equal to his favourite son. The Khwarezm Shah understood that subordination was being proposed to him. When Chinggis Khan sent a rich trade caravan to his land, it was robbed in the city of Otrar (it is still unclear on whose order), and nearly all the merchants and guards were killed. The incident triggered a war.

Before he waged war on the Khwarezm Shah, Chinggis Khan sent Jebe against Kuchlug. The Muslim population of the Western Liao, which was informed of the Mongol campaign, forced Kuchlug out of his camp in the city of Kashgar. Kuchlug fled. According to one of the versions, the locals caught him and turned him over to the Mongols, who killed him. Alternatively, he could have been killed by a man of the former Kara Khitan gürkhan. The Kashgar Region and Semirechye were included in Chinggis Khan's domain.

In 1219, after settling his Tangut affairs and conquering the Jin, at age 64, Chinggis Khan along with all his sons and an army of 150,000–200,000 people started a campaign

Mongol Army. Miniature.
Iran. 1301–1314.

against the Khwarezm Shah. In February 1220 Otrar fell, and Chinggis Khan reached Bukhara. The city was besieged on 7 February and fell after 3 days. The Mongol troops entered the city, 'plundered it, and killed whoever they found,' 'they divided women among them,' 'Bukhara was reduced to ruins, as if it had never existed, by the following morning' [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordj', 1884, pp. 9–10]. A total of 30,000 men were killed, while the rest were forced to besiege Samarkand, which fell on 17 March 1220. In April the troops commanded by Jochi conquered the cities of Jend, Sygnak, and Benakent. Chinggis Khan 'was able to easily crush the powerful state of the Khwarezm Shahs' before the end of April [Buniyatov, 1986, p. 146].

Jebe and Subedei were ordered to imprison the Khwarezm Shah. He fled to the southern shore of the Caspian Sea and hid on an island not far from the mouth of the Gurgan River. He died there in December 1220.

In the summer of 1220 Chinggis Khan fought near Nasaf, Termez, Kulyab and 'conquered these places. He wiped them off the map, robbing and beating the whole population, ruining and burning everything down' [Rashid al-Din, 1952, I, 2, p. 218]. Chinggis Khan spent the winter of 1220–1221 on the banks of the Amu Darya. In the spring of 1221 the Mongol army made a forced crossing of the Amu Darya and occupied the city of Balkh. After Khwarezm Shah's son Jalal ad-Din exterminated the Mongol forces of Shigi Khutukhu near the city of Pervan, Chinggis Khan faced him in person. He occupied the city of Ghazna that autumn. On 23 November 1221 Jalal ad-Din's army was exterminated on the banks of the Indus River.

Chinggis Khan spent the whole summer of 1222 in the mountains near Kabul and the winter of 1222–1223 near Samarkand. A *kuriltai* gathered in the spring of 1223. No information is available on its resolutions. In the summer of 1224 Chinggis Khan migrated within the Irtysh Valley. He moved to the Emil River in the winter of 1224–1225. From there he arrived in Mongolia. It is not clear why the way back took him three years. The western campaign, like the eastern one, ended with his troops crushing the enemy's army without fully defeating it. The war continued in Iran and Iraq as well as in North China.

Chinggis Khan spent the whole of 1225 organising his newly conquered lands and preparing for a war against the Tanguts. He introduced the title of *darughachi* (*dargha*) for vicegerents. Their responsibilities in the newly annexed territories included a census of the population, tax collection, military conscription of the local population, mail services, and delivery of tribute to Mongolia.

The Tanguts and the Jurchen people made peace in 1224. 'The Xia emperor...made a secret alliance for outside help,' although it is not clear with whom he allied [Yuanshi, 1935, Juan 119, p. 5a]. It was apparently with some peoples in Mongolia, with whom the Xia emperor allied or tried to do so. This was what Chinggis Khan had always feared—'his' people.

In the spring of 1226 Chinggis Khan personally led his army against Xia. The Mongol

troops crossed the border near the mouth of the Etsin Gol River, where the city of Ejina (Heishui, Khara Khoto) was occupied after a stubborn battle. Moving southwards, the Mongols divided the Xia territory into two parts. Chinggis Khan spent the summer in the mountains near the city of Ganzhou; all major western Xia cities fell then—Suzhou, Ganzhou, and Lingzhou. Chinggis Khan's troops reached the Huang He. They defeated the Tangut army in the battle of Lingzhou (now Lingwu), in which Chinggis Khan participated. Lingzhou fell, and a third siege of the Xia capital began in the winter of 1226–1227 and lasted for several months.

Chinggis Khan died in August 1227. The exact cause of his death is unknown. It is also unclear whether he lived to see the capitulation of the Xia emperor. The Great Xia ceased to exist in 1227.

The Mongols undertook no campaigns to Tibet when Chinggis Khan was alive. Thus, apart from his Mongolian victories—he exterminated the Tatar, Kereit, Merkit, and Naiman Uluses—Chinggis Khan destroyed two states of the Kara Khitans, namely the Western Liao and the Tangut Great Xia. The state of the Khwarezm Shahs did not fall until 1231. Jin ceased to exist in 1234. The Khitans fled from Jin to North Korea in 1216. In 1219 Jurchen General Puxian Wannu, who had taken the Mongol side, crushed the Khitan people with his Mongol detachment, and the king of Korea agreed to vassal relations with Chinggis Khan and a tribute. The Koreans supplied fur, silk, other fabrics, and paper to Mongolia [Serov, 1970, p. 143]. The great Korean campaign took place in 1231–1231 after Chinggis Khan died.

In a way, Chinggis Khan's wars can be classified into internal Mongolian (not taking into account the exact ethnic affiliation of the peoples of Mongolia from Manchuria to the Altai Mountains) and external ones, fought outside of Mongolia. They can also be classified into wars against nomadic states and settled ones. It was not easy for Chinggis Khan to subordinate his main rivals in Mongolia. His two aspirations were to restore the Mongol ulus and to avenge. The gen-

eral political situation in Mongolia and his personal ability to use it, which is beyond doubt, ensured his success. The practice of establishing large nomadic states in the region was millennium-old. It would be wrong to neglect Chinggis Khan's personal belief that heaven had given him power both over the peoples of Mongolia and over all peoples outside of it.

The conquest of 'heaven-given' peoples and plunder were the key motives for external campaigns. According to one of Chinggis Khan's noyans, people used to rob each other;

but now that there was a large united ulus, the khagan had to allow his warriors to rob others, to rob their neighbours. There is no need to speak of Chinggis Khan's deliberate geopolitical goals, such as uniting the East and the West, or uniting the scattered peoples of China within an empire. Temujin, or Chinggis Khan, personally carried out campaigns across a vast territory from Beijing to Kabul, from the upper reaches of the Indus River in North-Western India to the Irtysh, punishing whoever refused to submit, aggressive as a hunter pursuing his game and cruel.

CHAPTER 3

Form of Government in Chinggis Khan's Empire

§ 1. Civil and Military Administration System in the Chinggisid State

Eugene Kychanov

Chinggis Khan's activities were largely focused on organising the great Mongol Ulus after the 1206 kuriltai. He appointed his relatives, *nökürs*, guards, sons, younger brothers, and commanders of hundreds and thousands— young people of outstanding appearance, intelligence, and physical strength—civil and military administrators. Guardsmen were Chinggis Khan's 'blessing' (*kutukh*), his 'emchu kheshig,' or personal guard. *Hishigtens*, or guardsmen, were former *nökürs*. A *hishigten*, as a privileged civil or military state administrator, 'an outstanding representative of the ruling class in Mongol society' [Hsiao, 1978, p. 37], was to some extent a hostage in the Khagan's court, ensuring that the father or elder brother of a ten, hundred, or thousand commander remained loyal to the Khagan. *Nökürs* were personally dependent on the Khagan. Some *nökürs* were people adopted by the Khagan's family, and some were 'foundlings.' All were treated as younger members of the family. The guard needed night sentries, or *khebeuls*. It was strictly forbidden to know the number of *khebeuls* or be near them when it was unnecessary. A *khebeul* would even bring messengers carrying urgent reports to the Khagan. *Hishigtens* were the central state administrative body during the rule of Chinggis Khan. There was no clear distinction between functions such as guarding the Khagan and his camp, administering the court (the Khagan's clan, *aurug*) and administering the ulus (state) at the early stage of the Mongol state.

The Mongols adopted the Uighur script during Chinggis Khan's rule; young men in the Khagan's family and noble youth were obliged to learn to read and write. Some court people knew Uighur, Turkic, Jurchen, Kh-

itan, and Chinese. Did Chinggis Khan know any languages apart from his mother tongue? We do not know with certainty. However, the course of his life suggests that he could have had some knowledge of Turkic and Jurchen. Was he literate? Most likely, he was not. It was the *bichechi*, or scribe, who did the clerical work for the Khagan. The first *bichechi* was the *hishigten Sira Yagun*, then *Yelu Chucai*, a descendant of the Khitan ruling house, who served the Mongols. The *bichechi* managed a number of officials, including the *yarliqchi*, a dedicated position for executing the Khagan's orders. The secretariat kept '*koko defter bi-chig*'—that is, 'Blue Books.' They were used to record lists of subjects—that is, to register the population of the ulus; books of the same name were used to record court rulings.

Khebeuls were responsible for the Khagan's treasury. *Ulechis* and *morinchis* were responsible for horses, carts, and yurts in the Khagan's camp; *temchis*, for camels; *khonichi*, for flocks of sheep; and *khukerchi*, for herds of cows. *Nuntuuchis* were responsible for any migration of the Khagan's camp. *Hishigtens Ongur* and *Boro* were responsible for the Khagan's table, as well as for allocating food during military expeditions. The *khurchi* managed the court orchestra. Falconers and a group of hunting archers were responsible for the Khagan's hunts. 'Sabre carriers' 'eradicated theft and deception'; they performed police functions and apparently acted as judges at lower courts. The khagan's Supreme Court was known as *Gurderein Dzargu*. There is evidence that the code of law known as the Great Yasa initially contained common law regulations. Chinggis Khan said to his supreme judge *Shigi Khutuktu*: 'You hold the Great Yasa, Yeke Iosu. You,

Shigi Khutuktu, are the eye with which I see and the ear with which I hear!' [Kozin, 1941, p. 182]. It is unknown whether the Yasa was recorded when Chinggis Khan was alive. It probably was. It may have been found in his tomb. The official who kept the calendar was responsible for 'watching...years and months.' Shamans and court doctors lived with the Khagan's family. Kheboteul marshals of ceremonies were responsible for offerings made by the Khagan and his families, burial ceremonies, and funeral feasts. A special official was responsible for the Khagan's servants and those of his family.

It was common practice during the rule of Chinggis Khan, especially in the first years, to classify all affairs into 'domestic' and 'field.' Domestic affairs, namely those of the aurug and the Khagan's camp and his horde (nuntug), were addressed domestically. Field affairs, which apparently included military campaigns and various secret matters, were addressed in the field—that is, outside of the horde, where third parties could not see anything. Historian Hsiao Qi-Qing believes that the guard and its functions, which have been described above, constituted 'the nucleus of the original state apparatus' of Chinggis Khan [Hsiao, 1978, p. 44].

The khagan's camp looked like a ring with Chinggis Khan's yurts and those of his family and bichechi secretariat in the centre, surrounded by those of guard detachments. Hishigtens preserved their special status even after Chinggis Khan's death, under Yuan rule, when they continued to occupy at least one-tenth of all positions in the enormous administrative apparatus of Yuan China. Guardsmen mainly lived at the expense of the hundreds and thousands which they represented as hostages (apart from plunder). In 1263 Kublai resolved that new guardsmen should bring their people, horses, and cattle. Hishigtens began to live partially on salaries in 1281. The change was not completed in 1291. The guard as well as the army was replenished with subordinated and conquered peoples. By the early 13th century guard corps divided into wei sentries, and military agricultural units in the form of settlements of Chinese, Tangut, Karluk, Kipchak, and Alan people began to form.

Four ministers with the title of aka (viziers, or xiang in Chinese) were included in the central apparatus during the rule of Ögedei. As the conquest progressed, the practice of appointing vicegerents, known as darughachis (dargas), was developed and strengthened.

As for internal Mongol administration, when Chinggis Khan was titled Chinggis Khan as the Khagan of the all-Mongol ulus, he took the military administration model of nomadic states and divided the ulus into ninety-five military administrative units, called thousands. He appointed the people who had actively helped him to get the ulus, or to quote him, 'worked with me on creating the ulus,' as thousand commanders. Thousands were included in larger tumens of ten thousand warriors each and divided into hundreds, which in turn were divided into tens. Out of the eighty-eight thousand commanders, mentioned in the records as having been appointed before Chinggis Khan died, twenty-eight was his nökörs and hishigtens; the rest were their brothers [Ibid., p. 36]. That is, they represented the ruling class that surrounded the Khagan and his aurug without their ethnic affiliation being taken into account.

A thousand commander was responsible for administering the territory entrusted to him and its population, mobilising men bound to service to the army in wartime, and ensuring that every warrior had his own horse and weapons. A thousand commander collected taxes for the khan's treasury. He was obliged to arrange and ensure proper mail and transport service, or ula, and supervise the performance of these duties by his subjects, in particular, to ensure proper transport for elchis, who were the Khagan's messengers carrying paizas. The local population supplied horses for the ula—that is, the mail and transport system. The system had been in place for centuries in China; it was perfectly organised for the Khitans in Liao and the Tanguts in Xia. Descriptions of it that have come down to us suggest that it was fully adopted in Chinggis Khan's ulus and later spread beyond Mongolia.

The division of the population into tumens, thousands, hundreds, and tens was aimed at abolishing the old ulus system and tribal organisation where it had been preserved. Chinggis

Khan simply dissolved the Kereit, Naiman, Tatar, and other uluses, dividing the surviving population among different thousands, which he entrusted to his relatives and nökörs. When a tribe was smaller than a thousand people, it was

included in another tribe's thousand to reach the necessary number (that is, the size of an administrative unit's population that could supply a thousand warriors if necessary). Prisoners of war were also used to make up shortages.

§ 2. The Reforms and Yasa of Chinggis Khan

Mirkasym Usmanov

From the time of the Mongol conquest almost to the present all authors, writing about the military and political events of the 13th century, either directly or indirectly asked the same questions. They can be generalised as follows: What enabled the nomads—that is, culturally and socially backward people (sometimes called 'wild and cruel barbarians'), which were not even numerous, to regularly defeat settled populations, meaning culturally advanced and civilised states, and create an enormous empire—the Great Mongol Superpower—unparalleled in human history?

Many authors in the past, when posing the question, either fully or partly, reduced the answer to personal qualities—the 'genius' of Chinggis Khan and his talented commanders. Or correctly refraining from drawing any categorical conclusions, they left the questions completely open or confined themselves to stating well-known facts.

It was mostly Soviet historians of the latter half of the 20th century who began to provide more confident and categorical answers to these questions, trying to exhaust the problem as a whole. The multifaceted dedicated collection of articles 'Tatar-Mongols in Asia and Europe' [Moscow, 1970], which a reviewer assessed as the most effective attempt at generalising the complex issue [Kargalov, 1972, pp. 179–182], is representative of the trend. This is obviously why the second edition of the collection appeared only a few years later [Moscow, 1977]. To sum up the opinions and conclusions by the leading authors of the book as well as other Soviet historians who agreed with them, the following key reasons, formulated by another reviewer [Usmanov, 1972a, pp. 182–185], were

responsible for the Mongol victory: high discipline in the Mongol army, its incredible cruelty enabled by joint responsibility, the common practice of destroying cities and annihilating or enslaving the population of newly conquered countries using military equipment from China, Middle Asian states, etc.

The arguments aimed at persuading naive and ill-informed readers, or those confused by the pressure of propaganda, did not hold up under any criticism by serious historians, most of whom still had to keep silent for fear of being termed 'anti-Soviet falsifiers' or 'bourgeois nationalists.' First, it is not the backwardness, poor culture, wildness, or unruliness of 'savage people' that largely determines all social and military conflicts but a mature civilisation, high culture and social development, which—when taken together—provide extensive administrative experience and well-developed technology, in particular, military equipment. Second, it seems perfectly logical that the people who created powerful military equipment had every opportunity to use them, and not wild nomads from the steppe. Thus, the above arguments and reasons, which have been passed on from studies to textbooks, are dubious, to say the least.

Taking this all into account, it would be reasonable to shed more light on an important issue. Many general works more accessible to the general public, which to some extent deal with the history of the peoples of Central Asia, especially their relations with the population of settled communities, rely on a single definitive appraisal criterion, the key word—nomads. Nomads mean relatively uncultured or wild primitive barbarians, who usually not

only have no respect for other nations' cultural values, but who are also incapable of any transformations in terms of such development. They overemphasise the content of the appraisal criterion, which is questionable in principle. For instance, it is not reasonable to equate the nomads who lived three thousand years ago and those of the late Middle Ages, or the nomads from Central and Eastern Asia of the 1st century AD and those from the jungles of Polynesia, even the central part of Africa, of more recent times.

In fact, nomads can be very different. Unlike those of the Polynesian islands or African jungle, who have been frozen in their social development and more importantly are few in number, Central and Eastern Asian nomads, regardless of their ethnic affiliation, have taken a long path of social, economic, spiritual, and cultural development, for which various sources provide extensive evidence. That is, they created an authentic lifestyle, which is only possible in rough and hard geographical and climatic conditions, in which settled life would have been nearly impossible, while the land where it could be practiced had been long occupied by others. To stay alive, eat regularly, reproduce properly, and find enough water and grass both for themselves and for their livestock, they had to remain mobile—that is to say, nomadic. At the same time, they had to unite, eventually forming states, which they perfected to protect themselves from enemies and attack them. This is the way they lived for hundreds and thousands of years, resulting in a unique civilisation that would have been impossible in a place other than the steppe—the civilisation of steppe nomads of the climatically and geographically severe Central Asia and Europe in general. It may be qualified as a special type of civilisation.

* * *

From about the middle of the 1st millennium BCE to the early 2nd millennium AD, various nomadic and semi-nomadic peoples established themselves in Central and Eastern Asia, one after the other or, occasionally, somewhat synchronously. There were around twenty states, some of which were great empires that ruled

over vast territories (see overview in: [Kychanov, 1997; Klyashtorny, Savinov, 1994]). The first major state formation, which existed for several centuries, was the state of the Xiongnu (Hsiung-nu) people, the latest descendants of whom are known in the west by a variant of the ethnonym, the Huns [Materialy', 1968; Inostrantsev, 1924; Gumilyov, 1960]. During the rule of Chanyu Maodun The Huns State, with a population of 1.5 million people, was, to quote Sima Qian, 'as powerful as the Middle Kingdom,' which possessed considerably greater human resources [Materialy', 1973, p. 4].

After the Xiongnu people had left the historical arena of Central Asia, which at times encompassed parts of the Far East, there appeared the Xianbei, Tuyuhan, and Rouran state formations, consecutively or in part simultaneously. In the Mid-6th century the Turkic Khaganate was established, which existed until the middle of the 8th century. There then emerged, following the Uighur and Kyrgyz states, which were successors to the Khaganate in their own right, the states of the Khitan, Jurchen, and other peoples [Ye Lung-Li; 1979; Vorobyov, 1975].

These and other Central Asian states were mostly created by nomadic peoples. It must be pointed out, in this respect, that the overwhelming majority of these states, named after their individual ethnicities, had mixed populations, which was conducive to the exchange of experiences and cultural achievements. The names that have come down to us were mostly given to the states by their contemporary neighbours or were derived at a later stage from the ethnonym of the dominant ethnicity or tribal union.

The heads of many of these states, beginning with the Xianbei and the Rouran, were called khans or khagans, meaning they had similar systems of power and administration. The decimal system was used in some form or other in their military organisation. They lived in yurts and bred traditional forms of livestock, such as horses, cattle, sheep, goats, camels, and donkeys. They cross-bred the latter with mares, which would give them sturdy mules and stubborn hinnies. The skins, fur, and down of domestic and often wild animals were used to make everyday objects, including various arti-

cles of clothing. They had the skills necessary to produce essential arms. They were active hunters, which was important for securing their food supplies, and their cattle provided them with meat and dairy products. They used mares' milk to make a special drink known as kumis. They would often attack their near and more distant neighbours and rob them, frequently protect their land against attackers, but occasionally establish peaceful contacts with them, enter into marriage relationships, then break off alliance agreements, and form new alliances only to break them again. In short, they behaved like ordinary people. Hence, socially, organisationally, politically, economically, and culturally they had a lot in common.

The Mongols, who emerged on the historical arena in the 12th century but only became a dominant power in the 13th century, possessed all the above-mentioned life attributes of the earlier nomadic societies. Their military affairs and state administrative order, more specifically, their traditional origins and roots, are of particular interest to us here.

These issues were the subject of a dedicated and very detailed contemporary study by V. Trepavlov in his monograph 'The State Structure of the Mongol Empire in the 13th Century.' Relying on a wide range of sources and considerable historiographic experience, the author of this work analyses the main components of such traditional origins as information contained in written works, national memory (folklore), data provided by laws and regulations, and certain administrative skills that the Mongols borrowed from their neighbours and predecessors [Trepavlov, 1993, pp. 31–34]. The author provides reasoned evidence that these sources date back to the era of the Xiongnu and also the Ancient Turks [Ibid., pp. 18–21]. The latter 'had a decisive influence on the formation of economic types, political communities, and cultural traditions specific to Central Asia' [Klyashtorny, 1973, pp. 254–255]. His opinion that what was of great significance for Chinggis Khan was his relatively peaceful rapprochement with the Uighurs, the Karluks, and other Turkic peoples, who had a rich tradition of statehood, which was in fact a continuation of that of the ancient Turks, is very

convincing [Trepavlov, 1993, pp. 51–53]. All of this gave V. Trepavlov just cause to form the conclusion that, first, Chinggis Khan 'succeeded in ensuring that a large number of Turkic princes declared themselves his subjects,' and, second, 'the use of the ancient Turkic tradition of statehood in 1207–1223 enabled Chinggis Khan and his associates to secure additional social and military support outside Mongolia [Ibid., p. 58].

The reader may well be wondering in what way these traditions were adopted, or what 'devices' and means were used to impose them on the newly formed Mongol state.

I am inclined to see the answers to this question in the reforms by Chinggis Khan, which the overwhelming majority of recent and contemporary authors have hardly mentioned. Even objective studies by authors striving to ensure impartiality, who have seen and taken account of the results of Chinggis Khan's transforming actions, have managed to evade the issue—that is, failed to call this process by its proper name [Vladimirtsov, 2000, pp. 56–66]. It is probably their traditional prejudice that has prevented them from assuming that a leader of illiterate nomads could be capable of introducing any reforms. After all, sociopolitical, military, and administrative reforms are, in their understanding, attributes exclusively of civilised—that is, sedentary societies. However, what they have failed to take into account is the fact that the Mongol society, as an inherent part of the vast Central Asian world, having experienced over a thousand years of relatively close contact with other undoubtedly cultured and highly-developed countries of the Far East, had such direct predecessors as the ancient Turks and the Uighurs, who had created their own written tradition as well as a civilisation of its own, well adapted to the geographical and climatic conditions. This is evidenced by the ability of the Mongols to adopt, as mentioned above, the experience and traditions of their predecessors and contemporary neighbours at an early stage in the formation and development of their statehood. It is thus entirely feasible that Chinggis Khan succeeded in introducing a number of reforms in his ulus (khanate) in 1204, as noted by Ye. Kychanov,

which helped to consolidate his power and—in the long run—ensured successful external expansion. It is appropriate to note here that the term 'reforms,' used in reference to Chinggis Khan's activities, was only recently used legitimately in Russia [Usmanov, 2000, pp. 27–29], and, as we can see, this opinion is supported by Ye. Kychanov.

There is a body of sources that specifically provides evidence of the historicity of Chinggis Khan's reforms: a code of laws known amongst the Mongols as the *Jasaq*, and as the *Yasag*, or *Yasa*, amongst the Turks ('the Great Yasa' in the sources and certain studies); a collection of the khagan's pronouncements or, more specifically, instructions and recommendations called the *Bilig* ('knowledge,' 'wisdom'), which adds to or expands on certain provisions contained in the *Yasa*. It would be appropriate, therefore, to view them as a whole since, from all accounts (the way in which extracts from it have been preserved alongside fragments of the *Yasa*, or mixed up with articles of the code), the *Bilig* carried almost as much influence as the *Yasa*.

Of the Russian Oriental scholars, I. Berezin, an expert in medieval Persian and Turkic written sources, gives serious consideration to the importance of the *Yasa* and the *Bilig* [Berezin, 1864, pp. 404–421]. Ya. Gurlyand paid due attention to the extracts from the *Yasa* and the *Bilig*, which he regarded as one of the sources of later Mongol legislation [Gurlyand, 1904, pp. 60–80]. E. Khara-Davan presented a dedicated study on the history of the 13th century based on these materials in his book 'Chinggis Khan as a Commander and His Legacy' [1929]. The scholar was described by an expert in the history of Eurasia as 'the author of a profound biography' of the commander [Vernadsky, 2000, p. 34]. The materials contained in the *Yasa* and the *Bilig* were fundamental to the research carried out by V. Ryazanovsky, who published a major work on the common law of the Mongols in Harbin [Ryazanovsky, 1931, pp. 9–26].

The rather short but highly informative book by G. Vernadsky, published in Brussels in 1939, is of special significance for the historiographical interpretation of the importance of the *Yasa*. This author used the information contained in the *Yasa* in his research, too [Vernadsky, 2000].

However, in spite of the existence of such publications (albeit by earlier researchers, who have, for obvious reasons, remained barely accessible to a wider audience) and the accumulated experience, domestic historians have also tended to overlook, or rather ignore, those articles of the *Yasa* that are available to them, even though the source itself has not emigrated anywhere...

There are several reasons for this. First, the text of the *Yasa* and the *Bilig* has not been preserved in full, all that remains of them is scattered fragments, 'pathetic remnants,' to quote B. Vladimirtsov, 'which hardly enable us to imagine the whole picture' [Vladimirtsov, 2000, p. 64]. (The statement is, as we shall see, both categorical and somewhat one-sided.) Second, in the fragments that are preserved there appears to be a preponderance of articles reflecting everyday life and behaviour, which also seems to have given rise in some scholars to a caution, or rather a cautious distrust, in respect to their accuracy [Trepavlov, 1993, pp. 8, 40–41]. Third, and most importantly, the idea of a scientific approach to the question of Chinggis Khan's reforms in general was—and still is—met with prejudice, implying that nomadic and 'barbarian' life is not compatible with reformative changes. Finally, of political importance was the fact that Chinggis Khan's transforming activities were the focus of the so-called first-wave Eurasian scholars, who wanted to view the 'Mongol legacy' and experience as something positive for Russia.

The accuracy of the contents of the fragments that have been preserved, and of the historicity of the *Yasa* and the *Bilig* themselves, is beyond doubt [Vernadsky, 1939, pp. 5–6]. A simple comparison of materials by Rashid ad-Din, Juwayni, Maqrizi, Abu-l-Faraj, and certain Armenian and other authors of the 13th century will confirm this (contemporary studies also reveal considerable experience in this respect, for instance: [Vernadsky, 2000, pp. 106–116]). Thus, the fragments can be used to form an idea of a past event in general and of its individual elements in particular, for example, by biologists and archaeologists who use drops and pieces of broken crockery. It is no coincidence that authors contemporary to the

events as well as more recent scholars, striving to gain a deeper understanding of the history of the Mongols and the causes of their victories, have given due consideration to certain provisions and the entire content of the Yasa and the Bilig (for examples, see sources: [Juwayni, 2004, pp. 18–24; Rashid al-Din, 1952, I, 2, pp. 259–265]; recent studies: [Bartold, 1963; Vladimirtsov, 2000; Vernadsky, 2000, et al.]) All of this justifies our use of the surviving fragments of the Yasa and the Bilig.

Of course, the fragmentary nature of the materials and the untidy way in which the content of some articles is presented make the information obtained relative. However, even this relative information is representative to some extent. Let us, therefore, turn to the texts. (The extracts provided are from medieval records as well as contemporary publications, to enable the reader to compare and contrast them with other variants [Khara-Davan, 1996]. For the sake of clarity, I shall use longer quotes.)

According to one Mongol legend, Chinggis Khan took measures to create a code of laws, 'which would ensure the peace and well-being of all his subjects.' To this end, he invited 'a great teacher and his 18 disciples' and instructed them to 'make laws' [Ryazanovsky, 1931, p. 10]. This is how the Yasa was created, which was approved and adopted for universal use at the Great Kuriltai of 1206. New articles were added on numerous occasions, for instance, in 1210, 1218, and 1226. The Bilig was also enriched during the reign of the Khagan, as his new pronouncements and instructions were added. That is, they developed to meet the needs and interests of the rapidly growing state for 'the Great Yasa of Chinggis Khan formed the legal framework of the empire' [Vernadsky, 2000, p. 115].

The state, as is clear from the Bilig, **was viewed** by Chinggis Khan **as the composite** of a well-disciplined society, which recognises the priority of seniority and the principles of subordination, all of its members, and its clearly functional administrative links and their leaders, **who are responsible for the well-being of their subordinates** and their accountability to superior bodies up to the Khagan. Otherwise,

if these conditions—that is, legal requirements, were not met, society and the state could fall apart: *'If great people, bahadurs, and emirs (...) do not abide by the law, the state will be convulsed and fall apart; they will be eager to find [a new] Chinggis Khan but will fail'* [Rashid al-Din, 1952, I, 2, pp. 259–260; Khara-Davan, 1996, p. 209]. It must be emphasised that the instructions contained in the Yasa were binding on both the rulers of that time and on future rulers of the state: *'if their descendants, who come into the world and are raised to the position of khans, also maintain the law and customs of Chinggis Khan, which apply to every aspect of the people's lives, without changing them, heaven will help their state, and they will always live a content and happy life. The Lord of the universe will be graceful to them, and the inhabitants of the world will pray for them; they will live long and enjoy riches'* [Rashid al-Din, 1952, I, 2, p. 260; Khara-Davan, 1996, pp. 208–209].

These lines from the Bilig, according to which the misfortunes or well-being of the society and its different leaders are determined by the violation of or compliance with Chinggis Khan's instructions, are reminiscent of the famous ideas of the Turkic khagan, as expressed in 8th century epitaphs. They convey, in their own way, a very similar message, but in terms not of a positive but of a negative course of development of relations within the society: 'Turkic Beks and people, hear this! I have carved here [on the stone] how you, having gathered the Turkic people, have created a tribal union, how sinfully you have split apart (...),' and when 'younger brothers did not act like their elder brothers, and sons were not like their fathers,' their enemies 'separated the younger brothers from their elders (...); the Turkic people have disrupted their existing tribal union and brought about its destruction' [Malov, 1951, pp. 35–37].

Naturally, it would be wrong to infer the ideas contained in the Bilig directly from the ancient Turkic text. But it is entirely conceivable that a similar idea existed and was passed on from generation to generation in the memory of the peoples of the Central Asian societies, in their folklore mentality.

The earlier idea that there were prerequisites for the state's prosperity during the reign of Chinggis Khan was developed and implemented in accordance with his expectations. Chinggis Khan would, naturally, have taken the experience of other Central Asian states and those of the Far East into account. That is, the so-called 'Mongol idea' [Vernadsky, 2000, p. 104] of statehood had deep historical roots and was not confined to an ethnically narrow world. Hence, the Bilig and the Yasa were created not as aphorisms for everyday use but as a special tradition-based concept, according to which the entire society—that is, the state, was to be organised.

The accuracy of this conclusion is substantiated by the fact that the preserved fragments of the Yasa suggest that Chinggis Khan had an almost multifaceted—that is, holistic, approach to the structuring of the population of his state. He attached importance, above all, to the duties and responsibilities of leaders at every level, their ability to work and 'learn.' 'Only the emirs of the tens of thousands and hundreds, who come to listen to Chinggis Khan's biligs at the beginning and end of the year and then return, are capable of leading an army. Those, however, who sit in their yurt and do not heed the biligs, who resemble a stone that has fallen into deep water or an arrow shot into thick reeds (...), such people are not fit to be leaders!' Also: 'All those capable of maintaining order in a [whole] estate, all those who can properly marshal ten men for battle deserve to be given a thousand or ten thousand for they can marshal them for battle' [Rashid al-Din, 1952, I, 2, p. 260; Khara-Davan, 1996, p. 142].

As is clear from this text, Chinggis Khan's leaders were, first and foremost, military commanders because all men in the nomadic population who were subordinated to Chinggis Khan were, to use a contemporary expression, liable for military service: 'Every man (...) must serve in the army,' while 'those who do not participate in war personally must work for the benefit of the state for no remuneration for a certain period' [Khara-Davan, 1996, p. 144]. Abu-l-Faraj develops the wording of this provision more clearly: 'Men aged twenty years and older are recruited as warriors. An officer must

be appointed for each regiment of ten, a hundred, a thousand, and ten thousand men (...). No one may leave the regiment he has been assigned to for another place; if he does he will be killed, and so will the officer who accepts him' (quoted by: [Vernadsky, 2000, pp. 110–111]; see also: [Juwayni, 2004, p. 24]). The establishment of this military and, at the same time, serf order [Vernadsky, 1939, pp. 17–18] was possible because the decimal system was perfected and applied to all of the nomadic population that had preserved its tribal structures on the basis of the population's ability to supply the regiments of tens, hundreds, and thousands of warriors. This combined military and civil structure of the state's population, where 'the commander of a large army unit was, at the same time, a civilian regional vicegerent' [Vernadsky, 2000, p. 132], enabled the creation of an extremely mobile society, easy to control and keen to enjoy the spoils of war, which has been felicitously termed 'army people' [Gumilyov, 1970, pp. 174–175].

It was also convenient for levying taxes in the conquered countries. There is a clear description of this in one of the sources: '...standard census was introduced everywhere, the entire population was divided into tens, hundreds, and thousands, an army enlistment procedure was established, and duties on transport, travellers, and food were imposed in addition to the monetary taxes, and on top of all this a kopchur (a levy on cattle) was introduced' ([Juwayni, 2004, p. 25]; alternative translation by V. Minorsky: [Vernadsky, 1939, p. 50]). The implementation of a census in Samarkand, thus confirming the words of Juwayni, was reported by another historian [Rashid al-Din, 1952, I, 2, p. 208].

Whereas in the earlier nomadic states, beginning with the Xiongnu, the decimal system was only used for military organisation (at first apparently in the Khan's guard, and later in the rest of the army), Chinggis Khan applied it to all the population ruled by the Khagan. Thus, a revised decimal system was employed in the Mongol State (and later throughout the empire), facilitating the creation of the above-mentioned phenomenon—the 'army people'—on the basis of military territory and tribal affiliation, with

responsible commanders who were also vicegerents of certain areas.

From all accounts, these results did not come about immediately but were achieved by Chinggis Khan gradually. According to 'The Secret History of the Mongols,' after being elected khan and receiving the title of Chinggis Khan, he began by introducing new elements and the corresponding ranks of commanders in the military administrative system. Following his victory over the Keraites, he then implemented the decimal system in full [Kozin, 1941, pp. 109, 144; Trepavlov, 1993, p. 27]. Thus, Chinggis Khan's accomplishment of these transformations, or reforms, was conscious, not spontaneous, like the passive continuation of the long-established nomadic traditions. The fact that these measures and changes by the Khan were entirely deliberate is confirmed by the categorical instruction to: 'divide the troops into tens, hundreds, thousands, and tens of thousands. This order will enable us to gather an army within a short space of time and form command units' [Khara-Davan, 1996, p. 143]. This system ensured that the forces were enlisted 'with clockwork precision' [Vernadsky, 2000, p. 123].

From the beginning of his rule Chinggis Khan clearly took a number of measures necessary to optimise the administration of large units (thousands, tens of thousands) of his multitribal troops, such as the introduction of new military and court positions [Kozin, 1941, p. 110]. A somewhat indirect, or rather heavily folklorised, account of this process is given in the first section of the anonymous historical literary record 'Daftar-i Chinggis-name' [Usmanov, 1972, pp. 106–111]. It reports in detail that the newly enthroned Temujin assigned distinctive attributes to his associates—the tribal chiefs—that is, at the same time commanders of military units who had brought him to power. These included a special call (*uran*), a particular mark (*tamga*), a military costume (*saut*), and a symbolic bird (*kush*, possibly a banner element) [Ivanics, Usmanov, 2002, pp. 56–60, 228–232; Ivanics, 2002, p. 328].

Other aids were also used to ensure an efficient control of the forces in the battlefield. In addition to bearing diverse banners of various

colours, which belonged to the larger units, warriors of the units of hundreds and thousands were mounted on horses of the same coat colour [Khara-Davan, 1996, p. 149]. This presumably enabled the soldiers to quickly find their horses on the pastures, to distinguish some units from others, and to quickly find their place in the combat formation following joint attacks, battles, or withdrawals. This method was later used by the Tatar Mongol conquerors. For instance, Batu Khan imposed a horse tithe on the conquered princes of Ryazan not 'by articles,' which was the usual way, but by coat colour: 'white, black, chestnut, red, piebald,' etc. [Complete Collection of Russian Chronicles, 1, p. 514; Ivanin, 2003, p. 139, Note 6]. Horses were registered both by items and by coat colour in censuses carried out in Rus' [Vernadsky, 2000, p. 287]. There is further evidence that this procedure was traditional for the Mongols. For instance, in 1223 Jochi made his father a gift of '20,000 white horses' [Bartold, 1963 p. 522]. The question here is simply who was the inventor of this procedure—Chinggis Khan or his predecessors?

The fact that the military reforms were well thought out is evidenced by the importance that was duly attached to the behavioural or, to use a contemporary term, the psychological qualities of the troops. Above all, the commander was responsible for maintaining order and ensuring that the unit was constantly prepared to execute any order from above: 'Each emir of the units of ten thousand, a thousand, and a hundred must keep his troops in full order and prepared to start a campaign at any time when a firman (edict) or order is given, regardless of whether it is night or day' [Rashid al-Din, 1952, I, 2, p. 264; Khara-Davan, 1996, p. 143]. The commander had to ensure proper living conditions for the troops. The leader was supposed to be 'the person who knows what hunger and thirst are and can thus assess the state of others, who carefully prepares for the journey, and prevents his army from becoming hungry and thirsty and his animals from wasting away' [Rashid al-Din, 1952, I, 2, p. 262]. This conviction of Chinggis Khan explains the well-known fact that among his military leaders and talented commanders were many

men of common origin. Leaders were required to be personally (that is, internally, morally) upright: 'Anyone who can purify his inner being [of evil] can purify a [whole] domain from thieves' [Ibid., p. 260; Khara-Davan, 1996, p. 209]. Military commanders (who were civil administrators at the same time) and warriors were expected to lead a generally decent and modest life: 'Be meek as a young calf amongst the [civilian] population, but in war fight like a ravenous hawk swooping down its prey' [Rashid al-Din, 1952, I, 2, p. 261; Khara-Davan, 1996, p. 142 (variant)].

The requirement to be modest and meek amongst the population, the common people applied not only to the warriors and their direct commanders but also to higher officials, including the ruling dynasty. For instance, the Yasa introduced 'a laudable custom, which closed the door to servility, vaunting by titles, extreme arrogance, and unapproachability, which are common amongst the successful and the powerful. When one of them accedes to the throne as khan, he is given only one name—Khan or Kaan—and nothing more (...), while his sons and brothers go by the names that were given to them when they were born, both to their face and behind their back. This rule applied to the common people as well as the nobility (...) without distinguishing between the sultan and the common man' ([Juwayni, 2004, p. 20]; the same text is translated by V. Minorsky: [Vernadsky, 1939, pp. 43–44]). The historicity of this article of the Yasa is confirmed in Abu-l-Faraj's brief narrative that the custom of 'giving various lofty names' was characteristic of the Muslim rulers [Vernadsky, 1939, p. 54].

It was also the duty of the military commanders-administrators to prepare the youth to fight as soldiers: 'Military emirs must teach their sons to shoot arrows, ride on horseback and to engage in single combat properly, and make sure they exercise these skills. And in so doing, make [them] brave and fearless (...)' [Rashid al-Din, 1952, I, 2, p. 262]. Abu-l-Faraj provided the following detailed interpretation of the order: 'When Mongols are not engaged in war, they must devote themselves to hunting. They must also teach their sons to hunt wild animals so that they become experienced and

strong, energetic, capable of enduring fatigue, and ready to face the enemy as they face wild and untamed animals, without sparing [themselves]' (quoted by: [Vernadsky, 2000, p. 110]). A description of the types and techniques of the Khan's hunting, which was intended for training in the military arts, is given by Juwayni ([Juwayni, 2004, pp. 20–22], see alternative translation by V. Minorsky: [Vernadsky, 1939, pp. 44–46]). A more recent scholar also cites the importance of hunting for the development of the Mongol military art [Khara-Davan, 1996, pp. 154, 192].

Chinggis Khan established strict, even cruel regulations for his army. The slightest breach of discipline entailed some form of punishment, from corporal to capital. As I. Berezin notes, 'capital punishment is the predominant form of punishment' in Chinggis Khan's criminal code [Berezin, 1846, p. 45]. Members of the perpetrator's family were also subjected to repression. His treatment of those found guilty of deceit, betrayal, or treachery was particularly harsh. The instructions and the authority of the Yasa presumably played an essential role in the establishment of these regulations. As a result, Chinggis Khan succeeded, by 'suppressing every other will with his personality,' in establishing in his army 'a discipline so rigid that stealing and lying (...) were inconceivable' [Bartold, 1963, pp. 527–528].

The subjects' duty towards the state was not limited to military service. As has already been mentioned above, other duties also existed. However, 'each duty was assigned on an equal basis to all subjects of the Khan' [Vernadsky, 2000, p. 111]. The Yasa stipulated this in the following manner: 'Each person shall work like any other; there shall be no distinction between them on account of either their wealth or their power' ([Juwayni, 2004, p. 23]; alternative translation: [Vernadsky, 1939, p. 47]).

The quotes from the Yasa and the Bilig might create the impression that Chinggis Khan was striving by legal means to consolidate his state and create a highly disciplined, effective army, which would be 'meek as a calf' amongst his population. Indeed, he liked things to be legal and found it necessary to legalise in the Yasa savage, reprehensible human conduct,

such as robbery and plunder: 'It is forbidden, under penalty of death, to begin to plunder the enemy until the high command gives permission to do so. Once such permission is given, equal conditions must be ensured for all soldiers so that every soldier can take as much as he can carry, provided that he pays the collector the emperor's due share.' [Khara-Davan, 1996, p. 144].

This article of the Yasa reflects the essence of all the aspirations, the activities, and the military policy of Chinggis Khan, who, being a son of his epoch, took the path, as elsewhere during the Middle Ages, of 'legalised' plunder, robbery, and quite naturally the further exploitation of conquered peoples.

The results of Chinggis Khan's military reforms are familiar to everyone. Bloody conquests, the death of tens and hundreds of thousands of people, the suffering and humiliation of millions of survivors bear witness to them...

The so-called 'triumph of the Mongol arms' in the first half of the 13th century was in fact a heavy blow for the Mongols as it reduced their numbers dramatically, turning the country into a backward peripheral state (see: [Sandag, 1970, p. 42]), while at the same time serving as another illustration of the prospects of imperial peoples. There is, therefore, no need to provide further evidence of the consequences of these military transformations with the help of other authentic sources.

The Yasa contains special civil regulations, in particular those concerning family relations. Chinggis Khan evidently viewed the family as a unit of the state. The following statement is characteristic of him: 'When her husband is away hunting or at war, the wife must keep the house neat and tidy so that an ambassador or guest staying in the house can see that everything is in order; she must also prepare good food and provide everything the guest needs. [Such a wife] naturally creates a good reputation for her husband, raises his name, and [her husband] will be elevated at public gatherings like a mountain. The good qualities of the husband are told on the good qualities of his wife.' ([Rashid al-Din, 1952, I, 2, p. 261]; alternative translation: [Khara-Davan, 1996, p. 209]). And 'women accompanying the troops did the mens'

work while the latter went off to battle' ([Ibid., p. 214]; according to Maqrizi: [Vernadsky, 2000, p. 111]).

The subordinate social status of women was determined by the following instruction: 'The son shall determine the future of his dead father's wives, except for his mother; he can marry them or marry them off to another.' The following directive of the khan is also representative of the ideas of the time: 'introduce all your daughters to the sultan (khan) at the beginning of each year so that he can choose some for himself and his children' ([Khara-Davan, 1996, p. 214]; see variant: [Vernadsky, 1939, p. 49]). Taking into account the fact that, for instance, Chinggis Khan had many concubines in addition to his four official wives [Bartold, 1963, p. 528; Vladimircov, 2000, pp. 122–125], while Batu, as reported by William of Rubruck, had twenty six women; his son Sartaq, six; and the latter's eldest son, two or three more ladies [Puteshestviya, 1957, pp. 92, 111], the need for such an annual 'beauty pageant' is apparent.

Scholars have always been particularly interested in the attitude of Chinggis Khan and other Mongol khans to religion and to religious tolerance. The range of opinions is wide. Some, mostly medieval authors, attribute the Mongols' 'strange behaviour' to their backwardness and lack of education; others, especially scholars, tend to view the unique phenomenon as indicative of a kind of abstract humanism. A third group believes that the peculiar religious policy of the early Chinggisids can primarily be attributed to their 'political pragmatism.' The author of these lines once adhered to a similar opinion, as he was influenced by the wide-spread historiographic tradition (for more information on this and a short list of sources of dedicated studies, see: [Usmanov, 1985, p. 117 ff.]).

Several works have appeared in recent years that correct some biased concepts of the past, including my ill-considered statement that the actions of Mongol khans were predominantly motivated by 'political pragmatism.' 'The Mongols' religious tolerance is solely attributable to their beliefs and not political motives' [Krivoshcheyev, Sokolov, 2002, p. 165]. I agree with the correction. It is rightfully applicable to the

actions of the early Chinggisids—that is, until approximately the middle of the 14th century, exclusively. However, the situation changed dramatically later, and the pragmatism of religious policies increased. By imposing the mores of recent politicians onto figures of the ancient past, we cannot but ignore their right to have beliefs of their own. This is the first point. The second is that by ignoring data from adequate sources, which in this case includes the legal regulations of the Mongols of that epoch—enshrined in *Yasa*—we also commit such mistakes.

The following articles in *Yasa* are important: 'We order everybody to believe in the One God, the creator of the sky and the earth, the only granter of wealth and poverty, life and death.' Also: 'respect all faiths without giving preference to any (of them). This all (...) as a means of pleasing God' [Khara-Davan, 1996, pp. 134, 213; Ryazanovsky, 1931, p. 13]. As Chinggis Khan 'did not profess any religion, he did not show any intolerance or prefer any religion to another (...); on the contrary (...), he looked at Muslims with respect as well as favoured Christians and pagans' ([Juwayni, 2004, p. 20]; variant by V. Minorsky: [Vernadsky, 1939, p. 43]).

Data provided by authentic sources suggests that Chinggis Khan's beliefs were not merely declarative. Not only abstract religions but also ministers of various denominations and their temples enjoyed significant privileges. Representatives of different religions admitted this, as seen in their statements about the *Yasa* articles. For instance, according to a Muslim author, all descendants of Ali and other saints were relieved of 'any taxes and tributes; taxes and tributes were not imposed on any fakirs, readers of Al Quran, lawyers, doctors, scholars, prayers and hermits, muezzins, and those who wash the bodies of the dead.' Vartan, a Christian, gave a clear and informative account of some provisions contained in the *Yasa* articles: 'Chinggis Khan's *Yasa* prohibits lies, theft, adultery; it states that one must love one's neighbour as oneself, insult nobody and forget any insults completely, spare countries and cities that are willing to submit, relieve of any tax and respect temples dedicated to God

as well as his ministers' ([Khara-Davan, 1996, pp. 213–214]; see variants.: [Vernadsky, 2000, pp. 108, 111]).

Reports in other authentic sources, such as works by Giovanni da Pian del Carpine, William of Rubruck, and Marco Polo, confirm the historicity of the regulations as they not only provide detailed accounts of the Mongols' devoutness but also emphasise their tolerance to representatives of other religions [Travels, 1957, pp. 28–29, 118–119, 127–130, etc.; Marco Polo, 1955, pp. 95–98, 102–103, etc.].

Thus, according to I. Korostovets, *Yasa* generally encouraged 'religious tolerance, respect for temples, the clergy, and the elderly, and mercy for the poor' (quoted by: [Khara-Davan, 1996, p. 136]), which a contemporary scholar presented in a briefer and clearer manner: 'GChinggis Khan's *Yasa* ensured equal conditions for all religions' [Yurchenko, 2002a, p. 246].

At the same time, there is a phenomenon that might at first seem counter-intuitive: in spite of the individual preferences of Chinggis Khan's sons and grandsons for certain religions and their constant squabbling and rivalry over power (for details, see: [Bartold, 1963, pp. 531–584]), the key regulations on religious equality contained in *Yasa* were adhered to. This can be seen in the successions to the throne in the Jochid Ulus. First, Sartaq, a Christian (Nestorian), succeeded the Shamanist Batu, who was then followed by the Muslim Berke, and then the Shamanist Mengü Temür, etc. [Bosworth, 1971, p. 203; Vernadsky, 2000, p. 143].

Thus, the founder of the Mongol Empire carried out a major transformation and established a rigid order in the society's spiritual life. As a result, from the time the Mongol state was established in the early 13th century to the Mid-14th century—that is, during the rule of the khagan and the early Chinggisids, there were no religious wars, violence against specific ethnic groups, or mass campaigns to force people into Islam, Christianity, or Buddhism in the Eurasian domain. Shortly prior to this, the crusades were aflame in the West, and measures to combat 'religious heresy' developed into the inferno of the Inquisition (in the 11–12th centuries). Some members from

the clan of the Muslim Berke Khan 'adhered to all pagan rituals no less than in Mongolia' [Bartold, 1968, V, pp. 506–507]. It was during his rule that an Orthodox Christian eparchy was founded in Sarai, and the Christian clergy was privileged [Poluboyarinoва, 1978; Kri-vosheyev, Sokolov, 2002, pp. 166–170]. The Chinggisids were able to preserve elements of religious tolerance later on. For instance, Rus' captives were not subjected to circumcision in the Khanate of Kazan...

Yasa apparently contained numerous articles and regulations on ownership and property rights, both between individuals and within the same family. For instance, 'Children born by a concubine shall be treated as legitimate and will gain their share of the heritage as established in their father's will. Division of property shall be as follows: The eldest son gets more than the younger ones; the youngest son shall inherit his father's household. Children's elder-ship shall be determined by their mother's status; one of the wives is always senior, mostly by marriage time' [Khara-Davan, 1996, p. 215].

Reports by foreign travellers of the epoch, who were able to adequately analyse what they witnessed, confirm that the population of the empire adhered to all the paragraphs of the Yasa regulations on 'family affairs.' [Putesh-estviya, 1957, pp. 26–27, 92, 94; Marco Polo, 1955, p. 88, etc.]

Any form of property was considered sacred. One who violates the law shall be subjected to a strict punishment, including corporal punishment [Khara-Davan, 1996, pp. 143, 213]. For instance, even one who sees a piece of luggage fall off a transport in front of them but does not return the dropped item to the owner shall be punished, as well as one who hides a runaway slave without returning him to the previous owner [Khara-Davan, 1996, pp. 143, 213]. If 'anybody is found to keep a stolen horse, he must return it to the owner along with nine more similar horses; if he cannot pay the fine, his children shall be taken away; if he does not have any children, he shall be slaughtered like a ram' [Ibid., p. 214]. Giovanni da Pian del Carpine reported that it was common to return all lost items and live-stock for no charge, adding that the population

of the empire did not lock their doors [Putesh-estviya, 1957, p. 34].

The code contained articles then viewed as dealing with behavioural, moral, and ethical issues. Mongols had the same vices as representatives of other human societies, including normal civilised countries—various types of sexual deviations, from adultery to sodomy, drinking, rudeness in everyday life. So the punishment for any adultery was death 'regardless of whether the person is married or not'; both parties were to be punished; 'they can be killed at the scene' [Khara-Davan, 1996, p. 216]. Those who besmeared water and fireplace ashes with their urine were subjected to the same punishment [Ibid., p. 213] because for a Mongol living in the steppe, like any nomad, water and fire, apart from being sacred (fire was believed to be purifying), were always valued in everyday life as they prevented death from heat and cold (glowing embers were often kept in ashes, which could be used to make more fires...).

Policy makers attached particular attention to the problem of wine and drinking. 'To drink wine and vodka is neither healthy, reasonable, nor virtuous, nor does it ensure good manners and deeds.' On the contrary, it causes bad deeds, fights, and murder. It is especially harmful to rulers: 'An emperor who has an addiction to wine and vodka cannot commit great deeds, issue biligs, and [establish] important customs; an emir who has an addiction to wine and vodka cannot keep neither a thousand, a hundred, nor a ten [of his troops] in order and cannot complete his tasks [successfully], because 'a person who drinks wine and vodka gets drunk and becomes blind, (...) deaf (...), and dumb (...)' [Rashid al-Din, 1952, I, 2, p. 262; Khara-Davan, 1996, p. 210]. Drinks from hops are also harmful to common people for those addicted to them 'drink away their horse, their herd, and everything that they have and become poor' [Rashid al-Din, 1952, I, 2, pp. 262–263].

At the same time, while emphasising the negative effects of drinking, the severe conqueror, who established cruel punishments for violating the rest of his orders, remained quite mild to drunkards. He did not establish any strict punishments for them. On the con-

trary, he found it acceptable for a person with a heavy addiction to alcohol to get drunk 'three times per month,' preferably two, while 'once is even more commendable; if he does not drink at all, what can be better?!' The following thoughtful conclusion is also characteristic: 'But where can one find a man who does not drink! If such a person exists, he should be appreciated greatly!' [Ibid.]. The indulgence of drinking must be attributable to the fact that Chinggis Khan enjoyed wine at times, though he always did it to a moderate extent [Vladimirtsov, 2000, pp. 122–124], while some of his sons, for instance, Ögedei, were known to be wine lovers [Bartold, 1963, p. 532]. (It should be noted that the severe khan himself was selective in applying established punishments. While common people found guilty of a crime were subject to 'physical annihilation'—that is, capital punishment, members of the khan's clan were only subject to removal from their position 'for violating Yasa' (!)[Vernadsky, 2000, pp. 112–113].) Reports in authentic sources are indirectly representative of the policy maker's peculiar attitude to spirits, which he ostensibly did not favour. According to Giovanni da Pian del Carpine and William of Rubruck, drinking was very common for the Mongols [Puteshestviya, 1957, pp. 35, 95]. Thus, the absence of any categorical prohibition caused the vice to survive, presenting another, though indirect, evidence of the efficiency of the regulations contained in Yasa, their influence on the state structure, everyday life in the society, quality of its military organisation, and the populations' behaviour. To sum up, as Yasa was 'relentlessly strict, perfect order was soon established in Chinggis's empire; murder, robbery, deception, and adultery became rare in the Mongol community' [Vladimirtsov, 2000, p. 64].

Quite naturally, the strict regulations of Yasa and Bilig did not prevent Mongols, like members of any other society, from breaking laws, which was done both secretly and with the assistance of the powers that be, for example, with princes. Some scholars are inclined to view the intention of certain uluses, such as the Golden Horde, to withdraw as a violation of Yasa [Berezin, 1864, pp. 416–420; Gurlyand, 1904, p. 72]. In such a case, the agreement

made by princes on the Talas River in 1269, under which the Jochid Ulus was recognised as sovereign [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1941, p. 77] was a collective violation of Yasa. However, minor violations were too few to be noticeable, while the Agreement of Talas was 'legitimised' by the kuriltai of the same princes...

The legal framework established during the rule of Chinggis generally survived his successors in all the uluses of the empire, which was positively influenced by the preservation of the union as a confederation. Rulers of the Golden Horde adhered to the Yasa provisions. For instance, Yasa violators were executed on the order of Batu Khan. Besides, the Turkic-Mongol peoples of the epoch 'attributed a semi-magical power to the Great Yasa'; it influenced the law of other Turkic-ruled countries as well. For instance, the Mamluk 'Sultan Baybars intended to apply the laws and regulations of Yasa to Egypt. The essentially secular law of the Mamluk Kingdom, known as as-Siyasa, was in fact based on Chinggis Khan's code' [Vernadsky, 2000, pp. 107, 115–116]. During the rule of Berke the provision on religious tolerance expressed in Yasa was adhered to. Ibn Battuta reported that there was no practice of stealing and guarding pasturing cattle, and that it was common to return a stolen horse with a nine-fold fine [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1884, p. 282]. Besides, all foreign travellers visiting the Golden Horde from the Mid-13th century to the Mid-14th century, having been all across the country (from Giovanni da Pian del Carpine to Ibn Battuta), emphasised that it was generally safe and favourable for travellers. In fact, they did not mention any attacks or robberies.

The postal and transport service functioning 'all along the country and across it' was efficient and safe (quoted by: [Vernadsky, 1939, p. 49]). It was also stipulated in Yasa that the service must be organised (all rulers were to establish permanent post structures 'so that all state news arrived quickly') [Khara-Davan, 1996, p. 214]. Another witness, who travelled across most of Eurasia in the Mongol epoch, described the types of services provided by the smoothly operated, well-supplied transport service and

the efficiency of this communication system ([Marco Polo, 1955, pp. 121–122]; see also [Vernadsky, 2000, pp. 132–133]).

Thus, the above-mentioned social and organisational transformations and reforms in the various spheres, including everything from the state's military and administrative structures to the population's spiritual, moral, and living standards, resulted, as has already been stated, in the emergence of a mobile, highly disciplined, 'army-people,' easy to control, and transparent. It is thus no coincidence that competent western diplomat-spies, who had visited the Chinggisid domain, such as the Franciscans, 'described the empire as a highly organised social world and not a world of chaos, as their western contemporaries had believed' [Yurchenko, 2002c, p. 115].

It should be emphasised, however, that a number of innovations put into practice by Chinggis Khan were not novel for the nomadic world in general. Many of the military, administrative, social, legal, and behavioural rules and regulation that he established were not invented by him. He adopted elements or ideas from the experiences of many centuries, including the ancient administrative tradition and common law of many Central Asian peoples, and formed a more or less well-structured system, which he raised to the level of special Yasa articles—an official Law binding 'for everyone, including the Khagan, Chinggis Khan' [Vladimirtsov, 2000, p. 63].

All of this taken together enabled the ruler to quickly mobilise the physical energy and material resources of the very manageable 'army people' and, metaphorically speaking, hit the enemy or, to be more accurate, the victims with a tight fist. The victims responded by waving their hands with 'fingers spread wide'—hastily gathered, loosely-knit, often inharmoniously acting fighters from sedentary societies and states. The societies were torn by internecine feud—that is, deep sociopolitical crises, while their separatist princes and rulers 'placed their personal interests above that of the society' [Gumilyov, 1970, p. 369]. Think of the relations between North and South China, the internal differences within the vast state of the Khwarezm shahs, which in fact turned out to be

'truly a colossus with feet of clay' [Petrushevsky, 1970, pp. 101–116], as well as the inter- and intra-tribal internecine feud in the Great Steppe, and, finally, the fratricidal squabble among the principalities and princes of the Rus', which lasted for more than a century. To crown it all, think of the shameful disaster of the Battle of the Kalka River, dated 31 May 1233.

The enormous Chinggisid superpower, covering more than half, or even 4/5 [Khara-Davan, 1996, p. 162] of the entire Old World, stretching from the Pacific Ocean and almost to the Atlantic, was created within as little as 60–70 years. Thus, the establishment of the Mongol super-empire resulted from both the general boom of nomadic civilisations, which peaked in the 12–14th centuries, and the weakness and fragmented state of many sedentary countries and peoples of Eurasia, which entered a period of a dramatic sociopolitical crisis in the same period.

It is because of the events and against the backdrop of the crises and victories that the new state formed and developed—the Jochid Ulus (the Golden Horde), which, contrary to all recent debates, had a civilisation of its own (for more detail see: [Kramarovsky, 2005, pp. 15–31, 37–53]), which had both Central Asian and Far Eastern roots and a Eurasian, Middle Eastern origin.

This is a brief answer to the 'difficult' questions set at the very beginning of the text.

* * *

The material analysed helps to trace the substance of Genghis Khan's reformatory changes in a very clear and comprehensive way. Whether or not one believes the transformations were carried out in the Mongol State in the early 13th century depends on whether one wants to admit their historicity. The issue of the real or questionable existence of a unique nomadic civilisation among the peoples of ancient and medieval Central Asia, or Eurasia in general, are also applicable. Here one also needs to take a position regarding the Eurocentric approach towards interpreting and presenting the history of other peoples—that is, whether the nature and concept of civilisation should be reduced to a single model.

At the same time, the author of these lines realises that it will take time to provide a more or less comprehensive solution to the above issues. The present essay gives an account highlighting the importance of surviving Yasa and Bilig fragments in order to understand the specific nature of the given sociopolitical historical phenomenon—that is, the reasons, conditions, and results of the Turkic-Mongol conquests in the time of Chinggis Khan and his near successors. Thus, the famous statement that the 'wasted remnants' of Yasa can hardly provide an idea of 'the whole' [Vladimirtsov, 2000, p. 64] is both rightful and subjective.

The statement is rightful because the fragments, indeed, can hardly be used to obtain a sufficiently complete idea about the contents of Yasa. However, it ignores the informative potential of studying the specific aspects of the military, political, and social history of Central Asia in the 13–14th centuries as a whole.

To ensure a holistic understanding of the history of Turkic-Mongol conquests in gen-

eral in the future and the significance of other specific issues in particular, a comprehensive textological study of the relevant sources has to be carried out. Most importantly, these include fragments of Yasa and Bilig, Arab-Persian works containing extracts from them, and information in Chinese sources, both direct and indirect. In my opinion, it would be rather interesting and even useful to involve the 'ethnographic' relics of Yasa and Bilig that existed or still exist in the everyday life of a number of Eurasian peoples as elements of their common law and behavioural standards. As we have already seen, the 'rules' borrowed from common law and the experience of previous epochs and other peoples in the 13th century, having existed as an official Chinggisid law code for some time—that is, as universally binding orders, continued and partly continue to function as components and elements of the common law and behavioural standards of a number of Eurasian peoples.

CHAPTER 4

Mongol Conquests in Middle Asia and Eastern Europe

§ 1. The Military Organisation and Armaments of Chinggis Khan's Troops

Mikhail Gorelik

War was of primary importance for the history of the Chinggisid state, as it was for all states in the Middle Ages. What is different is that the Chinggisids had a higher level of military progress as compared to their neighbours for a long period of time, which brought about large-scale and relatively rapid conquest. It also determined the fact that it was not their neighbours who were all more or less subordinated to the Chinggisids but their own family members fighting for the territory of the Golden Clan who posed the gravest danger.

Military progress was determined by the state's organisation, military arts, armament, and mobilisation capability. The role of economics was indirect because even an underdeveloped and thin productive base could be used to subordinate the economies of conquered states to supply one's own military needs, which Mongol conquerors did brilliantly in the first stages of their rule in the conquered countries.

One of the most complicated issues is the composition of the army of Batu Khan, who conquered the territory that later became the territory of the Golden Horde. Some scholars refer to 'Jami at-Tawarikh' by Rashid al-Din to state that the army only contained 4,000 Mongols from the Sijut, Kingit, and Hushin tribes, while 'at present (late 13–early 14th centuries M. G.) the army largely consists of descendants of the four thousand people; who have come recently from Russian, Circassian, Kipchak, Majar, and other tribes that have joined us' [Rashid al-Din, 1952, I, 2, pp. 274–275]. At the same time, Rashid al-Din reported that the large-scale campaigns of Batu Khan were in fact undertakings of the entire 'Golden Clan,' represented by numerous grandchildren

of the founder of the empire, each leading the troops of specific Mongol tribes. It should be noted here that, in contrast to the common opinion that Chinggis Khan ruined the tribal structure of the Mongol society, it was rather individual rebellious and hostile tribes that he destroyed. The military and political structure of the Mongols in the Chinggisid states was quite a harmonious combination of tribal and military administrative principles. Although the princes, whose domains lay beyond the Jochid Ulus, were expected to take away their warriors after the campaigns, the tribal composition had a Turkic-Mongol composition, judging from their names.

Thus, non-physical sources indicate that the Mongol invasion brought a powerful Central Asian Turkic-Mongol cultural component to Eastern Europe.

Whether ethnic Tatars were present among the invaders in Eastern Europe is of utter importance, especially in the context of the present book. There is an opinion that says that the term 'Tatars' to denote Batu's troops is an exonym actually meaning Mongols, existing from China to Western Europe. However, if we turn to Rashid al-Din, we will see the Tatars proper—from the Alchi tribe—at the top of the power pyramid of Batu's house. Batu's senior wife, the famous Barakchin, as well as the wife of Khan Tuda Mengu belonged to the tribe. In addition to the high status that the queens had in the Mongol establishment, it is safe to say that each of them brought her family members to power. It is hard to tell whether or not the senior emir of Batu's time, Ture Qutlugh, and Timur Beg, the ulug karachibek during the rule of Mengu Temir, both Alchi Tatars, whom Rashid al-Din mentioned in his

work, belonged to the queens' families. It is easy to guess though that each brought along thousands of Tatars to occupy lower and common posts. These manifold representatives of the Central Asian steppes brought the Chinggisid cultural tradition to Europe. The Tatar tradition proper, which was quite authentic and distinguishable from the Mongol one in the 11–12th centuries, had already fused with that of the Mongols by the mid-13th century, contributing certain headgear types, the tradition of using feathers to decorate them, and authentic cuts of overclothes and their details. For non-Mongols and non-Tatars this represented a united imperial culture.

Judging by the more recent tribal list in the Jochid Ulus, the troops that the Chinggisids brought to Europe included Khitan-Kidan people, the Mongolian-speaking predecessors of the Mongols in terms of creating empires. It should be mentioned that the Chinggisids made use of their extensive military and administrative experience. There were different types of Khitan people in the Mongol Empire—the Central-Eastern Asian Khitans, who had been conquered by the Jurchens and had yielded themselves to Chinggis Khan, and the Middle Asian Kara Khitan people, who had left the Jurchen-occupied land and owned most of Turkestan for over a hundred years before the Mongols conquered their new home.

According to Rashid al-Din, the next group in the military contingents of the Golden Horde was the Kipchaks. The role of this important ethnic group has undoubtedly been overestimated (for the society of the Golden Horde) by both foreign and especially domestic scholars. The Kipchaks have been (and still are, by most of scholars) identified as the pre-Mongol inhabitants of the southern Russian steppes—the Polovtsians in ancient Russian chronicles and the Kuns and Cumans in European ones. However, S. Klyashtorny has recently proven that, in spite of their close affinity, the Kipchaks were not identical to the Sary, Kun, and Kai tribal unions, who were actually Polovtsians and Kuns (see Volume 1 of *'The History of the Tatars'*). It can thus be inferred that the first large Kipchak group was brought to Western Europe by Khan Batu

during his European campaigns and conquests. The numbers of Kipchaks could have further increased due to an inflow following the khans of the left wing of the Jochid Ulus, who often took the Sarai throne. As for the Polovtsians, they were largely slain by the Chinggisid troops. Part of them was able to escape westward to Hungary, Bulgaria, and other countries in Central Europe. Another part was deported to the east. Only a small number of them continued to roam the south Russian steppes.

The next ethnic group that appeared in the south of East Europe along with the Mongol invaders, according to Rashid al-Din, was the Majars. Muslim authors tended to attribute two meanings to the term. In most cases, it was used to denote the Bashkirs, who, by the way, are reported to have eagerly joined the Mongol invaders. In other cases, it mostly denotes the indigenous people of 'Great Hungary'—nomadic Hungarian-Magyars, who stayed in the Volga-Yaitsk Steppes after most of the Hungarians moved westward in the early 9th century. Anyway, whether they were Bashkirs, Magyars, or both, they undoubtedly were numerous as they appeared far west of the Yaik, accompanying the Chinggisid troops. Evidence of this can be seen in the name of the North Caucasian centre of the Jochid Ulus, which is called Majar. The name has long enabled some scholars to assume that large Hungarian contingents were present in the Kuban River Steppes back in the time of the Khazar Khaganate, beginning as early as the 7–8th centuries. In fact, the Hungarians of that period lived much farther to the north, while the name Majar is attributable to the trans-Yaik warriors whom Mongol rulers brought to the Kuban River Region.

Recent discussions have centred on a number of discoveries in the Volga Region and areas to the west of it, which are mostly iron, often with silver-inlaid strap accessories used for belts, harness, etc., pertaining to the Askiz archaeological culture—that is, to the Yenisey Kyrgyz people. The discoveries led a number of scholars to infer that bearers of the culture were physically present in the Volga and Kama Region in the pre-Mongol peri-

od. The materials found in the ancient town of Zolotarev, which was ruined as a result of military action in the early 13th century, have even given rise to the hypothesis that a Kyrgyz garrison (in the Bulgar army?!) was slain by Mongol invaders while heroically defending the fortification.

In fact, the only way in which the Askiz set of discoveries could have entered East Europe is with Mongol troops. Any mass presence of Central Asian strap accessories in the Volga Region and West of it in the pre-Mongol time is impossible. The thing is that it was Volga Bulgaria that not only produced but virtually monopolised the manufacture and trade of such prestigious, highly specialised, mass, and expensive (extremely profitable) articles as strap accessories in the area from the Middle Dnieper to the Trans-Ural Region beginning with the 11th century. The Bulgars would not stand any competition from the Kyrgyz people, who lived thousands of kilometers east of them. They could only, at best, buy certain Kyrgyz export products for their own needs or to resell them. They were by no means interested in distributing Kyrgyz toreutic articles, especially as they had carriers of the handicraft tradition living among them, as that would undermine Bulgar handicrafts. Besides, many authors view the 'Mongol epoch' as beginning in 1237, the time of Batu's invasion of East Europe. Yet, the time aberration can cause a number of mistakes in research on the territories east of the Volga. Turning to the Kyrgyz issue, we should emphasise that the Kyrgyz 'Mongol epoch' began in 1207, when they were annexed by the Mongol State. This was accomplished by Jochi, the father of Batu, as well as Orda, Berke, and other princes who later led the conquest of East Europe. It would be natural to assume that the services of skillful Kyrgyz toreutic workers were put to use by the house of Jochi; their articles became traditional for the subjects of the Jochid princes. The first items that they received were old, dating back to the 12th century. Later the craftsmen, their traditions, and their production moved westwards along with the Jochid troops. The Kazakh steppes, adjacent to Bulgaria, became their home already

13th century Mongol horseman
Reconstructed by M. Gorelik

in the 1220s. They maintained communication networks for 10 years, a very long period for the development and establishment of any handicraft. Thus, the abundant materials in the ancient town of Zolotarev, a Bulgar borderline outpost in the Asian part of the Sura River Region, which are often used to illustrate the myth of a Bulgar-Kyrgyz anti-Mongol alliance, only indicate that the detachment from Batu's army that was defeated while defending the settlement was either composed of Kyrgyz soldiers or was traditionally supplied by Kyrgyz toreutic workers.

We should now analyse the state of the Chinggisid invaders' troops in the second third of the 13th century, when they were conquering European territories. By that time, they had already invaded and annexed southern and western Siberia, the north of China, Tangut, Eastern Turkestan, Mawarannahr, Khwarezm, the north of Iran, and the Caucasus. The territories, including that of Mongolia, were ancient and well-developed centres of military production of arms and munitions; China and the Muslim regions were also centres of military engineering. However, Mongol rulers built their military apparatus pri-

marily on the Central Asian steppe tradition, to which they gave an authentic form.

The classic steppe way of organising military contingents is the decimal system, dividing soldiers into tens (*arban*), hundreds (*jagun*), thousands (*mingan*), and corps of ten thousand soldiers (*tumen*). The clan and tribal structures of Mongol ethnoses were disrupted only in those cases in which the tribal union was very large, had been a stable state-type political union before being annexed by the empire of Chinggis Khan and his descendants, and was openly hostile to Chinggis Khan's clan. This applied to the Naimans, to a lesser extent to the Keraites, but especially to the Tatars. Such hostile unions were dissolved and divided among princes and higher military and court noblemen. The only reason for dividing friendly Mongol tribes was because of a large size, to ensure efficient commanding and convenient military units. Small tribes that were merited by Chinggis Khan's clan were taken intact as military unions. These included the Manhud (*Mangyt*) and Urud tribes. Hostile clans and tribal Mongol nobles were annihilated in the process of military and state formation, to be replaced by members of Chinggis Khan's clan or merited people personally appointed by the khagan. The nobility of the tribes friendly to Chinggis Khan's clan was not replaced; it was only re-subordinated to someone appointed by the Chinggisid khagan. It was common practice to establish a connection between it and the ruling clan through marriage. The situation with Turkic-speaking nomads was similar to the Mongol tribes, though the Turks were quite naturally a step lower.

It was even easier for Mongol rulers to introduce the decimal system to contingents supplied by regions with a well-developed sedentary agricultural culture, almost regardless of their ethnic and linguistic affiliation.

Besides, these peoples provided special contingents that the nomads could not provide—infantry and engineer units. It is certain that craftsmen from these regions formed the production units and field workshops that were established to meet the surging demand for arms and munitions in the army of the Chinggisid empire.

The situation with the Kidan was more complicated. They were seemingly closer, ethnically and culturally, to Mongol rulers as compared to other non-Mongol peoples. Yet, they were treated like hostile Mongol tribal state formations. This also applies to the Western Khitan—the Eastern Turkestani and Middle Asian Kara Khitans. However, we can state that the imperial armies of Chinggis Khan and his descendants relied almost entirely on the principles of the Khitan Liao Empire of the 10–12th centuries. It is no coincidence that Yelu Chucai, a representative of the Khitan emperor's clan, was the chief organisational advisor for both Chinggis Khan and his successor and son Ögedei.

All of the military forces of the Mongol Empire can be classified into three key categories. Mongol units—exclusively cavalry—formed the basis. The elite was comprised of the khagan's guard, the *kheshig*, which could be as large as a *tumen*—that is, ten thousand warriors. Apart from the khagan's guard, the elite included princes from the Chinggisid clan. The guard mostly consisted of the sons of Mongol noblemen, their close friends. All guardsmen were expected to be excellent combatants. Therefore, winners of sports competitions, called *nadams*—that is, the best shooters, horse riders, and fighters, were accepted into the guard. The third category was the *tanmatroops*, consisting of foreign units. These included warriors conscripted as 'blood tribute' at the rate of 1 out of 10 combat-capable men. The measure applied to countries with sedentary populations. It is beyond doubt that the rate was higher for nomads. Foreign units were always commanded by Mongol *tanmachis*. They were well-known in Europe under the Turkic term *basqaq*. *Tamna* units always acted together with Mongol units during military actions and were used according to their specialisation (infantry, engineer units) or to protect Mongol detachments by being in front of them (cavalry) in the most dangerous locations.

Discipline was Chinggis Khan's most important innovation, or rather the cruelty with which it was maintained. This is attributable to the military experience of Temujin, who

had suffered a lot because of the neglectful attitude to war in the steppe. He lost numerous important battles and campaigns because of his ill-disciplined allies. This is why Chinggis Khan's regulations stipulated capital punishment for any misconducts potentially leading to the loss of property. Death was the punishment for fleeing from the battlefield, leaving one's comrade-in-arms in danger, plundering the enemy's wagon train before the battle was over, etc. The principle of collective punishment applied. Along with the guilty man, all ten soldiers were executed; along with a guilty ten, one hundred were executed.

Tactically, the army of the Mongol Empire remained typically and traditionally nomadic in field battles. It used old techniques such as attacks with diversionary retreats to draw the enemy into an ambush; a gradual, wave-by-wave introduction of forces to the battle; a strong reserve that was released at the decisive moment; the so-called circle dance, when horseback archers formed a continuously spinning circle before the enemy's lines to ensure incessant dense shooting at short distance. The techniques, which were already efficient, were enhanced significantly by strict discipline, becoming the main advantage of the Mongol army.

Unlike the armies of other nomads, however in full accordance with the military tradition of the Khitan Empire, the army of the Mongol Empire made active and efficient use of engineering. China provided stone and missile weapons, including catapults or systems of catapults; heavy counterweight trebuchets and lightweight trebuchets, in which a pole with a stone 'spoon' on one of its ends, attached to ayoke, launched stones when people simultaneously pulled the ropes on the other end of the pole; mobile siege towers; the art of mining; and finally, gunpowder projectiles—vessels and rockets. Muslims'—from Middle Asia and Iran—siege devices included powerful counterbalance trebuchets. The active and mass use of siege machines led to the appearance of Mongol engineers and even engineering dynasties. Mongol commanders used hydrotechnical devices, too—they built dams to accumulate necessary volumes of water. They

then opened the dam when necessary, directing the water to flood the enemy's camp and break the fortifications of the besieged. They destroyed existing hydrotechnical structures for the same purpose.

According to the Khitan tradition, the Mongols used numerous prisoners of war and civilians to ensure that labour-intensive work was done quickly and in a well-organised manner. The prisoner and civilian contingents, termed the crowd (*hashar*), were treated cruelly and died quickly as they received little nutrition and munitions. The Mongol treatment of the enemy's population mostly looked like terror—they killed all citizens of resisting cities except for certain categories of skilled craftsmen. Part of the male population were formed into a crowd, that was used during sieges and thus exterminated by their compatriots or died of hunger and natural conditions. The use of terror was also borrowed from the Khitan and Jurchen people, who actually 'surpassed' their successor in this aspect. The Mongols only had mercy for rulers, cities, states, and communities that surrendered before any military actions had commenced.

The Mongols were good at establishing headquarters—that is, planning strategic support for future military actions. The headquarters of the ruler's camp was the horde, while the brain centre consisted of representatives of the ruling clan, merited commanders, and allied rulers. The horde was where commanding staff was trained from among *khesigten* guardsmen. Intelligence—political, military, and economic—played a major role in the planning of military activities. Merchants—both Mongol and especially Muslim from Central Asia—often became intelligence officers. Apart from intelligence collection as such, the Mongols used their agents to spread panic rumours, thus instilling fear and diffidence and undermining the morale of the target population and troops. It is noteworthy that the rumours often turned out to be true. The most terrible fears were justified. At the same time, when Chinggis Khan's empire had become a full-fledged one, the nobility and the most talented representatives of conquered countries had about the same career opportunities as Mongols. It par-

ticular, they could occupy military positions at the khan's court.

Let us study the Mongol-Tatar military equipment that the Chinggisids brought to Eastern Europe.

The famous Russian weapons expert A. Kirpichnikov believed that the Mongols brought no new arms to Rus'. He is both right and wrong. He is wrong because the Chinggisid army brought a variety of new forms and variants of weapons to East Europe. The Mongol set of arms was very typical for Central and Eastern Asia; however, some of its forms were even archaic (which by no means reduced their efficiency). Besides, it should be taken into account that by the turn of the second third of the 13th century—when Jochid detachments reached the borders of Bulgaria—armourers from North China, including Jurchens, Khitans, Chinese, craftsmen from oases in Eastern Turkestan and Tangut cities, and the Western Liao (from the Kara Khitan state), had been working for the Mongol troops for over ten years. Moreover, armourers from the conquered empire of the Khwarezm shahs, which included Middle Asia and the north of Iran (including today's Afghanistan) had been working for them for almost ten years. According to Rashid al-Din, they only made Mongol-style weapons, regardless of their origin, under the strict supervision of Mongol armourers. Some local shapes and motifs can be seen in their decorative details. Additionally, the Mongols themselves never ceased to produce weapons.

The bow and arrow was the most basic and wide-spread Mongol weapon, owned by very nearly every soldier. Armenian chronicles refer to the Mongols as 'the archer people.' Prince Hethum (Hayton) of Cilicia emphasised that there were 'very many dead and wounded at once' when Mongols began to shoot their bows, which distinguished them among other peoples. The Mongols' European enemies also reported them to be extremely efficient archers. This virtually overshadowed the other components of Mongol warfare, such as spear attacks with armoured cavalry, and close combat with edged and short-pole weapons.

The classic Mongol bow developed as a result of the long evolution of the weapon in Central Asia to become an advanced, complex, and expensive instrument by the 13th century. It belonged to the composite bow category. That is, it consisted of five separate parts—a handle, two shoulders, and two long slightly curved horns, each consisting of several layers of different materials, such as wood (birch and pine), horn, bone, boiled sinews, and birch bark. It took a long time to align the layers. Animal, preferably fish, glue was used to connect them. Being extremely strong, the glue still left the parts somewhat mobile relative to one another. The Mongol bow was characterised by a bone onlay on the internal side of the handle, shaped as a double-sided oar. It had a highly stretched M-shaft. The string was made of thick sinews or woven from leather strips. The bow was large—about 1.5 m long with the string on. It also had a high tension force of 40 to 80 kg. It is no wonder that an arrow shot with a weapon like this covered a long distance and had a high penetrative power. An inscription on a stone found at the archaeological site of Khirkhira, Buryatia, has survived to the present day. It describes in the Mongolian-Uighur script an outstanding shot by the famous prince Yesunkhe (1190–1270), a grandson of Chinggis Khan and a son of Qasar, after the 'campaign of Sartaul' (that is, the conquest of the Khwarezmian Empire)—its reach was 335 sazhen, or 536 m. The beauty of the bow was not exclusively functional; it had a perfect shape, smooth smoky horn inlays on the belly, and a mild golden back of birch bark. It was common to apply thin leather over the birch bark of the bow shoulders and decorate them with bright and golden paint. The composite bow had only one serious disadvantage—it grew damp very quickly under wet conditions, in particular in the rain, and its power reduced dramatically, making it almost useless. Varnish coating could partly compensate for the flaw. However, its availability was limited since natural varnish was only produced in China. Being made of organic materials, the bow 'died' sooner or later. The primary cause was the mineralisation of boiled sinews in it, which took place after about 100 years.

It was probably within fifteen years after the 'Sartaul campaign' that the troops of Mongol rulers adopted another type of composite bow, which was popular in the Middle and Near East. The bow was nearly arch-shaped. It had short curved horns (each of the horns had only one horn onlay on the external side with a cut to hold the string on in its top part) and was only 1–1.2 m long. In spite of its modest dimensions, it was hardly inferior to the classical Central Asian bow.

The Mongol arrow had a long 70–80 cm shaft, carefully carved of wood (mostly birch) in the shape of an elongated cigar, usually painted red with additional mark stripes. Arrowheads, hammered into the shaft with their long stalk with a lock, bore varying feather shapes depending on their purpose. The Mongols had different terms for arrows depending on their function and arrowhead—*khoorcakh*, *uchumakh*, *godoli*, *tomar*. All arrowheads can be cardinally classified into armour-piercing and those used for bodies not covered with metal armour. The former are characterised by quite a narrow outline resembling a willow leaf and a rhombic cross-section. The rest have a flat cross-section (except for three-blade ones, probably of Kyrgyz origin, that have holes in the blades) and a rhombic, irregular triangle (with an even or rounded blade), sesame-leaf (specifically Mongol), or two-horned shape. It should be noted that the traditional classification into armour-piercing and general is rather inaccurate because armour-piercing arrows are good for piercing mails of armour. At the same time, there is written and ethnographic evidence that flat arrowheads with an even or slightly convex/concave rounded blade, or narrow chisel-shaped arrowheads, are extremely efficient (of course if the bow is powerful). Characteristically, many Mongol arrowheads were large. Marco Polo noted that arrows with large arrowheads were used for sight shooting at a close range, while those with smaller arrowheads were used for massive flat shooting. Two-horned arrowheads were used to cut the enemy's bow string. The fragment from the great Italian's memoirs largely explains the Mongols' combat efficiency at a long range. If you use a very

powerful bow for sight shooting arrows with large arrowheads at a close range of 20–30 m—which was exactly the distance between the spinning Mongol 'circle dance' troops and the enemy's front line—'many dead and wounded' would come naturally since arrows would almost always hit unprotected parts, which no armour could help.

To ensure better targeting, the Mongols fletched their arrows with three or less frequently four-sided feathers. Some arrows had bone, horn, or wooden whistling balls. Those were hollow and were attached to the shaft under the arrowhead. The arrow produced an unpleasant whistling sound while flying. A single whistling arrow could be shot as a signal. On a mass scale they could be used to suppress the enemy's will and scare its horses.

The right thumb was used to hold the string while drawing it; the end of the index finger was held over the thumb nail, holding the bull's eye mark of the arrow shaft on the string. The force of the bow was very high, so a special ring of a peculiar shape was used to protect the bend of the thumb, which was the only part of the body applying force to draw the string. It could be made of bone or horn; rich Mongols could use Chinese articles of nephrite or Iranian ones made of gemstone. Scholars of the 19th century termed the above method of string drawing Mongol, though it was first recorded in China back in the 13th century BCE, as a nephrite drawing ring discovered there suggests.

The bow was kept in a leather case shaped as half a bow with its string on, which was attached to the left side of the baldric. Arrows were kept in a quiver, of which the Mongol-Tatars had two variants. The first one looked like a long wide-bottomed flattened case with a flat bottom; it had a box-type receiver with a flared top, the external side of which was used as a lid opening to the side or down. The quiver was made of birch bark on a frame of wooden or less commonly iron bars, with wooden details. Such quivers held the whole arrow, feathers down (the flared bottom of the quiver was meant to prevent feather deformation), head up. Such quivers were attached to the right side of the baldric in a diag-

13th century armour-clad Mongol horseman
Reconstructed
by M. Gorelik

onal position, the receiver (and, respectively, arrowheads) up and to the front. This type of quiver continued the old Central Asian tradition dating back to the Mid-1st millennium AD. The rounded, often protruding beyond the sides, top of the box-type receiver was a Mongol feature. Bone loops were usually used to attach such quivers to the baldric. The quiver itself was partly coated with engraved bone plates. The decorations of such plates is a wonderful branch of purely Mongol, nomadic craft, with plant, animal, and geometrical motifs. Some articles are true masterpieces. It was less common to use engraved bone to decorate the bow case.

The second quiver type was a flat rectangular box of thick leather or hide. It held half of the arrow's length. Arrows were kept there with their arrowheads down and feathers up. The quivers were attached to the baldric on the same side as the first type, also in a diagonal position, but with the aperture up. A long tail of a feline predator was used to separate arrows meant for different purposes; it was attached to the top corner of the quiver and run between stacks of arrows with differ-

ent arrowhead types. Such quivers appeared in the 9–10th centuries and are connected to the Kidan tradition. The Tatars used quivers of the same type, but they also used textile to wrap the top part of the arrows.

The quiver and the bow case were attached to a dedicated 'archer's' belt. Mongols often had belts of a very peculiar shape, cut from leather to resemble a narrow conical corset with blades protruding down, to which the bow case and the quiver were attached. The archer's belt could also be narrow, with plates with holes in them and loops on the bottom part for the bow case and the quiver. Archer's belts usually had a hook as the end of a plate on one of the ends of the belt, which was used to buckle them. A belt, especially a wide one, could also have a needle frame buckle.

The Mongol-Tatar second-strike weapon for battles was the spear. The idea that the Mongols borrowed the spear battle technique from the Russians—because it was not typical for nomads to use spears—is incorrect, both generally and in details. Numerous archaeological discoveries of spearheads in ancient nomadic burials as well as linguistic [for instance, the literal ancient Turkic for 'to combat' is 'to fight with spears,' while the Mongol term for the spear 'jida' was borrowed by a number of languages to denote the javelin, or dart (Turkish: cid, Arabic: jerid, Russian: dzhid—several darts in one case—and Belorussian: dzida)] and visual material prove it to be wrong. It should be emphasised that the statement that the Mongol-Tatars did not practice spear combat implies that they did not have the main feature of the medieval cavalry—heavily-armed spearmen, whose ram attack usually determined the outcome of the battle.

The most common Mongol-Tatar spearheads can be classified into two basic categories—those with a narrow lance-shaped feather with a rhombic cross-section or lens-shaped ones and those with an axial edge ridge and a feather shaped as a narrow sharp-ended tetrahedron of varying length. This was the type

designed to pierce the enemy's armour. Less common were spearheads with flat rhombic feathers as well as specialised simple knife-shaped spear heads with a single blade. It is possible that this type originated in the ancient Eastern Asian tradition of single-bladed spearheads. Though they are few, some discovered Mongol-Tatar spearheads have a hook under the feather. Giovanni da Pian del Carpine provided a very vivid description of such spearheads, explaining that the Mongol-Tatars used the hooks to drag the enemy off the saddle. The materials of Far Eastern excavations suggest that such details originated with the Jurchen tradition. Apart from a hook firmly attached to a bush, it could look like a flat blade with a concave internal edge, being horizontal and movable along the bush. To drag the enemy off the saddle was not the main function of the device. It could be used to cut off heads and arms. When the point of the spear pierced the enemy's body, the blade became perpendicular to the feather and caused the enemy to fall onto the ground, producing an enormous laceration. The device was most efficient only when used against an unarmoured enemy. The blunt spine of the blade would prevent it from piercing the enemy's body through metal armour, acting as a lock preventing the feather from penetrating the enemy's body too deeply. It was quite prudent of the Mongols to limit borrowings from the Jurchens to a simple hook.

The Mongols used certain types of short-pole and bladed weapons. Marco Polo, who had witnessed a number of Mongol internecine battles, constantly mentions 'swords and clubs' as melee combat weapons. Many archaeological remnants and images of such weapons have been preserved.

Short-pole weapons were the most widespread melee weapons. These included axes, maces, and flails.

The Mongol-Tatars used several types of combat axes. The first type includes light-weight axes with a long narrow trapezoidal blade, a short cutting edge on one side of the head, and a hammer-shaped back edge on the other. The shape, being in itself very archaic, was still quite effective in cavalry battle as it combined the light weight of the weapon

with the piercing effect of the blade and the opportunity to contuse the enemy, thus leaving him alive as a prisoner or a slave. Axes with a small, long-edged, asymmetrical, trapezoidal blade or a wide sector-shaped blade are quite original; a long iron stalk was used to connect the blade to the short pole. Taking into account their small dimensions, it can be assumed that the axes were also meant for throwing. This is another Jurchen adoption of the Mongols. Finally, shaft-hole axes with a wide-edged sector-shaped blade with concave 'radii' and a hammer-shaped back edge, which had a powerful cutting effect, are an 'intermediate' variant.

The mace was very common among the Mongol-Tatars. They used it not only as a combat weapon but also to symbolise their status or rank. This very ancient function of the mace was especially pronounced in the centuries immediately preceding the Mongol invasions of the Khitans, Jurchens, and Song China. Elite guards used them as weapons; they had quite a long shaft at that time.

The Mongol-Tatar mace had a head of iron, bronze or cast iron, stone, or horn. Its shape varied greatly—a ball, a pear, a gear, or a disk—all covered in small sharp projecting parts, a polyhedron, or a cube with sharp projecting parts on its vertical edges. Even lash heads were used as maces. From ancient times they had a beak-shaped spur, making them convenient to hold and stick on the belt. It became common to cast them of bronze as a cube with pyramidal projections on three edges and a beak on the fourth one in the 13th century. This might be a hybrid of the Turkic lash and the Middle Eastern mace.

The flanged mace with its combat blades splayed is especially characteristic of the Mongol-Tatar mace. It was the most popular, and it was probably the Mongol-Tatars who brought it to Europe.

The most prestigious and expensive melee weapon among the Mongol-Tatar troops, just like among other peoples of the time, were long-blade weapons—swords, broadswords, and sabres. The reason why they were prestigious was not only their high combat efficiency but also their narrow specialisation and

the fact that a good blade was difficult to produce and could be decorated in sophisticated ways; all this made them expensive weapons. Therefore, not every warrior could afford one. Giovanni da Pian del Carpine reported that only noble and rich people had sabres.

Mongol-Tatar blades were straight double-edged (swords), straight single-edged with a point sharpened on both sides (broadswords), and curved single-edged (sabres). The broadsword and the sabre also had a peculiar handle position—at a slight angle to the blade. Important features of the Mongol-Tatar broadswords and sabres include wide-spread fullers—longitudinal depressions on the blade meant to make it lighter and stronger—as well as peculiar cuffs under the cross-guard, with a lug about the size of the hand, covering the part of the blade adjacent to the handle. The lug, which was meant to protect the index finger and the top part of the sheathe from cuts, often had an ornately shaped edge. The specific cross-guard shapes that the Mongol-Tatars brought to Europe included flat oval, characteristic of the entire east of Asia, and protruding with a rhomboid central piece and—which actually made them peculiar—asymmetrical flare-shaped ends.

The issue of Mongol-Tatar defensive devices is of special interest. The opinion that the Mongol-Tatars won due to their discipline and quantitative superiority, while only few commanders, noble warriors, and their bodyguards—a small minority—had defensive devices, was predominant, especially in the domestic scholarly community, for a long time. This is why numerous defensive devices discovered in nomadic burials were dated as pertaining to the pre-Mongol time or declared to be Russian imported goods. However, there is written, artistic, and physical evidence that the nihilist attitude to the Mongol-Tatar armour is wrong. For instance, Marco Polo, other European witnesses to the Mongol invasion of Europe, and eastern authors unanimously reported that Mongol-Tatar troops had a lot of defensive equipment. The secretary of the Sultan Jalal al-Din Mankubirni, al-Nasawi, wrote that all Mongols put on armour before battle. 'Jami at-Tawarikh' by Rashid al-Din

provides some information on the production of Mongol weapons in conquered sedentary countries. The author, just like his predecessors—Muslims of the 13th century—reported that the Mongols selected craftsmen, and firstly armourers, as soon as they conquered sedentary agricultural territories with well-developed handicrafts. Part was sent to the khaqan's camp, part was assigned to hordes—the nomadic camps of khans and nayons, and part united in large state-run plants (Persian: *karhane*, 'work house'), where craftsmen, living as slaves and often in dug-outs, as evidenced by excavations of cities of the Golden Horde, made weapons for their new masters, for which they got a ration. Rashid al-Din emphasised that they did it under the supervision of Mongol armourers and according to Mongol samples because the Mongol-Tatars would not accept non-Mongol weapons. He also reported that, as soon as the Mongols conquered the north of Iran, Argun Aqa, who was appointed the vicegerent, used the well-developed local resources for weapon production. This is where Mongol weapons came from to Batu's warriors in the Jochid steppe, where there were no cities at the time.

It is beyond doubt that most Mongol-Tatar troops had protective soft armours, which people of any income could afford. The materials used for such armour included multi-layer soft felt, soft leather, and thick coarse fabrics. Horse-hair, wool, cotton, and other kinds of lining were used between the layers, after which the multilayer parts were padded and stitched. Soft armours were cut as Mid-calf long robes. Those with an axial vertical cut had leaf-shaped, often ornate blade neckpieces. There were also robes with an oblique—right to left—wrap and true wrist-long, rather narrow sleeves. The sleeves had a blade piece covering the back of the hand. Less frequently, soft armour looked like short, hip-long, wide caftans with a straight axial cut and leaf-shaped blade neckpieces or very short and wide sleeves. Such soft armour ensured efficient protection from arrows, especially at a long range, glancing blade blows and especially axe or mace blows. Their Mongol name was 'hatangu degel' ('robe of steel').

Armour of Mongolian warriors according to Iranian miniatures. 13–14th centuries.

The next type of armour in terms of strength and value (and price) was the *hatangu degel*, reinforced with large iron plates sewn to the inner side of the soft padding. They were additionally riveted to the padding in two or three spots in a top corner of the plate. Such armour was efficient against nearly any weapon, except for the spear. Their strength, flexibility, and weight varied greatly depending on the vertical and horizontal overlapping of the iron plates. The more they overlapped, the stronger yet less flexible and heavier the armour was. Little overlapping meant increased flexibility and reduced weight, but also reduced strength. The disadvantage of this type of armour was that a blade could easily cut the soft padding. However, it prevented the enemy from seeing where the impenetrable armour lay. An armour like that could be very ornate and expensive when coated with an expensive fabric; it could also have gilded rivet heads. In fact, it was invented in China in the 8th century and meant for the emperor's bodyguards—an ornate piece of clothing with hidden armour.

Even more reliable and expensive was armour made from hard materials, such as thick three-layer rawhide, which was as hard as plywood reinforced with iron or steel onlays. Laminated armour was easier to produce. The structure consisted of fabric strips, about 10 cm wide, the length depending on the location. The strips were arranged horizontally

and overlapped horizontally, the top of the underlying strip covered the bottom of the overlying one; leather strips, lacing, or ties ran through apertures in the strips for vertical attachment.

The lamellar armour structure was the most advanced—flexible, strong, and relatively lightweight. It consisted of rectangular vertical plates overlapping vertically to form horizontal rows held together with similar strips running through a system of apertures in the plates. The flexible strips were interconnected vertically like lamellar armour.

The Mongol term for any hard armour (including mail) was '*huyag*' (Tatar: '*kuyak*'); the term '*hudesutu huyag*' ('laced *huyag*') represented the type that was connected.

Lamellar and laminated armour came in two basic styles. The first looked like a cuirass corset made of a chest piece and a back piece connected with shoulder straps and latches on one or both sides. Blade-shaped neckpieces of varying length, from Mid-forearm to Mid-ulna, could be attached to the straps. Hip blades, Mid-thigh, knee, or Mid-calf long, could be attached to the skirt. The second style was identical to the robe-like soft armour with all its variants. Often armour combined alternating lamellar and laminated rows. Hard armour could be very ornate. This was achieved through mirror finish polishing of the metal plates, plate gilding, bronze plates, varnish coating and painting, and brightly dyed con-

nective lace contrasting with the colour of the armour itself. An armour could have neck-pieces with ornate edges and painted leather with metal plates attached to it, fringed and fur-trimmed. Convex disk mirrors could be attached to the chest and back as additional protection, a means of repelling hostile spirits, and finally as armour adornment.

The Mongol armour tradition, and the Central Asian, dates back to the 3rd–5th centuries, when it began to develop to become full-fledged in its Jurchen-Mongol variant by the 12th century.

It should be noted that Mongol armour-clad warriors did not limit themselves to one armour. 'The Secret History of the Mongols' often mentions that a noble warrior first put on a *hudesutu huyag* over a *hatangu degel*. This was the beginning of the tradition of wearing two armours at the same time, the soft one being worn beneath the hard one.

The 'dula' helmet was no less common with Mongol warriors than the 'huyag.' It also pertains to the Central Asian tradition and includes its features, being spherico-conical; it has a crown of several riveted sectors with cut-edged onlays, connecting them around, and a cap band ring holding them in the bottom part, with a cup-shaped or hemispherical topper with a point or a hackle tube. The helmets that the Mongols brought to the west had the following Mongol traits: peaks, forehead plates with a cut three-piece top edge, often with arched brow slits and nose-pieces on the bottom edge, disk-shaped (sometimes double) earpieces, tall spikes on top of the helmet, and rings on the helmet topper, to which a ribbon was attached to form two ends. This was the typical Mongol helmet decoration.

Mongol helmets always have a camail—soft, lamellar, laminar, or chainmail. Camails protected the nape of the head, the neck, and the throat; camails of mail could cover the whole face except for the eyes. A visor of steel strips arranged to form a cross could also be used to protect the face. However, a forged mask, which the Mongols most probably adopted in the 1230s in the Middle East, where it came to be used no later than the 10th century, was more common. The Mongols may have also

borrowed half-masks with massive nose-pieces, protruding 'eyebrows' and 'eyelids.'

It was in the Middle East or in Eastern Turkestan that the Mongols adopted two-leaved arm-shields/elbow-pieces, which they brought to Europe. Traditional Central Asian necklace collars of thick leather were popular with Mongols as a protective device; rare Mongol protective clothing included calf- and foot-pieces of connected horizontal metal strips (on a leather lining?), borrowed from China or Tangut.

Finally, the Mongols used shields. The basic, purely Mongol by origin, type of shield used by the Mongols was the 'halha' shield, the equivalent of the Turkic 'qalqan.' The etymology of the word, which is a derivative of the verb 'halhasun' (to wicker), is representative of the structure of the shield. Indeed, both the description by Giovanni da Pian del Carpine and its entire further history indicate that the 'halha' was made of flexible wicker, arranged in a concentric spiral, starting from the wooden base in the centre, interconnected with dyed threads. It was a hemispherical 60–90 cm shield, taught enough to repel blade blows and hold arrows, very light and very ornate due to the colourful patterns formed by the connective threads. An iron boss over the wooden base boss was used to fend off the most dangerous blows. The shield was held with the left fist by two crossing ropes attached to rings riveted to the surface of the shield. A leather pad glued to the inner side of the base boss protected the warrior's fist.

Apart from wicker shields, the Mongols used shields made of leather-coated boards and probably of hard, thick, multilayered leather. Such shields were much heavier than wicker ones and less taut, but they could be stronger. The Mongols also coated their shields, fully or partly, with iron sheets. Such shields were called 'temirhalha.' The combination of a taut wicker base and a strong iron coating must have been extremely efficient. It should be noted that the shield was less widespread than armour and helmets.

The defensive equipment of the battle horse was no less important than that of the warrior himself for the horseman's success

and even life depended on it. The Mongol saddle already had a number of distinctive features in the 13th century. Its bars were more massive, and their position on the back of the horse was more efficient as the horseman sat higher, so his weight exerted less pressure on the horse. The massive almost rectangular vertical front gullet protected the horseman's stomach efficiently, while the sloping back cantle did not prevent the rider from moving in the saddle, especially when shooting to the side or backwards. Expensive saddles had cantles and bar ends decorated with silver and gold. Large and thick leather flaps, rectangular or more often roundish, protected the rider's legs and the sides of the horse from friction. They were often decorated with beautiful paintings, impressions, and metal onlays. Apart from belly bands, a breast strap, and a crupper, other decorations were on the metal plates, trusses, nose and forehead plumes, and decorations under the horse's neck, buckles, lockets. It was not uncommon to decorate any metal parts with, or make them of, precious metals.

Noble armour-clad warriors also had armour for their horses. Detailed descriptions

and numerous images of barding indicate that it consisted of the following parts: a forehead mask of thick hard leather or forged iron, a two-wing neck-piece, a chest-piece, two side-pieces protecting the horse's sides, the rear-piece, and the crupper-piece. Horse armour was usually lamellar and laminar and had a structure similar to that of human armour, though its plates were larger, and strips, broader and longer. Soft horse cloth armour was also popular. The whole Mongol equine armour tradition originated with the rich traditions of Central and Eastern Asia. However, just as other Mongol equipment, it has a very distinct image.

As has already been proven, the weapons of Chinggisid troops were not only diverse, efficient, and ornate but Mongol, with special features that made it distinct from that of contemporaries.

§ 2. The Conquest of Eastern Turkestan and Western Siberia

Eugene Kychanov

Chinggis Khan's conquest of the southern areas of Siberia and its adjacent regions began even before the Great Kuriltai of 1206 took place, when Temujin became the khan of all the Mongols (khan of khans) for a second time, and the state named Yeke Mongol Ulus, the Great Mongol State, was founded.

The most powerful people in the Altai Region and southern Siberia were the Naimans, who had an ulus (state) of their own, used the Uighur script for their records, and professed—at least the elite of the Naiman khanate did—Nestorian Christianity. The ethnic affiliation of the Naimans is controversial. Some historians, quite rightfully, believe them to be Turkic-speaking people. Others, especially Mongol historians, think that they were Mongolian-speaking.

Internecine feuds within the ruling clan had weakened the Naiman Ulus by 1204. The brothers Tayan Khan and Buyuruk Khan, sons of the powerful Inanch Khan, fought for power. Tayan Khan was also at odds with his son Kuchlug. Tayan Khan (this is not a name but a title, Dai Wang, Great Wang, given to him by the emperor of the Jurchen state Jin) knew that the Tatar and Kereit uluses had fallen but, according to 'The Secret History of the Mongols,' had remained aloof from the race for power over Khalkha for too long and underestimated Temujin's power. Moreover, he wanted to conquer the entire Khalkha, too. Tayan Khan viewed himself as the sun, Temujin being the moon, and often said that it was impossible 'for the sun and the moon to shine in the sky next to each other,' meaning that two khans could not co-exist on the earth.

Temujin made serious preparations for the war against the Naiman Ulus as he was aware of its large population. It was in the early 1204 that he implemented the reforms in his ulus, reorganising the army, the guard, and the administration. In the summer of 1204 Temujin's army of 45,000 soldiers set off to the south-west, starting the Naiman campaign. Before doing it, they made an offering to the banner of war, in which the patron spirit of the army, Sulde, was believed to live.

The Naimans were not alone. The Merkits and the Tatars, the remnants of the exterminated uluses' troops, the Oirats, and the part of the Mongols, who still adhered to Temujin's sworn brother Jamukha, supported them. The Mongols made five times as many fires as they had warriors at night to show the enemy that they were numerous and drove scraggy horses to the Naiman camp to persuade the enemy that their horses were undernourished and not prepared for war.

Tayan Khan was reasonably cautious. He denied a battle to the Mongols and began to retreat to the Trans-Altai Region. However, his wife, son Kuchlug, Jamukha, and many advocates for an immediate battle eventually persuaded him. The battle took place in a mountainous region. Jamukha and his people left the Naimans during it. The Naimans persevered; Tayan Khan himself was wounded several times. However, Temujin's warriors defeated the Naimans. Tayan Khan fell; Kuchlug was able to escape with the surviving rest of the army [Rashid al-Din, 1952, I, 2, p. 148; Kozin, 1941, p. 150].

In the autumn of 1204 Temujin's Mongols crushed the Merkits, who lived in the lower reaches of the Orkhon River and along the Selenga River. The Merkit ruler Tokhtoa Beki fled westward to Kuchlug. Kuchlug and Tokhtoa Beki roamed in the Irtysh Valley, Trans-Altai Region. Temujin spent the winter of 1204–1205 in the south of the Altai Mountains. He moved to the Bukhtarma River, a tributary of the Irtysh, in spring. Here the Mongol troops attacked Kuchlug and Tokhtoa Beki. Merkit Tokhtoa Beki fell in the battlefield; his surviving troops went to the Kipchaks in the territory of today's Kazakhstan. Kuchlug and his survivors went to the Kara Khitan people, to the Western Liao on the Chu River. Though the organisational structure is unclear, the Altai Mountains, which used to belong to the Naiman Ulus, became part of Temujin's ulus.

The Kyrgyz people lived in the upper reaches of the Yenisey and its tributaries. The Kyrgyz state in the Upper Yenisey Region dissolved

into several independent territories in the 13th century. The territories were ruled by inals. Being well aware of the situation in Khalkha and the ruination of the Naiman Ulus, the Kyrgyz people wanted to play it safe. They sent ambassadors to Chinggis Khan. As a response, a Mongol embassy went to Kem-Kemchiut. A second Kyrgyz one soon visited Mongolia. The Kyrgyz ambassadors were received by Chinggis Khan. They presented him with a white falcon and apparently yielded themselves to the Mongol khan [Yuanshi, 1935, p. 8a]. The version in 'Yuanshi' that the Kyrgyz people submitted to the Mongol khan of their own accord conflicts with the data in 'The Secret History.' According to the source, Chinggis Khan sent his eldest son Jochi with a detachment of troops to conquer the 'forest peoples' of the south of Siberia in 1207. It was a military campaign. Jochi conquered the ancestors of the Buryats and the Oirats. Soon after that Kyrgyz nayons Yedi Inal, Ardiyer, and Oliber Digin came to him. They brought white gyrfalcons, white horses, and white sables. Jochi formed an embassy of the 'forest peoples'—the Oirats, the Kyrgyzes, etc.—to follow his detachment to Chinggis Khan. The Oirat rulers and their sons received noble Mongol girls as wives because they were related to the Mongols. Jochi was able to subjugate the 'forest peoples' without losing any people and horses, and the 'forest peoples' were granted to him [Kozin, 1941, pp. 174–175].

Ten years later, in 1217, the Tumats, settled to the west of Lake Baikal, rebelled against the Mongols. They defeated the Mongol detachment sent to subjugate them. Then Chinggis Khan ordered the Kyrgyz people to suppress the Tumat rebellion. However, the Kyrgyz people would not obey Jochi's order; the ruler of the 'forest people' had to personally lead the punitive campaign. Having crossed the icy Selenga River, Jochi's troops moved westward along the fringe of the southern Siberia, through the Tumat and Oirat land to the Usa River, a tributary of the upper Yenisey. The Mongol troops then moved downstream the Yenisey to the central Kyrgyz territories. The Kyrgyz people were subjugated. Moving westward, the Mongol detachment conquered the Telengits in the

Altai Mountains. Then the Mongols reached the Ob River and returned.

The campaign was unparalleled in terms of scale and overcoming of natural difficulties. Unfortunately, no detailed information is available about it. The vast area in the southern Siberia from Baikal to the Ob River was subordinated to the Mongol State. Explaining the motivation behind the campaign, academician B. Vladimirtsov stated that 'Chinggis Khan wanted to conquer those territories, protect himself against any sudden attacks, and have control over the trade routes to the Yenisey, where crop yields were high at that time. The crops were exported to Mongolia with the mediation of Muslim and Uighur merchants. Besides, the land of the 'forest peoples' enjoyed an abundance of sables and other fur skins. It also exported hunting falcons' [Vladimirtsov, 2002, pp. 173–174].

Extending the territory of Yeke Mongol Ulus in every direction required preparations to strike blows at the two most powerful enemies—the Jurchen state Jin (North China) and that of Anushteginid Khwarezm shahs. This would require the Mongols to subjugate smaller territories. They struck the first blow at the Tangut state south to the Gobi Desert, the Great Xia, even before the Great Kuriltai. Yet, it took over twenty years and even the life of Chinggis Khan to subjugate the Tanguts.

The Tangut campaign of 1207–1208, which Chinggis Khan led personally like the anti-Naiman campaign three years before, scared the Uighurs. The Uighur state covered a large territory from Hami in the east to Kucha in the west, from the Jungar Plain in the north to Lake Lob Nor in the south. Two significant processes were taking place there—ethnic and denominational. Ethnically, the Turkisation of the region (East Turkestan) as well the Uighurisation of the local, previously Indo-European, population was approaching its end with great intensity. Denominationally, Islam was advancing from the west; the number of Buddhists was decreasing constantly, while the Muslim population was growing. After the Western Liao was founded, the Uighurs declared themselves its vassal. A Kara Khitan vicegerent resided in their capital Kucha.

In 1208 Chinggis Khan sent a detachment commanded by Subedei Bagatur and Jebe to finish the Naimans, headed by Kuchlug, and the Merkits, led by Qudu. The joint Naiman and Merkit troops were defeated on the Bukhtarma River. Kuchlug fled to the Kara Khitans; Merkits sought refuge with the Uighurs. The Uighur ruler Idikut Barchuk, clearly expecting to get some help from the Mongols, killed the Kara Khitan vicegerent by burying him alive under the ruins of his destroyed residence [Han Ru Lin, 1982, p. 48]. Uighur ambassadors went to Chinggis Khan's camp to report that the Uighur State yielded to the Mongols. Chinggis Khan said that he wanted the Uighur idikut to personally meet him with luxurious gifts: 'let the Idikut come bringing along gold, silver, pearls, mothers-of-pearls, gold brocade, patterned fabrics, and silk'—that is, declared that the Uighur ruler had to bring the tribute to the Mongol khan in person [Kozin, 1941, p. 174].

At that time Merkit ambassadors arrived to ask the Uighur idikut to give refuge to their people and ruler. The Uighurs killed the ambassadors, refused to accept the Merkits, and sent away those Merkits who had already entered the territory of the Uighur state. Barchuk either was reluctant to meet Chinggis Khan or waited for him to return from the Tangut campaign because he did not arrive at Chinggis Khan's camp on the banks of the Kerulen River until 1211. A rich tribute had been collected from the idikut's subjects, which he brought to Mongolia. Chinggis Khan gave Barchuk a warm reception and declared him to be his fifth son. Chinggis Khan married off his daughter Al Atunu (Yeli Khatun) to him. Idikut Barchuk and his descendants were treated as great khans and members of Chinggis Khan's urug (clan) because Chinggis Khan had adopted him. They participated in Mongol campaigns, remaining independent within the Uighur state. Later they were considered vassals to the Yuan Dynasty. When Chinggis Khan was alive, the Uighurs helped

Pursuit Scene. Miniature. Iran. Early 14th century.

the Mongols to conquer the Tangut state; their army was among the troops that fought against the Khwarezm Shah. Chinggis Khan benefited from subordinating the Uighurs as it put an end to the Tangut-Uighur anti-Mongol alliance (the Tangut Great Xia and the Uighur state had friendly relations in the late 12–early 13th centuries). Chinggis Khan ensured that those whom he had not defeated and had sent out of Khalkha would not find refuge with the Uighurs.

According to 'Yuanshi,' 'Karluk Khan Arslan Khan arrived from the Western Land and submitted' in 1211 [Yuanshi, 1935, p. 86]. The Karluks lived south-west of Lake Balkhash in the basins of the rivers Ili and Chu [Han Ru Lin, 1982, p. 49]. Just like the Uighurs, the Karluks were dependent on the Kara Khitan people in the 12th century. They had a Kara Khitan vicegerent during the rule of Arslan Khan. Chinggis Khan intended to subjugate the Karluks, and for this purpose he sent expedition corps, commanded by Kublai. However, Arslan Khan killed the Kara Khitan vicegerent and proclaimed himself subordinated to the Mongols even before the approach of the Mongols. In 1211 Arslan Khan also went to Mongolia and was received by Chinggis Khan.

There was another Turkic Karluk ruler, independent of Arslan Khan, Khan Wazdar of Olmaliq. Wazdar also depended on the Kara

Khitans. However, he secretly maintained communication with Chinggis Khan to inform him of Kuchlug's affairs. Wazdar also went to Mongolia and was received by Chinggis Khan. When Kuchlug found it out, he attacked Olmaliq and took Wazdar prisoner. Chinggis Khan sent his troops to help Wazdar. Kuchlug left Olmaliq and killed Wazdar. The Mongols gave the power over Olmaliq to Wazdar's son, who was titled khan; Chinggis Khan married off to him a girl from his urug to express his gratitude for the loyalty of his father. The Karluks participated in the campaign against the Khwarezm Shah's state.

When Chinggis Khan had subjugated the Uighurs and the Karluks, his domain became directly adjacent to the Kara Khitan state Western Liao. In the 12th century, after the Jurchens had defeated the Khitan state Liao (1125), a representative of the Liao House, Yelu Dashi, went westward with part of the troops. He eventually got power over the weakened Karakhanid state and established his own state Western Liao with its capital in Hus Ordo (the city lay close to today's Tokmok, Kyrgyzstan). The Kara Khitan gurkhans had come to control the Uighurs in the Karluks and made the Khwarezm shahs their tributaries by the end of the 12th century. In 1209 the Khwarezm Shah killed the gurkhan's ambassador, who had come to collect tribute, and inflicted a military defeat on the Kara Khitans.

Having fled to the Kara Khitans, Kuchlug was received at the court, married the gurkhan's daughter, and even converted from Christianity to Buddhism to win the gurkhan's trust. The gurkhan's defeat by the Khwarezm Shah and his capital's rebellion against him enabled Kuchlug to get the power. He did not kill the gurkhan and paid respect to him but 'conquered... the areas of Turkestan that the gurkhan had owned and his throne' [Rashid al-Din, 1952, I, 2, p. 182]. The gurkhan died after two years, and Kuchlug became the sole ruler of the Western Liao. Kuchlug was a cruel and unwise ruler. To quote Rashid al-Din, '...he opened a hand of violence and exaction above his subjects.' His chief mistake was to persecute Muslims, whom he demanded to convert to Christianity or Buddhism. Kuchlug personally participated

in disputes with Muslim theologians. Following one of such disputes in the city of Khotan, he crucified Imam Alah al-Din Muhammad-i Khotani on the door of his mosque because the imam had insulted him. It was the time when Buddhism was getting less popular in Eastern Turkestan, while Islam was becoming well-established, so most of the gurkhan's subjects were hostile to Kuchlug. The Mongols had been studying the state of affairs in Kuchlug's state for seven years and were well aware of the religious conflicts in the former Kara Khitan land.

In 1218 Chinggis Khan ordered Jebe to start a campaign against the Kara Khitan state under the banner of religious tolerance, 'so that every person would profess their faith and keep their ancestors' way in religion' [Ibid., p. 183]. It is probably the first evidence that the Mongols not only were religiously tolerant but also deliberately declared freedom of worship in pursuit of their political purposes. Expecting the Mongols to help them soon and anticipating religious freedom, Muslims in Kuchlug's realm rebelled. Jebe used the rebels to quickly crush Kuchlug's army.

Chased by the Mongols, Kuchlug fled to Badakhshan, where 'Yuanshi' reports a Muslim of the Kara Khitan gurkhan's people to have killed him. According to Rashid al-Din, Kuchlug was captured by the ruler of Almalyk and then killed. The Kara Khitan state ceased to exist [Kozin, 1941, p. 86; Rashid al-Din, 1952, I, 2, pp. 183–184].

Thus, in about ten years the region that the Chinese called Xi Yu (Western Region), a large part of which was to later become known as Eastern Turkestan, a region that was already predominantly Turkic with remnants of an Indo-Iranian and Khitan population, where Islam was replacing Buddhism and partly Nestorian Christianity, came under the rule of Chinggis Khan. He also got control over part of today's Kyrgyzstan, the so-called Zhetysu. The Mongols reached the borderline territories of the Irtysh River to the Kipchak steppes (today's Kazakhstan) and to the frontiers of the Khwarezm Shah's domain. Starting the western campaign, Chinggis Khan left behind the ruined areas of the Jin state north of the Huang He (Yellow River) and what remained of the Tangut state.

§ 3. The Conquest of the State of Khwarezm Shahs

Eugene Kychanov

Within his region, Khwarezm shah Ala al-Din Muhammad might have been a conqueror no less successful than Temujin, or Chinggis Khan. At the beginning of the 13th century his realm covered Mawarannahr, Khorasan, Mazandaran, Kerman, the Persian Iran, Azerbaijan, Sistan, and Ghazna. He occupied Bukhara in 1207, Herat and Khwarezm in 1208. The two victorious conquerors were naturally aware of each other. Their realms and the territories that they controlled were already adjacent, and a first trial of strength was of the agenda. Though most of the Merkits, who hated Chinggis Khan, had been exterminated, part of them was able to flee to the Kipchak steppe, the territory controlled by the Khwarezm Shah. Subutai and the ruler of the 'forest peoples' Jochi were ordered to finish them.

The Mongols ran into a detachment of the Khwarezm Shah, which he had sent against the Kipchaks, in pursuit of the Merkits.

When the Khwarezm Shah's troops appeared before the Mongols, the latter had already done away with the Merkits. They were reluctant to fight against the Khwarezm Shah's warriors, so Jochi said that he had been sent against the Merkits only. The Khwarezm Shah, whose seal read, 'the shadow of Allah on earth,' treated all disbelievers, all non-Muslims as his enemies. He imposed a battle on the Mongols. It was cruel and lasted for three days, without either of the parties winning. The Mongols retreated on the fourth night. They left numerous fires on the old place to deceive the enemy, who was ready to fight even on the fourth day.

The victorious Khwarezm Shah Muhammad not only came to believe that he was superior to Chinggis Khan but grew even more resolute to start a campaign against China. Having found out Chinggis Khan to have already conquered China, he decided to check the information. He sent an embassy, headed by Beha al-Din al-Razi, to Chinggis Khan. He did receive the ambassador. During the negotiations he said that he would like to develop mutual trade and divide the spheres of influence. He sug-

gested that he should recognise the Khwarezm Shah as the ruler of the West, while he was to recognise Chinggis Khan to be the ruler of the East. A Mongol embassy was sent to the Khwarezm Shah. During his audience with the Khwarezm Shah the Khwarezmian head of the embassy Mahmud told the ruler that Chinggis Khan treated him as 'equal to his most-loved son.' 'You are like my most-loved son to me. It is not a secret to you that I have conquered China and the neighbouring Turkic countries' [Rashid al-Din, 1952, I, 2, pp. 187–188].

The Khwarezm Shah inferred from the aforementioned events that Chinggis Khan believed establishing equal relations with him to be out of question. He interrogated Chinggis Khan's ambassador secretly at night to find out 'who the damn one is to call me his son? What kind of an army has he got?' According to Muslim authors, Mahmud, who was under apprehension of his life, provided false information on the state of the Mongol army to the Khwarezm Shah, assuring him that it was like a single horseman as compared to a cavalry detachment when contrasted to his troops. It is unknown whether the Khwarezm Shah believed his compatriot, though a Mongol ambassador, or took the bareface flatter for granted. He did not either reward or punish the Mongol ambassador but proposed him to spy for him at the Mongol court and in the Mongol Ulus. The exchange of embassies and trade caravans, which often coincided at that time, ensured efficient data collection [Petrushevsky, 1970, p. 105].

Mahmud's embassy was followed by a new caravan embassy sent by Chinggis Khan, this time headed by Mongol Uzun. Uzun was carrying a letter by Chinggis Khan, in which he praised trade and advocated for fostering its development. The letter contained the following phrase: 'We have ordered,' Chinggis Khan wrote to the Khwarezm Shah, 'that peace should be established from now on among all countries in the world so that merchants can go in any direction without fear' [Rashid al-Din,

Mongol troops besieging a city.
Miniature. Iran. 1301–1314

Chinggis Khan's sermon in Bukhara.
Miniature. Iran. 1397/98

1952, I, 2, p. 188]. The 'we have ordered' could not but hurt the Khwarezm Shah's feelings. Was it Chinggis Khan's usual confidence that he was entitled to order everyone or rather a sophisticated diplomatic device used to unsettle the rival? The rival did waver and take abrupt measures. The only thing that we know for sure is that the vicegerent of the frontier city of Otrar, where Uhun's caravan embassy arrived, killed the ambassador and the merchants, whether of his own accord or on the Khwarezm Shah's order, and appropriated the goods. The Mongols thus had a legitimate pretext to attack the Khwarezm Shah's state.

Chinggis Khan demanded the Khwarezm Shah to turn over the vicegerent of Otrar. The Khwarezm Shah did not agree because the vicegerent of Otrar, Inal, was the Shah's maternal cousin. The Khwarezm Shah also killed Chinggis Khan's ambassador who brought the demand to turn over Inal.

A number of Muslim authors believe the Arab Caliph of Baghdad al-Nasir, who was hostile to the Khwarezm Shah, to have encouraged Chinggis Khan to wage war at the Khwarezm Shah.

Anyway, vengeance was the pretext and not the root cause of the war. 'The Secret History' of the Mongols reports vengeance to have been the main cause of the war with a meaningful remark, namely it was not the murder of his ambassador and merchants but rather the fact that 'the Sarataul people' took the liberty to 'remove the decorations of my (Chinggis Khan's.—Ye. K.) gold royal reigns with impunity' what Chinggis Khan avenged for [Kozin, 1941, p. 182]—that is, it was unambiguous that the Khwarezm Shah got out of the khan's hand. The sense of vengeance brought about 'rightful wrath.' Not every member of the urug—that is, Chinggis Khan's immediate family, shared his mystical belief that he was entitled to rule peoples. Many remembered Mongolia as it was only 20 years before. Tatar khan's wife Yesui declared openly that Chinggis Khan's 'enormous kingdom' would fall apart like a handful of hemp as soon as he died. His sons Jochi, Chagatai, and Ögedei could contest his power. At a family council Chinggis Khan appointed Ögedei his potential successor. When his elder brother wanted to assure him that the two of

them would serve their elder brother, Chinggis Khan uttered a remarkable saying, 'Why the two of you? Mother Earth is bid. It has many rivers and waters. You had better say you would rule foreign peoples separately!' [Ibid., pp. 183, 185–186]. He thus determined the future of the Chinggisids. One was to rule his native land, and others were to control other nations, those that should be conquered and to the extent that they would be conquered. The world was facing a charismatic figure, who derived his strength not only, speaking in modern terms, from the Cosmos, the Eternal Blue Sky, but from the traditions of the Central Asian empires, whose vast realms stretched from the Yellow to the Black Sea.

Why did Chinggis Khan hesitate to wage war at the Khwarezm Shah's state? He knew it to be weak. The Kipchaks, also nomads, who had long been rivals to the Mongols and Khwarezm shahs, lived in the north of the Khwarezm Shah's realm. They were easy to understand and had to be conquered or at best neutralised. Chinggis Khan realised that it would not be easy to conquer North China. He had failed to conquer even the small Tangut state, not to mention North China, the Jurchen state of Jin. The struggle would be long. It would require a new impressive external success and new resources. Chinggis Khan offered the Tanguts to join him against the Khwarezm Shah; but the Tanguts refused, so Chinggis Khan swore to exterminate them as soon as he returned from his western campaign.

When discussing the plan of the future war, the Khwarezm Shah and his people decided, quite unsoundly, not to give a general battle to the Mongols but to defend large cities, spare their forces, and scatter those of the enemy, who was good at open field battles but could not besiege cities. They failed to take into account the fact that the experience of being at war with Jin and Xia had taught the Mongols to besiege and occupy large cities, and they even had experts in this branch in their army.

In the spring of 1219 Chinggis Khan's army of 200 thousand people started a campaign against the Khwarezm Shah's state. Chinggis Khan took his time, apparently to instill diffidence in the enemy and avoid summer heat in

Middle Asia. This is why the Mongols spent the summer of 1219 in the Irtysh Valley. They waited for their horses to store some fat and become sturdy enough. Probably they also waited for their allies. Uighur Idikut Barchuk, the Turk-Karluks, headed by Arslan Khan and Suqnaq Teshi from Almalyk, who was controlling the former Western Liao, Kuchlug's domain, joined the Mongol army. Besides, Chinggis Khan's troops included Khitans from Jin, Kara Khitans from the Western Liao, Chinese from the state of Jin, all of whom, except for a few Jurchens, had taken the Mongol sides, Tangurs, people from Mongolia and Manchuria, Muslims of various nations in Chinggis Khan's service. The multi-ethnic army became known simply as the Tatars in Middle Asia, the Caucasus, later also in Eastern Europe, the Kipchak-Polovtsian land, in the Bulgar state, in Russian principalities, in Poland, Hungary, and Western Europe.

Chinggis Khan, who knew that no united army of the Khwarezm Shah was going to check their invasion, divided his troops into four columns. He personally led one of them, the main one. His best commanders, Jebe and Subutai, commanded the troops directly. The column marched against Bukhara and Samarkand. Conquering the cities was viewed as its main mission. The second group of troops, headed by Chinggis Khan's sons Chagatai and Ögedei, was to besiege Otrar. The third group, led by Ulag Nayan and Suketu Cherbi, was to attack Khujand and Benakent. The fourth group of the army, commanded by Jochi, attacked the cities of Jand and Yangikent. Thus, Jochi's army was the northernmost one; the first central army was led by Chagatai and Ögedei; the second central one, by Ulag Nayan and Suketu Cherbi; the southernmost, by Chinggis Khan, Jebe, and Subutai. They attacked the area of the lower and upper reaches of the Syr Darya and the valley of the Zeravshan River, a tributary of the Amu Darya. The Khwarezm Shah's camp lay south of the upper reaches of Amu Darya in the city of Balkh.

The Mongols had their major victories in the early spring of 1220. Bukhara fell on 10 February; Otrar was occupied in February; Samarkand, on 17 March; Sygnak, also in March;

Mongol troops chasing the enemy.
Miniature. Iran. 1301–1314.

Jand, on 21 April; Khujand surrendered at the same time. The enemy occupied a large part of the Khwarezm Shah's state within three months. The rulers of the cities of Kunduz and Balkh took Chinggis Khan's side of their own accord.

The Mongols were killing everyone who resisted. They used captives, women, and children to besiege cities as the *khashar*. All valuables became plunder; craftsmen were sent to Mongolia. Descriptions by Chinese, Muslim, and Christian authors of the epoch provide detailed information on Chinggis Khan's cruel methods of war.

The twenty-thousand corps of Subutai and Jebe were to catch the Khwarezm Shah. The Shah fled to Khorasan, first to the city of Nasa, then to Nishapur. Nishapur was conquered and reduced to ashes [al-Nasawi, 1973, p. 92]. The Khwarezm Shah hid on Ashur Ada Isle in the southern part of the Caspian Sea, near the mouth of the Gurgan River. He died there in December 1220. His son and successor Jalal al-Din buried him in the Ardahi Fortress. The Mongols occupied the fortress, exhumed the remnants of the Khwarezm Shah, and brought them to Mongolia, where they were burned when Ögedei became the ruler.

Chinggis Khan spent the summer of 1220 near the city of Nasaf. His corps moved to-

wards the city of Termez in the autumn. Having conquered the localities, he wiped them off the map, robbing and beating the entire population, ruining and burning down everything. He spent the winter of 1220–1221 on the banks of the Amu Darya. The Mongols were besieging Urgench, the capital of the state of Khwarezm shahs, in the lower reaches of the Amu Darya. Chinggis Khan wrote a letter to Terken Khatun, the Khwarezm Shah's mother, suggesting that she surrender. She refused. Terken Khatun was later captured along with the Khwarezm Shah's children and wives. As he was leaving the Khwarezm Shah's realm, Chinggis Khan arranged a victory parade. Terken Khatun had to lament loudly for her son's state while the troops were parading by. Then she was brought to Mongolia, where she lived in the khan's camp, feeding on leftovers from the khan's table until she died in 1233.

In the summer and autumn of 1221 major battles took place near Ghazna. Jalal al-Din was able to defeat the Mongols for the first time near Kandahar and Pervan. However, the Mongols occupied Ghazna in 1221. They inflicted a crushing defeat on Jalal al-Din in the battle on the banks of the Indus River on 23 November 1221. Jalal al-Din retreated to India, and the Mongols chased him along the Indus banks up to the city of Multan.

In 1222 Chinggis Khan's horde was camping north of the Hindu Kush. It was here that he got the unsettling news that 'the Tangut and Khitan (here the population of North China, Jurchens, and Chinese) people had taken advantage of his absence to cause disorder and riots among his subjects.' He decided to return to Mongolia. Chinggis Khan spent the winter of 1222–1223 near Samarkand; the summer of 1223 and the winter of 1224, on the Chu River; and the summer of 1224, in the Irtysh Valley, which he liked. He spent the winter of 1224–1225 near the Emil River before returning to Mongolia in 1225. Chinggis Khan's biography has a lot of mysterious sides. One of the mysteries is his three years' travel from Middle Asia to his homeland. In 1225 the office of *darughachi* vicegerents was introduced to Chinggis Khan's administration to control the conquered peoples. Mashut Hurumshi became

the darughachi of Middle Asia, and Mahmud Yalavach, of Yan (Beijing), North China. Jochi remained the ruler of Khwarezm.

The corps that chased the Khwarezm Shah was not satisfied when he died. The Mongols marched around the Caspian Sea to ravage the cities of Azerbaijan in 1221, enter Georgia in 1222 and crush the Georgian army in the Kotman Valley. They entered the North Caucasus—via Shamakhi—Derbent—to defeat the Kipchaks and the Alans and crush the joint Kipchak and Russian forces in the Battle of the Kalka River on 31 May 1223.

The conquest of Middle Asia was the pinnacle of Chinggis Khan's life-long 'western' expansionist policy if we view his campaigns against the Great Xia and Jin as his 'southern' policy. The voluntary submission of the Uighurs and the Turk-Karluks, the fall of the Kara-Khitan state, occupied by Naiman Kuchlug, and the involvement of the Uighurs and the Karluks in the western campaign all contributed to it. Hardly any detailed information is available on the Uighur and Karluk annexation. Why did the state of Khwarezm Shah become the second target of revenge? The Jurchen people were the first. The Tanguts were to become the third. Even though his state was rather weak, the Khwarezm Shah was another claimant to 'world dominance,' just like Chinggis Khan. 'The Ruler of the West' came to contest the power of 'the Ruler of the East.' Chinggis Khan had no rivals in Jin, Xia, or the Southern Song. South China was in fact his ally in those years.

Thus, having neutralised Jin and Xia, whom he even put at war with each other in 1214, Chinggis Khan used nearly all of his power—and that of his allies—to attack his rival, the Khwarezm Shah. The 'Islamic factor' was of importance, too. Though the relevant literature might seem to be extensive, the role of Muslims in the development of the Yeke Mongol Ulus, the Great Mongol State, and in the domestic and foreign policy of Chinggis Khan and his successors has not been studied in depth. However, their role was significant, more significant than that of the Khitan (Yelu Chucai), who were ethnically close to the Mongols and even the Chinese. Chinggis Khan's Muslim advisors had a better understanding of the Muslim world than they had of the Chinese one and a better idea of what the Mongol cavalry could conquer there, though they probably did not expect the campaign to be so devastating. The Turkic-Kipchak factor, the deep Turkic-Mongol conflict in Khalkha, of which scholars only have a general idea associated with the outcome—the Turks being forced out of their homeland Mongolia—also made a significant contribution to the western campaign.

The conquest of Middle Asia, the defeat of the Caucasian rulers and that of the Kipchak-Russian group on the Kalka River, and the ambition to finish the Kipchaks, all initiated new campaigns in Eastern Europe. After a little more than ten years this had become an urge to own any land where the hoof of the Mongol horse could trample.

§ 4. The Eastern European Campaigns of 1223–1240

Iskander Izmaylov

The campaigns in Eastern Europe by Jebe and Subedei in 1223 and Jochi's campaign from Khwarezm to the Trans-Volga Region. The history of the conquest of western countries and territories is an important chapter in the history of the Great Mongol Empire, which determined the establishment of the Jochid Ulus on its historically largest area. It is directly connected to the issue of the Jochids' hereditary domain and their right to conquer

countries that lay in their way to the 'last sea.' Jochi's hereditary ulus, which Chinggis Khan apparently allocated to him in 1207–1208, initially lay in the west of the Mongol State. Data given by Rashid al-Din suggests that Jochi's wing contained four Mongol thousands from the Sijiut, Kingit, and Hushin tribes [Rashid al-Din, 1952, I, 2, p. 274]. It is quite obvious that the thousands were guard detachments, the basis of the future Jochid army. They were on

the front line of the war against nomadic peoples: first the Merkits and the Naimans, who had retreated to the Irtysh basin and Eastern Turkestan; then with the 'forest peoples'—the Oirat, Buryat, and Kyrgyz people [Buell, 1992, pp. 1–32]. Successful campaigns and diplomatic actions caused the Jochid Ulus to become well-established as the western flank and a foothold against the Kipchaks and other western countries. Already during the reign of Jochi, detachments of Oirat, Kyrgyz, Uriankhai, and later also other Turkic-Kipchak and Tatar tribes, who were annexed or expressed their loyalty to Chinggis Khan in 1207–1211, were included in his troops. The northern territories of the Altai Mountains, the Transbaikalia, and Minusinsk Hollow were finally conquered in 1217, when Jochi's commanders defeated the Khor-Tumats.

Extremely significant events took place in the following year—that is, 1218. Willing to get hold of Kuchlug's state from the north and finally defeat the Kyrgyz and other 'forest peoples' as well as the Merkits, who had been getting stronger, and the remnants of other tribes crushed by Chinggis Khan who had joined them, Chinggis Khan sent troops, led by Jochi and directly commanded by Subedei and Tokhuchar, to the Turgai Steppe. According to Subedei's biography in 'Yuanshi,' he 'marched a large army to the Chan River, faced the Merkits, captured two commanders, and subjugated their people completely after two battles. Their head Qutu fled to the Kipchaks; Subedei chased him until they had a battle in the Kipchak land near the Yuyu mountain valley, and he defeated him' [Khrapachevsky, 2004, pp. 498–499]. This apparently describes the Battle of the Irgiz River, one of the outcomes of which was the first battle against the Khwarezm Shah's troops. Importantly, it was the first time that Jochi's troops had fought against the Kipchaks. T. Allsen believes that it refers to the nomadic Yemek state, headed by the Olburi (Ilbure) clan, which lay in the Aral and Trans-Volga Regions [Allsen, 1983, pp. 9–10; Allsen, 2003, 3/4, p. 130] (for more details on this clan see: [Golden, 1986, pp. 5–30]).

The following large-scale war against the Khwarezm Shah, which ended with the fall of

his empire and the annexation of Mawarranahr, Khwarezm, and Khorasan by the Mongol Empire, had a crucial outcome for Jochi and his descendants. Their ulus extended nearly to the Yaik (Ural) River, while in the south they, to some extent, controlled Khwarezm and the cities on the banks of the lower reaches of the Syr Darya (for details see: [Togan, 2002, pp. 146–187]). A war against the Kipchaks and the Yemeks was clearly on the agenda. However, the sequence of events led to this to being not a war against separate Kipchak tribes but against a coalition of Volga-Ural peoples and states.

The military conflict that lasted for almost 5 years began in 1223. In fact, it was triggered in 1220, when three tumens, commanded by Subedei, Jebe, and Tokhuchar, were sent to Khorasan in pursuit of Khwarezm Shah Muhammad. After he had been reported dead, they were sent to conquer the western part of the state of the Khwarezm shahs—Arran, Azerbaijan, Iraq, and Shirvan' [Rashid al-Din, 1952, I, 2, p. 225]. Tokhuchar fell in one of the battles; his tumen apparently was partly killed and partly reallocated among other Mongol corps. Episodes of bad luck did not affect the campaign in general. Subedei and Jebe's victories over the Georgian troops had already brought about the conquest of Transcaucasia in 1221. It seemed that their mission had been completed. However, they suddenly turned around to travel to the North Caucasus via Derbent.

Having fought their way through the eastern foothills of the Caucasus, they reached the plains of the North Caucasus. An alliance of Kipchak and Alan troops tried to halt their advance there. Both armies fought with courage and bravery. The Alans and the Kipchaks could not retreat, which would mean leaving their country to the merciless conquerors. However, to lose would mean death for the Mongols, too. The brutal battle had no winner. The Mongols then resorted to cunning. They bribed the Kipchak leaders, also promising to leave their camps intact. This proved to be decisive. The Kipchaks left their ally, thus dooming them to defeat. The Mongols then attacked the Kipchaks, who had believed their assurance of friendship. According to the same Arab chroni-

Mongols. Miniature.
Illuminated Chronicle of the 16th century.

cler, 'the Mongols descended upon them all of a sudden, killing everybody they could find, and took twice as much as they had given them.' The effect of the attack was especially severe on the Don and North Caucasian Kipchak unions of Yuri Konchakovich and Danik Kobyakovich. To quote Ibn al-Athir, 'the Kipchaks fled without beginning the battle and disappeared; some hid in the swamps, others, in the mountains. The rest went to the land of the Russians [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1884, p. 26].

The Kipchaks had to escape to the Russian borders, so the Khan of the Dnieper Kipchaks, Kotyan, asked Russian princes for help. Realising the threat to the Russian Lands, the principal southern Russian princes faced the Mongol troops. They turned to other princes for aid. Their primary argument was Khan Kotyan's words, which the First Novgorod Chronicle has preserved, 'They have taken our land today, and they will have taken yours tomorrow'

[Polnoe sobranie russkix letopisej, 3, p. 62], and also generous gifts presented by the Kipchaks. A Mongol embassy arrived in Kiev at that moment to discourage the Russian princes from helping the Kipchaks, assuring them that they were not intending anything against the Russians, and that their campaign was aimed exclusively at the Kipchaks, 'them heathen Polovtsians, men, and horses' [Ibid.]. However, the Russian princes rightfully refused to believe them, and the gathering of princes in Kiev decided to provide aid to the 'heathen' Kipchaks.

At that time the Mongol troops, having completed a raid on the Azov Sea Region, entered the Crimea and ravaged Sudak, interrupting the Black Sea trade [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1884, p. 26]. From there they moved to the Dnieper River Region for the city of Zarub, where they found out that the Russian princes had departed. The joint Russian and Kipchak army was a considerable force. The Mongol troops had to face Mstislav of Kiev, Mstislav of Galicia, Mstislav of Smolensk, Daniel of Volynia, and more princes with their druzhinas. The Kipchak detachments, headed by several khans, were also quite large. For instance, the horde of the Kotyan khan, who had already fled to Hungary after the battle, alone was powerful enough to constitute a self-sufficient army. Therefore, the allied troops must have included as many as 40,000 warriors in total.

According to the Russian chronicle, Subedei and Jebe turned to the Russian princes with an offer of peace, 'we have heard you march against us on the request of the Polovtsians; we won't enter your land and attack your cities or yourselves, nor will we attack, God so willing, those heathen Polovtsians, men and horses; make peace with us; fight against them when they come to you and take their goods, for we know they have done a lot of harm to you; this is why we wage war against them' [Polnoe sobranie russkix letopisej, 3, p. 62], suggesting that they would not provide any aid to the Kipchaks. They even killed their ambassadors and moved on to the steppe.

Curiously, the famous historian L. Gumilyov tried to present the situation as if the Rus-

sians thereby triggered the further campaigns and the conquest of Russia. He called what happened 'a base crime, when one murdered one's guests and those who trusted one!' He further wrote, quite emotionally, that 'there is no evidence that the Mongols' proposal of peace was a diplomatic trick...; the Mongols sincerely wanted to make peace with the Russian, which became impossible after the treacherous killing and unprovoked attack' [Gumilyov, 1992, p. 501]. It is unclear how the author knew the Mongol chiefs to have been 'sincere,' which is certainly not suggested by events of Subedei and Jebe's Caucasian campaign. Suffice to say, they deceived the Kipchaks to make them leave their Alan allies alone. Even if the Russian princes only had a small amount of information on the then-recent battle, which is hardly possible because many of the Kipchaks 'went to the land of the Russians,' they clearly wanted to halt the Mongol attack on the distant approaches to their frontiers. Besides, as Ch. Halperin correctly noted, it was common for Mongol ambassadors to be assaulted and insulted in different territories and countries, and they were often too impudent, as though it was their ambition to trigger Mongol expansion by dying, to view the act as universal vengeance [Halperin, 1998, pp. 322–323].

The outcome of the steppe campaign was the notorious Battle of the Kalka River on 31 May 1223. The joint army of the southern Russian princes and the Kipchaks, about twice as large as that of Subedei and Jebe, was defeated and nearly annihilated. Numerous works have been written on the events preceding the battle and its course due to a number of sources, including Russian chronicles, providing a detailed account of that year—from N. Karamzin and S. Solovyov to B. Grekov, I. Danilevsky, and R. Khrapachevsky, who studied different aspects of the event in detail.

It is only safe to say that the victory can be attributed to the tried and tested tactics of the Mongol troops, who employed tactical withdrawal, enveloping, and launch and attack. The commanders used similar tactics when they crushed the troops of King Lasha of Georgia on the Beruji River (Jegam Chai) [Rashid al-Din, 1952, I, 2, p. 228]. Ibn al-Athir described the

course of the battle as follows: 'The Russians and the Kipchaks, who had prepared for a battle against them (the Mongols—I. I.), took the way of the Tatars to meet them before they entered their land and repel them from it. The Tatars found out that they were approaching, and they hurried to retreat. Then the Russians and the Kipchaks wanted [to attack] them. Thinking that they had turned back because they were afraid of them and were not strong enough to fight against them, they began to chase them with perseverance. The Tatars did not stop retreating. They chased them for 12 days, [but] then the Tatars turned back to face the Russians and the Kipchaks, who did not notice them until they had run into them; [it happened very suddenly] for the latter because they had believed themselves to be safe against the Tatar, being confident that they were superior to them. Hardly had they gathered for a battle when the Tatars attacked there with significantly larger troops [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1884, pp. 26–27]. Russian chronicles give a similar account of the final stage of the battle. The united troops crushed the Mongol advance detachment and killed its commander Gemyabek. Then '...the Russian princes along with their troops went to the other side of the Dnieper, and they moved like this for 90 days' [Polnoe sobranie russkix letopisej, 3, p. 62]. Having reached the bank of the Kalka River, the allied troops began to set up their camp along its banks. The princes were sure that the Mongols were weak and were fleeing to escape a crushing defeat. Their overconfidence cost them dearly. All of a sudden on 31 May 1223 a battle broke out that became a real disaster for the joint army. Without encountering the enemy, Princes Daniel of Volynia and Mstislav the Bold of Galich, followed by Kipchak detachments, began to move to the other bank of the river: 'they crossed the Kalka River, sent Yarun with Polovtsians to be the guard while they made a camp there [Ibid.]. The princes suddenly faced the enemy, who had been avoiding the battle for such a long time. Prince Mstislav 'saw a Tatar regiment; he went back and said, 'Get armed.' Mstislav and the other Mstislav in the camp did not know anything about it. Mstislav did not tell them

Commander of the Golden Horde.
Reconstruction by M. Gorelik

because he envied their large domain.' [Polnoe sobranie russkix letopisej, 2, 1998, Column 743]. In the meanwhile, what had seemed to be a skirmish with the advance detachment of the Mongols developed into a battle, for which the allies were unprepared. Though the chronicler, who described the Battle of the Kalka River in the Galician-Volynian Chronicle, tried to shift the blame onto the Princes of Kiev and Chernigov, who did not support the attack of the Galician and Volynian troops and even neglected Mstislav the Bold's warning that they should arm for a battle, it is largely Mstislav who is to blame. First, he started the attack before the Kiev and Chernigov troops were there to help him. Second, according to an earlier narrative in the Novgorod Chronicle, which is independent of that in the southern Russian chronicles, it appears that it was the Galician and Volynian regiments that were not prepared for the battle. 'Then Yarun attacked them for a battle, and the Polovtsians, who were not prepared, fled, so did the regiments of the Russian

princes for they had not been able to get armed against them; a great commotion began, and a fierce and violent battle took place' [Polnoe sobranie russkix letopisej, 3, pp. 62–63].

Taken together with the report by the Arab historian, the data is helpful for reconstructing the general course of the battle. The Arab historian's mention (there is no equivalent in the Russian sources) of the numerical advantage, provided that it is not a literary allegory of an educated author trying to justify the disgraceful defeat of the joint troops by attributing it to 'circumstances beyond control,' obviously means that the Mongols directed all their forces at the chasers, whose army was stretched all along the steppe, forcing a series of battles and forcing the advance regiments, especially the Kipchaks, to flee, and attacked the united army part by part. It appears that even the Galician and Volynian troops were not ready ('for they had not been able to get armed') and were wiped off the battlefield. The two princes fled in advance of their troops until they reached the banks of the Dnieper too fast for the Mongols to catch them.

It was the troops of Chernigov and Smolensk who tried to resist; but they were defeated. Only the Kiev part of the army remained in the battlefield. 'At seeing this evil, Prince Mstislav of Kiev did not move; he stood on a hill above the Kalka River as it was a rocky place; there was a city, and he fought with them for 3 days. The rest of the Tatars marched against the Russian princes, forcing them to fly to the Dnieper; near the city 2 commanders, Tygrykan and Teshukan, remained against Mstislav' [Ibid.]. Having failed to occupy the fortified camp by storm and siege, the Mongol nayons sent Brodnyk voivode Ploskinya to the Prince of Kiev. He persuaded the Russians to surrender, promising that the Mongols would spare their lives, which they did not—they killed the princes, voivodes, and common soldiers. Prince Mstislav of Kiev was killed among them; Mstislav of Chernigov, his son, and four more princes fell in the battlefield. The troops suffered dramatic losses; the number of casualties from Kiev alone was up to ten thousand [Polnoe sobranie russkix letopisej, 1, p. 447]. 'Yuanshi' reports in the biography of Hesimaili

(apparently a Muslim named Ismail), '...they reached the Russians and attacked them. They subjugated them in the Iron Mountains. They conquered their ruler Michirisil (Mstislav). Jebe ordered Hesimaili to present him to Zhuochi. They executed him [Mstislav]' (quoted by [Kychanov, 1995, p. 196]).

The victory on the Kalka River proved the Mongol troops to be tactically flexible and well-trained. However, it cost them a lot. For instance, the battle is described as 'most bloody' in Subedei's biography [Khrapachevsky, 2004, p. 513]. Chasing the fleeing warriors, Subedei and Jebe reached Novgorod of Svyatopolk, burning down villages and killing people on their way.

Then the Mongols went to their summer camping grounds, apparently in the Don River Region, ready to move towards the Great Bulgaria. However, a dramatic failure awaited them. The Bulgar troops apparently defeated the victorious troops of Subedei and Jebe in the autumn of 1223. Importantly, it is not the Bulgar's numerical advantage but their successful tactics that ensured the victory. As has been already mentioned above, it appears that G. Belorybkin discovered some traces of the battle near the ancient town of Zolotarev near Penza recently.

T. Allsen once raised the curious issue that other detachments from the Jochid Ulus began to attack the Turks of the Northern Aral Sea Region at the same time as Subedei and Jebe advanced to the North Caucasus from Western Asia. The historian referred to some reports by Juwayni to state that Jochi himself led the campaign, starting his attack at the Kangly simultaneously with Subedei and Jebe's campaign [Allsen, 1983, pp. 10–14]. As a result, the two armies merged apparently in the Trans-Volga Region. This must be what Juwayni meant when he wrote that after 1222 'Tushi's army was in Desht-i Kipchak and nearby; they joined each other and from there came to Chinggis Khan' [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1941, p. 21]. Sources do not report any major successes by Jochi against the Kangly, although it appears that they were largely subjugated or exterminated because Subedei's biography

in 'Yuanshi' claims that, when Subedei had returned from the long campaign, he 'reported to the throne that 'thousands' of Merkits, Naimans, Kireis (probably Keraites or Keray/Geray.—I. I.), Kanglys, and Kipchaks should form a united army. [Chinggis Khan] followed his advice' [Khrapachevsky, 2004, pp. 500–501]. That is to say, there is evidence that the Kangly had been subordinated by that time.

Thus, the campaign of 1222–1223 can only be viewed as an 'exploratory' one by Russian historians. It appears to have been a well-planned, though not so well-coordinated and much worse-implemented, military operation. It is natural when we take into account its large territorial scale and how difficult it was to supply and reinforce the army. It is entirely possible that the attacks were targeted at the Bulgar territory on the Lower Volga—Saqsın and a number of other cities. However, it looks like Subedei and Jebe, having defeated the Saqsın people and the Alans in the North Caucasus in pursuit of their mission, deviated heavily to the west. It is unlikely that they encountered the Russian princes deliberately. However, their success on the Kalka River demonstrated the power of the Mongol army, which then moved to the Volga Region to complete their direct combat task. But their luck did not hold. Having suffered a crushing defeat on the Bulgarian borders, Subedei and Jebe were unable to provide any effective help to Jochi's troops. However, the latter succeeded. Holding the Bulgar troops in position, they prevented them from providing any efficient aid to the Kipchak unions, which were falling one by one in a losing battle. In a manner of speaking, it was the simultaneous attack on the Kipchaks—from the Caucasus on the south and from Khwarezm on the east—that opened the new stage of the Mongol conquest of Eurasia, marking the beginning of the subjugation of Eastern Europe.

The Trans-Volga Campaigns of 1229–1234. The campaign of 1223 showed to Mongol rulers that to conquer the West would require major military effort, which was impossible because the Mongols had overstretched lines of communication and were exhausted. They needed to take a pause and reinforce their power in their newly conquered countries. It was

all the more important because those were far from subjugated, and some centres of rebellion remained unsuppressed. This was the situation when new administrative and territorial units, namely 'thousands' of conquered peoples—the Merkits, the Naimans, the Keraites, the Kipchaks, and the Kangly—were established in the Jochid Ulus [Khrapachevsky, 2004, p. 500]; a Yemek-Olburi corps was formed somewhat later [Golden, 1986, pp. 5–30; Allsen, 1983, p. 14; Allsen, 2003, 3/4, p. 133]. Centres of rebellion were gradually suppressed, rebels killed, and local Mongol administrations reinforced. The new campaign in the Trans-Volga Region of the Southern Urals was postponed because a new war broke out against the Tangut state, Xi Xia, where all forces were sent, in particular, Subedei and Jebe with new detachments composed of Turkic tribes.

Apparently there were other internal reasons. The relationship between Jochi and his father deteriorated dramatically. According to Rashid al-Din, Chinggis Khan, before he returned to Mongolia, 'ordered Jochi to start a conquering campaign and occupy northern areas, such as Kalar, Bashgird, Urus, Cherkes, Desht-i Kipchak, and other areas there, but... he [Jochi] evaded the task and went away' [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1941, p. 64]. Chinggis Khan felt the fact that his son had ignored direct orders from the Great Khan outrageous and summoned him to inquire about the reasons. However, Jochi postponed his visit to the Khan's camp on the pretext of being ill. Chinggis Khan got even angrier when a Mangyt from Jochi's realm told him that his son was by no means ill but was indulging in hunting. An open conflict was about to break out. Chinggis Khan interpreted Jochi's actions as a revolt. 'Jochi must be mad to do this,' he said and ordered his army to start a campaign to capture his land. He wanted Chagatai and Ögedei to lead the advance detachment, while he was intending to follow them [Ibid., p. 65]. However, Jochi's mysterious death prevented the campaign from taking place. Rumour had it that he was dissatisfied with his father's policy and was poisoned (see references to sources and historians' opinions: [Kychanov, 1995, p. 205]). We do not know for

sure whether Jochi was the victim of a court plot or had really been preparing a revolt.

Anyway, a short peace was established in Desht-i Kipchak following his death. The Mongols did not care about the western territories because a war against the Xi Xia had broken out. Besides, Chinggis Khan died only six months after his son, after which preparations began for the Kuriltai, which was to determine the successor to the throne.

It was not before 1229 that Ögedei, after much negotiating, scheming, and compromising, was declared to be the Great Khan. Batu was officially approved as the ruler of the Jochid Ulus at the same Kuriltai—he had been previously appointed that on Chinggis Khan's order [Pochekeyev, 2006, pp. 63–65]. It is entirely possible that the Jochids lost control over the land west of the Irtysh River Region when Jochi was ostracised, and the new khan was being agreed on. It is hard to say what caused the changes to the frontiers. However, by losing the Altai Mountains, Batu received much more—his rights in his father's ulus and to the not yet conquered land in the west of Eurasia were confirmed.

The Kuriltai of 1228/29 'assigned him (Batu.—I. I.), according to Chinggis Khan's previous order,' along with his brothers and other princes to conquer the northern areas. The thirty-thousand corps of Quqdai and Subedei was provided to Batu and his brothers for the campaign [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1941, p. 34]. Another army, commanded by Churmagun, was sent to Western Asia and Transcaucasia to suppress the last centre of resistance, headed by the successor to the Khwarezm shahs, Jalal al-Din Mingburnu.

Now that Batu's power and his troops had been reinforced, he could start to conquer the Trans-Volga and Lower Volga Regions. However, he had to face a powerful coalition of peoples who had united to resist the threat from the east. Domestic historians tend either to omit to mention the resistance or to describe it as abortive, thus presenting the war in the Trans-Volga Region as an introduction to the conquest of Rus' (for instance, see: [Grekov, Yakubovsky, 1950, p. 207; Cherepnin, 1977,

pp. 190–192; Khrapachevsky, 2004, pp. 339–340; Khrustalyov, 2004, p. 96]. This does not apply to works by Tatar [Khalikov, Khaliullin, 1988, pp. 4–22; Khaliullin, 1988, pp. 23–27; 1955, pp. 118–135] and foreign [Allsen, 1983; 1987–1991; Allsen, 2003] historians). The principal centre of the resistance was not the alleged 'state cities in the Volga Region,' as assumed by some historians [Khrapachevsky, 2004, p. 339], but Volga Bulgaria, which controlled some territory in the Lower Volga Region, and the Yemeks (Kipchaks), Alans, and Magyars (Majgards/Bajgards), who had joined it. The city and province of Saqsin (for more details on the province see: [Fedorov-Davydov, 1965; Izmaylov, 2006b, pp. 370–371]), most of its population being Bulgar and Suvar, was a centre of resistance in the Lower Volga Region in 1229. Most probably, it is Saqsin whose ruins Astrakhan archaeologists discovered near the village of Samosdelka in the Volga delta not long ago. Some discoveries, primarily the set of ceramic articles, suggest that it was the centre of Saqsin Province [Grechkina, Vasilyev, 2001, pp. 156–157; Vasilyev, 2004, pp. 36–38; Zilivinskaya, 2004, pp. 75–78]. It is entirely possible that the As people from the Don River Region were still staying in Saqsin as the Bulgars' allies after the campaign of 1223. The Yemeks, headed by the Olbari (Ilbari/Ilbure) clan (for more details on the Kipchak clan see: [Golden, 1986, pp. 5–30]), constituted the basic military element of the anti-Mongol coalition.

Unfortunately, we do not know the details of the war. There is evidence, however, that it was fought in the Trans-Volga Region. Almost the only source providing any detailed report on the events of the year is the Laurentian Chronicle, records in which could have been made by the Bulgars, who came to make peace with the princes of Vladimir-Suzdal in the same year. It reads, 'In the same year 6737 the Saqsins and the Polovtsians met the Bulgars in front of the Tatars, and the Bulgar guardsmen returned from the Tatars beaten, near a river, the name of which is Yaik' [Complete Collection of Russian Chronicles, 1962, p. 453]. Eastern sources seem to have preserved some information on the war. For instance, the Arab author of the late 13th century, Ibn Wasil, reports, 'in 627

(1229/30) the flame of a war between the Tatars and the Kipchaks broke out' [Collection of Works Related to the History of the Golden Horde, 1884, p. 73].

Scholars have long noted that the report is to some extent connected with information on the first stage of the Mongol conquest in the area, collected by Friar Julian, who visited Bulgaria in 1235, and Giovanni da Pian del Carpine and William of Rubruck, who were travelling through the Trans-Volga Region. Both, with a number of differences, retell reports and rumour about a country named 'Sascia' (according to Julian), a 'Saxon' city, or a city of 'Summerkent,' which had resisted the Mongol troops violently. Most probably, all the stories referred to the same city, though its name differs, which is attributable to the sources' informers, not to mention that the city of the 'Saxons' is clearly a mistake, made either by Giovanni da Pian del Carpine himself or miscorrected by the copyist, who interpreted the unfamiliar name as 'Saxony.' It is not impossible that there were other settlements in the Volga delta. However, Saqsin was the capital and the centre of the area. It was its defence and fall that all witnesses described. Indeed, it would be strange if William of Rubruck had described the defence of a town without mentioning such a well-known event as the many years' struggle over Saqsin. Another piece of evidence that the sources refer to the same city is that the archaeological remnants of the ancient town of Samosdelka lie on an isle formed by Volga creeks. Quoting Giovanni da Pian del Carpine, '...they (the Mongols.—I. I.) besieged one city of the above Saxon people and tried to conquer them, but they made machines against their machines and broke all Tatar machines; so machines and ballistae preventing them from approaching the city for a battle; at last they made themselves an underground road and jumped into the city; some were trying to set fire to the city, while others were fighting. The citizens assigned the job of extinguishing fire to part of the population, while the rest fought bravely against those who had entered the city; they killed many of them and wounded others, making them return to their people; the Tatars saw that they could not do

anything, and that many of them were dying, and left them' [Travels, 1957, pp. 57–58]. When describing the Volga delta and comparing it to that of the Nile near Damietta, William of Rubruck mentioned that '...there is a city named Summerkent, which has no walls; but when the river floods, water surrounds the city. The Tatars had to stand at its walls for 8 years before they conquered them. Alans and Saracens lived in it' [Ibid., 185]. Since Julian said that he found out that Bulgaria and 'Sascia' had fallen in 1237, we can agree with T. Allsen [Allsen, 1983, pp. 15–16; Allsen, 2003, 3/4, p. 133] that the Mongols began to attack Saqsin in 1229, but the defenders held out for a while.

It is quite possible that the failure of the Mongol troops was caused, apart from the heroism of those who defended the Saqsin, by the Bulgar military power. The Russian chronicle indicates that Bulgar sentry detachments, supporting the local army of Saqsin and the Yemek units, were sent to the Trans-Volga Region. The Bulgars probably did it in response to the Mongol campaign against Saqsin. The general strategic situation enables us to assume that it was an attempt on the Mongol troops' flanks to prevent them from besieging Saqsin. The long-distance steppe campaign, which was unusual for the Bulgars, is attributable solely to this (assumed) reason. Anyway, the Bulgar troops moved to the banks of the Yaik (Zhayyq) River and had a battle with the Mongols. The Bulgars and their allies, the Saqsins and the Yemek, were eventually defeated. However, their sacrifice was not in vain. It was the second time that the Bulgars had disrupted a conquest of the Volga River by using various tactical defensive manoeuvres to break-in to the steppe.

The Bulgar support enabled the Yemek to strengthen their resistance. Assaults by the Mongol troops apparently forced the rebellious Kipchaks to retreat to the Volga River, but they did not cease to resist. According to T. Allson, this is when a power shift happened in the Yemek community. Part of them yielded to the Mongols and, commanded by Khan Banduchar (or Baltuchak; probably Bachman, see: [Kychanov, 2002a, pp. 79–80]), participated in the

western campaign, while the rest continued to resist, led by Bachman [Allsen, 1983, pp. 16–17; Allsen, 2003, 3/4, p. 134]. It is hard to tell where his ancestral territory was; later Tatar sources located it on the Akhtuba (Ak Tuba) [Usmanov, 1972, p. 116], which is consistent with the report on his war against the Mongols in the Lower Volga Region. As reported by a witness to the events, Julian, the Magyars (Bajgarbds) of the Southern Urals, who undoubtedly relied on Bulgaria's military support, continued their struggle until as late as 1236.

Batu's campaign against Saqsin failed. The ruler of the Jochid Ulus had to retreat. However, he could not give up his plans of conquering the region. There were several reasons for this. Batu Khan dreamed of impressive conquests in the west to enlarge his realm. There was another reason. The resistance in the Volga Region could spread to the newly conquered areas. The Mongols had a reason to treat their new allies with suspicion; it was not uncommon for Kipchak detachments to take the enemy's side, as they did in China.

However, the general lack of success of his previous campaigns motivated Batu to change his tactics. Now the main blow was targeted at Volga Bulgaria. The campaign took place in the summer or autumn of 1232. We know even less about the campaign than about others (see overlook in: [Khaliullin, 1988, pp. 23–27]). The only source of information on it, the Laurentian Chronicle, provides the following brief report: 'In the year 6740 (1232)...The Tatars came and spent the winter there without reaching the Great City of Bulgaria...' [Complete Collection of Russian Chronicles, 1, 1962, p. 459]. Short as it is, it still enables us to infer that this time the struggle took place in the territory of Bulgaria, while the capital—the 'Great City' in Russian chronicles—or the historical Bilyar was the target. This also suggests that the invasion began in the Cis-Ural Region, the general route being via the basin of the Sheshma River towards Bilyar. However, the resistance of the Bulgars, field troops, and fortress defenders prevented the Mongol from breaking their defences and besieging the capital. Anyway, it is evident that the Mongols had to withdraw.

Mongols firing at the city from a mandzhanik (stone fougasse) and bows. Miniature. Iran, 1301–1314.

Mongols attacking the city. Miniature. Iran. 1301–1314.

The situation in Trans-Volga Region was paradoxical in 1234. In spite of a number of military victories and probably even a westward expansion of the Jochid Ulus, no decisive success had been achieved. This is why the author of 'The Secret History of the Mongols' had to note that 'Subeetai Bagatur met with powerful resistance by the peoples and cities, the conquest of which had been assigned to him,' which included the Kangling (Kangly), the Kibchaut (Kipchaks), Bachjigit (Magyars), Orusut (Rus'), Asut (As-Alans), Sesut (Saqsin), Bular (Bulgaria), and Kelet (probably a general term for the Polish and the Hungarians), 'as well as cities behind the deep rivers Adil and Jayah' [Kozin, 1941, § 270, pp. 191–192]. That is, the Jochid Ulus had not expanded significantly over 11 years of continuous frontier war (from 1223). It is no wonder that the author of the same 'Secret History of the Mongols' wrote frankly, speaking about the West: 'there are many hostile countries there, and the people are fierce. The people kill themselves in anger by throwing themselves on their own swords. Their swords are said to be sharp. ..' [Ibid., p. 192]. Having tried the sharpness of the enemy's swords, the rulers of the Jochid Ulus saw their military politics collapsing. The

dissatisfaction of the Jochids, who were definitely an important power supporting Ögedei on the throne against other Chinggisids, made the Great Khan receptive to Batu's requirements that they should begin a joint westward campaign. He turned back to the 'western' issue again and again, viewing it in the context of other wars—those against the Southern Song Empire, Korea, and Tibet.

The Kuriltai of 1234 resolved to assign to Subedei's corps to Batu. However, the experience of the previous years had shown this to be insufficient. The issue was becoming so burning that the khan had to take an unprecedented step. He gathered a new kuriltai after only a year. Apparently as a concession to the Jochids, the Great Khan had to proclaim an all-Mongol westward campaign, headed by Batu Khan. Ala al-Din Juwayni, who referred to the documentation at khan's chancellery (hence information similar to that presented by Rashid al-Din) and witness reports, was able to preserve interesting information about it. He wrote in 1252/53, fifteen years after the events. He reported: 'the kaan [Ögedei] gathered the Great Kuriltai for a second time, they [princes] met to discuss the extermination and subjugation of those who had not been conquered. They resolved to

conquer the land of the Bulgars, the Ases, and the Ruses, which lay near to Batu's camp. They had not been subordinated and took [vain] pride in the large number of their cities' (quoted by: [Arslanova, 1988a, p. 41]).

The Western Campaign and the Conquest of Volga Bulgaria. Additional taxes were collected within a short period of time, and conscription to the military began. Ögedei ordered as follows: 'Both great princes who rule appanages and those who have none must send their eldest sons to the war. Nayons of tumens, thousands, hundreds, and tens, as well as people of any income must also send their eldest son to the war. Princesses and sons-in-law must also send their oldest sons to the war' [Kozin, 1941, § 270, p. 191–192]. That is, each family was to supply one warrior. Such mobilisation of forces was unprecedented in the Mongol Empire. Many Chinggisids personally participated in the campaign in obedience to Ögedei's order. These included Chinggis Khan's youngest son Kulkan, Ögedei's sons Guyuk and Kadan, Tului's sons Mengü and Büchek, Chagatai's sons Buri and Baidar, and all adult Jochids—Batu, Orda, Shiban, and Tangut, as well as well-respected emirs such as Subedei Bagatur, Burundai Batyr, and several others [Collection of Works Related to the History of the Golden Horde, 1941, p. 34].

How large the army was remains a controversial issue among historians. The 'last chronicler' N. Karamzin set the standard by writing, 'Batu's forces were superior to ours beyond comparison and were the only reason of his success; he then directly mentioned 'Batu's half-million troops' [Karamzin, 1992, IV, 1, pp. 13–14]. S. Solovyov believed the army to have been smaller, namely 300 thousand warriors [Solovyov, 1988, II, 3–4, p. 137]. Domestic historians largely believed the model and either mentioned the Mongol troops to have been larger 'beyond comparison' or accepted the number suggested by S. Solovyov (see works by I. Berezin, M. Ivanin, D. Ilovaysky, V. Pashuto, Ye. Razin, A. Strokov, and others).

Some time later attempts were made at using more realistic figures, based on some calculations. For instance, Soviet historian V. Kargalov rejected the number 300 thousand as

'dubious and exaggerated' and believed Batu's army to have consisted of 120–150 thousand warriors, assuming that each of the 12–14 Chinggisids participating in the campaign commanded 10–12 thousand warriors [Kargalov, 1966, p. 75]. There could be a point in it if we could be sure that each descendant of Chinggis Khan did command a *tumen* of 10,000 warriors, which is not beyond doubt. N. Munkuyev provided a more accurate estimate by assuming that, knowing that the eldest sons of all Mongol families were sent to the campaign, there could have been 139 thousand warriors [Munkuyev, 1977, p. 369]. Anyway, the figure 120–150 thousand warriors is the most popular with historians. It is usually composed of 50 thousand Mongol troops and 70–100 thousand Kipchak warriors and those of other ethnic groups. Some contemporary domestic and foreign historians share this opinion [Saunders, 1971, p. 81; Philips, 2003, p. 75; Weatherford, 2005, p. 279; Khrustalyov, 2004, p. 69; Khrapachevsky, 2004, pp. 182–183, 351].

G. Vernadsky [2000, p. 57], I. Grekov and F. Shakhmagonov [1986, p. 62], L. Gumilyov [1992, p. 518] estimated the Mongol troops to have been considerably smaller, namely 30–50 thousand people. This has been recently supported by a number of historians [Chernyshevsky, 1989, pp. 127–129; Choysamba, 200b, p. 68]. Others believe the enormous number to have been 'simply impossible' [Khrustalyov, 2004, p. 69]. In fact, it appears much more realistic if we take into account that this refers to the Mongol troops, the Chinggisids' guard, which obviously 'gathered' contingents of allied and subordinated peoples.

Quite naturally, the differences are attributable to our poor source base. On the one hand, there is a highly detailed description of the Mongol troops during the rule of Chinggis Khan, in fact a register, which has come down to us within the dynasty history 'Altan Debter,' states the number to have been 129 thousand in 1227. However, 'The Secret History of the Mongols' (about 1240) mentioned it as 95 thousand warriors [Kozin, 1941, p. 158]. In fact, we cannot be sure that all Chinggisids commanded *tumens*, and that the army sent to conquer the West was large because the Empire was

carrying out military actions on a number of fronts at that time. On the other hands, there are sources, primarily those by European travellers, which report much more fantastic numbers. For instance, Julian, referring to a Mongol ambassador as his source, claims the army to have consisted of 375 thousand warriors, including those from subordinated peoples, in a report to western rulers [Anninsky, 1940, p. 90]. Yet, the figure is hardly accurate because, as R. Pochekeyev rightfully noted, 'they merely represent the prophecy, which was very popular in the Christian world, 'about King David, grandson of Prester John,' who was to come from India to help Christians against Muslims' [Pochekeyev, 2006, p. 80]. That is, it would be reasonable to take a critical approach to such reports. Therefore, we agree with the historians who believe that no clear and objective evidence on the actual size of Batu's army is available to us.

At the same time, speaking of the Mongol army, we should take into account a number of facts that prevent us from accurately estimating the number of Batu's warriors participating in this or that military action. First, there is the myth of numerical superiority. The English historian J. Fennel, who had a generally unbiased and cautious approach, wrote: 'What enabled the Tatars to defeat Rus' so easily and so soon?...We should take into account the size and extraordinary power of the Tatar troops. The conquerors undoubtedly had a great numerical advantage over their enemy' [Fennel, 1989, p. 130]. Did they, however? The allies did not benefit from the fact that the Russian and Kipchak force was almost twice the size of Subedei and Jebe's troops. The Mongols won in spite of their being less numerous. What makes domestic historians be so sure that only a bigger army could defeat Rus'? Its mobilisation opportunities were far broader than those of Mongolia. For instance, the population of Vladimir-Suzdal Rus' in the early 13th century must have been as many as 1-1.2 million people, yielding almost a hundred thousand warriors. They would be dramatically inferior to Mongol horsemen in terms of skills and endurance, though. Quantity is not quality. Besides, the Mongols were good at military tac-

tics. They would skilfully coordinate their actions and raise tension in a number of locations, splitting the enemy's army and defeating it bit by bit. Taking this into account, the Mongols could be numerically superior within a certain location. Another factor, namely the army having been constantly refreshed from subjugated peoples, not only complicates the estimate but makes it highly relative.

However, even if the total size of the Mongol army commanded by Batu was 120 thousand warriors, we should take into account the fact that they acted in several directions, while still keeping a significant army behind the lines to maintain order in the conquered territories. Therefore, the army with which Batu conquered Rus' is unlikely to have been bigger than 30–50 thousand warriors. This does not seem likely given that the military actions in Rus' took place in the winter, while the Mongols had no supply bases. Most probably, they would have been unable to provide enough rations for the enormous number of men and horses (remember that each warrior had two to three horses). Anyway, R. Pochekeyev was right to state that 'what matters is not how many warriors Batu and his relatives had at their command during the western campaign but the fact that they won' [Pochekeyev, 2006, p. 82].

Batu was appointed Commander General of the Chinggisid army, while Subedei became his chief advisor. Being of non-Chinggisid origin, the commander and associate of Chinggis Khan played a most important part in organising and managing the military actions of the western campaign. To prove it, a Mongol captured by Russian warriors in the autumn of 1240 said: 'Even though he was 'not of his clan,' 'Sebedyai Bogatur' was Batu Khan's 'first commander' [Complete Collection of Russian Chronicles, 2, Column 781]. Other sources, such as his biography in 'Yuanshi,' confirm it [Khrapachevsky, 2004, pp. 501–504].

It was Subutai who began the attack on the Yemeks without waiting for the whole army to gather [Allsen, 1983, pp. 18–19; Allsen, 2003, 3/4, p. 135]. According to his biography in 'Yuanshi,' in the year Yi Wei (21 January 1235–8 February 1236) Kaan Ögedei 'ordered Zhuwang Batu to undertake the Western Campaign

against Bachman and said: '[We] have heard Bachman to have cunning and courage; Subutai also has cunning and courage, so he will be able to defeat him.' So he ordered Subutai to be in the advance guard and fight against Bachman and then also assigned [him] to command the main army. After that Bachman's wives and children were captured on (the bank of) the Kuang Tieng Chi Ssu (Caspian Sea). Bachman learned about Subutai's arrival; he got very scared and fled to the sea [Allsen, 1983, pp. 18–19; Khrapachevsky, 2004, p. 503]. This suggests that the defeat of the Yemeks, commanded by Bachman, was a prelude to the 'Western Campaign.' Being unable to check the Mongol advance, Bachman retreated to the lower reaches of the Volga and resorted to sudden raids on separate Mongol detachments. Thus, Subedei was able to prepare for a general attack on Bulgaria as his southern flank was in no danger of a Yemek counter-attack.

In the autumn of 1236 the united Mongol army set off for the Volga Region. According to Juwayni, princes went to their uluses after the kuriltai to gather their armies to reach the frontiers of Bulgaria in the spring. It is unlikely that D. Khrustalyov was correct in believing that Batu's army started the campaign as two wings, the northern one, commanded by Batu, invading Bulgaria, while the southern one, commanded by Möngke, was to subjugate 'the Cumans (Polovtsians), the Maris, and the Mordvin people' [Khrustalyov, 2004, p. 69]. Such dispositions are simply impossible both in military and in geographical terms. The author used isolated phrases from source texts to model a ridiculous campaign of the 'southern' (!) wing moving via the Kipchaks to the Upper Volga Region. First, a big Mongol army could not have gone unnoticed in the 'area of Rus' particular attention'; and the chronicles do not mention the event. Second, why should the wing fighting near Kazan be termed southern? It looks like the two wings are the author's fancy, resulting from his misunderstanding of clear reports in sources. Juwayni provided an unambiguous description: 'All princes went to their places of residence. In spring they set off and hurried to begin. The princes met within the territory of Bulgar. They were so many that

the earth shook, and even wild animals were astonished by how much more numerous and how noisy their troops were' (quoted by: [Arslanova, 1988a, p. 42]). Rashid al-Din's report is very similar. Only his information contains a mistake attributable to either him or the scribes, who misinterpreted the list of conquests as repeats, namely the conquest of the Bulgars (and their capital Bilyar) and the Magyrs (the 'Bulars' and the 'Bajgards') and the European conquest, where the target was 'the Kelars and the Bashgirds' (that is, the Polish and the Hungarians) are presented within the same narrative. The Persian author wrote that, following the Kuriltai, all princes 'set off together in the spring of Bieching Yil—that is, the year of the monkey, which is Jumadi II, the Hijra year 633 (11 February 1236–10 March 1236), spent the summer on the way, and joined Jochi's urug—Batu, Orda, Shibani, and Tangut, who had been assigned to the outskirts—that autumn' [Collection of Works Related to the History of the Golden Horde, 1941, p. 34]. We can infer that in the spring and summer of 1236 the troops of Batu and his brothers fought against the Magyars in the Southern Cis-Ural Region, while in the summer they attacked the Bulgars. At least Julian, who visited Bulgaria and the Magyars within a several days' trip from the Bulgar capital that summer and turned back on 20 June, encountered on his return a Mongol ambassador, who told him that 'the Tatar army, which was nearby, within a five days' passage from here, wanted to march against Alemanian; but they were waiting for another, whom they had sent to defeat the Persians' [Anninsky, 1940, p. 81]. That is, Batu's troops prepared for the Summer invasion while waiting for other Chinggisid forces to arrive to help them, which is fully consistent with the official Mongol tradition. In this respect, the words of the ambassador as well as his boastful statements concerning the size of the Mongol army ('the Tatars say that they have so many warriors that one could divide them into 40 parts, and no power of the earth could resist one of the parts' [Anninsky, 1940, p. 90]) could have been false information disseminated within the framework of a psychological war as it was common Mongol practice to spread rumours about how

many warriors they had and how invincible they were—note that they would become even more powerful after the victorious troops from Iran joined them—to demoralise the enemy. It is unlikely that Batu intended to split his forces since he had too much at stake, while the Bulgars were strong enough as an enemy to let them hope for success.

The Bulgars were not indifferent to the direct and obvious threat. There is archaeological evidence that old fortifications were rebuilt, and new structures, erected in a number of cities [Khalikov, Khaliullin, 1988, pp. 13–15]. The Great City was well-fortified for that time. It lay in the flood plain of the Maly Cheremshan, surrounded by concentric rows of fortifications. The inner city was protected with two lines of ramparts and trenches over 5 km long, and the outer city, with three lines of fortifications over 10 km long. It was, to quote Julian, the 'large city of the area' that could supply, 'as rumour had it, fifty thousand warriors' [Anninsky, 1940, p. 81].

The Chinggisids' invasion began in the late summer or in the autumn, following the campaign of Guyuk and Möngke's corps, apparently with several corps that advanced along routes converging to Bilyar (the 'Great City'). It is possible that autumn had been chosen deliberately as the time to attack. It was unusual to conduct military operations in Eastern Europe during the winter season. Perhaps nobody expected the Mongols to introduce such an innovation. Maybe the Bulgars, who had kept considerable military forces in combat readiness for the whole summer, had to release part of the troops for harvesting.

The Mongols apparently reached the walls of Bilyar rapidly, which would have been natural given their tactics, and besieged it. To quote Giovanni da Pian del Carpine's description of their siege technique, 'They conquer fortifications as follows. If they come across a fortress, they surround it. Moreover, they sometimes fence it so that nobody can enter or leave it. They fight with weapons and arrows bravely without stopping for a single day or night, so those at the fortifications cannot have a rest either. The Tatars do have rest because they split their troops so that one unit can replace another

in the battle, so they do not get too tired. If they fail to conquer the fortification in this way, they throw wildfire at it... they undermine the fortification and enter it with arms from under the ground. When they have entered, one part throws fire to burn it down, and the rest fight against the people at the same fortification...' [Travels, 1957, pp. 53–54]. Chinese sources provide a similar description of their siege tactics: 'Each time that they attack large cities, they first attack small cities, occupy them, bring along their citizens, and use them. Then they order each warrior to capture at least ten people. When they have enough people, each [captive] must [collect] a certain amount of grass or firewood, soil, or stones. When [people] are brought there, [they] fill and smooth out trenches; they use [some] for maintenance of [siege carts that look like] geese, storming domes, catapults, etc. They do not even spare tens of thousands of people. This is why everyone is captured when a city or fortress is stormed, without exception. As soon as the city walls have been broken, they kill everyone without distinguishing between the old and the little, the beautiful and the ugly, the rich and the poor, those who resist and those who submit, usually without any mercy' [Meng Da Bei Lu, 1975, p. 67].

It is beyond doubt that Bilyar was also a big, densely populated, and defiant city. However, desperate resistance was no use this time. The city was conquered and burnt down, its population apparently annihilated. The Laurentian Chronicle reports: 'In the year 6744 (1236)... the godless Tatars came to the Bulgar land from the eastern countries and conquered the Great City of the Bulgars, and killed everyone, the old and the small, with their weapons, and took a great amount of goods, and set their city to fire, and captured their entire land' [Complete Collection of Russian Chronicles, 1, p. 460]. Juwayni provides a similar account of the events: 'At first they [the princes] conquered Bulgar, which is famous around the world as unapproachable and having a large population, by force and storm. They killed [part of] the citizens and captured [the rest] [Collection of Works Related to the History of the Golden Horde, 1941, p. 22]. Archaeological discov-

eries to some extent confirm and complete the description. The Bilyar Archaeological Site (the historical Bilyar) was ruined completely, any life ceased to be there; traces of fire and destruction, mass graves, and separate human bones have been found in its top layer [Khalikov, 1984, pp. 82–98; Khuzin, 1988, pp. 43–58]. Having successfully stormed the most well-fortified and the strongest city of Bulgaria, Mongol detachments began to conquer other cities and localities. Approaching the borders of Rus' and Bulgaria in the following year, Julian found out that the country ('Fulgaria') had fallen, and that the Mongols had also conquered 60 well-fortified castles with populations large enough to provide fifty thousand armed warriors each [Anninsky, 1940, p. 85]. This report clearly has much in common with Julian's previous mention of the Bulgar capital. However, it contains some new information on the many conquered cities. It is entirely possible that the traces of destruction found in some archaeological sites are attributable to such a ravage (see: [Smirnov, 1951, p. 53 ff.; Kaveyev et al., 1988, pp. 58–71; Kazakov, 1988, pp. 71–82; Gazimzyanov, Izmaylov, 1992, pp. 79–89]).

There is no evidence that the campaign was rapid, and 'the Bulgars' resistance was suppressed in a moment,' as Rashid al-Din described the event seventy years later: the princes 'occupied it within a short time without any great effort, beat its population, and plundered it' [Collection of Works Related to the History of the Golden Horde, 1941, p. 34; Khurstalyov, 2004, p. 70]. We should remember that the description refers to the western campaign in general because it further described the conquest of the Christian country of the Bulars (Kelars—that is, Poland), and that Batu's army would have reached the frontiers of Rus' a year earlier if the Mongol victory had been that rapid. It was apparently a cruel war, and the victory cost more to the Mongols than it may seem. The devastation of Bulgaria and the extermination of the unsubmissive population were extreme.

Most probably, any organised resistance died away following the downfall of the Bulgarian defence centre. Only a few localities tried to repel the Mongols. However, extensive archaeological evidence indicates that all Bul-

gar citizens, whether resisting or surrendering, were destroyed. The fact that part of the Bulgar aristocracy took the Mongol side—namely 'the local chiefs Bayan and Jiku' [Collection of Works Related to the History of the Golden Horde, 1941, p. 35]—aggravated the military defeat. The memory is apparently preserved in the oral traditions. At least Giovanni da Pian del Carpine's companion and secretary Benedict the Pole wrote that Batu had waged war 'at the Bilers—that is to say, the Great Bulgaria, and the Mordvans and, having conquered their [nobility], made them part of his army' [Christian World, 2002, p. 112].

Victory over the Bulgars paved the way for the Mongols conquest of all of the Volga Region. Most probably, it was then that their army split and began conquering the lands of the Volga Region, one after another. It cannot be ruled out that in summer 1237 part of Batu's army retreated to the Trans-Volga steppes to take a rest and to remain, with some of its detachments staying in Bulgaria where they were suppressing some resistant towns and regions. Taking reinforcement from the conquered peoples was obviously a common practice. Thomas of Split witnessed: 'then, having their troops manned, mostly from the Cumans and other peoples they had conquered, they again turned against the Ruthenians' [Thomas of Split, 1997, p. 104].

The next blow was struck against southern Bulgaria and perhaps the Lower Volga Region. When exactly the region was completely conquered is difficult to say, but most probably it immediately followed the fall of Bulgaria—that is, 1237–1238. According to Giovanni da Pian del Carpine, some Saqsins were fighting so persistently it took serious efforts and some while to crush their resistance [Travels, 1957, pp. 57–58].

Sources offer rather scanty information on the events that followed. Rashid al-Din mixed information from different times when he wrote that '... in the year of chicken—that is, 634 year of Hegira (4 September 1236–23 August 1237–I. I.), sons of Jochi Batu, Orda and Berke, son of Ughetai-Khaan, Kadan, grandson of Chagatai Buri, and son of Chinggis Khan, Kulkan, made war with the Mokshas,

the Burtases, and the Ardjans and conquered them in a short time... in autumn of the year mentioned all sons of tsar who were there (on the Western campaign—I. I.) held a joint assembly, and all agreed to turn their arms against Russians [Collection of Works Related to the History of the Golden Horde, 1941, p. 36; Rashid al-Din, 1960, II, p. 38]. The passage cannot lead to an unambiguous conclusion on how the campaign was progressing. A mistake appears to creep into the sequence of events described by this Persian historian who had compiled his work from various sources. The events seem to follow a reverse logic: first, in autumn 1237 the Chinggisids held an assembly where they decided to unleash war against the North-Eastern Rus' and then raided the Sura River Region, where they conquered the Bulgar fortresses in the area of historical Bulgaria and subdued the Mordvinian tribes of Moksha and Erzya. Although it is quite possible that the assembly of the Chinggisids followed the conquest of Transsura Bulgaria, and it was that assembly that approved the campaign against Russia. This was proved by Julian, a monk from Hungary, who witnessed the event. In his other attempt to reach the pagan Hungarians, who lived in the eastern borders of Bulgaria and whom he had visited on summer 1236, he came to Suzdal in 1237 to learn that '[the Mongols] turned to the west and within one year or a little longer seized five greatest Pagan kingdoms: Sascia, Fulgaria, and 60 rather fortified castles.' 'In addition, they assaulted Vedin, Merovia, Poidovia, kingdom of the Mordans [Anninsky, 1940, p. 86]. Sascia and Fulgaria on this list are undoubtedly Saqsin and Bulgaria, Vedin is most probably the Sura River Region, and the rest are the names of areas in the Middle Volga Region.

However, it is certain that in late summer or early autumn 1237 Mongol forces crossed the Volga in the vicinity of a traditional crossing located near the Samara Bend. Obviously, that time saw the destruction of Bulgar towns on the Volga and the Samara Bend; the blow was so grave they never survived (see: [Matveyeva, Kochkina, 1998, pp. 41–42]). Historians have little doubt that from there Mongol army proceeded to the heads of the Sura and the Khoper

Rivers, to the south of Bulgar lands, where near the ancient town of Zolotarev the Bulgars had crushed Subedei and Jebe's armies in the year 1223 (see: [Yegorov, 1985, p. 181; Belorybkin, 1988, p. 85]). There archaeologists discovered numerous proofs of towns fallen: burned buildings, plenty of arrow tips, human skeletons, and separate bones. The destruction was complete and merciless. Unburned remains prove that probably all the people were killed, and towns were never rebuilt (see: [Belorybkin, 1988, pp. 82–87; 2001, pp. 181–182]). Such complete destruction and cruelty must have been revenge for the earlier defeat.

In the Sura River Region, the area around the Uza River became a centre for suppressing the resistance. A unique reference of the Novgorod chronicle I cast light on the circumstances of that campaign: 'In the year 6746 there came strangers called the Tartars to the land of Ryazan, and they were countless, like cockroaches; and the first ones who came approached Nuzla, and won it, and put a camp nearby. And from there they sent their messengers... to the princes of Ryazan... And the princes of Ryazan... together with those of Murom and Pronsk did not let them enter their towns but went to fight them in Voronezh' [Complete Collection of Russian Chronicles, 3, p. 74]. That Nuzla or Onuza [Complete Collection of Russian Chronicles, 1, p. 514] was a rendezvous area for Mongol troops; from there they began raiding the lands of the Mordvins and subdued them in very short space of time. Rashid al-Din seemed to be correct when he stated that 'tsareviches captured them in short time' as, with the fall of Bulgaria, its vassal Mordvinian princes just became the subjects of new rulers, and quite probable that year it was just a formal step for both sides. Batu protected his rear, and Mordvinian princes could hope that with the Mongols leaving they would gain independence from the Bulgars. In the absence of the unifying influence of Bulgars tribal leaders and local rulers either recognised the power of the Mongols or they resisted. For Mordovian lands this was clearly illustrated in Friar Julian's report: 'one prince with all his people and family resigned to the lord of Tataria, and another one with a handful of people head-

ed for protected places to defend themselves should they be strong enough' [Anninsky, 1940, pp. 85–86].

It was from the Nuzla camp that Mongol messengers were sent to demand obedience from Ryazan, and Batu's troops followed them as they obviously believed their demands were to be backed with the argument of strength.

1237 Campaign in the North-Eastern Rus'. The circumstances of the campaign in the North-Eastern Rus' have been well studied by historians since the times of V. Tatishchev and N. Karamzin. Recently the events of the Mongol conquest of Rus' were scrutinised in a number of serious works (see: [Danilevsky, 2001, pp. 133–180; Khrustalyov, 2004, pp. 72–189; Khrapachevsky, 2004, pp. 354–388; Pochekeyev, 2006, pp. 113–135], and that enables us to focus on the key events of the campaign. In spite of the fact that they were supported in several parallel texts of 13–14th century chronicles, there is no guarantee they contain genuine copied chronicle texts that failed to survive to today and had been compiled by witnesses or nearest contemporaries of those tragic events. Chronicle historians prove even the earliest revision of the Laurentian Chronicle was thoroughly rewritten in late 14th century. Therefore chronicles originating from it or from its later versions have much lower credibility. Of greater interest is information in the chronicles of Novgorod and the Galitsia-Volhynian Principality of southern Rus', whose authors used their own information and borrowed data from sources that had not yet been corrected by biased sources from Rostov. There is no sense at all in the attempted reconstruction of the Mongol invasion from 15–16th century written sources like 'The Tale of Batu's Capture of Ryazan or 'Tale of Mercury of Smolensk,' made by some historical researchers [Cherepnin, 1977, pp. 193–194; Khrustalyov, 2004, pp. 86–89; Choysamba, 2006, pp. 74–79, 96–98]. Some curious details can be found in the memoirs of European travellers, who lived at the time of Mongol campaigns. They could see the immediate results and relate stories told by survivors together with fragmentary mentions of Eastern authors (Juwayni, Rashid al-Din, 'The Secret History of the Mongols' and

Yuan-shi). Important, though mixed, archaeological data sometimes adds to the details in the overall picture of 'Batu's invasion' to Rus'.

Most of Mongol army was concentrated at the border of Ryazan principality, probably, in the vicinity of modern Voronezh, at the location of a small ancient town known as Semiluki, a centre of a neighbourhood subdued to the prince of Ryazan (for more details, see: [Tsybin, 1987; Pryakhin, 1988, p. 108–126]).

Invasion was not totally unexpected by the Russian princes, as rumours of the approaching Mongol army reached the rulers of Russian principalities. The roads were crammed with refugees and even Julian, a monk from Hungary, who barely spoke Russian, knew several Mongol armies were heading for Rus', and, apparently, Georgy Vsevolodovich, the Great Prince of Vladimir, personally retained some Tatar messengers, or scouts, who went to the king of Hungary. And yet, the Mongols attacked Rus' like a bolt from the blue. The prince of Vladimir and other princes could only be justified by the fact they had never expected 'pagan nomads' would dare to attack Rus' in winter; it had never happened before, as, usually, military operations were brought to a halt in the cold season. Perhaps, they planned to have strengthened their defences by spring, but Batu's campaign dispelled those plans. There was no effect of surprise, but Batu had a strategic initiative and the freedom of manoeuvre, the most effective weapon in the hands of Mongol warlords.

A Hungarian monk, Julian, collected valuable information on the approaching Mongols. When he came to Suzdal in Autumn, 1237, he had already learnt that 'pagan Hungarians, and the Bulgars, and many tsardoms were completely smashed by the Tartars' [Anninsky, 1940, p. 83], and his talks to refugees from those lands made him conclude that the Mongol army broke down into four parts: 'one, near the Etil river that borders Rus', came to Suzdal [Sudal] from the East. Next, from the South, already attacked the borders of Ryazan, another kingdom of Rus'. The third part stopped at the river Don [Den], near the castle of Voronezh [Ovcheruch], also a kingdom of Russians. As we were told by the Russians, the Hungarians

and the Bulgars who had escaped before, they waited for ground, rivers and marshes to freeze with the coming of winter, and after that the whole of the Tartars would easily rob all the Rus', all the land of Russians' [ibid., p. 86–87]. What can only be understood out of this confusing passage by Julian is that refugees saw Mongol troops everywhere and gave different information on the roads their detachments had taken to go to Rus'. On the other hand, it contains a positive record that it was only a part of the Mongol troops that set out against Rus'. Obviously there were some reserve units that were to cover the attacking armies from the south and from the west (see: [Khrustalyov, 2004, p. 98]). In any case, there are no grounds for thinking that the huge mass of cavalry numbered at many thousands (some historians estimate it to be between 70 and 120), with spare horses, could move compactly; however, there is no information that, before the invasion of Vladimir, Batu's army had been broken down by task groups. Most probably, what Julian described was an attack in depth, made by some large corps of the Mongols. With due consideration to the rear and covering units, the advanced corps of Batu could hardly outnumber 30 thousand, yet, as it moved forward, it embraced more tumens that covered their rear, supplied them with food and forage, and made regular rotation in tumens depleted in offensive battles.

Some chronicles contain a text on Batu's messengers, 'a woman sorceress and two men', who were sent to pass his demands to the prince of Ryazan, where 'he asked a tithe of everything: princes, peoples, and horses, a tithe of white ones, a tithe of black ones, a tithe of brown ones, a tithe of red ones, and a tithe of pied ones' [Complete Collection of Russian Chronicles, 1, p. 514]. According to the same chronicles, no reply came from the prince of Ryazan; instead, he sent their requirements to his suzerain, the prince of Vladimir, Yuri Vsevolodovich, and, in addition, prayed for his help. That the whole story is a later addition, cannot be ruled out. It includes undoubtedly later features, such as tithe, although further chronicles never mentioned any messengers. Moreover, it is not quite clear, why Batu should send his messengers,

16th century.

when he was approaching Ryazan without waiting for the outcome of talks?

As soon as rivers froze, the Mongol army moved towards Rus'. Before approaching Ryazan, the Mongols had captured all the large cities of Ryazan Principality: Pronsk, Belgorod, Borisov-Glebov, Izheslavets. Plundering outlying areas solved many tactical tasks for the Mongols: when refugees (women and children) filled some town, they reduced its food supplies, whereas the Mongols got food and especially valuable forage, together with a workforce for labour-demanding siege works; the inhabitants of the town, on their side, were able to realise that they would be given no mercy.

The siege of Ryazan began on 16 December 1237, when all of the attacking army of Mongols gathered around the place. According to Rashid al-Din, 'Batu, Orda, Guyuk Khan, Mengu Kaan, Kulkan, Kadan and Buri, they all besieged the town of Arpan together and seized it in three days' [Collection of Works Related to the History of the Golden Horde, 1941, p. 36]. The event was also mentioned in the Bahn Shi: '[Mengu], together with Chzhuvan Batu, reached the town of Ryazan (Ye-re-zan), himself went to hand-to-hand fight and destroyed it [the town]' (cited from: Khrapachevsky, 2004,

p. 358]). The siege of Ryazan that lasted from three to seven days, according to different sources, was ended with an all-out storming that used various siege devices. As Yuan-shi wrote, 'Sili Tzyanbu, a man of the Tanguts, was with Chzhuvan Batu in his campaign against the Russians. They reached the town of Ryazan, were fighting there for 7 days and captured it' (cited from: [ibid., p. 258–359]). According to Russian chronicles, an all-out assault on Ryazan took place on 21 December 1237, the city fell, its defenders and almost all inhabitants were killed: 'burned all the place, and killed their prince Yury and his wife, and some—namely, men, and wives, and kids, and monks, and nuns, and hierarch, were cut with a sword, and some were shot with arrows, and some were thrown in fire, and some were tied, and nuns were raped, and priests' wives, and good women, and girls in front of their mothers and sisters' [Complete Collection of Russian Chronicles, 1, p. 515]. Then, having captured Pereyaslavl-Ryazansky, the Mongols entered the kingdom of Vladimir and Suzdal.

The Mongols moved upstream along the Oka River and reached Kolomna, a rather strong fortress of the period and one of the centres of Ryazan Principality. As early as news spread on Batu's invasion in the lands of Ryazan, the great prince sent his voivode Yereimei Glebovich to Kolomna: 'sent Yereimei as a voivode to that fortress', and there he met the prince of Kolomna, Roman Ingvarevich, a brother of Yury, the prince of Ryazan. Probably they were joined by the remains of Pronsk detachments headed by the voivode Kir Mikhailovich, who brought to Vladimir the news about the attacking Mongols. When the Great Prince of Vladimir, Yury, learned of the fall of Ryazan, he decided to accept an open battle and sent an army, headed by his heir, to join the troops near Kolomna: 'Yury sent his son, Vsevolod, together with all the people' [Complete Collection of Russian Chronicles, 2, column 779]. Troops from Vladimir, with a squad of Romans and some detachments from Novgorod ('and people of Novgorod with their troops from Vladimir' [Complete Collection of Russian Chronicles, 1, p. 515] made a formidable force. Its number is hard to estimate, yet it could be compared

with that of the Mongols, otherwise the latter would just smash the Russians, although sources agree the forces were equal. Russian chronicles are unanimous in seeing this battle as the most cruel and bloody in the whole period of 'Batu's invasion'. Generally speaking, the battle of Kolomna was the first attempt following the battle of Kalka, and the last one in that campaign, by Russian voivodes to fight a regular pitched battle with 'the Tartars'. Chronicles mentioned it was a large-scale battle with a huge death toll on both sides: 'and they were fighting severely, and there was a great battle, and the Russians turned them out to obstacles, where Prince Roman was killed, and Yereimei, the voivode of Vsevolod, was killed also, together with many men who died in the battle, and Vsevolod, with a small squad, ran away to Vladimir' [ibid., p. 515–516]. These sparse lines can hardly explain how the battle developed, yet obviously, the Russians, upon attacking the Mongols, succumbed to traditional Mongolian tactics of false retreat and were involved into the battle. The Mongols closed their wings and surrounded Russian regiments who fought their way to the city walls ('obstacles'), where the last cruel and bloody battle took place and only the squad of the prince's son Vsevolod happened to escape from it. Ryazan regiments headed by Roman Ingvarevich especially distinguished themselves in the battle: they had nowhere to retreat and only hoped to give their lives dearly. It is significant that they were the only ones Rashid al-Din mentioned in his brief record of the event: 'After that (the capture of Ryazan—I.I.) they (the Chinggisids) captured also the town of Ike. Kulkan was wounded there, and he died. One of Russian emirs, named Urman, went out with a squad, but it was smashed and he was killed...' [Collection of Works Related to the History of the Golden Horde, 1941, p. 36]. The report on Chinggis Khan's son death and the name 'Urman', that is Roman Ingvarevich, stand suspiciously close, suggesting the prince was Kulkan's killer (see: [Khrapachevsky, 2004, p. 361]). It was his feat of arms that, quite probably, became the foundation of tales about the deeds of Ryazan voivode Yevpaty Kolovrat, the legendary hero of war tales. The only death of a Chinggisid in the battle (by the way, the only one

throughout the Western campaign) is the best proof of how fierce and furious the battle was. In fact, the outcome of that battle shaped the whole development of the further campaign. Obviously, the elite of Vladimir's squad, the professional knight-hood, fell there, and for that reason there was no one to resist attacking Mongol troops. After the battle, Batu's army could easily, one by one, besiege and storm towns and fortresses without waiting for a strike from the rear.

After the defeat on the battlefield, the fall of Kolomna was just a question of time. After it was taken, the Batu troops moved to Moscow. According to the chronicles: 'The same winter Tatars took Moscow and killed voivode Philipp Nyan-ka, and the tsar Volodimir, and burned down the city and the churches and monasteries and all the settlements, and took a lot of property' [Complete Collection of Russian Chronicles, 1, p. 460–461]. It is interesting to note that the information about it remained also in the official Mongolian stories: '... (then) together in five days they took the city Makar (Ucar, Iahn) and killed the prince of (the) city, named Ulaytimur' [Collection of Works Related to the History of the Golden Horde, 1941, p. 36, app. 6].

The fall of Kolomna and Moscow opened the direct route to the centre of Vladimir-Suzdal for Batu's troops. The absence of regiments capable of resisting the Mongols made their defence hopeless, therefore when he learned Moscow was taken, the Grand Prince Yuri Vsevolodovich left the Vladimir city heading for northern volosts, saying that he's heading for Yaroslavl to collect armies, probably meant to be led by his brothers Yaroslav and Svyato-

Conquest of Suzdal.
Miniature. Illustrated Chronicle
of the 16th century.

slav. 'Yuri left the Vladimir with a small družina,' writes the chronicler, 'he left the defence to his sons Vsevolod and Mstislav and went to the Volga River with his nephews Vasilk, Vsevolod and Volodimir, there he made a camp on the Sit River and waited for his brother Yaroslav with his regiment and Svyatoslav with his družina to join forces against Tatars' [Complete Collection of Russian Chronicles, 1, p. 461]. It is possible that the Grand Prince was just fleeing from the war, counting on the power of the metropolitan centre's fortifications and hoping to sit out in the woods, waiting for enemy armies to leave. Vladimir was only left with a small družina and the sons of Yuri, Vsevolod and Mstislav were in charge of the defense.

Meanwhile, the Mongolian troops rushed to Vladimir and, showing the captured prince Vladimir to the besieged townsfolk, offered to surrender the city at the mercy of the victors, asking, 'Is the Grand Prince in the city?' But the townsfolk refused to open the gate, saying, 'Shoot arrows at the Tatars' [Ibid., p. 516] and on 2 February, 1238, the Mongols surrounded the city and besieged it.

At the same time, the Mongol detachments flowed into the surroundings, ravaging the nearby settlements. Within two or three days they captured the second capital of Suzdal and its surroundings, virtually unopposed by the demoralized people.

At the same time the surrounded Vladimir was heavily sieged. The Persian historian and panegyrist of the Chinggisids Juwayni describes this siege in the most general terms: '...they (the tsareviches) went to the lands of Rus' and conquered it up to the city M.k.s., its townspeople were as numerous [as] ants and locusts, and its surroundings were swamps and forests so dense, a snake couldn't crawl [inside of it]. The tsareviches surrounded the city together and firstly built such wide roads from each side that three or four wagons could go [there] side by side, and after that they put catapults in front of the city walls. After a few days only the name was left of this city, and they found a lot of loot [there]. They ordered to cut people's right ear. They counted 270,000 ears' [Collection of Works Related to the History of the Golden Horde, 1884, p. 23]. Aside from the exotic details, common for descriptions of the Northern countries, in fact we are talking about the siege and storming of the city, carried out according to the laws of military science. The city was flooded with refugees escaping from the enemies beneath its walls, when Mongols surrounded it and started to move siege engines to its walls and to the main Golden Gate. The chronicles recount it too: '...at the first Saturday of Souls (Mongols) supplied timber and at night they surrounded the whole city Vladimir with lath fences' [Complete Collection of Russian Chronicles, 1, p. 462, 517]. As a result of many days of continual assault and bombing by stone-throwing machines, the city walls were brought down: 'Tatars approached the city, broke through the granite wall, filled up the moat with fresh woods and that way they entered the city' [Complete Collection of Russian Chronicles, 15, p. 369], and the attackers rushed inside. According to another data, Mongols 'rushed into the city from the Golden Gate, from the Lybid River to the Gate of Irina and the Copper Gate, from the Klyazma River to the Volga Gate; and so they took the city

before the midday and set it on fire; Vladimir and Mstislav fled to Pechernij city' [Complete Collection of Russian Chronicles, 1, p. 517–518]. After a short resistance the whole city was seized and burned on 7 February. According to the data of Rashid al-Din, Chinggisids: 'Besieging the city of Yuri the Great, seized (it) in 8 days. They fought fiercely. Möngke Khan himself performed heroic deeds until they defeated them (the Russians)' [Collection of Works Related to the History of the Golden Horde, 1941, p. 36]. Judging by the chronicles, both of the Vsevolodovich princes died along with the most of the people hiding in the city.

After destroying the capital of Vladimir-Suzdal, Batu divided his army into separate corps which were to suppress the last resistance and find the Grand Prince Yuri Vsevolodovich: 'And from there Tatars spread to all the lands' [Complete Collection of Russian Chronicles, 15, p. 369]. Since no one in Vladimir, apparently, knew which way Yuri went, Batu sent troops in three directions. The chronicler wrote, that one detachment went to Rostov city and one to Yaroslavl city: 'from there they went to look for the Great Prince Yuri, some went to Rostov and the others to Yaroslavl' [Complete Collection of Russian Chronicles, 1, p. 518], and it was the strong corps of Burundai sent there [Complete Collection of Russian Chronicles, 2, p. 779]. The other detachment was sent to the East, to the Gorodets on the Volga River: 'the others went to the Volga River, to the Gorodets city' [Complete Collection of Russian Chronicles, 1, p. 518] and then 'took all the cities on the Volga River up to Galich city' [Complete Collection of Russian Chronicles, 15, col. 369]. Almost all Suzdal Opolye was ravaged in a month. The chronicles counted 14 only big cities: Yaroslavl, Gorodets on the Volga, Kostroma and Galich, Pereyaslavl-Zalessky, Tver, Yuryev, Volokolamsk, and Dmitrov. As a result of it, Mongol troops were provided with food and fodder, and if the opponent would start massive war actions, they would bleed him.

It is interesting that the chronicles directly contradict themselves, speaking of the complete defeat of Suzdal. Rostov and Uglich had been almost unharmed as they yielded to

the approaching Mongol armies. No wonder the Novgorod chronicler wrote: 'Rostov and Suzdal ended up differently' [Complete Collection of Russian Chronicles, 3, p. 288], apparently, emphasizing with these largest of metropolises the different fates of cities of Vladimir's land. In this regard it can be assumed that not all the cities mentioned by the chronicler were destroyed and burned. Many of them in the absence of power and organized resistance just paid off Batu's armies, giving him a ransom, food and fodder, and later the chronicler simply wrote down all the North-eastern cities to exacerbate the eschatological picture of the country's defeat in anticipation of 'the eighth day' (see more: [Danilevsky, 2001, p. 133–180]), but according to the historian J. Fennell the chronicle didn't have a complete 'idea of which cities were attacked by Tatars, which were ravaged and which were left aside' [Fennell, 1989, p. 120].

Batu himself went with the main army to the northwest, to Tver: 'to Yuryev, and to Pereyasavl, and to Dmitrov, and took all those cities; and the other took Tver and killed the son of Yaroslav there' [Complete Collection of Russian Chronicles, 15, col. 369] and after that he moved to Torzhok.

Meanwhile, corps of Burundai, having taken Yaroslavl, found the camp of Yuri and surrounded it. Apparently Yuri, hiding in the woods, did not imagine that the nomads would reach so far into the winter forest, or moreover, would bypass all his outposts and guard posts. Hardly, by following Russian historians, it should be assumed that the Grand Prince was waiting for reinforcements from his brothers—he got into the woods, where it was difficult to get there even in the summer, not to collect the regiments there as it was the worst place to start any military actions. The region, poor in people and food, could not become a base for a large army, and actions of a small detachment would be pointless at all. It seems that Yuri just fled the war and wasn't going to either initiate military actions or get caught, no wonder the later chronicles were full of descriptions of his melancholy and moral sufferings about Motherland's and his own fates, but there were no indications of attempts to take arms against

Storming of Kozelsk. Miniature.
Illustrated Chronicle of the 16th century.

'wicked Tatars'. But his attempt to hide from the war failed.

Burundai managed to teach one more lesson of military science to the hapless Russian commander. Apparently, he didn't just simply attack swiftly and suddenly, but also from the side where it was less expected. The unbiased southern-Russian chronicler directly stated that the main reason of Yuri's defeat was carelessness and inaction: 'gathering all the troops around him and having no guardposts, and the lawless Burundai rode down his whole town (that is fortified camp—I. I.) and killed Prince Yuri himself' [Complete Collection of Russian Chronicles, 2, p. 779]. It is possible to assume that Burundai's corps didn't outnumber Yuri troops, and his *druzhina*—they were the remains of Vladimir professional army, were not much inferior to that of the Mongols.

On the morning of the 4 March 1238, the guarding detachment on their usual scouting reported: 'Prince Yuri sent Dorozha with 3,000 men to scout', have found some troops: '...and Dorozha came back and said: "Prince, the Tatars are close already!" Hearing that, the Prince mounted his horse, got together with his broth-

er Svyatoslav, his nephews Vasilk Konstantinovich, Vsevolod and Volodimer and all his men, and they rode against the wicked, and as the Prince started to place his regiments, the Tatars suddenly came down the Sit River, so the Prince went to them and the two armies met, and was that a fierce fight, and they ran from the foreigners, and the Great Prince Yuri Vsevolodovich was killed on the Sit River and a lot of his men died including Vasilk Konstantinovich' [Complete Collection of Russian Chronicles, 1, p. 519; 15, p. 370]. Thus, the run-in quickly turned into a battle and the fight turned into the massacre of Russian soldiers who were caught by surprise. The battle on the ice of the Sit river ended in a complete defeat of Russian detachments, and some chronicles, describing the sudden attack of Mongols, emphasize that prince Yuri '...did not manage to do anything and fled; and on the Sit River he was captured and killed. God knows how he died: they say a lot about it' [Complete Collection of Russian Chronicles, 3, p. 288; 15, p. 370]. It seems that the rumors, hinted at by the Novgorod chronicler, were even more unpleasant for the Prince's reputation, so he was silent about them, just stating the flight and inglorious death. Rashid al-Din, concise as always, tells about it as a minor episode: 'the emir of this area, Vike-Urku, fled into the woods; he was caught and killed too' [Collection of Works Related to the History of the Golden Horde, 1941, p. 36–37]. Most likely, Burundai ordered to decapitate the Grand Prince to confirm his victory and prove that the legal authority belonged to the victors by the right of conquest [Complete Collection of Russian Chronicles, 1, p. 520–521].

Organized resistance in the north-east of Rus' was broken basically.

Even before the battle on the Sit river, Batu's advanced detachments besieged Torzhok on 22 February 1238. Unlike many others the city refused to surrender, and the Mongols started a systematic siege: '...they surrounded the city with lath fences, as they did with other cities, and sieged, wicked, for 2 weeks' [Complete Collection of Russian Chronicles, 15, p. 370]. All Mongolian armies began to gather under the walls of Torzhok. When they

all gathered, Batu started to intensify the siege: 'the townsfolk pined, and there was no help from Novgorod, as they were all in disbelief and fear; and so the wicked captured the city...' [Complete Collection of Russian Chronicles, 3, p. 288]. The city was captured at March, 5 and was demonstratively destroyed. It kept the defense for 12 days, and even strongly fortified Vladimir held twice as less. Angered Mongols didn't just 'kill all men and women' but even run some townspeople who escaped from Torzhok and hunted them to the Ignach Cross: 'godless Tatars hunted them down the Seliger Road to the Ignach Cross, and mowed them all like grass, and only 100 verst was to Novgorod' [Ibid., p. 289]. At the same time, the main Batu forces were near the Tver and Torzhok, and the rest were scattered on the principality, going to rejoin.

The main goals of the campaign were achieved: Vladimir-Suzdal was defeated, its ruler was killed, there was almost no resistance. In addition, the troops were exhausted by continuous campaigns and battles, which lasted for five or six months already and they were burdened with trophies. It is unlikely that Batu planned to go North to Novgorod (see: [Kargalov, 1967, p. 106–108]). He understood as well as the princes of Vladimir that the one who owned Novgorod is the one who owned Vladimir, and an assault wasn't necessary to subject Novgorod. But if he would decide to continue the campaign and go to Novgorod, nor he or his troops could be stopped by the spring as his victorious tumens were not stopped by notorious 'General Frost' during a raid on the North-Eastern Rus'.

After Torzhok Batu began to go back to the steppes of the Upper Volga Region. According to Rashid al-Din: 'after that they (Chinggisids) left that place, as they decided on a conclave to go in tumens and capture and ruin every city, area and fortress they would see (on their way)' [Collection of Works Related to the History of the Golden Horde, 1941, p. 37]. It is possible that Batu was going to let his troops rest in the upper reaches of the Ob River and wait for rearwards to rejoin, so they could proceed into steppes together. It is also possible that this corps of Batu was already thoroughly battered

in the battles and the commander did not venture to proceed without the main forces. But in that point his troops met the strong resistance of the small but heavily fortified town of Kozelsk. Besides the usual for an ancient Russian town fortifications, it was protected by the very nature, as it was placed on a high hill on the coast of the Zhizdra River, which was flooded from the melting snow along with the local swamps [Rapov, 1983, p. 86]. Batu's army, weakened by the campaign, couldn't provide a straight assault, and siege engines were ineffective because of the environmental conditions. As a result, they had to wait for reinforcements, experiencing huge inconveniences. Moreover, the townspeople of Kozelsk performed successful raids and during one of them they destroyed the siege engines: 'townsfolk destroyed the catapults, attacked Tatar troops and killed Tatars' [Complete Collection of Russian Chronicles, 2, p. 781].

According to the Russian chronicles, the siege lasted for 7 days, Rashid al-Din wrote almost the same, saying that 'during this campaign Batu reached the city Kisel-Iske and, besieging it for two months, couldn't capture it. Then Kadan and Buri arrived and captured it in 3 days. After that they stationed themselves in houses and rested' [Collection of Works Related to the History of the Golden Horde, 1941, p. 37]. During the last battle townspeople 'who came out of the city and destroyed catapults, attacked the troops and killed four thousand Tatars, were beaten. Batu took the city, killed them all, even the suckling babes. There was nothing of prince Vasiliy, and some said he had drowned in blood as he was very small. Tatars named the town of Kozelsk "the evil city" as they fought there for seven weeks and lost three temniks (emirs). Tatars looked for them amongst numerous bodies and could not find them' [Complete Collection of Russian Chronicles, 2, p. 781].

After they rested and gathered all the corps, 'Batu left for the Polovtsian lands' [Complete Collection of Russian Chronicles, 1, col. 522]. The first campaign of 'Batu's invasion' of Rus' had finished. In winter 1237–1238 Batu struck in Ryazan, Vladimir-Suzdal, Novgorod and partly Smolensk and Chernigov principalities.

Armies were defeated with terrifying speed and the main fortresses of the strongest Russian principalities of the first half of 13th century, Vladimir-Suzdal, were stormed and burned down, and its prince and almost all his heirs were killed. The country was ravaged and for some time had no political unity or any war power. In practice, it was not yet a subject to Batu Khan, but in fact it had already been conquered. The discord between the princes and the cities was the most obvious evidence of this.

The war with Kipchaks. The campaign against the Bulgars and the Mordvins of the 1238. Russian chroniclers emphasized the new year (starting on 1 March) after all the terror of 'Batu's invasion', they accented in cinnabar: 'the summer of the same year was peaceful' [Ibid., col. 461]. However, that peace was relative and didn't last for long. Mongol Khans, having occupied the Don River Region, began to systematically suppress sporadic resistance in the Lower Volga Region, the North Caucasus and the forest zone of the Sur-Oka rivers.

One of the most important tasks for the Chinggisids after their successful winter campaign against the North-Western Rus', was the final conquest of the Kipchaks who apparently tried to consolidate their forces to repel the invaders. One of the main packet of resistance were the Yemeks under Bachman's command, who, having been defeated by the Mongols in the Trans-Volga Region in 1229, remained unconquered and continued to wage a fierce war with Mongol detachments in the Lower Volga Region. It is possible, that the area of resistance was even wider, including the area between the Ural and the Volga Rivers and the Lower Don Region. This is exactly why the Mongols struck them. Möngke was in charge of that detachment. Obviously, due to this circumstance, these military actions have been described in the Mongol dynastic chronicles, and later became a part of all the descriptions of Mongol campaigns on the West. This campaign is described with various level of completeness but very detailed in general and quite similar to each other in works of Juvayni, Rashid al-Din [Collection of Works Related to the History of the Golden Horde, 1941, p. 24, 35–36] and in 'Yuanshi' [Kychanov, 2002, p. 39]. The differences are mostly

in unimportant details and, more importantly, in the chronology of that campaign. Juvayni describes the Möngke campaign against Bachman as it happened after the campaign against Rus' and western Europe, Rashid al-Din and 'Yuanshi'—before the campaign against the North-Eastern Rus', although chronology in those sources is very confusing in general. It is possible, that different authors compiled the information from the Mongolian dynasty story 'Altan Debter' differently, which had this data scattered in different biographies. Moreover, it should be noted, that there were several battles with Bachman, and authors, seeking to create a clear narration, combined different stories into one. That was what Rashid al-Din did, using as it is known the works of Juvayni and the 'Altan Debter'. As a result, the real timeline of those events remains very unclear and can't be precisely scaled. About the Möngke campaign and the death of Bachman we can say that they, it seems, happened in 1238, but it can be possible that the suppression of the Kipchaks and their allies was delayed until the beginning of the 1240.

It is possible, that Juvayni was closer to the truth, and he was almost a concurrent to these events, and just highlighted the story in a separate paragraph. This is how he described that war: 'When Khan (Ugetay) sent Möngke Khan, Batu and the other tsareviches to conquer the lands of Bulgar, As, Rus', Kipchak, Alans and others, (when) all these lands were cleared of troublemakers and all who survived swords, bowed their heads before the higher command, then between the Kipchak rascals the one was found, named Bachman, who managed to escape with a few Kipchak fellows; a group of refugees joined him. As he didn't have a (constant) place and shelter where he could have stayed, he was in a new place every day, he was, as it's written in verse, "one place during the day, different at night", because of his houndish nature he rushed up, like a wolf, in any direction and collected something. Slowly, the evil caused by him intensified, and turmoil and unrest increased. And where Mongol troops searched for him, they couldn't find him, as he went to the different place and remained unhurt' [Collection of Works Related to the

History of the Golden Horde, 1941, p. 24]. In other words, after his defeat to Subutai, Bachman managed to recover and during the leaving of the main Mongol forces for Rus', he started to look for allies and prepare forces for a war. Probably, because of his noble origin and military achievements, namely Bachman could be the center of anti-Mongolian forces and only he could organize a serious resistance to the Chinggisids. Recalcitrant Kipchaks were obviously supported by the Turkic Ases of the Don River Region and the Lower Volga Region under the command of Kachir-Ukule (on Ases / Yases, in the Don Region and the Volga Region in the 10–13th centuries, see: [Allsen, 1983, p. 20; Bubenok, 1997, p. 125–173]).

Batu and his counselors were well aware of this danger and sent the best, and, apparently the most recent tumens. Rashid al-Din wrote, that 'Möngke Khan went with his left hand ('wing') on the (Caspian) sea coast. They captured Bachman, one of the most shameless emirs from the Kipchaks of the Olburlik tribe, and Kachir-ukule from the As people' [Collection of Works Related to the History of the Golden Horde, 1941, p. 35]. Most likely, the Mongolian troops gradually managed to divide the Kipchak forces and their allies and defeat them, and squeeze the ring around Bachman. According to Juvayni: 'As his (Bachman's—I.I.) shelters were mostly the coasts of the Itil River, and he hid and sheltered in the forests as a jackal, left, picked something up and disappeared again, the Leader Möngke Khan commanded to build 200 ships and each ship was boarded with a hundred armed Mongols. He and his brother Buchek both raided river coasts. Having arrived in one of the Itil forests, they found a trace of a camp which had been left in the morning: broken carts and fresh horse manure, and in the middle of all that they found an ill crone. They asked her what it meant, whose camp it was, where they went and where to find (them). When they knew for sure that Bachman has just left and hid on the island in the middle of the river, and that the cattle and goods collected and looted during the unrest were on the same island, they couldn't cross the river as they had no boat and the river was trembling like a sea. Then suddenly the

wind got stronger and moved the water from the crossing, so the solid ground was revealed. Möngke Khan commanded his troops to ride (to the island) immediately. Before he (Bachman) even knew, he was captured and his army was destroyed. Some men were tossed to the water, some killed, women and children were landed prisoners, and a lot of goods and property were taken. After that they decided to return, the water moved again and after the army crossed, it was already in order again. No warriors were harmed by the river. When Bachman was brought to Möngke Khan, he started to ask for the honor of being killed by his own hand. Möngke Khan ordered his brother Buchek to cut him (Bachman) in two' [Ibid. p. 24]. Later the emir of As, Kachir-ukule was defeated and killed [Ibid., p. 36]

After they defeated the main packet of resistance, Mongolian detachments started to wipe out Kipchak tribes in the Don Region and North Caucasus. In the autumn of 1238 Möngke and Kadan 'started a campaign against the Circassians and they killed their lord named Tukar in the winter. Shiban, Buchek and Buri went to the country of Merim of the Chinchakan people and took Tatara. Berke went with a campaign against the Kipchaks and captured Ardzhumak, Kuran-bas and Kaparan, the Berkuti commanders' [Ibid., p. 37].

All those countries and tribes did not have a proved location, but, however, during the war manoeuvres of 1238–1239 the largest tribal associations of the Kipchaks were defeated by the Mongols. Only the hordes that rapidly retreated to the West kept their independence and unity. One of the largest Kipchak associations, under the command of Kotyan Khan asked the king of Hungary for a shelter. They got his resolution for relocation and in the autumn 1239 king Béla IV himself met the forty thousand men of Kotyan Khan on his borders. The Kipchaks adopted Catholicism and formed an army under the direct command of the king [Murgulia, Shusharin, 1998, p. 173–184]. In the future, the increasing power of Béla caused discontent among the Hungarian nobility and a revolt, which resulted in deaths of Kotyan and other noble Kipchaks, and the remained fled to Balkans [Pashuto, 1977, p. 211]. The Kipchaks

Devastation of the Russian Land. Miniature. Illustrated Chronicle of the 16th century.

who had moved under the command of Batu were included in the Mongolian military system and joined the armies of the Chinggisids.

During the war with the Kipchaks in the South, Batu's troops started active operations in the North in the area between the Sura and Oka rivers. Rashid al-Din wrote about it, reminding us that when the Chinggisids 'reached the Great city (of Bulgar) and its surrounding areas, they defeated the army there and made them submit. Their leaders Bayan and Dzhiku arrived and submitted to the tsareviches, they were (graciously) gifted and went back, (but later) they rebelled again. The secondary Subutai-bahadur was sent to calm (them)' [Collection of Works Related to the History of the Golden Horde, 1941, p. 35]. Usually that is interpreted as 'a desperate attempt by the Bulgars to turn back the conquerors' and they even see these events reflected in the foundation of a town—the Balynguz Archaeological Site near the Bilyar [Khalikov, 1994, p. 37–39; Khaliullin, 1995, p. 130–131]. Such an interpretation of events does not seem to be convincing, since that ancient town is a record of the Golden Horde period and has quite a level on it; moreover, the

rebellion itself hardly could have happened in the center of Bulgaria, ravaged by the invasion of the 1236. Most likely, the events related to the Bayan and Dzhiku struggle took place in the Cis-Volga Region and the Sura River Region, where, apparently, Bulgarian domains remained untouched by Mongolian campaigns. The atmosphere of that time was described by Hungarian monk Julian, who informed about two Mordvin princes, one submitted to the Mongols and the other fought them [Anninsky, 1940, p. 85–86]. Having a conflict with Bulgars, Mongolian detachments invaded the area between the Sura and Oka rivers and crushed the resistance in the autumn-winter of 1238–1239. Therefore, the Mordvin lands which were subject to Bulgaria before were conquered.

Evidently while chasing the Bulgars, Subutai's troops invaded the Principality of Murom, captured Murom and ravaged the lands from the lower Klyazma River to Nizhny Novgorod: 'in the winter the Tatars took the lands of Murom, burned down Murom, fought on the Klyazma River and burned Gorokhovets city, then returned to their camps' [Complete Collection of Russian Chronicles, 1, p. 470]. However, some Mongol detachments followed the Oka River up to the Volga River and took 'the city of Radilov on the Volga River' [Complete Collection of Russian Chronicles, 15, p. 374].

Therefore, in the spring 1239, almost all Eastern Europe was conquered by Batu. The Southern and Western Russian principalities, Crimea and Dagestan, remained unconquered. They became the object of the new massive attack.

Campaigns against Pereyasavl and Chernigov. The invasion of the North Caucasus and the North-east Black Sea area in 1239. The new campaign developed in two directions. In the south, Möngke's and Güyük's tumens were ordered to conquer the North Caucasus and Dagestan: 'Güyük Khan, Möngke Khan, Kadan and Büri headed for the city of Minkas and took it in the winter after a siege that lasted one month and fifteen days' [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 39]. The History of Yuan describes this event as follows: 'In the winter, in the eleventh moon, troops headed by Möngke

surrounded the Alans' city of Me-Tse-Sy and captured it in three months' (quoted from: [Hrapachevsky, 2004, p. 376]). It is difficult to say what city this was, but probably one of the Alans' centres in the Ciscaucasia—Mangash/Manach [Gadlo, 1994, p. 179–180].

In the west, Batu Khan and his brothers tried to conquer the Northern Black Sea region. However, to protect themselves from the Rus', they began their campaign by invading the Pereyasavl principality. This target was chosen very carefully. The small Pereyasavl principality played an important military and political role, as it was the southeastern Russian outpost that defended Kiev and the Chernigov lands from Kipchak invasions. Towns such as Voin, Rimov, Lukoml, Bron, etc. had been built there back in the 10th century to defend Kiev from the south [Kuchera, 1975, p. 118–143; Korinny, 1992, p. 142–153]. Batu sent troops of his brothers led by Berke to break the line of fortresses in the Sula region: 'Batu began to send his troops against Russian cities' [Complete Collection of Russian Chronicles, 17, p. 22]. A number of border fortresses were seized most likely in the winter of 1239, and cavalry tumens swept into Pereyasavl, the capital of the principality. According to the chronicles, the siege of Pereyasavl was not long, and already on 3 March 1239, Berke's tumens 'seized the city of Pereyasavl with their spears' [Complete Collection of Russian Chronicles, 2, p. 781]. This attack broke through the defense of the entire southern Russian border. Pereyasavl's fall cleared the way for Mongol troops to reach Kiev and Chernigov—the centres of Southern Rus'. But Batu's troops retreated to the steppes over the summer to give the soldiers a rest and replenish the troops.

In the autumn of 1239, Jochids' tumens headed by Berke began a siege of Chernigov. They came near Chernigov, approaching it from the southeast and 'surrounded the city with great forces' [Ibid., p. 782]. Having heard about an invasion of 'foreigners', Prince Mstislav Glebovich came to the city with his regiment. Unlike Pereyasavl, which was seized with a fast attack, Chernigov was besieged using all of the siege techniques. It was surrounded and blockaded, and then was subject-

ed to massive strikes from battering rams and stone catapults: 'the battle near Chernigov was severe; the Tatars attacked the city and threw a stone for one and a half shots, and the stone was so large that four strong men could only lift it' [Polnoe sobranie russkix letopisej, 7, p. 144]. The city was stormed and taken on 18 October 1239. 'The Tatars seized Chernigov and their princes went to Ugry, [they] burned the city, killed people and robbed monasteries' [Polnoe sobranie russkix letopisej, 1, p. 469; 2, p. 782]. After the siege of Chernigov, Mongol troops did not immediately go to conquer Kiev Land, but conquered small towns in the Chernigov principality. Some of them, such as Novgorod-Seversky, Putyvl, Vshchizh, Serensk and Rylsk, were devastated and destroyed. But others such as Ljubech, Debriansk, etc. apparently surrendered to the victors and avoided destruction [Kuza, 1989, p. 77–85]. After that, Mongolian tumens returned to the south, to the Polovtsian Steppe.

Having secured their northern flank, the Chinggisids began to systematically conquer the steppes of the Northern Black Sea Region and Crimea. It is possible that the message of Rashid al-Din about a campaign of Batu's brother, Shiban, and Buchek against the 'land of Merim' [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 39] describes this particular campaign. Whether it is or not, we know that Mongol troops reached Sudak on 26 December 1239, due to a record made by an eyewitness in the fields in one of the ancient manuscripts dated this day, 'the Tatars came on the same day' [Zapiski Odesskogo obshhestva istorii i drevnostej, 1863, 4, p. 497, No. 10].

Resistance from the Kipchaks, Bulgars and Russians slowed the Mongol invasion, while the Chinggisids were trying to break through to rich countries, which caused a conflict in the Mongol army. In addition, the Chinggisids were separated from their uluses for a few years, as well as from political intrigues around the throne of the great Kaan. Due to the Kaan's illness, the various factions of the Mongolian aristocracy began to struggle more intensely for the throne. All of this couldn't help but affect the unity of the Chinggisids

participating in the 'Western campaign'. The first sign of a future internecine feud took place in early 1239 when there was a dispute between Batu and Güyük, who was supported by the Chagataids, to see who would take the lead in commanding the troops [Kozin, 194, p. 194–195]. To settle the conflict they need to correspond with the great Kaan and, apparently, go to Mongolia. It appears that in 1239–1240, Batu, Güyük and some other Chinggisids left the army and personally went to the all-Mongolian Kurultay [Pochekayev, 2006, p. 129]. Perhaps they delayed active operations against Kiev and European countries because Batu wanted to obtain a sanction to make new conquests and confirm his rights to the newly conquered territories and countries from the kurultay of the Kaan himself. Once again, the Great Kaan confirmed the Jochids' rights and Batu's priority to control the 'Kipchak campaign' [Ibid., p. 195]. However, Batu ramped up his preparations for a decisive campaign against the West because he feared that the troops of other Chinggisids would be transferred somewhere else after the death of Ögedei, who was already ill at that time.

Campaigns against the Kiev principality and the Principality of Galicia-Volhynia in 1240. Batu Khan moved his troops to conquer Dagestan and Derbent, most probably to execute the decisions of the all-Mongolian Kurultay: 'Having assigned an army for the attack, they entrusted it to Bukday and sent it to Timur kakhalka (that is Derbent—I.I.), so that it would conquer the Avir Area as well (perhaps Serir—I.I.)' [Sbornik materialov, ot-nosyashhixsya k istorii Zolotoj Ordy, 1941, p. 39]. Most likely, Bukday's troops were supposed to support Chormaqan in his attack on Transcaucasia against Jalal ad-Din (for Mongol campaigns in the Caucasus see [Galstyan, 1977, p. 166–185]).

At the same time, Möngke's troops were withdrawn from the North Caucasus and transferred to conquer Southern Rus'. In early 1240, Möngke sent a reconnaissance expedition to Kiev: 'Batu sent Möngke Khan to spy in Kiev' [Complete Collection of Russian Chronicles, 15, column 374] that probably tried to persuade Mikhail of Chernigov and the townspeople to

submit. According to the Galician-Volhynian Chronicle, 'Möngke Khan came to Kiev, which stood on one side of the Dnieper river near the town of Pesochny, and seeing the city, he was surprised by its beauty and grandeur: he sent his ambassadors to Mikhail and the townspeople, and although they were tempted, they did not listen to him' [Complete Collection of Russian Chronicles, 2, p. 782; Galician-Volhynian Chronicle, 2005, p. 107]. A number of other chronicles enhance this story by pointing out that the Grand Duke Mikhail ordered the ambassadors be killed, 'and killed those who had been sent to him' [Complete Collection of Russian Chronicles, 15, p. 374]. Obviously believing that his forces were insufficient to storm such a large city as Kiev, Möngke retreated into the steppe. It is likely that he was waiting for Batu to arrive from Mongolia with the authorization for a new campaign.

Meanwhile, the conquered territories were being assimilated. The conquered Kipchaks and other peoples of the Volga Region were included in the administrative, military, and clan structure of the Chinggisid empire. This applied not only to setting up taxation, but also to forming new military subdivisions on this basis. An interesting report about this has been preserved in Subutai's biography from the History of Yuan: 'Subutai selected an army from among the habichi (that is "subordinates", "those under a feudal protectorate" [Khrapachevsky, 2004, p. 539]) and fifty or more people of [their] kings, who worked hard for him' [Ibid., p. 503]. We can definitely say that those 50 'kings' were the Kipchaks included in the Mongolian *tumen*, as well as militias of some subordinate tribes. The principle by which dependent soldiers were included in the troops was described by Julian: 'In all the conquered countries, they immediately kill princes and nobles who fill them with fear that they may someday resist. They arm and send warriors suitable for battle and other people ahead to fight, against their will' [Anninsky, 1940, p. 85–87]. In addition, Rubruck mentions how the Mordvins participated in a European campaign: 'There are vast forests to the north where two peoples live, namely the Moksel, who have no laws and are pure pagans. They have no cities and live in small huts in the

forest. Their ruler and a majority of the people were killed in Germany. It was the Tatars who took them along on the German invasion, so the Moksel look very favourably upon the Germans, hoping that with their help they will manage to get free from the Tatar servitude... Other people called Merdas live among them, who are called Merdins by the Latins, and they are Saracens' [Travels, 1957, p. 110]. 'Moksel' is obviously a generic name for representatives of the Finno-Ugric tribes of the Middle Volga Region, and 'Merdins' are the Muslim population of Bulgarian regions of the Sura River Region—the lands of the historical Burtasia. We can conclude that Mongolian military leaders sought to create battle-ready troops that were to have been the basis of the Jochids' army after the departure of the main Mongolian troops. The same was reported by Benedict of Poland, a secretary of the papal embassy: 'And Batu then went against Bilers, that is, Great Bulgaria, and the Mordvins, and having captured their [noblemen], he included them in his troops' [Christian world, 2002, p. 112]. But most of the troops that participated in the western campaign were Kipchaks, as evidenced by Thomas the Archdeacon: 'They have a great number of soldiers from various peoples conquered by them, primarily Cumans, whom they force to fight. If they see that any of them is afraid and does not rush to death, they immediately cut off his head' [Thomas the Archdeacon, 1997, 37]. In other words, already by 1241 a significant part of the Chinggisid army consisted of Kipchaks, other Turkic tribes and a number of conquered peoples: Bulgars (most of whom were apparently from Transsura Bulgaria), Mordvins, etc. It should be kept in mind that, according to a number of witnesses (Julian, Giovanni da Pian del Carpine), these troops and probably, the clans to which they belonged, were called Tatars because the kings 'required those people to be named Tatars' [Anninsky 1940, p. 67].

A decisive attack on Kiev began in the autumn of 1240. According to Rashid ad-Din, 'In autumn, Prince Batu and his brothers Kadan, Buri and Buchek went on a campaign against the country of the Russians and the people of the black hats' [Collection of Materials Relating to the History of the Golden Horde, 1941,

p. 37]. This very interesting statement demonstrates that before besieging Kiev, the Mongol troops attacked Chorni Klobuky in Porosye and its center—the city of Torchesk (see the opinion that this city is mentioned in Subutai's biography [Khrapachevsky, 2004, p. 503]). Thus, the entire Chinggisid army ravaged Kiev Land and broke the resistance of the border fortresses. The road to Kiev was opened up.

Prince Mikhail of Chernigov had already left the city for which he had so viciously fought with other Russian princes, and fled to Hungary to allegedly seek military aid, 'Mikhail had fled to Hungary with his son before the Tatars came' [Galician-Volhynian Chronicle, 2005, p. 108]. The Grand Prince of Kievian throne was immediately captured by Smolensk Prince Rostislav Mstislavich, who was expelled from Kiev by the Galician Prince Daniel Romanovich. However, the Prince of Galicia did not plan to stay in Kiev and 'left Dmitry there, and authorized Dmitry to control Kiev against their will' [Ibid.]. The city remained virtually without the protection of the prince's *druzhina*. It was defended only by a small garrison and militia headed by the *posadnik* Dmitry.

The entire Mongol army was against them. The Galician-Volhynian Chronicle tells us that, according to the words of a captured 'Tatar man', besides Batu, the city was approached by '...strong voivods of his brother: Urdyuy, Baydar, Biryuy, Kadan, Bechak, Mengu and Kuyuk... Subutai and Burunday, who did not belong to his family, but were his first voivods, took Bulgarian and Suzdal lands and a number of their voivods' [Ibid., p. 109]. The army was so large that, according to the chronicler, 'Nothing could be heard except for the creaking of his carts and the great number of his roaring camels and his neighing horses. And the land of the Rus' was full of his soldiers' [Ibid., p. 108]. Mongol troops surrounded the city from all sides, and then began to destroy the walls and gates, 'Batu battered the Lyadsky gates for days and nights until his men broke the walls' [Ibid., p. 109]. Then the Mongols stormed the city and after a fierce battle threw its inhabitants down from the walls, [the inhabitants] retreated to the upper town to Sofia Church and the Church of the Tithes. The next day the storming con-

tinued: 'And the battle between them was severe; people fled to the church with their belongings, and the church walls fell under their weight' [Ibid.]. After the city was captured, it was destroyed and burned. According to the Laurentian Chronicle, 'The Tatars seized Kiev and plundered Saint Sofia Church, as well as all of the monasteries, took holy icons and crosses, church decorations, and killed many people from young to old with their swords' [Polnoe sobranie russkix letopisej, 1, p. 470]. At the same time, however, Batu gave orders to leave one wounded voivode alive: 'Dmitry was wounded but not killed because of his courage' [Galicko-Voly'nskaya letopis', 2005, p. 109].

It is interesting that earlier chronicles do not indicate the dates the siege began or the city was captured. Later chronicles state fantastic figures for the siege of the city—10 weeks and 4 days, and indicate that the city fell on 19 November 1240 [Complete Collection of Russian Chronicles, 16, p. 51; PL, 1, p. 12]. Other, closer sources provide the vague date of 'before the birth of our Lord on Saint Nikola's Day', that is, on 6 December [Complete Collection of Russian Chronicles, 1, p. 470; 15, p. 375]. Rashid al-Din seems to be a much more reliable source in this sense, when he indicates that 'Tsarevich Batu and his brothers took a large Russian city in nine days, a city called Mankerman (Meng-Kerman—"Big/Great City"—the traditional name for Kiev among the Bulgars and Kipchaks—I.I.)' [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 37]. We can consider the conditional date of the capture of the city to be 19 November, and perhaps even earlier.

Undoubtedly, the city and the entire principality were completely devastated, and almost all its inhabitants were killed. Giovanni da Pian del Carpine, who passed through Kiev two decades later, wrote about what he saw, 'They (the Mongols) went against Ruthenia and committed a great massacre in the lands of Ruthenia, destroyed the city and fortresses and killed people, besieged Kiev, the capital of Ruthenia, and after a long siege they took it and killed the city's residents;...this city was very large and crowded, but now it has been reduced to almost nothing: there are barely two hundred houses

there, and they keep people in the most severe slavery' [Puteshestviya, 1957, p. 47].

Apparently, after Kiev was captured, Batu received an order from the Great Kaan to return Güyük's and Möngke's tumens to Mongolia. Ögedei had made the decision to withdraw them in Karakorum in winter of the 'twelfth moon year' (15 December 124–13 January 1241 [Khrapachevsky, 2004, p. 492]), but news of it arrived in Europe some time later. Anyway, Rashid al-Din did not mention these Chinggisids among the commanders who continued their march west. The withdrawal of two major Chinggisids and their combat-ready troops apparently weakened Batu, but he remained confident about continuing the invasion of the 'midnight countries'.

After the fall of Kiev, the Mongols were divided into corps and invaded Lands of Galicia-Volhynia. Rashid al-Din wrote that after the capture of Kiev, Mongol detachments 'were raiding through all the cities of Uladmir [Vladimir] and conquered fortresses and regions on [their] way' [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1941, p. 45]. It is characteristic that Daniel, the Grand Prince of Galicia, did not gather an army or arrange for the defense of his principality, but went to Hungary, leaving his country in the hands of fate. Cities and rural settlements were left to themselves. In some places the citizens and military guards tried to arrange a resistance and refused to open the gates to the Mongols. Then the cities were besieged and assaulted; the cities of Kamenets, Izyaslavl and Kolodyazhin were captured and burned this way. Moreover, the residents of the latter one started to defend themselves at first, but then realized that the city walls would not stand against 12 stone catapults. They surrendered and were slaughtered. Others surrendered and even became allies of the Mongols (Bolokhov cities such as Derevich,

Gubin and others—'as the Tatars left them, they gave them wheat and millet' [Complete Collection of Russian Chronicles, 2, p. 792]). Others ended up not in the way of the main forces, but only of small detachments who devastated the area but did not decide to undertake a direct assault against well-fortified fortresses (Kremenets, Danilov and Kholm).

Despite the heroic resistance of defenders of fortified cities on the Sluch, Upper Teteriv and Goryn rivers, the Mongols passed deep into the center of Volhynia—the town of Vladimir. There is little information about its siege or storming in the sources. According to Rashid al-Din, 'Then they [Kadan, Buri and Buchek] besieged the city of Uchogul Uladmir [Vladimir Volynskiy], and captured it in three days' [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1941, p. 37–38]. Russian chronicles report without any details that the city was taken by storm and ravaged, 'Batu came to Vladimir and captured it with a spear and killed people without mercy' [Galicko-Voly'nskaya letopis', 2005, p. 109].

Perhaps other corps under Batu's command attacked Galich, which was also taken by storm and ravaged ('and they captured it with a spear and killed many people without mercy, as well as the city of Galich and a great number of other cities' [Ibid.]).

In the winter of 1240–1241, the Mongols appeared on the borders of Western Europe for the first time. Having gotten within a three or four days' journey from the borders of the Hungarian and Polish Kingdoms, the Mongols wintered in wealthy Galicia and waited for the snow to melt and the Carpathian passes to open in order to start invading the West. At the beginning of March of 1241, three corps of Batu and other Chinggisids almost simultaneously invaded Poland and Hungary. A campaign began that struck terror across all of Europe and was remembered for many centuries to come.

Thus, over several years (1235–1241) the Mongol armies not only defeated the largest feudal states of Eastern Europe—Bulgaria, Vladimir-Suzdal, Chernigov and Galicia-Volhynia principalities—but actually swept numerous Kipchak, Yemek and As tribes across the steppe. As a result of these campaigns, the main military forces of their opponents were destroyed, and all major cities, except for the western and Northern Russian Principalities, were taken by storm and devastated. Their full subordination to the power of the Great Kaan represented by Batu Khan, the leader of the Ulus of Jochi, was only a matter of time.

§ 5. The Western Campaign and Invasion of Eastern Europe

Hansgerd Göckenjan

In the autumn of 1239, Mongol troops renewed their offensive against the west. At the end of 1239 or the beginning of 1240, Möngke organized a reconnaissance mission to Kiev [Complete Collection of Russian Chronicles, 2, p. 782]. When a messenger sent by him was killed, the Mongols, who perceived the murder of any messengers as the termination of peaceful relations, took vengeance on Kiev [Boyle, 1958, I, S. 77 ff.] (compare: [Schutz, 1973 S. 267, Anm.67]). Prince Mikhail of Chernigov, who understood the hopelessness of his position, managed to escape to Hungary [Complete Collection of Russian Chronicles, 2, p. 782], but in November of 1240 Batu again stood at the wall of 'the mother of Russian cities' commanding a huge army [Boyle, 1971, S. 69]. Although the people desperately tried to defend themselves, Kiev was captured after a nine-day assault. Almost all the inhabitants of the city were killed in battle; whole districts of the city were leveled to the ground [Complete Collection of Russian Chronicles, 2, p. 781–785] (compare: [Karger, 1949 p. 55–102; 195, p. 298–320 ; Tolochko, 1980, p. 208–217; Kilievich, 1982, p. 125–135; Goehrke, 2004, S. 121, etc.]). The news of the fall of Kiev made quite an impact in the West. In one of his letters to the king of England, Emperor Frederick II wrote, 'They conquered Kiev (Kleva), which is the greatest city of the state, as well as the entire glorious state, killed its inhabitants and turned the whole country into a wasteland' [Matth. Paris., 1872–1883, 4, p. 113]. In fact, 49 out of 74 settlements of Kievan Rus' were destroyed by the Mongols, of which 14 remained in ruins forever [Rabinovich, 1970, p. 249, etc.]. When Giovanni da Pian del Carpine visited Kiev six years later, he found only 200 households there instead of the previous 8,000 [Carpine, 1989]. The Mongols believed that the assault of Kiev meant a victorious end of the war against the Cumans and Kievan Rus' and at the same time was the beginning of a great campaign against the kingdoms of Hungary and Poland. The goal that Batu and Subutai had set was exceptional-

ly complex. The Mongolian army had suffered substantial losses during battles on the Volga River in Rus' [Boyle, 1971, S.59]. In addition, they needed to leave significant detachments to secure the rear and keep control over the conquered peoples. And finally, disputes erupted between Chinggisid princes who participated in the campaign, especially between Batu on the one hand, and Güyük and Buri on the other [Ibid., S. 69]. Yet eight princes took part in the campaign against Poland and Hungary. According to information given by Giovanni da Pian del Carpine, the campaign involved two of the five Mongol corps, about 60,000 soldiers in total [Risch, 1930, S. 246].

Preparing and conducting a campaign against Hungary and Poland demanded a carefully thought-out strategic plan which, according to contemporaries, was prepared by Subutai [Bretschneider, 1910, 1, S. 332]. There was no room for error. Mongolian princes and commanders knew that they could face an equal or dangerous opponent, especially in Hungary, who could be defeated only through great effort. Already in 1237 Ögedei characterized the Hungarian king as a 'rich and strong ruler', a commander of 'many soldiers' and a manager of a great state [Dome, 1956, S. 179; Gockenjan, Sweeney, 1985, S. 107]. According to Juvayni, a Persian historian, the Mongols thought that the Hungarians had become too arrogant 'because of their large number, their significance and the power and strength of their weapons' [Boyle, 1958, S. 270].

Spies were sent again, and they tried to learn from deserters all about the internal relationships in the opposing states. In 1240, two of these spies were captured and questioned by Hungarians [Gockenjan, Sweeney, 1985, S. 277]. A year later, one English adventurer was captured by the Austrians and it turned out that he was a Mongol spy and had been in the court of the Hungarian king twice as a messenger of the Great Khan [Matth. Paris., 1872–1883, 4, p. 270–277]. Thus, even before the campaign, Mongolian commanders knew the location and

The Battle of Legnica. Miniature. Western Europe. 13th century.

the state of border fortifications and military routes, military power and morale of the enemy troops [Olbricht, Pinks, 1980, p. 183]. The Mongols were even aware of internal quarrels between the king and noblemen in Hungary [Guillelmus de Nangiac, 1840, p. 342].

The Mongol army left Kiev already in December 1240 and began a campaign against the West. They captured the principality of Galicia-Volhynia in several weeks. In Vladimir Volynskiy, their forces were divided. While the main army consisting of 50,000 people under the command of Batu and Subutai went in the southern direction through Galich to Hungary, the other part of the Mongolian forces consisting of 10,000 warriors, or a 'tumen' in Mongolian [Hystoria Tartarorum, 1967, p. 9] (for the term 'tumen' see Doerfer, 1963–1975, 2, S. 632–642), headed by Orda, Batu's brother, went to Poland. In fact, this detachment was to cover the right flank of the main forces and prevent the Hungarian king from assisting the Polish troops.

In January of 1241, the first rearguard in Poland inflicted a rapid blow and reached Ratibor ([Johannes Dlugosii Annales, 1975, p. 12; see also: [Strakosch-Grassmann, 1893, S. 37–67; Labuda, 1959, S. 189–224; Korta, 1985, S. 3–73]). A month later, it was followed by the main army, which stormed and took Sandomierz on 13 February 1241, and defeated Polish troops on 18 March near Khmelnik who

were trying to block the Mongols from going to Krakow. The unfortified Krakow was burned on 24 March (see the dating in [Strakosch-Grassmann, 1893]). Near Ratibor, Orda's detachment crossed the Oder river and went north through Opole. Like later in Moravia and Hungary, the conquerors left signs of death and devastation after them [Johannes Dlugosii Annales, 1975, p. 18]. By 5 April they had reached Breslau, which had been abandoned and burned by its inhabitants

[Ibid.]. It wasn't until Legnica that the Silesian Duke Henry II the Pious met the Mongols with 7500 soldiers [Labuda, 1959, S. 281], including Polish and French knights, as well as highlanders from Goldberg (Złotoryja) [Johannes Dlugosii Annales, 1975, p. 19.]. It seemed that the duke had already won, but Orda used the reliable tactic of 'false flight' and, having changed the situation, managed to surround the Polish-Silesian army and defeat it. Henry the Pious and many of his close people were killed in the battle (for the course of the battle see [Mularczyk, 1989, p. 3–26]).

With the victory at Legnica, the Mongols achieved the goal of keeping the Polish allies of the Hungarian king out of the battles. But Orda's army did not need to seriously threaten the western neighbors of Silesia. In fact, nothing indicated such plans [Strakosch-Grassmann, 1893, S. 52]. Rather, Orda turned to the south, in order to execute Batu's order to unite with his main army in Hungary after the devastating raid on Moravia [SRH, 1938, II, p. 574; Göckenjan, Sweeney, 1985, S. 167; Dorrie, 1956, S. 107, 158].

The state of the Arpads was the most dangerous enemy for the Mongols in the West. It impressed them not only with its military force, but also by the fact that Béla IV of Hungary was perceived by the conquered Cumans to be as friendly as Prince Mikhail of Chernigov, or

Boleslaw, the Krakow-Sandomierz prince. This country could well have become a rallying camp for all anti-Mongolian forces and therefore had to be conquered. If they managed to conquer it, it could become a very favourable basis for further expansion to the West because of its plains and wealth [Dorrie, 1956, S. 107, 158; Gockenjan, Sweeney, 1985, S. 277].

Strategic plans developed specifically for the conquest of this state were implemented with impressive precision [Gockenjan, Sweeney, 1985, S. 277]. The operations in Poland and Hungary were implemented very cohesively and almost synchronously (note that the two decisive battles in this war—near Legnica and Mohi—were held on 9 and 11 April, that is, just two days apart!). The concentrated attack begun by Mongol troops in Hungary in March of 1241 was like a gigantic battue hunt (*jerga*). It was organized like the Khan's hunting, which, according to Arab historian al-Umari [Lech, 1968, S. 98, etc.], was used to teach the troops and strengthen their discipline. Batu used this strategy, which had already proven to be effective during campaigns in Central Asia and Rus' [Ibid., S. 8]. It was designed to isolate the enemy, surround it from all sides, and finally destroy it using all their efforts, and was successfully used again in the war against Hungary. The invaders moved in five columns from different directions. While Batu and Subutai moved with the strongest army through the Verecke pass and ended up right inside the country, the three other columns crossed the Carpathians from the south and southeast. The fifth corps fighting under the command of Orda in Poland advanced from the northwest and entered Hungary through Yablunka Pass [SRH, 1938, 2, p. 564].

On 12 March the main army of Batu and Subutai stormed the border fortresses. Shibani's advanced detachment surprised the Hungari-

The Battle on the Sajó River. Miniature. Western Europe. 13th century.

ans, when his combat readiness was evident, and he reached Pest's gates in a quick advance in three days. The arrival forced the king to act quickly. Under constant crossfire, he followed Shibani's retreating detachment and met up with Batu's main army near Mohi on the Sajó river [Ibid., p. 569]. The Hungarian army was numerically larger than the Mongolian one [Gockenjan, 1991, S. 43]. Many sources report that Batu sometimes even considered having his detachments retreat [Boyle, 1958, 1, S. 80, 270; 1971, S. 57; Bar Hebraeus, 1932, 1, p. 357; Carpine, 1989, p. 276; Hystoria Tartarorum, 1967, p. 21;

Bretschneider, 1910, S. 332]. And yet, the Mongol commander noticed that his opponent's army was not united. King Béla IV was in conflict with some barons due to issues like land confiscation or recruitment of fugitive Kipchaks (Cumans), and they didn't run to his aid [SRH, 1938, 2, p. 569, etc.; Gockenjan, Sweeney, 1985, S. 16, etc.]. Although Béla IV tried to show prudence in the defense of his country, he proved to be not very skillful as a commander. Therefore, the Mongols managed to surround the Hungarian army on the Sajó river and defeat it. King Béla survived by a miracle. He fled from the pursuing Mongols for a long time and managed to hide in the Dalmatian island city of Trogir.

Large areas of Hungary to the north and to the east of the Danube were left without protec-

Mongols pursuing King Béla IV. Miniature. Hungary.

tion and were easily captured by the conquerors. Batu and Subutai stuck to the plan while conquering Hungarian territories just as carefully as they had prepared the campaign. Scattered groups of kings who had managed to escape slaughter, or who had not initially come at the king's call were pushed into impassable areas and destroyed by other Mongol detachments [SRH, 1938, 2, p. 565; Göckenjan, Sweeney, 1985, S. 155] (for the tactics of feigned flight, see: [Rachewiltz, 1980, S. 35; Ratchnevsky, 1983, S. 77, etc.; Olbricht, Pinks, 1980, S. 191, etc.; Göckenjan, 1989, S. 11]). Where cities and settlements resisted longer, deliberate terror was applied. The towns were completely ruined; their inhabitants were killed to intimidate the survivors. In Eastern Hungary, up to 60% of all settlements were destroyed [Gyorffy, 1960, S. 23]. When the people surrendered without any resistance, they were forced to pay a tribute. Obviously, the Mongols planned to stay there a long time. The land in Hungary was already distributed between noyans; they minted their own coins there and created tax districts [SRH, 1938, 2, p. 581; Göckenjan, Sweeney, 1985, S. 177; Spuler, 1965, S. 313, 333; Vernadsky, 1953, p. 125, 214–227]. When the Mongols strengthened their power in Hungary and ensured legal order to some extent, their dominance began to be perceived as more or less tolerable [Boyle, 1971, S. 56; Sagaster, 1973, S. 238].

And yet the calm didn't last very long. When the Danube froze in January of 1242, Mongol detachments crossed the river to conquer Western Hungary, which had not yet been touched by war. They took such royal cities as Buda and Gran by assault and reached the Adriatic coast, but failed to completely subjugate the country. Twelve towns and castles, including the city of royal coronations Stuhlweißenburg (Székesfehérvár) and the monastery of Martinsburg (Pannonhal-

ma) successfully repelled the attack. Unlike in the east, only about 10% of the towns were ruined there [Gyorffy, 1960, S. 23]. In addition, the Mongols didn't have much time to conquer the rest of the country. While they had a whole year to take territories to the east and north of the Danube, in Pannonia they had only two months.

All the Mongolian detachments suddenly left conquered Hungary in late March of 1242 and began retreating east. Obviously, Batu had abandoned his plan to conquer Italy and Germany back during the operations in Hungary. There are various reasons why he could have made such a decision. Studies often note logical problems such as the difficulty with receiving supplies over such long distances [Morgan, 1986, S. 141], or a lack of feed for horses, which was especially evident in the Karst Dalmatian region and in mountainous areas [Sinor, 197, p. 181]. In addition, the heavy losses incurred by the Mongols during the campaign against Hungary and Poland could have forced them to turn back. But still, the sudden death of the Great Khan Ögedei and the election of his successor, which forced Batu to stop military operations to participate in the upcoming election, played a decisive role [Ruotsala, 2001, p. 34]. Later he actually managed to prevent his most dangerous rival Güyük from being elected until 1246.

The Mongols left a ravaged and devastated Hungary in their wake. In 1241, Emperor

Frederick II wrote to the King of England, 'The noble kingdom was devastated, ruined and left without people' [Matth. Paris., 1872–1883, 4, p. 113]. A Bavarian chronicler Hermann from Niederaltaich noted at the same time, 'In the same year the Kingdom of Hungary was destroyed by the Tatars after 350 years of existence' [MGH, 1861, p. 394]. Although these reports seem to be exaggerated at first, the Mongol campaign brought such devastation to Hungary that it didn't recover for a long time. According to the latest estimates, about 1 million out of 2 million inhabitants of Hungary in 1240 became victims of the 'Tatar' invasion and its consequences [Györffy, 1980, S. 627]. See also I. Szabo's publication in: [Nagy, 2003 p. 493–498]. Those who managed to escape death could die from starvation, diseases or loss of strength. Many people were captured. Even Giovanni da Pian del Carpine and William of Rubruck met such deported people in the middle of Central Asia [Wyngaert, 1929,

p. 192, 210, 217, 224 et seq., 245, 252, 262, 304, 315].

In Hungary, King Béla IV began to energetically restore his country and strengthened its defense by founding fortified towns, constructing new castles and organizing an armored knight army [Marczali, 1902, p. 161]. This became especially evident after it became known that the Mongolian Kurultay made a decision in 1246 to re-launch the war against Hungary [Wenzel, 1860–1874, 7, p. 164]. All defensive measures were to justify themselves in the next few years. When the Mongols launched the last campaign against the state of Arpads in 1285, it didn't take much effort for King Ladislaus IV, Béla's grandson, to repel the invaders [Györffy, Szűcs, 1981, S. 31]. And yet here, like in Poland and in Rus', the trauma inflicted by the 'Mongol storm' remained in the minds of people and was remembered for many years to come [Nagy, 2003, p. 228–452; Krivosheev, 2003, p. 84–119].

§ 6. The Invasion of the North Caucasus and Dagestan in the 1220–1240s.

Lyudmila Gmyrya

The Mongols invaded Dagestan in 1220 for the first time, when the 20,000-man corps led by Jebe (Jebe Noyon) and Subutai, while pursuing a Khwarazm Shah, entered Northern Iran, and in 1220, following the Khwarazm Shah, advanced to Transcaucasia having captured Mughan, Arran and Aghwan [Ashurbeyli, 1983, p. 148–149]. Countries located on the western coast of the Caspian Sea were of special interest for Chinggis Khan. The commanders pursuing the Khwarazm Shah, as noted by Rashid al-Din, a Persian historian, were instructed to gather intelligence on them [Rashid al-Din, 1952, 1, 2, p. 209].

Researchers have a number of explanations for Chinggis Khan's successes, mainly the weak resistance, 'Resistance to the conquerors on site was often heroic, but it was passive, scattered, not united by a single command or a common military plan' [Petrushevsky, 1970, p. 113]. But one of the main factors contributing to the Mongol's victories was the sudden-

ness of their invasions, making it impossible to organize a resistance. A contemporary of the Mongol invasion in Transcaucasia, the Armenian historian Kirakos (born approximately in 1200–1202), describing the main events of this campaign in Aghwan in the 1240s, noted, '... suddenly, a great number of fully-armed soldiers appeared' [Gandzaketsi, 1976, p. 137]. Another factor ensuring the success of the Mongols was their merciless violence against the local people. Kirakos left a figurative description of the atrocities of the Mongols, 'And all that they met on their way—people, animals, and even dogs—they killed with a sword' [Ibid.].

Most of Transcaucasia's population did not understand the seriousness of their situation, and according to Kirakos, were 'careless'. There was a rumor among the residents of Aghwan that the Mongols were Christians and they 'came to revenge the Muslims for oppressing Christians' [Ibid., p. 138]. 'Therefore,' Kirakos

writes, 'the country's population did not fortify their cities' [Ibid].

The battle tactics employed by Mongol commanders played an important role. These tactics were decisive in the defeat of the Georgian King George IV Lasha (1213–1222): 'They fought with each other and at first made the enemy flee; but as the (other parts of) the enemy waited in ambush, it (the enemy) hit in the rear and began to slash the Georgian army. Those (Tatars) that were made to flee also turned back and attacked the (Georgians) and having surrounded them from both sides, defeated the Christian army. The tsar and all princes fled. And the enemy, having taken away the spoils of war, brought it to their camp' [Ibid.].

Shortly after this battle, Mongol troops went to the city of Derbent. Sources report that the Mongols intended to enter the steppes of the North-West Caspian Sea region through the Caspian Dagestan, and to return to their possessions from there. However, it did not explain the sudden withdrawal of Mongol troops from Transcaucasia. Kirakos noted that the Mongols wanted to avoid a new battle with the large Georgian army [Ibid.]. However, as further events showed, the Mongols pursued a different goal.

The Mongols not only hastily left the Caucasus, but, as described by Kirakos, rapidly crossed Dagestan: 'And the (Tatars), taking their wives, children and all their possessions, intended to go through the gates of Derbent to their country. But the Muslim army located in Derbent did not let them go through. Then they crossed the Caucasian Mountains through inaccessible places, filling chasms with trees and stones, their property, horses and military equipment, crossed the mountains and returned to their country. And their leader was called Sabata Bagatur' [Ibid.].

According to Rashid al-Din, the road was shown to the Mongols by subjects of Shirvan-shah [Rashid al-Din, 1952, I, 2, p. 228–229]. Derbent's barrage fortifications (Naryn-Kala fortress, city walls blocking the passage between the sea and the predominant mountain ridge, and the system of the long Dagbary mountain wall, which stretched from the city fortress to the mountain territory for 40 km)

could not be overcome by the troops of Chinggis Khan [Ibn al-Athir, 1940, p. 135–136; Gandzaketsi, 1976, p. 138; Rashid al-Din, 1952, I, 2, p. 228–229; Armyanskie istochniki o mongolax, 1962, p. 23].

The direction the Mongol troops went shows that the Mongols' strategic plans included the seizure of Alania and political entities of the north-western Caucasus region. Their hasty withdrawal from the Caucasus can be probably explained by their desire to launch a surprise attack, which would be effective if they could move unhindered along a short road—through Derbent, Caspian Dagestan and the Ciscaucasian Steppes. But time was lost because the Mongols had to go through the mountainous regions of Dagestan with their carts, and they probably tried to avoid meeting the local population and traveled over unpopulated, undeveloped lands.

It is difficult to reconstruct the exact path the Mongol troops took to the Alans from the written sources. The Arabic-speaking historian Ibn al-Athir (1166–1238) describes it as follows: 'Having crossed Derbent in Shirvan, the Tatars entered an area in which many peoples live: Alans, Lakz and several Turkic tribes (Taif), robbed and killed many Lakz Muslims and infidels, and slaughtered the population, who met them with hostility, and reached the Alans, which consist of many peoples' [Ibn al-Athir, 1940, p. 142]. Interpreting this information, researchers believe that the Mongols passed through the interior of mountainous Dagestan [Istoriya Dagestana, 1967, p. 203; Istoriya narodov Severnogo Kavkaza, 1988, p. 191; Gadlo, 1994, p. 147; Gadzhiev and others, 1996, p. 294; Istoriya Dagestana, 2005, p. 225], except for its coastal part. But all the difficulties of traveling through the mountains described by Kirakos were probably due to the need to bypass the long mountain wall of Derbent (Dagbary). And then the Mongolian troops apparently reached the lowland regions of Dagestan and turned west, where they faced resistance from the local population identified by Ibn al-Athir as 'Lakz' and Turkic tribes (probably the Kipchaks).

The news about the advancement of the Mongol army reached the Alans [Sbornik

materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1884, p. 26]. The Alans and Kipchaks were united in the fight against the Mongol invasion, but Jebe and Subutai split this alliance with false promises, and defeated their opponents individually in 1222 [Ibid.; Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1941, p. 31–33; Ibn al-Athir, 1940, p. 142]. As pointed out by Ibn al-Athir, most of the Kipchaks 'went to Derbent in Shirvan' [Ibn al-Athir, 1940, p. 145].

The displacement of the Kipchaks to Derbent destabilized the situation in the Eastern Caucasus. Having reached Derbent, they appealed to its leader Rashid with a request for asylum. The Kipchaks were refused, and so penetrated into the city by deception and took it [Ibid., p. 145–148]. Then they went to Shirvan and having approached Georgia, appealed to its tsar to grant them a place to settle on the terms of service, but were also refused [Gandzaketsi, 1976, p. 139]. The residents of Ganja, who, according to Kirakos, had suffered harassment from Georgian troops and hoped for protection from the Kipchaks, gave the Kipchaks refuge. The Georgian troops attempted to defeat the Kipchaks and destroy Ganja, but were defeated, '...many were captured, others fled' [Ibid.]. But several days later, the Georgian troops suddenly attacked the Kipchaks and defeated them, taking spoils and capturing their children [Ibid., p. 140].

Ibn al-Athir states that after their defeat, the Kipchaks 'moved to the Lakz country', that is, passed through the interior, mountainous regions of Dagestan (see: [History of Peoples of the North Caucasus, 1988, p. 192]) and settled in the lowlands of Dagestan to the north of Derbent. While retreating, the Kipchaks were attacked by the local population. Ibn al-Athir said, 'However, Muslims, Gurgi, Lakz and others felt courageous in relation to them, destroyed them, killed, robbed and captured prisoners, so the Kipchak slaves (Mamluk) were sold in Derbent, Shirvan for the (most) low price' [Ibn al-Athir, 1940, p. 148].

In 1225, the Khwarazm Shah Jalal ad-Din was being pursued by Mongol troops and entered Transcaucasia hoping to settle and fortify the settlement in this region [Ashurbey-

li, 1983, p. 152–154]. However, after being pulled into wars with Georgia, Armenia, the Seljuks and the Baghdad Caliphate [Gandzaketsi, 1976, p. 149–150], his military potential was crippled and in 1226 he was defeated by the united forces of Armenian and Georgian troops [Istoriya narodov Severnogo Kavkaza, 1988, p. 193]. The Khwarazm Shah went to Derbent, but did not manage to take the city, even though he stormed it with a 50,000–man army of allied Kipchaks. After the lands south of Derbent were devastated by the troops of the Khwarazm Shah, and the northern outskirts of the city devastated by the Kipchaks, the peoples of Dagestan started to resist, including 'Sarirs and Lezghins', according to Rashid al-Din [Rashid al-Din, 1960, II, p. 27–28], that is the peoples of southern Dagestan ('Lezgins') and highlanders of inner Dagestan ('Sarirs') [Istoriya narodov Severnogo Kavkaza, 1988, p. 193].

In 1231, Mongolian troops who had penetrated the Caucasus from the south defeated the Khwarazm Shah [Gandzaketsi, 1976, p. 152; Ashurbeyli, 1983, p. 154–157].

In their 1219–1223 military campaigns, the Mongols failed to establish their dominance in the countries they invaded. However, military operations carried out over such a vast territory (Transcaucasia—North-western Caucasus) can be hardly called reconnaissance. It was one of the large-scale Mongol campaigns in a long series of campaigns undertaken by Chinggis Khan to establish control over this strategically important region.

In 1237, the Mongols began a new phase of the North Caucasus invasion. Batu Khan, who had led a campaign against Rus', sent some of his troops to the Northwestern Caucasus to seize the lands of the Circassians (see: [Istoriya narodov Severnogo Kavkaza, 1988, p. 193]), and then Mongol troops entered Crimea. In autumn of 1238 the Mongols began military operations against the Alans, who occupied large territories in Central Ciscaucasia. The operation went on for almost a year. After a winter siege that lasted a month and a half, the capital of the Alans was captured (Meget, according to Mongolian sources), and large areas were devastated.

In spring of 1239, Batu Khan sent troops to conquer Dagestan. Rashid al-Din notes, '...having assigned troops for the campaign, they entrusted them to Bukday and sent them to Timur Kahalka so that he could capture the Avir Area as well' [Rashid al-Din, 1960, II, p. 39]. Timur Kahalka ('iron gate' in Persian) refers to the city of Derbent, and Avir is the mountainous region of Dagestan—Avaria [Istoriya narodov Severnogo Kavkaz, 1988, p. 194–195; History of Dagestan, 2005, p. 225]. William of Rubruck, who visited Derbent in 1253, described what was left after the city was captured by the Mongols: 'The Tatars... destroyed tops of the towers and gun slots in the walls, having razed the walls and the towers to the ground' [Puteshestviya, 1957, p. 187].

Mongol troops advanced into the mountainous areas of Southern Dagestan. Their presence in the town of Richa in autumn of 1239 (upper reaches of the Chirakhchay river, left tributary of the Gyulgerychay river) was recorded in epigraphic inscriptions. Three dated inscriptions have been preserved on a wall of a cathedral mosque from the 11–12th centuries in this town that describe how its residents fought the Mongol army. The first of these inscriptions [Istoriya Dagestana, 1967, figure on p. 205; Istoriya Dagestana, 2005, figure on p. 226] reports that the inhabitants of Richa held back the enemy for 27 days, from 20 October to 15 November 1239: '... An army of the Tatars came... to Bab al-Kist Rija, when 10 days were left from the month of Rabi al-Awwal. Then the residents of Rija were fighting with them until the middle of the Rabi al-Ahir month of the year six hundred and thirty-seven' [Lavrov, 1966, p. 81]. The second inscription contains information about the destruction of a cathedral mosque in Richa in 1239: 'This cathedral mosque of Bab al-Kist Rija was destroyed by the Tatar army at a time when Kurd Rija was destroyed in the month of Rabi al-Ahir... of the year six hundred and thirty-seven' [Ibid., p. 83, 276]. The third inscription refers to the exact date the town was destroyed—12 October 1239: '...when nine days were left in the month of Rabi al-Awwal' [Ibid., p. 82]. The capital of a small fief possession, Richa resisted Mongol troops for almost a month (see: [Shikhsaidov,

1958]). But Richa was apparently one of many intermediary points in the Inner Dagestan that made it difficult for the Mongols to advance through the mountainous regions because of their heroic resistance. However, less than two years later, as evidenced by the inscription from Richa, in July of 1241, the local ruler built a fortress, and in 1250 the mosque was restored, which still stands today [Istoriya Dagestana, 2005, p. 228].

The Mongols' siege of Avaria (Avir) in the 1240s is not described in sources, although studies reference it [History of Peoples of the North Caucasus, 1988, p. 195; Gadlo, 1994, p. 180]. Moreover, some information from the local historical chronicle 'Tarih Dagestan' by Muhammadrafi is interpreted in several studies as evidence that Avaria's leader established allied relations with the Mongols and used their military power to fight with his political opponent Gazikumukh Shamkhal. 'Tarih Dagestan' by Muhammadrafi describes the essence of the relationship between large political groups in Dagestan—Kaytag (Haydak), Qazi-Kumuh (Gumuk) and Avaria—in which 'the country of the Turks' was also involved: 'Then, when much time had passed, the agreement between Gumuk's emirs and Haydak's was broken... After that, the descendants of Hamza, the martyrs' head, and Abbas, the commander of the faithful from among Haydak sultans and the sea of khan genealogies, who survived during these feuds ... fled, complaining and begging for help, to the Avar leaders and entered into an alliance with them to share the good and evil in all circumstances. (At this time) terrible wars and satanic strifes began between them (the rulers of Avaria) and (emirs) of Gumuk. The Avarian ruler sent letters and ambassadors from among eloquent and wise men to Sultan Kavtar Shah, to the Turks... They agreed to remain friends and good neighbours, to provide mutual assistance in the fight against the enemies. This treaty was based on friendship, harmony, and fraternity' [Muhammadrafi, 1993, p. 104–105].

The source also pointed out that the allied relations were confirmed by marriages of children of both rulers (the son of Kavtar Shah married the daughter of the Avar ruler, and the

son of the latter married the daughter of a Mongol official) [Ibid.].

Moreover, according to the source, they undertook a joint campaign against Qazi-Kumuh using the forces of 'Turkic troops', the Avar ruler and his allied sultans of Kaytag: 'Then Kavtar Shah went against Gumuk with Turkic (troops) from the east side, and Sirtan with Avar Vilayah troops together with Haydak sultans from the west side, and they reached Gumuk on Monday, at the beginning of the month of Ramadan, during... Najmaddin' [Ibid.]. Sirtan was the son of the Avarian ruler who married the daughter of Kavtar Shah. The source does not explain who initiated this operation, but these were apparently Avarian and Kaytag exiled sultans who were at war with Qazi-Kumuh.

In spite of the long-term heroic resistance of Kumukh residents, the fortress was taken by assault, and the village itself was destroyed [Ibid.].

Studies have left two issues unresolved: the meaning of the term 'Turks' in the source and the date of the Kumukh assault. The source indicates the date of this event was 'the year seven hundred eighteen under Hijrah of the prophet' (1318/1319) [Ibid.]. However, the 38 copies of this work, from among which the copy quoted here was drawn up in 1246/1930–31, and different interpretations have given rise to different opinions regarding the date of

the event, and the identity of the external forces participating in it (for a discussion of these issues see [Ibid., p. 93–95]). L. Lavrov's viewpoint is the most widespread one, which contends that the 'Turks' mentioned by Muhammadrafi are the 'Tatars' (Mongols) mentioned in inscriptions from Richa, and that events in Kumukh took place after the capture of Richa, namely at the beginning of April, 1240 [Lavrov, 1966, p. 179, 187–188, 194]. This viewpoint dominates in other studies as well (see: [History of Dagestan, 1967, p. 206; History of Peoples of the North Caucasus, 1988, p. 195; Gadlo, 1994, p. 180; Gadzhiev and others, 1996, p. 297–298; History of Dagestan, 2005, p. 228]). Although some publications describe this event as happening in 1240 [History of Peoples of the North Caucasus, 1988, p. 195], or as an event from the beginning of the 14th century [Ibid., p. 211].

As can be seen from the sources, military operations of the Mongols in the first half of the 13th century in interior, mountainous Dagestan were scattered and short-term. William of Rubruck, who described the situation in the North Caucasus (1253–1256), stated that the highlanders of Dagestan ('Lezgi') numbered among other peoples of the region that the Mongols didn't conquer [Puteshestviya, 1957, p. 66, 88–89, 95, 169].

Section III

Establishment of the Ulus of Jochi

CHAPTER 1

Formation and Political History of the Ulus of Jochi Before 1266

Vadim Trepavlov

§ 1. The initial stage of the formation of the Ulus of Jochi: 1206–1243

Jochi, the elder son of Chinggis Khan, was given an appanage twice. The first time was soon after the crowning of Temüjin in 1206, at the very beginning of the conquests. In charge of the right wing of the newly-formed Mongol army, Jochi made a campaign against the Tuva, Khakassia and Altai tribes, and conquered them by his father's order in 1207. Glad of his success at the beginning of the campaign, Chinggis Khan declared: 'You, Jochi, the eldest of my sons, have recently left home, and in the lands you crossed in a good way, you have already conquered forest tribes. Neither people nor horses were wounded. Now I give these tribes to you! [Lubsan Danzan, 1973, p. 184].

Nothing is known about the organisation of the Mongol government in South Siberian region at that time. Obviously, the system they established turned out to be quite soft, as the increasingly stiff demands of the government for Siberian residents caused immediate, massive turmoil among the Kyrgyz in 1218, the most numerous ethnic group in that area. Their unrest had to be suppressed by Jochi alone, as he was the demesne governor of the country.

However, later Tuva, Khakassia, and Mountain Altai became a demesne part of the Mongol Empire and were added to the 'Root Yurt' ruled by Tolui, a younger son of Chinggis Khan, and his family. Thus, Southern Siberia was excluded from Jochi's jurisdiction, as Chinggis Khan prepared other lands for his firstborn.

The second assignment of land to him was completed in 1225 when the main part of the Mongol army returned home to their native steppes after the extensive Middle Asian cam-

paign. By that time, in addition to Mongolia and Southern Siberia, Chinggis Khan ruled Manchuria, the principalities of the Uyghurs and Karluks in Eastern Turkestan, the ex-state of the Khwarezm Shahs (Middle Asia and Khorasan), and Eastern Desht-i Qipchaq. The majority of these lands were conquered by Chinggis Khan himself or by his son. In particular, Jochi's detachments persecuted the Merkits retreating to the west and fought for the first time against the army of the Khwarezm Shah in the steppes of Desht-i-Qipchaq. Eastern chroniclers mention the strong affection of the elder Chinggisid to the steppe land in the west of the Mongol State. In particular, Juzjani focuses on Jochi's impression of the Kipchak steppes: '...He found that there was no land more pleasant than this, no air better than this, no water sweeter than this, no meadows and pastures vaster than these' [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordj', 1941, p. 14]. It was exactly these lands that so amazed the prince that were given to him as his father distributed the conquered lands.

This distribution caused a certain interpretation of property and land rights among medieval nomads. Their details should be mentioned to better understand the status and circumstances of how Chinggis Khan's sons formed their uluses.

In nomadic empires, the highest posts were usually assigned to people belonging to the same clan as the ruler. In the Mongol Empire, this was formally the clan of Chinggis Khan, the Borjigins from the Taichiud tribe. However, the political situation forced the top rulers of the empire to review the unchangeable canon

of the family legacy. There is no proof that the founder of the Mongol State ever treated all Borjigins as family members that he had certain responsibilities to. His words 'you are my family tribe' were addressed only to his own sons and younger brothers [Lunsan Danzan, 1973, p. 189]. After his enthronement in 1206, Chinggis Khan issued an order to one of his close noblemen: 'Distribute this multi-ethnic state and give a part to our genetrix, younger brothers, and sons...' [Kozin, 1941, p. 159]. Thus, the concept of the family is even narrower as it does not include uncles, relatives-in-law, and does not even mention distant relatives. It simply defines a circle of people who theoretically have access to power.

However, during the distribution of the appanages, the Mongol sovereign made this circle even narrower: 'the heritage of Hasar goes to one of his heirs. His other heir runs his heritage of Alchidai; the other one, of Otchigin; and the other one, of Belgutei (here the brothers of Chinggis Khan are listed.—V. T.). In this understanding, I also give my heritage to one' [Ibid., p. 186]. This 'one' was his third son Ögedei, appointed as successor to the all-Mongol throne. Under the rule of Ögedei, there were his brothers and Chinggis Khan's sons from his elder wife Börte: Jochi, Chagatai, and Tolui. This means that this state, created during wartime, was regarded as an area governed only by the Borjigins, the family of Chinggis Khan.

What was the reason for the latter to single out his descendants from other clan branches? In 1225, Chinggis Khan told Jochi and Chagatai before they left for their just-formed ulus: 'My kinsmen have become famous among their relatives. They make attacks even though the cliffs' [Lunsan Danzan, 1973, p. 230]. His contributions to the Siberian, Jin (Northern Chinese) and Khwarezm campaigns, his skilled commanding, and his personal courage and initiatives seemed to him enough to place the priority of his own sons before their uncles and cousins.

In 1225, Jochi obtained from his father an ulus estate to govern in the northern part of Khwarezm (the Lower Amu Darya) and Eastern Desht-i Qipchaq [Ibid., p. 232; Kozin, 1941,

Chinggis Khan and his sons. Miniature. Iran.
14th century.

p. 186]. According to al-Nuwayri, the area of his appanage embraced 'the summer and winter lands from the borders of Kayalik and the lands of Khwarezm to the extreme outskirts of Saqsin and Bulgaria, which were reached by the horses of their hordes during raids' [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1884, p. 150]. At the moment of Jochi's death, in the west the Mongol troop's horses reached as far as Volga Bulgaria and the Black Sea Polovtsian pasture lands. The prince's headquarters were located 'within the Irtysh' [Rashid al-Din, 1960, 2, p. 78]. Traditionally, this area was the home of the Yemaks (the remaining members and descendants of the tribal union of the Kimeks, the founders of the Kimak Khaganate in the 9–11th centuries), as well as unions of the Kipchak-Ilburli and the Kangly.

In addition, by Chinggis Khan's order, there were several thousand Mongol warriors from the tribes of the Kingits, Sijiuts, and Hushins under Jochi's rule. Jochi's close successors also included Argyns, Oghuzes, Naimans, Buiraks, Oirats, Karluks, Kushches, Wusuns, Mings, Khongirads, Keraites, Barlases, Tarkhans, and Kiyats (see: [Klyashtorny, Sultanov, 2000, pp. 207, 208; Fedorov-Davydov, 1973, p. 55]). As we can see, this list does not contain just Mongol tribes but undoubtedly Turkic tribes as

well: the Oghuzes and Karluks. However, the most numerous people of Jochi's lands were evidently the Kipchaks.

In February 1227, Jochi died amidst unclear circumstances (perhaps, he was killed by order of his father, who suspected him of separatism). His descendants are numbered differently in various medieval texts. As a rule, historians focus on the writings of Rashid al-Din, who delineated the genealogy of Jochi's fourteen sons. The elders were Orda, named 'Ichen' (lord), and Batu, later named 'Sain Khan' (good master). According to certain information, both of them managed to obtain the investiture of their grandfather (who died at the end of 1227), who decided to hand power over Jochi's ulus to them. Because of the fact that later the descendants of these khans, Orda and Batu, were governors of the Jochids in the 13–14th centuries, this version could be trustworthy. As for Jochi's other sons, Toqa-Timur and Shiban, their 'appointment' as independent governors by Chinggis Khan should be treated as further falsifications to justify the authority of the khans who descended from the Jochi's lines laterally.

It was precisely Orda and Batu, as legitimate representatives of their father's ulus, who took part in the meetings of the nobility in 1229 and 1235, where the upper ranks of the Mongol Empire discussed their plans for conquering Eastern Europe. The head of the army formed not only from Jochi's ulus but also from other uluses was Batu. Perhaps, this can be explained by the fact that the conquered lands in the planned campaigns would be under his direct ruling. The demesne khanate of Orda Ichen and his four younger brothers subordinate to him had already been formed on the lands of the Irtysh River Region by that time. Some Chinggisids from other uluses of the empire joined this army with their troops 'to help and strengthen Batu's power' [*Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordj*', 1941, p. 22].

As a result of the military campaigns in 1236–1242, Jochi's ulus was expanded by the addition of Volga Bulgaria, the territory of modern Bashkortostan, Western Dash-i Kipchak (between the Yaik and the Danube), and

part of the North Caucasus. It is more difficult to define the status of the Russian principalities. Vladimir Grand Princes initially (at the time of real unity in the empire) obtained yarliqs, meaning investiture charters, in Karakorum at the court of the khakan, while the other lower-status princes were satisfied with yarliqs from Batu. The duty of gathering tributes in Rus was also most likely distributed between the Jochid and imperial authorities. The latter arranged a population census of the principalities in the 1250s. Thus, ruling Rus' was not initially a monopoly of Golden Horde governors, which is why it would not be right to consider the Slavic lands a part of Jochi's Ulus. This is indirectly proven by the participation of the non-Jochid princes in the wars in Rus and Europe, which were mentioned above.

After the European campaign, Batu settled down not in his father's headquarters (which were occupied by his elder brother) but in the Volga Region. The permanent centre of Batu's portion of Jochi's Ulus was located in the city of Bulgar, but the khan himself, a true Mongol, evidently preferred the nomadic way of life. Thus, the area of old urban culture actually transformed into the khan's domain. Later, Batu founded the capital city of Sarai in the Lower Volga Region, which means that the Lower Volga Region also became a domain estate. Seasonal movements among these two regions (later also including movement in the North Caucasus) were a unique aspect of the annual life of Batu and other Golden Horde khans.

The headquarters of Orda Ichen was located somewhere in the south-east of Kazakhstan. There are complications involved with localising it more precisely because of the differences and brevity of data in the sources (see: [Fedorov-Davydov, 1973, pp. 56–57]).

The widespread opinion in the literature that Ulus of Jochi (the Golden Horde) was founded only after the return of the Mongol army from Central Europe in 1242 or in 1243 is based on a misunderstanding. It is obvious that the beginning of Batu's reign over the newly-acquired western lands should not be taken as the beginning of the Golden Horde's sovereignty. We have seen that the ulus was founded

(singled out by Chinggis Khan) in 1225, and Batu with his brothers during the wars of the 1230s–1240s only expanded its borders.

After these campaigns, the territory of Ulus of Jochi never underwent any more radical changes. As far as can be judged from the sources, certain border modifications (or rather zones of influence) only took place in the Caucasus, owing to the variable success of the Jochids at war against the Hulaguids. Only in

the second half of the 14th century, when the state was overcome with riots and beginning to sink into chaos, the outskirts started coming out of the influence of Sarai one by one. During the period of its largest territorial expansion and internal stability, the Golden Horde stretched from the Lower Danube in the west to the Upper Ob in the east and from the Trans-Kama Region in the north to Khwarezm and Zhetysay in the south (see details: [Egorov, 1985]).

§ 2. Relations with the central power: from vassalage to autonomy

During the first decade of its existence, the Ulus of Jochi was part of the general system of power and governance in the Mongol Empire. According to the Mongol sources, the first rulers of the western uluses, the sons of Chinggis Khan Jochi and Chagatai, made their father a promise as early as in 1219 to obey their younger brother Ögedei indisputably in the future, as he was to inherit the supreme (khagan) throne, and thus to carry out all orders sent by him from the khagan headquarters.

Formally, the khagan (kaan), or the Grand Khan, as Head of the Empire, was its supreme governor and master of the destinies of its peoples and uluses. The famous statement of Giovanni da Pian del Carpine upon first consideration proves the monopoly of the Mongol grand khan on power: 'Everything is concentrated in the hands of the emperor, so much that no one can say: 'This is mine or his', but everything belongs to the emperor, that is, all the property, livestock, and people' [Puteshestviya, 1957, pp. 45–46]. In actuality, this fact is an exaggerated reflection of reality. For one, between the imperial and ulus powers, there was a division of authority (first of all regarding taxes and finances), but there was also a separation of governors based on competences in accordance with the traditional, long-lasting norms of nomadic sovereignty.

These norms included the division of the territory and the state population into two wings (right and left, or western and eastern) with an autonomous governor in each of them, where the right wing was considered 'young-

er'. This principle functioned in the majority of the nomadic empires of the Middle Ages, and things were no different in the Mongol Empire. The Uluses of Jochi and Chagatai were considered the right wing (*barağun ğar*), and the eastern part of the empire (which received the Chinese name Yuan at the end of the 13th century) was the left wing ruled by the khakan. The Chinggisids formed a peculiar co-governing system where the khan of Ulus of Jochi governed the right wing and was actually (not nominally) equal to the status of the head, located in Karakorum.

Even Chinggis Khan noted the separation of the Jochids and the Chagataids from the left wing. After his death, the co-governor of the khakan was Chagatai (for further details, see [Trepalov, 1993, pp. 77–78]). Then after his death in 1242, the hierarchic priority in the west shifted to governors from the house of Jochi.

In Karakorum, Güyük, a son of Ögedei, started governing in 1246. The relations between him and the Jochid Batu Khan were extremely hostile. However, according to some data, it was precisely these two monarchs who co-governed together. Giovanni da Pian del Carpine noted that 'Batu was the most powerful in comparison with all the Tatar princes, except the emperor, whom he had to obey'. European travellers were sure that despite the presence of the powerful khakan in the Mongol Empire, the Golden Horde khan is 'the main ruler of the Tatars'. His name was honoured even in Khorasan,

Ceremony at the Khan's court. Miniature. Iran. 14th century.

far from the Golden Horde, where from the variety of the Chinggisids, Güyük and Batu (and a local chief-noyan) were called to western ambassadors as the superior rulers from the point of view of the Mongol informers [Puteshestviya, 1957, p. 69; *Sobranie puteshestvij k tataram*, 1825, p. 223; de Saint-Quentin, 1965, pp. 93, 95].

The reign of Güyük Khan (1246–1248) is described by Juzjani: 'All court nobility and the chiefs of the Mughal troops obeyed Batu and usually looked at him as at his father Tushi (Jochi.—V. T.)' [Tabakat-i Nasiri, 1881, p. 176]. Batu is described more specifically by Kirakos of Gandzak. This Armenian chronicler discussed the embassy of the Georgian Tsarina Rusudan and her offer to pledge allegiance to 'a Tatar chief, named Batu, who commanded the troops in Rus', Ossetia, and Derbent, as he was the second person after the Khakan. And he ordered her to take the throne in Tiflis, and (the Tatars) did not oppose it, as in those days the Khan has died' (presumably, Güyük Khan) [Kirakos Gandzaketsi, 1976, p. 181].

Even this segmental data allows us to make a conclusion about the special status of the khan of Ulus of Jochi, his subordination to the Grand Khan, and his power and influence over a certain part of the western imperial territories. However, the sources keep silent whether

Batu was considered the elder governor in the Ulus of Chagatai. It is known that during the reign of Ögedei, the appointees of the khakan and Chagatai, Mahmud Yalavach with his son and Kurkuz from Khwarezm governed China, Mawarannahr, and conquered by that time regions of Iran from Khorasan to the borders of Rum and Diyarbakir' [Rashid al-Din, 1960, 2, p. 64]. However, their authority was not spread throughout the Jochid lands across the Jayhun (Amu Darya).

More definite relations between the co-governors were

solidified during the reign of Möngke (Mengu) Khakan (1251–1259). After the death of Güyük Khan, the Mongol nobility offered the imperial throne to Batu, as he was the eldest Chinggisid at that time. He refused by referring to the fact that he already had a lot of lands and 'to run them, and to possess them, and govern the states of China (China.—V. T.), of Turkestan, and Ajam (Iranian lands ruled by the governors sent from Karakorum.—V.T.) would be impossible'. That is why he offered to enthrone his close friend and younger cousin Möngke (Mengu). 'Mangu Khan... took the throne of China and Upper Turkestan' [Tabakat-i Nasiri, 1881, pp. 179–180]. This means, firstly, that he started ruling the countries 'rejected' by the Jochid Khan, and secondly, that 'the throne' of Möngke was not considered the throne of Desht-i Qipchaq and other western regions.

Obviously, Batu Khan was not absolutely independent. The Grand Khan appointed his fiscal officials in Russian principalities and regulated the financial expenditures of the Sarai court (see [Bichurin, 1829, pp. 319–320, 331]). As can be judged from the messages of William of Rubruck, the Golden Horde at that time did not have the right to establish diplomatic relations without permission from the central government or detain ambassadors to Mongolia, as in any event, according to Rubruck, 'Möngke Khan is

the most important in the world of the Moals'. And the same Rubruck quotes the khakan: 'Just as the sun spreads its rays everywhere, so does the sovereignty of mine and of Batu spread' [Puteshestviya, 1957, p. 141]. The traveller noted that in the lands subordinate to Möngke the messengers of Batu were accepted with more honour than the Khan's emissaries in the Jochid lands.

In order for khakan decrees to be effective in the west of the empire, Batu's confirmation was required. According to Kirakos, Möngke Khan granted the Armenian Tsar Hetum I 'a decree with a seal, so nobody can suppress him and his country', and Hetum sent a messenger with this decree to Batu 'in order for him to write the decree in accordance with the charters (of the khan)' [Kirakos Gandzaketsi, 1976, pp. 224–225]. The Seljuk Sultans used the governor of Sarai as a judge in their internecine quarreling in the 1240s–1250s, although they (as well as Armenians) went to Karakorum for yarliqs. Information about active relations between Batu and foreign governors generally contradicts Rubruck's writing about the dependence of the Jochid khan regarding external policy.

The border of the area of influence was still considered the Amu Darya. There is a well-known typical case that demonstrates the sovereignty of the Golden Horde's governor. By the instigation of his brother, Muslim Berke, Batu stopped the army of Hulagu, sent by the Khagan to conquer Iraq, on the right bank of the Amu Darya. The troops did not move for two years: returning was not allowed by the order of Möngke Khan, and crossing was forbidden by the ambassador from Sarai. Only after the death of Batu in 1255, after accepting the persistent requests of Hulagu, the khakan ordered the campaign to continue [Das mongolische Weltreich, 1968, pp. 101–102].

Moreover, the beginning of the reign of Möngke Khagan was marked by the massacre of the tsareviches, the descendants of Chatagai and Ögedei. Later, their lands were divided between the supreme khan and the Golden Horde, where the latter obtained Mawaran-nahr (Transoxania) under its rule.

Delhi Sultanate

After Batu's death, the Golden Horde's throne was inherited by his son Sartaq. Möngke Khakan 'glorified him and rendered honours to him: he granted him his father's power to command all the troops and (run) all the lands conquered by him (Batu). Then, by appointing him the second (in the state), let him go home' [Kirakos Gandzaketsi, 1976, p. 226]. The Armenian chronicles state that the Mongol Grand Khan 'honoured him (Sartaq.—V. T.) and gave him his father's power by admitting him as the second governor after himself'; 'upon the demands of Möngke Khan, he (Sartaq.—V.T.) was given all the estates of his father, even with additions' [Armyanskie istochniki o mongolax, 1962, p. 27; Istoriya mongolov po armyanskim istochnikam, 1873, p. 11]. Thus, the successor of Batu accepted the number two position in the empire, just as his father did, and obtained the right to make legislation autonomously. It is likely that the

Jochid Khan could make up laws on any issue of the internal life of the regions run by him simply if they did not contradict 'the Yasa' of Chinggis Khan and the orders of the capital administration.

As is well known, Sartaq died after hardly making any use of these prerogatives. In Sarai, his uncle Berke was enthroned in 1256. He maintained a great deal of power and influence in the western part (the right wing) of the Mongol Empire and even tried to spread this over the newly-formed Ulus of Hulagu in Iran and Mesopotamia.

In general, as Rashid al-Din writes, until the end of Batu's days and 'after his death, during the times of Sartaq... and most of the times of Berke, between the houses of Tolui Khan (the khakan government.—V.T.), the path of unity and friendship was finally crossed' [Rashid al-Din, 1960, 2, p. 81].

In 1260 the new Kublai Khakan, who had just defeated his rival brother Ariq Böke, who was supported by Berke, addressed a message to the ulus khans: 'There are riots in the regions. From the banks of the Jayhun (Amu Darya) to the gates of Misr (Egypt.—V. T.), you, Hulagu, must run the Mongol army and the Tazik regions and guard them well... From the Altai side to the Jayhun, the ulus and the tribes may be guarded and run by Alghu (Chagatai's grandson.—V. T.), and from this side, from the Altai to the coast of the sea and the ocean, I will guard' [Ibid., p. 162]. As seen, Kublai Khan does not mention here the Golden Horde's governor, the supremacy of whom in the north-west of the state was stable and indisputable. However, there was an attempt to remove Berke's jurisdiction in the lands of Hulagu, as well as Transoxania, by approving Alghu to the rights of the Chagatai Ulus khan.

Since that time, the relations between the Golden Horde and the imperial government, along with the neighbouring uluses usually hostile to it, hit their bottom. It is clear that the main obstacle was political rivalry, but besides this issue, the contact between them was also objectively prevented by inconsistencies in the cultural and political orientations of

the elites of the enormous Mongol state. For example, the governors of its eastern parts turned into Yuan emperors, sinicised their court, and arranged their state governance in accordance with the Chinese, and partially Jurchen, canons.

An additional obstacle in the support of regular relations perhaps partially rests in the adherence of the governors to different religions. As is well known, Buddhism was widespread in China at the time of Kublai Khan; the Jochids and Hulaguids adopted Islam and, consequently, the orientation of the urban Islamic bureaucracy and merchantry. However, it is hardly justified to grant principal significance to these confessional differences. This must be noted, as the literature contains facts that after these ideological transformations, the governors of different uluses turned into believers of varying faiths and thus into 'infidels' when it came to one another.

Religious intolerance was never typical of the Mongol state. Having been created as a polyethnic world state with a pagan ruling ethnic 'nucleus', it absorbed and attracted members of the most various faiths to service. This practice was dictated not only by ideas of reasonability but also by the legacy of the founders of the empire. The tolerance of Chinggis Khan's attitudes towards members of numerous religions is clearly and complementarily proven by Juvayni [Ala al-Din Juvayni, 1997].

The decisive factor keeping the empire from a final division was the huge clan of Chinggisids. Despite severe conflicts between certain branches, the authority of Chinggis Khan's descendants was indisputable. The Yuan emperors preserved the formal status of elder governors in the lands of this clan. After the death of Möngke Khakan in 1259, the Jochids did not take part in the all-imperial councils of the nobility. However, the nominally preserved unity of the empire was proven, firstly, by the presence of the Chagataids and Hulaguids at these kurultais, and secondly by traditional trading and military relations. Upon the demand of Kublai Khan in the late 1260s, Ulus Jochi moved some troops to help conquer South China (Song)

[Vernadsky, 1997, p. 82]. In any event, it is known that the Golden Horde Öz Beg Khan admitted the hierarchic superiority of Yuan emperor Buyantu Khan in the first half of the 14th century [Ibid., p. 92]. It is quite possible that the same formal superiority of the khakans was supported by their obtaining the same symbolic yarliqs to rule in western uluses. However, real control over the Golden Horde's policy was lost by the central government most likely in the 1260s.

Historiography considers that Jochi's Ulus split from the empire was during the reign of Mengu-Timur Khan (1266–1282), when he ordered to engrave his name on the coins instead of the current Ariq Böke Khakan. Be-

cause autonomous emission served as one of the main features of state independence in the Middle Ages, this interpretation of events is acceptable. The first yarliq to the Russian metropolitan was issued on behalf of Mengu-Timur. However, the real re-subordination of the imperial vassal lands (in particular, Rus'), which also used to be controlled by Karakorum, to the Jochids had been visible even earlier. Since the times of Sartaq Khan, Russian princes had not gone to Mongolia for investiture (the last visit by Gleb Vasilkovich Belozersky had taken place in the Mid-1250s [Polnoe sobranie russkix letopisej, 1, 1962, column 474, 524]) but acquired yarliqs from the hands of the Sarai khan.

CHAPTER 2

The State System of the Ulus of Jochi

Vadim Trepavlov

§ 1. Traditions of the Turkic-Mongol statehood in the administrative and political system of the Ulus of Jochi

The state organisation of the Mongol Empire and its uluses was based on different institutions: those that were original and 'proper' Mongol; borrowed from the conquered people (the Uighur, the Khitan, the Chinese, the Jurchen, the residents of Islamic countries); and those inherited from ancestors and historical predecessors: founders of the nomadic empires of the early Middle Ages. The same 'multilayeredness'

was also typical of the state of Jochi's Ulus. The administrative system of the Golden Horde absorbed aspects of the traditional nomadic Turkic-Mongol ancient times as well as more contemporary phenomenon as a result of conquests.

One of the main components in the state system of the Jochid country was the concept of supreme (monarchic) power and organised governance.

§ 2. Conception of the supreme authority

The foundation of monarchic governance and the organisation of the ruling elite had several sources in the Golden Horde. The first and main aspect was the authority ('the legacy') of the founder of the Mongol Empire. In addition, upon inheriting power, internal clan principles of transferring the rank of khan were dominant. From nomadic ancient times, there was the tradition of prebiscite in electing the governor (in reality, the approval of the elected). As the Ulus of Jochi was a secondary formation within the empire, the investiture of the superior suzerain (the Karakorum khakan) was of high importance during the 13th century. When the Golden Horde khans turned to Islam, there was an issue regarding the legitimacy of their power, which was to be developed in accordance with the canons of this religion. Finally, during the course of the disputes and riots, it happened that the forefront was occupied by different Turkic-Mongol tsareviches and princes. After defeating their rivals, they took part in running the state or its split provinces, persuaded as they were that the supreme powers were on their side

as they had ensured success in battle against their competitors.

The Jochid clan was constantly growing and branching out, and the system of eldership of its different lines was becoming increasingly complicated. It is likely that by the end of the 13th century, their hierarchic priority of order had been fully defined. According to the currently available data, it can be supposed that the supreme places in this hierarchy belonged to the heirs of Batu, and (after him) of Buval in the west of the ulus and to the heirs of Orda in the east. The next by age were the heirs of Toqa-Temur (in the following century, they were replaced by Shibanids (the heirs of Shiban)).

While Mongols remained mostly pagan, their interpretation of the sources and the limits of the khan's power was based on statements typical of the nomadic world. Evidently, the main points of the concept of supreme power were inherited by the Mongol Empire from its historical ancestors: the khanates of the early Middle Ages. Their understanding put forth an idea of the enthronement of the founder of a

state, and the successful governance of it by his descendants with the benevolence and support of the divine powers. First and foremost, this meant the leading pair of the Central Asian pagan pantheon: the Sky (Tengri) and the Earth (Etugen).

The aulic Khorchi retold his prophetic dream: 'The Sky made an agreement with the Earth and appointed Temüjin as the tsar of the tsardom. May him, they say, rule the tsardom!' [Kozin, 1941, p. 107]. This means there was a 'meeting' of the divine world-builders about the candidature of the governor. The choice was given precisely to Temüjin, the future Chinggis Khan, and he explained it this way: 'From dawn until dusk I worked until the Sky and the Earth granted (me) the powers' [Lubsan Danzan, 1973, p. 188]. Being active and determined were seen as the criteria for acquiring the title of monarch: 'works' gave 'power'. The Sky and the Earth also took part in electing the governor and granting him power. As proof of Khorchi's dream, Chinggis Khan said later: 'Now I am strengthened by the will of the Sky and the Earth, with the might of the Eternal Sky' [Kozin, 1941, p. 104].

The Sky was often an independent, supreme substance. The functions of the Earth were clear from the words of Chinggis Khan: 'I was called forth by the Mighty Tengri, and Mother-Earth Etugen Eke carried me on her breast' [Ibid., pp. 104–105]. This means that the Earth was the first thing the Sky's will ever brought forth. After giving birth to the governor (having brought him into the world), Mother Earth did not take part in his further destiny. However, in some echoes of nomadic charismatics in folklore there is reason to believe that she 'is responsible' for his personal safety and health. Later, the Sky appointed the chosen to the estates and residents of his future power and helped in conquering new lands. 'The Eternal Sky helped, the Sky's gates opened, and I gathered my peoples,' said Chinggis Khan [Lubsan Danzan, 1973, p. 188]. The same idea can be seen in the letter of Güyük Khakan to the Roman Pope Innocent IV in 1246: 'Thanks to the power of the Sky, all the kingdoms from the east to the west were granted to us, and we possess them' (as cited in [Spuler, 1972, S. 69]).

After fulfilling the will of the divine powers and making use of their benevolence, the governing conquerer gave them the benefits of his 'works': 'In the Sky Lord,' Chinggis Khan said to his relatives, 'I trust absolutely, and have trusted (him) with all of my state!' [Lubsan Danzan, 1973, p. 189].

Thus, as much as it is possible to reconstruct the transcendental participation in the governor's destiny, the stages of implementing the khakan charisma were as follows: 1) the Sky and the Earth chose a worthy candidate for the kingdom; 2) the Sky appointed him; the Earth gave birth (brought him into the world) and guarded him; 3) the Sky handed the power to the monarch and provided the ability to carry out the tasks bestowed upon him (we will cover these tasks below); 4) the Sky helped its chosen one in all of his beginnings; 5) the Sky was a guarantor of the power of the governor and his successors; 6) after creating the state, the governor handed its and his own destinies to the Sky.

The cosmic power of the Sky was embodied in the personality of the governor by the charismatic god's will (Mong. *sulde*). At first it was granted by the divine protectors to Chinggis Khan, then it spread out over his descendants. However, later the bearer of Charisma was considered the entire Chinggisid clan (for more details, see [Skrynnikova, 1997]). Thus, political success was regarded as a result not of the governor's personal talents but of the Sky's good will towards him. Chinggis Khan stated on this subject: 'I became a governor not by my own courage. I became a governor by the will of the Sky, of my father. I became a governor not owing to my merits. I became a governor by the order of my father Tengri Khan. He granted me to defeat my cunning enemies' [Lubsan Danzan, 1973, p. 123].

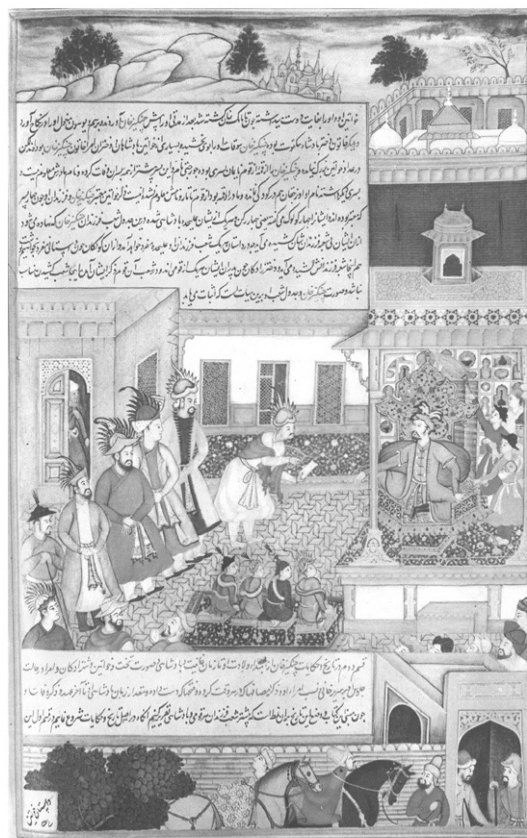

The governing rank of Chinggis Khan's family was strengthened by the famous legend of the family's first ancestor Bodonchar being sky-born. According to this legend, the foremother Alan Goa gave birth to him and two brothers from a ray of light that got into her womb through the smoke hole (upper hole) of their yurt (Rashid al-Din, 1952, 1, 1, pp. 10–14; Kozin, 1941, pp. 80–81). In addition, as regards

the family's origins, there was a totemic ancestor called Borte-Chino (the Fulvous Wolf), also born 'by the will of the Supreme Sky' [Kozin, 1941, p. 79]. As we can observe, the legitimacy of the Chinggisid's governance, including the Jochids, was based on a set of pagan concepts about the participation of supernatural powers in singling out this clan over others.

Granted by the Sky and protected by the Earth, power was carried out in three main areas: protecting the integrity and strengthening the State; expanding the borders through conquering; caring for the welfare of residents; and supporting the readiness of troops. At the very beginning of Chinggis Khan's career, his first supporters saw him as 'a person who could take care of the army and run the ulus well'. Chinggis spoke on this subject in the following way: 'Having become a pillar (of the State), I took upon myself the very difficult responsibility of protecting the people'. Similar issues are also mentioned in his speeches to his sons [Kotwicz, 1923, pp. 95–96; Lubsan Danzan, 1973, p. 189; Rashid al-Din, 1952, 2, p. 90].

Thus, the power of the ruling clan in the empire and uluses was based on the charisma of Chinggis Khan as well as on the charisma of the Chinggisid family. Later, during the Islamisation of the Mongol and Turkic nomads in western uluses, there was an issue regarding the legitimacy of the Chinggisid governance from the point of view of Islam. It could not happen that they even formally obtained investiture from the powerless Abbasid caliph, living aimlessly at the Egyptian court. Instead, a version with more fantasy was developed: Chinggis Khan was turned to Islam by the Prophet's follower: 'he accepted all the stipulations of God except circumcision, adopted the Islamic faith' and pronounced the shahada (the symbol of faith). It was almost as if the adoption of Islam by the Mongol governor became known to the righteous Caliph Abu Bakr, who actually lived in the 7th century [Kniga puteshestviya, 1999, p. 64–66]. Now, Chinggis Khan could generally be added to the grouping of Muslim dynasties that ceased to be 'infidels'.

In the early 1200s, the Mongols did not have a developed national identity. Therefore, the ruling elite did not have clear hierarchic

Chinggis Khan and his four sons. Illustration for Rashid al-Din's manuscript. Delhi Sultanate

gradation formed with the respective nomination of titles. The relative simplicity of the titulary was also adherent to the supreme governors of the empire. Muslim authors noted that 'unlike the other peoples, the Mongols do not give sophisticated names and titles to their governors and nobility... as for the name of the person who is on the throne, they add only one name, 'khan' or 'kan'; his brothers and relatives call him by his first name given to him at birth' [Abu'l Faraj, 1976, p. 354]; 'When one inherits the state throne, he gets the additional name of 'khan' or 'khakan', and nothing extra is written'; the brothers and sons of the khakan 'are called by the names given to them at birth, both when they are present and absent'. This is applicable both to the common people and to the nobility' [Juvaini, 1912, p. 19].

Thus, the supreme governors of the Mongol State were granted the imperial title 'khakan' ('khagan'), which was brought back to usage

by Chinggis Khan. The term 'khan' also related to the tsareviches, meaning the ulus rulers. In fact, in very important cases (such as the seals used for the charters to foreigner sovereigns), the khakans made use of the sacred formula mentioning the powers of the Eternal Blue Sky as the source of their power (see, for example [Pelliot, 1922–1923, p. 22]). This formula was evidently inherited from the ancient Turkic people, and it can actually be likened to the full khakan title.

All the other Mongol non-Chinggisid noblemen possessed the 'princely' rank of noyan, which later in the Golden Horde was similar to the Turkic bek and the Arab-Persian emir. As for the patriarchal traditions in the tribal life of the Middle Ages, there were the honorary titles (or rather, ranking names) of baghatur, mergen, etc. And as for personal achievements, the following titles could be granted (more seldomly, self-assigned): ilkhán, gurgan, tarkhan, etc. For the non-governing members of the Chinggisid dynasty in the 13–14th centuries, they actually simultaneously used the synonymous terms 'kobegun' (Mong.) and 'oghlan' (Turk.) in the meaning of 'tsarevich' (liter. 'son'). In the 15th century, in the Turkicised and Islamised former western uluses of the empire, they were replaced in this regard with the Arab 'sultan'.

Belonging to the Altan Urug ('The Golden Family' of Chinggis Khan) theoretically allowed all descendants of the founder of the empire to count on possessing demesne lands. That is why, in reality, power was carried out not only by the central government and by the ulus courts but also by a large group of close and distant relatives arranged in complicated hierarchical pyramids. Periodically, members of a huge clan were granted investitures in different regions of the vast, conquered landscape of Eurasia. Juvayni writes about this exact issue: 'Although it seems that the power and empire are inherited by one person, namely the one who is called the khan, in reality all the children, grandchildren, and uncles have their own part of power and property as well. The proof is that... Mengu Khakan (after his crowning in 1251–V.T.) at... the kurultai (meeting) distributed and divided all his lands between

his relatives: sons and daughters, brothers and sisters' [Juvaini, 1912, pp. 30–32].

The question regarding the principles of succession to the throne in the Empire and uluses is quite jumbled in the sources but has been well analyzed in historiography. The transfer of the throne by the Mongols was not legislative, which means it was subject to customary rules and traditions. These traditions allowed inheritance by sons (dynasties) as well as by brothers and other relatives senior to the sons ('an appanage agnatic system', refer to [Gumilyov, 1959]).

Chinggis Khan designated as his successor Ögedei, the third of four sons from his chief wife, and not one of his two elder brothers, Jochi or Chagatai. Here is how the 'Secret History of the Mongols' describes this scene. Jochi and Chagatai were asked about the possible future ruler, and they offered the candidature of Ögedei to their father. Chinggis Khan agreed, specifying that if Ögedei's family was not able to reign, 'will there not be a worthy one among my descendants?' [Kozin, 1941, pp. 185–186]. Thus, the family of the third Chinggisid was not enthroned permanently, but under certain circumstances the ulus tsarevichs could seize the throne (although some researchers suppose that this scene was made up only later to justify the enthronement of the fourth son of Chinggis Khan, Tolui, in Karakorum). Secondly, it is remarkable that Jochi and Chagatai by common consent were not offered khakanship. Rashid al-Din and Juvayni inform us that Chinggis Khan had to choose from just two candidates, Ögedei and Tolui [Rashid al-Din, 1952, 2, p. 258, Juvaini, 1936, p. 3].

In all likelihood, the matter here is that both elderborn tsareviches were sent to rule in the Western half of the Empire. Invested with the perquisites of co-regents, they did not dare to hope for sovereignty in the capital of Karakorum (for more information on this event in the history of nomads, refer to: [Trepavlov, 1991]), which is why Chinggis Khan did not take them into account when choosing his successor. This can explain why they offered up the candidature of their older brother, who lived in the East.

Batu's pointed refusal of sovereignty in favour of Tolui's son, Möngke, even though it

was Batu's 'turn to rule' [Rashid al-Din, 1960, 2, p. 113] as the senior Chinggisid at that time, serves as an indirect acknowledgment of the initial enthronement of the dynasties of Ögedei and Tolui. The indifference of the Jochids to the khakanship can be explained by the circumstances of the alliance of Ögedei's grandson, Kaidu, with the khan of the Jochid Ulus Berke. Fighting against Kublai Khakan, Qaidu turned to the neighbouring uluses for help in the restoration of his rights ('I am the legal heir of the khakan's throne!'). The Golden Horde supported him [Dalai, 1983, pp. 48–49], thus admitting that his arguments were convincing, and the complaints of the Ögedei dynasty were reasonable.

Tolui, the younger son of Chinggis Khan and Börte, as far as can be gathered from the sources, was never a contender to the monarch's throne. Rashid al-Din reports on the Turkic and Mongol custom according to which 'during their lifetime they define for their elder sons... and they give their younger son what is left' [Rashid al-Din, 1960, 2, pp. 107–108]. It is remarkable that Ögedei abandoned the throne in favour of, in turn, Chagatai, his uncles, and Tolui. The latter was on this list because he was always around his father when he was still alive, knew the rules and customs well, and also because he was a younger son and thus the heir of his father's succession. Most likely, this was part of a ceremony and a tribute to tradition. In the same way Güyük refused 17 years later, but the procedure was described in a more concise way (literally 'so-and-so is better suited for the khakanship'). In addition, Abu'l Faraj directly points to the fact that the tsarevich did this only to follow tradition [Abu'l Faraj, 1976, p. 411].

Neither Ögedei nor his successor achieved anything with their suggestions and were enthroned by force. Nevertheless, the order of the ceremonial offering of khakanship indicates the obsolete priority of elder relatives, including those from secondary and cousin family lines. Perhaps, this was the official doctrine of succession to the throne. It can be recalled that in 1248, after the death of Güyük, it was Batu's 'turn to rule', when he was left 'the eldest of the tsareviches'.

Nevertheless, the archaic system of inheritance was not always held as a matter of practice. During his lifetime, Ögedei bequeathed his throne to his grandson even though his sons were still alive, meaning he was a supporter of the dynastic principle performed at the will and bequest of the ruling sovereign. As a result of court intrigues, Güyük, the son of Ögedei, ascended to the Karakorum throne. At the Kurultai of 1246, Güyük agreed to be crowned only provided that 'after him (the khanate) will belong to his dynasty' [Rashid al-Din, 1960, 2, p. 119]. Devotion to the dynastic order of priority manifested itself in the domestic policies of the new khakan as well. Rejecting the candidature of the next Chagataid Khan, Güyük wondered, 'How can a grandson be the heir when the son (of Chagatai) (Yesü Möngke.—V.T.) is still alive?' [Ibid.].

After long-lasting intrigues and consultations with Batu, in 1251 the Mongolian nobility decided to set the elder Toluid, Möngke, upon the white felt. Apparently, he supported the conception of dynastic governance, or at least he gave *yarliq* for Ulus Jochi to Sartaq, son of the deceased Batu, and then to Ulaghchi, the son of Sartaq. But due to his sudden death, he did not manage to make arrangements for his own throne.

Military forces settled this inheritance dispute between the two brothers of Möngke, Ariq Böke and Kublai, in favour of the latter. Eventually, the problem of Kublai's successor was resolved by the original will of khakan: a competition was created to find out the biggest *bilig* expert (which were the sayings of Chinggis Khan), that was won by the grandson of Kublai, Öljeitü Temür, who was then enthroned.

Thus, three of the six all-Mongolian rulers in the 13th century (besides Chinggis Khan, but including Ariq Böke) were the closest and direct descendants of their crowned predecessors, which exemplifies dynastic order. Generally speaking, ruling khakans were in support of establishing a dynasty, and their cousins were proponents of clan principles, in direct opposition to dynasties.

The same trend can be observed in the uluses of Jochi, Chagatai, and Hulagu. There was a logic to all of them: initially, the first khan's

son succeeds to the throne (Jochi—Batu—Sartaq, Chagatai—Qara Hülegü, Hulagu—Abaqa), after which it is inherited by uncles, brothers, and nephews. Obviously, each of the ulus rulers strove to consolidate power behind their own homes. In the 13th century, the majority of the Golden Horde and Chagataid Khans were appointed by superior rulers that resulted from co-regent relationships between the Jochids and khakans, and from the dependence of the Chagataids from Qaidu. It was a rare experience when the throne was willed to a particular

person. This demonstrates that succeeding to the throne at the will of the predecessor was an unpopular and untraditional practice in Mongolian nationhood.

As for the familial relationships of the suzerains who came and went, one can only say that the clan principle dominated over the dynastic principle. Mostly it was the blood brothers or cousins of the preceding monarch who became khans, but every so often there was a succession of nephews (especially by the Chagataids and the western Jochids).

§ 3. Evolution of the governmental system (central administration and territorial division)

The governmental system of the Golden Horde was complicated and had multiple branches. It formed and changed shape for the almost three centuries of the state's existence. Starting with the introduction of the institutes traditional for the Mongol Empire in conquered Desht-i Qipchaq, the Jochids made efficient use of the administrative traditions of conquered people and neighbouring states. A complex of administrative bodies and positions, central and local offices, and capital and country administrations adhering to a hierarchical order made its appearance.

Traditionally, historians have taken great interest in the Jochid administration system, which is caused by several reasons. Firstly, the system was so stable that it outlasted the state it was created in and continued to function (mainly) in hereditary post-Golden Khanates and Hordes. In other former ulus-es of the Mongol Empire, such as China and Iran, this did not occur. However, in Middle Asia some principles of imperial statehood got a second wind from time to time thanks to the politics of Tamerlane and the Öz Beg Khans that moved to Transoxania in the 15th century.

Secondly, the administrative system of the Golden Horde had an objectively significant effect on Russian princedoms. In other words, the study of the history of 13–16th century Rus' is incomplete without regard to this aspect, and historiography gave rise to an entirely new dis-

cipline involving eastern patterns in Russian nationality and culture.

Additionally, the national identity of Ulus of Jochi demonstrates quite a rare historical example of a long-term, conflict-free coexistence over a huge territory with subjects belonging to different economic spheres (nomadic cattle herders and sedentary farmers), who belonged to different religions and spoke different languages.

Despite all the importance of this problem, historians are faced with its scanty coverage in the medieval texts. The most important sources for the study of the Horde's administrative system are a few preserved Khan's yarliqs. However, the Arabic and Persian chronicles and Russian chronicles are also of some help.

There were several events in the history of the Jochid Empire that could be interpreted as crucial landmarks in the transformation of its administrative system. The independence attained by the state from the Empire government in the latter half of the 1260s motivated the Sarai Khans to improve the state according to its new, sovereign status. Yarliqs granted on behalf of Mengu Timur to the Russian Orthodox hierarchs could serve as a first indication of this. Nevertheless, infighting that took place after his death distracted the Jochid nobility from administration improvements, and thus the administration system of the independent Golden Horde was formed only after the end of the infighting, during the times of Tokh-

ta Khan (the beginning of the 14th century). Soon the conversion of Öz Beg to Islam as the official religion resulted in new transformations, and as a result, the Golden Horde turned into another Islamic state with all the specific administrative ways and canons inherent to them, tried and true as they were throughout the centuries.

Later, as far as can be judged from the sources, there were no more significant transformations in this sphere. The internecine feuds of the 1360–1370s and the invasions of Tamerlane never allowed the authorities of the Horde to further improve its system. Waging a cruel struggle for power, they simply maintained the administrative institutes that were preserved after political convulsions.

Certain administrative characteristics proved to be quite stable and viable. They can be found in the Golden Horde, as well as in post-Golden Horde states; hence, they were typical of administrative management in this part of medieval Eurasia.

The following characteristics are relevant here: a) the monarchical power of the Khan, certain features of which were discussed above; b) the participation in the administration of the karachibeks, who were representatives of several (usually four) Tatar aristocratic dynasties; c) the division of the nomadic population and sometimes of territory into right and left hands ('wings'); d) the ulus system, that is, the whole population of subjects and territory appanages granted by the khan to commanders and 'civil' dignitaries; e) the institute of vicegerents *darugachi* (*daruga*)—in the administration of the sedentary population in the city and country; f) *yasak*-taxing; g) a combination of the state administration with traditional local governing bodies of the population.

The khan was the head of the Jochid administrative system. The apparatus functioned on his behalf and as executions of his orders, whether the throne was occupied by a sovereign ruler or a puppet of the nobility. The khan was responsible for assignments to the main administrative positions, the issue of currency, and negotiations with foreign rulers. He also headed the army during large military campaigns, etc.

But formally, he shared his powers with karachibeks, one of whom was senior (*beklyaribek*, *ulug karachibek*). Some sources reasonably consider that these four superior magnates represented the most authoritative Turkic-Mongol clans and also constituted the ruler's council. As far as it can be judged based on information about the Tatar Khanates of the late Middle Ages, they were the ones who had to perform the enthronement ceremony. The structure of the four main dynasties (except for the regnant dynasty) was traditional for Turkic-Mongol statehood and originated from ancient nomadic times. One can suppose that at the times of Öz Beg, in addition to their court duties, they also received four parts of the state for administration that turned them into *ulusbeks*.

Little is known about how the karachibek institute functioned in the Ulus of Jochi in the 13–14th centuries. Available data only allows us to reconstruct its effect in the right hand ('wing') of the ulus in terms of Batu's descendants. But there is also singular data on a four-clan system in the eastern steppes by the khan descendants of Orda Ichen.

As in any other state founded by nomads, the military occupied the most important place in the state's life. In addition, nomads were the majority of its population and army. This is why administrative institutes were created in the Golden Horde in the first place for the administration of the nomadic population. Yet the settled population—farmers, craftsmen, and tradespeople—were also the most important category of subjects, first and foremost as taxpayers. Gradually, following the conversion to Islam and the prosperity of cities in the first half of the 14th century, its significance in the economy and, consequently, social significance, increased significantly. It was for this reason that the central administration seemed to be orientated on these two main parts of the population.

Nominally speaking, one could consider that military issues and the ulus-appanage system related to them were under the authority of the *beklyaribek* and the three karachibeks hierarchically subordinate to him, while non-military issues (most importantly, financial) were

Male and female outfits
of wealthy Tatars, 14th century.
Reconstruction by M. Gorelik

under the authority of the vizier and the subordinate chancellery (divan). In other words, the nomadic population of Golden Horde was mostly under the supervision of the beklyaribek, and the settled answered to the vizier.

In the midst of such a division in jurisdiction, the role of the khan was to control his dignitaries, arbitrate in cases of their disagreement, and make final decisions in matters of principle. Not without good reason did medieval observers notice that the Jochid monarch 'takes notice only of the heart of issues, not going into details, and is satisfied with what he is informed of, and does not go into details

of levy and expense' [Collection of Works Related to the History of the Golden Horde, 1884, p. 230]. But such an indifference of the khan towards daily pursuits was typical of the 14th century, and perhaps in 1270–1290, Batu and Berke scrutinised the details of the administration because they were still fixing the operations of apparatus.

The beklyaribek was the figure-head of the bek class (noyans, emirs) and served as superior commander. When Ulus of Jochi converted to Islam, the ideological basis of foreign policy typical of medieval Muslim states—fight (go to war) for religion—was related to it. But

the perquisites of the beklyaribek fell short of those of the khan. In addition, the beklyaribek, as the second most powerful person in the state, was entrusted with the responsibility of building bridges with other states and, possibly, administering justice as the supreme judicial authority (in those spheres of life and among those social groups where Sharia was not spread).

It is no wonder that because these dignitaries were in possession of so many perquisites and resources, now and then they could claim independence and make arrangements for the throne. The most widely known and powerful beklyaribek Nogai, Mamai, and Edigü (which are often misnamed in historiography as temporary rulers), appointed khans at their discretion and had total control over everything in the state.

While the institution of beklyaribekship has its origins in the Turkic-Mongol state tradition, the vizier and divan were a result of borrowing from Muslim state institutions. The main responsibilities of these structures included support of the financial system's operation, fiscal policy making, monitoring of the ever-branching administrative apparatus, regulation of trade, urban planning, and others. While khans and the main beks spent most of their time in habitual (and prestigious) migrations, all the officials mostly stayed in cities. The divan was responsible for keeping tax registers (*daftar*), along with different journals and land inventories.

Unfortunately, this entire treasure trove of documentation is now lost. But even the little bit that is known about the functioning of the central governmental authorities of the Golden Horde attests to the fact that it contained elements of record keeping from the culture of different states and peoples, including the Uighurs, the Khitans, the Jurchens, the Chinese, and others. Ulus of Jochi has a noticeable trace of influence of the Muslim regions of Khwarezm and Transoxania, and perhaps, there are also some traces left by Volga Bulgarian culture.

The existence of two dignitaries, the beklyaribek and vizier, reflects the division of the ruling nobility of the Golden Horde into two parts: the military nobility (*noyons*, *beks*,

emirs) and high-ranking members of the administration. Medieval Arabian authors refer to them correspondingly as rulers of *emirs* and city rulers [Collection of Works Related to the History of the Golden Horde, 1884, pp. 347 et seq., 412 et seq.]. Both structures, military and civil, worked side-by-side and performed different functions.

The hierarchy of *beks* is known from the originals of *khan yarliqs* and their Russian translations, where commanders of *tumens*, commanders of thousands, centurions, decurions, ulus princes, military princes, regiment princes and people's princes (perhaps a synonym of ulus princes) are all mentioned. All these commanders and vicegerents made up a pyramid, on the top of which were *karachibeks* and *beklyaribeks*. During the 13th century they formed a sort of corporation that kept the military and administrative structure of the state in check and stood apart from non-military issues. In the 14th century, the tightening and sort of fusion of the military and nomadic nobility—the guardians of the war traditions of the Mongol empire—with officialdom started to become obvious.

The ulus system was one of the distinguishing features of the Golden Horde system. The term '*ulus*' came to the Golden Horde from Mongol antiquity and originally meant the people under rule. Later this term spread throughout the territory occupied by these people, making it a term for the appanage and for the state in general (the appanage was segregated as Ulus of Jochi, Ulus of Chagatai, and Ulus of Hulagu).

As mentioned before, the Golden Horde was divided into two wings delineated by the Yaik river, that is, the Ural, composed of a right wing (western, Ak Horde) and left wing (eastern, Kok Horde). Each of these was further divided into wings. Ak Horde consisted of two halves delineated by the Don river, and Kok Horde contained the appanages of Jochi sons Orda Ichen and Shiban, but it is difficult to define the border between them because of the lack of information. Historians only have access to usefully explicit information on the territorial and administrative structure of Ak Horde.

Ulus were not hereditary in the Golden Horde, at least not until the latter half of the 14th century. In fact, they represented conditional domains where the ruler could use the appanage if he fulfilled the following conditions: the accurate paying of tributes by the population, maintaining order and stability in their lands, and the mobilization of the appropriate number of warriors into the militia. It is believed that ulus corresponded to the military *tumen*, meaning a group of ten thousand. In other words, each ulus provided ten thousand warriors, and the ruler of the ulus held the rank of *temnik*.

Khans could change the owners of ulus, taking away and passing around the appanages at their discretion. Apparently, the borders of ulus never changed. Each of them had two capacities, or forms of existence: territory and people. The area of pastoralism was referred to as the *nutag* (Mong.) or *yurt* (Turk.), and the population as *irgen* (Mong.) or *el*, *il* (Turk.). Together, the *nutag/yurt* and *irgen/el* constituted an ulus. Over the course of time, the territorial component of the term 'ulus' became prioritised, while in terms of the Mongols, the nomadic population was top priority in the 12th century (which, in fact, made up the appanage). This kind of transformation prepared for the complete administrative division of the state in the 14th century when it was divided into four provinces, or *ulusbegs*.

V. Egorov analysed the state of the ulus structure of Jochid's entire right hand ('wing') in the middle of the 13th century taking into account various sources [1985, pp. 163–164].

In addition, Khwarezm was undoubtedly an independent administrative region, and the northern part of this state with the cities of Urganch and Khiva belonged to the Golden Horde. Perhaps this part of the ancient culture in the Lower Amu Darya Region was an enclave of the right hand ('wing'), surrounded by Chagataid and Kok Horde possessions.

As for the inner divisions of the left wing, only locations in the possession of Orda Ichen and Shibani are known. The elder Jochid inherited his father's headquarters along the upper reaches of the Irtysh. The sources describing the khan's domain of Kok Horde name differ-

ent placenames in south-eastern Kazakhstan. Among the big cities there are mentions of Otrar, Sawran, Jand, Barchkent, and Sygnak, which turned into the residence of the local monarchs in the latter half of the 14th century. For the most part, these settlements are along the Syr Darya, river in an area urbanised back in the pre-Mongol period.

Shiban's ulus spread out over the immense steppes of Western and Central Kazakhstan. According to the narrations of chronicler Abu al-Ghazi (17th century), Batu gave an appanage to his younger brother with a farewell speech: 'The yurt you will live in... will be between my yurt and my senior brother Orda-Ichen's yurt, and in summer you shall live on the eastern side of the Yaik, on the Irgiz, Sanuk, and Or rivers up to the Urals, and during the winter in Arakum, Karakum, and along the shore of the Syr river, on the creeks of the Chu and Sarisu rivers' [Abu al-Ghazi, 1906, p. 160].

There is no data on the location of the nomad camps of other Jochi's sons appointed as subordinate to Orda Ichen: Udur, Shingum, Singum, and Toqa-Temur.

Due to an increase in the significance of the urban economy and the development of administrative structures in the forms typical of stable sedentary states, administrative transformations and territorial divisions took place prominently in the Golden Horde in the 14th century. While preserving the structure of the nomadic appanages, the government established four more *ulusbeks*, named in the Arabic documents as Sarai, Khwarezm, and Desht-i-Qipchaq. One could notice that the first three are quite local regions with developed urban life, and one vicegerent was enough for them. As for the huge Desht, additional local division was probably used for administrative purposes, which was probably carried out under the old ulus system.

The boundary marking principle they used to define ulus borders is impossible to specify based on medieval texts. As we can see, geographical criteria (river borders) do not always work. If, suppose, an ulus had the Volga or Yaik as a boundary on one side, then what was its border in the naked steppe? Smaller rivers? Other landscape landmarks, such as mountain

ridges? There is a suggestion in the historiography that ulus-wing borders were based on the colonisation of various ethnic communities. Thus, it is suggested that the Kok Horde and Ak Horde almost entirely coincide with settlement areas of the Oghuz and the Kipchaks (according to the archaeological data) (refer to [Fedorov-Davydov, 1973, pp. 57–58]).

It is possible that upon the formation of the Jochids appanage system, the structure of tribes was taken into consideration, so one ulus corresponded to a specific tribal com-

munity or community group. This is proven indirectly by late medieval references to the population of the Desht-i-Qipchaq in the first place as the main group of *els*, meaning the human contingents of ulus estates. Moreover, every *el* is marked in the sources by a tribal ethnonym: *el* of Naimans, *el* of Kungrats, *el* of Mangyts, and so on. If the theory about the four leading noble clans in control of the state (see above) is true, it is reasonable to suppose that these clans were in possession of their own nomadic areas.

Section IV

The Golden Age of the Ulus of Jochi

CHAPTER 1

The Administrative/Territorial Structure and Cities

§ 1. The system of wings and the administrative structure. The problem of the Ak Horde and Kok Horde

Vadim Trepavlov

In the majority of state formations created by nomads, the territory and population were divided into two provinces, or wings. The wings were equal (symmetrical) in a formal sense, although in reality they could have been different sizes. One of them was usually situated in the west (the right wing—'Barungar' or 'Ong Kol'), and the other in the east (the left wing—'Jungar' or 'Sol Kol'). What can be considered the centre ('Gol') was under direct control of the supreme ruler. The centre was sometimes formed as an independent administrative unit, but it often merged with the left wing. Therefore it was the latter, which was ruled by the main (senior) khan, that was considered to be more important than the right wing, which was controlled by a special vicegerent who could not belong to the khan's kin. It was often the case that this vicegerent occupied the position of the state's supreme commander (in the Ulus of Jochi—*ulug qarachi bek / beklyaribek*).

The rationale and prototype of this system was the mounted militia. According to their affiliation to certain wings, detachments of noions (later—emirs and beks) and tribes occupied certain positions in the left or right flanks during campaigns and in battles. It is known that Chinggis Khan set a rigorous decimal principle, according to which every subject occupied their own place in a ten, hundred, thousand and Tümen [unit of ten thousand], both as a warrior and a tax payer. Since every Tümen belonged to one wing or another, compliance with the wing's layout was also obligatory.

At the very beginning of the history of the Mongol Empire, when its territory included a comparatively small steppe area in the east

of Central Asia, the territorial and military features of the wings were apparently equal. However, when the empire grew to an unprecedented size, the wings became an abstraction or a political/geographical category, because it was impossible, for example, to gather a militia army in the right wing of the empire (uluses of Jochi, Hulagu and Chagatai). However, the typical organisation of the state life of nomads, the management of the population and command over the army required the wings to have an active structure, as there was a constant necessity to gather troops into a militia and arrange them into flank corps. This is why a secondary bifurcation of the wings eventually occurred: new compact left and right wings appeared within the existing wings and then the new ones split even further. It is obvious that this splitting continued until the territory in which it was possible to quickly mobilise the population and send them to war fell under the control of the governor. This type of situation was prevalent throughout the entire history of nomadic empires, and the Mongol Empire and the Golden Horde are not an exception.

The wing structure is well traced in the political history and administrative/territorial structure of Jochid Ulus, which began to form in the middle or towards the end of the 1220s. Lubsan Danzan wrote that when defining the appanage for Jochi, Chinggis Khan appointed 'Orosuts and Cherkisuts of Hukin-noion (for the management of) the territory...(saying): "Sever the western side of Jochi's possession!" [Lubsan Danzan, 1973, p. 232]. It is most likely that Chinggis Khan's order was not fulfilled that time: in 1225 when he ordered it, the North

Caucasus ('Cherkisuts') and Russian principalities had not yet been conquered, and the wars that begun in the mid 1230s were led under the command of Jochi's sons and general Subutai.

Lubsan Danzan said nothing more about Hukin-noion's destiny. However, it is important to note that the founder of the empire himself laid the foundation for the bifurcation of Jochid Ulus. The khanship of Jochi himself was supposed to be located in its eastern part, with its main camp "within reaches of the Irdysh" (according to Rashid al-Din), while the administration of his vicegerent, who was subject to the ulus holder, was in the western part (because the matter was not about Hukin-noion not being granted his own dominion, but about detaching a section of the possessions of one of the senior Chinggisids). A similar system was consolidated among Jochi's offspring.

The Ulus was divided between Jochi's eldest sons, Orda and Batu. Earlier we mentioned data from the sources describing the circumstances of this division. Other Jochids with their uluses were appointed to the wings of this territory: the right, or western side (Ak or White Horde) and the left, or eastern side (Kok or Blue Horde). Each of them had their own khan. According to some historians, the border between them was the Volga, and according to others, it was the Yaik River (Ural), but still others consider that the left wing constituted only the southeastern outskirts of the Ulus, ignoring the principle of the symmetry of wings (the personal, dominion nomadic territories of Khan Orda). In fact, the asymmetry of wings was possible, and such examples can be found throughout history. During Chinggis Khan's rule, the Mongol army of Jungar was almost twice as large as the army of the left flank. But if it is still possible to speculatively deduce a double quantitative superiority from the approximately equal size of nomadic territories occupied by a militia contingent, a ten-fold difference in the sizes of the territory is unexplainable.

It is possible that the division of Jochid Ulus was also influenced by the long-held ethnic division of Dasht-i Kipchak between the Oghuzes and Kipchaks across the Volga, or more likely, across the Volga-Ural interfluvium.

According to Rashid al-Din, princes Udur, Tuqa-Timur and Shingum were also in the left wing, together with the Orda [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 41]. Apart from that, there are reasons to suggest that the ulus of Jochi's fifth son Shibani also belonged to the Kok Horde, though there is much confusion regarding this historical character in the late medieval sources because of multiple falsifications caused by the apologetics of Öz Beg tsars of the Shaybanids.

Keeping in mind that the right wing was usually located in the lands conquered during the campaigns of Batu and Subutai (Western Dash-i Kipchak), we can conclude that the ulus-wing system was finally formed in this part of the empire not earlier than in the 1230s–1240s.

White and blue are the traditional Turkic and Mongol colour symbols of the right (western) and left (eastern) parts. Most Eastern sources entitle rulers of the Jochid right wings as khans of the Ak Horde, and rulers of the left wing as khans of the Kok Horde. The Russian chronicle refers to Khidr Khan, who came from beyond the Yaik River and occupied the Sarai throne during the internecine strife of the 1360s, as a native of the Blue Horde. The issue of colour terms in the Golden Horde system was unclear for a long time and was finally solved by G. Fedorov-Davydov [1968a; 1973, pp. 141–144].

The further split of the wings made the problem even more controversial, as new halves then appeared within them and each obtained their own colours. Therefore, for example, a new Ak Horde was formed inside of the Kok Horde: Shibani's ulus in Western Kazakhstan and South-Western Siberia. This blue-hordian Ak Horde should not be mixed with the common Jochid right wing that was designated in the same way. (Later, in the 15th century, when the Shibaniids achieved the rank of khan, the name of their appanage was used for the entire left wing, which is why it became known as the White Horde.) In the same way, the common-Jochid Ak Horde in the last quarter of the 13th century had one more Ak Horde within its structure to the west of the Don River and ruled by beklyaribek Nogai.

As we mentioned earlier, the left wing was traditionally considered to be superior than the

right wing, and its governor was the state's main ruler. Indeed, Orda Khan and his offspring had formal precedence over Batu and other western Jochids. But this priority was expressed only in the order of names when listing relative lines, and when the Karakorum administration addressed the Golden Horde's rulers.

In reality, throughout the first century of its existence the Ak and Kok Hordes were almost autonomous and were listed within the Ulus of Jochi only nominally, without any clear signs of cooperation. The khans of the Ak Horde rarely and only episodically interfered with eastern affairs, while there is almost no information about participation of Kok Horde suzerains in the events to the west of the Yaik River before the middle of the 14th century. There is no evidence that the aristocracy of the two hordes gathered to take part in quriltais to dis-

cuss common affairs (it seems they had none). There is also no information that a common tax system or the mobilisation of armies existed in both wings. It is possible that only a family relationship of rulers, a network of caravan routes and postal stations and, during the first decades, subordination to the imperial centre, could demonstrate the affiliation of both wings to the common state organism.

The two wings were apparently merged in the 1380s during the rule of Tokhtamysh Khan. This appeared to be short-lived and inefficient, because it happened in the environment of the emerging state crisis and the collapse of the Golden Horde, and also on the eve of Timur's raids, which were fatal for it. After them, the territory of the right wing was absorbed by the chaos, and new independent khanates started to form inside of it.

§ 2. The Ak Horde

Iskander Izmaylov

After returning to the Volga Region and understanding that his forces alone were not enough to attack Europe, Batu Khan started consolidating and organising his ulus. He introduced the traditional Turkic-Mongol military/political division of the state into right and left wings, and left the uluses that were most significant in size to himself and his brothers. Thus, his elder brother Orda Ichen became the head of the left wing and gained the Kok Horde in his possession, which was the outermost eastern borders of the empire, the Irtysh River area and the Aral Sea Region. Their other brothers and certain supreme Mongol nobles obtained smaller possessions within these uluses on the conditions of vassal use for their participation in military campaigns and paying taxes. It is most likely that the khan had a right to change and even take away one ulus or another if its holder broke his obligations [Safargaliev, 1960, pp. 39–45; Fedorov-Davydov, 1973, pp. 49–62; Trepavlov, 1993, pp. 96–102]. There is a dispute in the historical literature regarding the quantity and territories of the uluses into which the Ak Horde or the right wing of Jochid Ulus were divided.

If we sum up all of these data, we may assume that in the middle of the 13th century the Ak Horde was divided into several dominions. The Volga Region was most likely the khan ulus, i.e. the common possession of the entire 'Altyn Urug,' and it is possible that each Jochid had some possessions or rights for earnings there. We cannot exclude the possibility that the lands of former Bulgaria enjoyed special status and were first of all controlled directly by the supreme khan and, starting in the latter half of the 13th century, were included in the structure of the khan ulus.

As for internal divisions, the Ak Horde and Kok Horde were in turn divided into uluses that were governed by Batu Khan's and Orda's successors, who bore the title of *Oghlan* (or sultan, tsarevich). The possessions of independent beys followed. It appears that uluses represented a complex military/administrative system of hierarchically organised and subdominant possessions (*il*). The ulus, the governor of which was to deploy 10 thousand armoured knights in military campaigns, included beys who deployed one thousand warriors each. Possessors

who commanded a hundred warriors were in turn subject to beys. All these possessions included different forms of property (tarkhans, soyurgal), but their place in the system of 'wings' and the military was unchanged. As a result, the military/administrative system on the one hand was strictly connected to territorial possessions, and on the other—to the tribal structure of the aristocracy.

Khans of the Golden Horde controlled a vast territory in the 14th century, which spread from the Danube in the west to the Irtysh in the east, and from Derbent and Khwarezm in the south to the Cis-Kama Region and the Cis-Chulyman region in the north. The basic structural element of all these territories were the possessions of ulus-beys. However, the courts and fiscal/administrative apparatus of these uluses were located in main cities. Moreover, urban infrastructure appeared even where it had not been developed before, thus spurring an increase in the trade and craft activities of the area. It cannot be excluded that gradually, with the growth and consolidation of cities, they contributed to the split of big uluses into small possessions, thus prompting the regionalisation of power and management.

It is no wonder that almost all travelers and geographers paid special attention to the urban infrastructure, identifying these centres with their areas. Arabic historian al-Umari fairly accurately described the territory of the Golden Horde in the first half of the 14th century based on the stories of merchants and diplomats who had visited it. Among its most famous cities and areas he listed Khwarezm, Sygnak, Sayram, Yarkend, Jend, Sarai, Majar, Azak, Akchakerman, Kaffa, Sudak, Saqsin, Ukek, Bulgar, Derbent, as well as the lands of Siberia and Ibir, Bashkird and Chulyman [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 236]. Admiring the size of the possessions of 'the tsardoms of Khwarezm and Dasht-i Kipchak', Arabic traveler Ibn Khaldun described it to his readers in the middle of the 14th century as 'a vast tsardom in the north, from Khwarezm to Yarkend and Sogd and Sarai, to Majar city and Arran and Sudak and Bulgar and Bashkird and Chulyman; and the city of Baku is located within this

tsardom as well, it belongs to Shirvan's cities, and there are Iron gates near it, and it spreads in the south to the borders of Constantinople' [ibid, p. 378]. According to the data presented by Arabic geographers, this state's length was an eight-month journey, and its width was six, and it spread from the sea of Constantinople to the Irtysh River, 800 parasangs long, and its width stretched from Bab-al-Abwab (Derbent) to Bulgar, i.e. approximately 600 parasangs [ibid, p. 175, 206].

The entirety of the historical, archaeological and numismatic data have allowed researchers to determine the borders of the Ulus of Jochi [Egorov, 1985, pp. 75–150]. In the middle of the 14th century, the most western edge of the Horde was apparently the territory of the interfluvium of the Dniester, Prut and Siret, bordered in the south by the lower stream of the Danube. Here, the main camp of the rebellious karachi-bek Nogai was defeated by Tokhta Khan after a lengthy and difficult opposition (1300). The main city of this part of the Horde was Akkerman (modern Belgorod, near the Dnieper estuary) founded by the Horde's rulers in the latter half of the 13th century, which quickly became an important craft centre and a trading port through which crops, wool, meat and other cattle-breeding products were exported to Western Europe and the Middle East. A vast rural area with flower and vegetable gardens was located nearby.

In the Northern Black Sea Region, the steppes from the Black Sea coast to the borders of Rus' as well as the lands of Steppe Crimea were under the direct control of Golden Horde khans. The southern coast of Taurica was occupied by small Genoa port colonies. Their centre was Kaffa (Feodosia), a small territory of which was purchased by Genoa in 1266 and which by the end of the 14th century became a genuine trade capital of the entire Northern Black Sea Region: "a well-known inhabited city", according to archbishop Johannes de Galonifontibus, "a place of gathering for merchants from all over the world", where merchants speaking 35 languages would always come to trade [Galonifontibus, 1980, p. 14]. Among other cities, Soldaia (Surozh or Sudak) is noteworthy. All of these cities had small ru-

ral areas, but their main source of revenue was the transit trade with the Mediterranean. Based on written sources, these cities were dependent on the Horde and paid tribute to it, though sometimes they were still attacked by the Tatars and had to take part in internecine feuds. The main city of the Crimean steppes was called Qirim (Europeans called it Solkhat, and today it is known as Sary Krym). It was founded back in the 1260s and, thanks to an increase in the Black Sea's trade, became the most important economic and administrative centre of the whole peninsula. Ibn Battuta referred to it as 'a big and beautiful city' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 280], while Ibn al-Wardi described it as "a big city with bazaars, mosques, inns and banyas" [Polyak, 1964, p. 50]. Another important centre of the Crimea was Qırq Yer (today, Chufut-Kale) near Bakhchisaray. Starting in the beginning of the 15th century, it served as an administrative centre for the Crimea, and later it was the centre of the emerging Crimean Khanate.

In the north, the border between vassal Russian principalities and the rest of the Horde, just like centuries before, went along the water-parting lines of the Dnieper's tributaries: on the right bank, somewhere near the Ros, and on the left bank, along the Psel River and the Vorskla River, i.e. along the natural border between the forest and steppe. North-eastern, north-western and southern Russian principalities were part of the Golden Horde upon the right of dependent possessions through keeping their administration and dynasties, but also paying regular tributes ('the Horde return'). The territory of Rus' controlled by the Horde's khan included the possessions of Volhynia, Kiev, Novhorod-Siverskyi and Ryazan princes, as well as lands of Novgorod and Pskov. The Horde's khans also ruled the principalities of Smolensk and Galicia-Volhynia for some time, which were later included in the Lithuanian State. The border between these kingdoms and the territories that were part of the ulus system of the Horde apparently also lied along the watersheds between the forest and steppe, approximately along the line of: Kiev–Kursk–Tula–midstream of the Tsna River–estuary of

the Sura River Region [Nasonov, 1940; Fennell, 1989; Gorsky, 1996; Egorov, 1985].

The territories of the Sura-Sviyaga interfluvium were also part of the Horde. Here, centres of the Horde's military-administrative power (for example, the Bolshetoyabinsk Archaeological) as well as small settlements were located. To the south, in the Sura River Region and the Moksha River Region, there were lands that used to belong to Bulgaria. In the 13–14th centuries, the ulus of Muksha (Moksha), with its centre in the city of Naruchad (present-day Narovchat) was located here. It was a developed trading and economic centre of that time that even minted its own coins. Excavations revealed brick houses, banyas and a large Islamic cemetery with mausoleums [Fedorov-Davydov, 1994, p. 37].

The lands of former Volga Bulgaria—the Bulgar Ulus—were located on the Middle Volga and Lower Kama rivers. Emirates, who were subject to the Jochids, were located here. This dependency bore a different character in various years, from strong to purely nominal. In any event, the Bulgar Ulus of that epoch was one of the most developed areas of the Horde and had several fairly large cities (Bulgar city, Kashan, Kirmenchuk, Juketau, Bilyar, Kazan), as well as dozens of townlets and hundreds of settlements.

The largest and most famous Bulgarian city of that time was Bulgar. This town, which first appeared back at the beginning of the 10th century, was not particularly large in the pre-Mongol period, though it was an important economic centre. Its real history began in the 1240s when, after returning from the Western campaign and stifling the Bulgars' rebellion, Batu Khan transferred his main camp to the area of the Lower Cis-Kama Region. This region had a strategic significance because it allowed control over the country's heart—the Middle Volga Region—in the initial period of the empire's formation. The city of Bulgar at the end of the 13–14th centuries became one of the largest and richest centres of Europe. Its favorable geographical location at the intersection of river and terrestrial routes made it an important transshipping point in world trade [Smirnov, 1951; Gorod Bolgar, 1987; 1988;

1996; 2001]. Moreover, this city was the largest centre of Turkic urban culture and the centre of the entire area where Islam was being spread since the 10th century. Economic and military strength allowed the rulers of Bulgar emirates to actively participate in the internal affairs of the Ulus of Jochi in the 14th century.

In the north and northeast, the borders of the Ulus of Jochi, according to Eastern sources, included the 'lands of Chulyman, Bashgard, Sibir and Ibir'. It is most likely that Chulyman constituted the area of the Upper Kama River Region (the Bulgarian name for the Kama's upper reaches). 'Bashgard was the clearly denoted steppes of the Southern Cis-Urals, while 'Sibir and Ibir' were the vast steppe and taiga lands of Western Siberia stretching to the Ob and the Irtysh River Regions.

In the North Caucasus, the lands of the Golden Horde stretched through the steppe zone to the northern foothills of the Caucasus occupied by the militant Circassians, Alans and Vay-Nakh people, who were always fighting the Horde people. Among the many cities of the North Caucasus, we should name Azak (today—Azov) and Majar (near the modern city of Prikumsk). Azak was an important trade and economic centre and the final culmination point of many terrestrial and river routes. Thanks to the Genoese (they called them the *Tana*), who had a colony here, the city was widely known throughout Europe in the 14th century. Majar also played a significant role in the life of the region as the central point on the way from the Middle East to the Horde. According to Ibn Battuta, it was 'a large city, one of the best Turkic cities' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 287]. In Primorsky Dagestan, the lands of the Ulus of Jochi reached the important strategic fortress of Derbent (the Arabic name of which is 'Babal-Abwab', and the Turkic is 'Temirkapu' or 'Iron gates'). The Horde people repeatedly penetrated into Transcaucasia and sometimes conquered the lands of Northern Azerbaijan, right up to Tabriz and Ardabil. However, they were unable to hold these lands for a long time.

The main territory of the Ulus of Jochi was covered by steppes. In the linguistic and apparently even in the economic and cultural senses,

A khan tent. Miniature.

its population had to deal with only insignificant changes in comparison with the pre-Mongol period. It is no wonder that Eastern sources continued to name the territory of the Golden Horde 'Dasht-i Kipchak' [Arslanova, 1990]. Nomadic tribes continued to nomadise traditionally in the meridional direction from the south to the north (in winter) and back (in summer). Changes first of all affected the social and tribal structures which appeared to be the foundation of the system of Tatar-Mongol clans, the collection of household items, jewellery, weaponry and horse harnesses, and their shapes and ornamentation. Vivid evidence of the changes in spiritual culture are attested to by the change in the burial ceremonies of the population of the Eurasian steppes [Fedorov-Davydov, 1966, pp. 150–163].

The appearance of a great number of cities in Dasht-i Kipchak in the 13–14th centuries (today approximately a hundred of them are known) is a unique phenomenon in Medieval history. Not just independent cities, but an entire farming region that became the centre of the special civilisation combining the nomadic steppe and settled Islamic cultures, emerged on an almost empty site in the region, and had a small urban area. According to the historian's allegoric phrase, Golden Horde cities in their

golden age 'were a mixture of Middle Asian mosques and minarets, tiles and glazed crockery with wooden frames and nomadic yurts' [Fedorov-Davydov, 1976, p. 120].

Everything described above is indicative of the fact that a unique civilization had formed in the Golden Horde which, when absorbing the achievements of their conquered peoples and neighbours, brought forth a syncretic, colourful and magnificent culture. The golden age of the Horde's culture was so vivid and intense that it influenced the material and spiritual life of all of its neighbouring states.

We should also mention three circumstances that contributed to the prosperity of cities, the development of rural areas surrounding them, and the consolidation of the state's unity, thus holding the empire's disparate parts together and helping form its civilisation. The most important aspect is the creation of an uninterrupted, functioning communication system—*yams* (*jams*)—which were postal stations with horses and caravanserais. They were usually located at a distance of 30–50 km between each other, i.e. at the length of a day's passage by all the most important caravan routes of Ulus of Jochi that connected the various cities and ports of the country. The yam service was one of the most important public services of the population, and its elimination was especially argued for in the tarkhan yarliqs, for example, to the Russian clergy. Apart from purely state interests—the quick spread of important public information to all parts of the country—the system of yams together with caravanserais that emerged near them, became important trade veins of the country, over which caravans with goods moved from Crimean ports to Karakorum and Khanbaliq without encountering obstacles. At the beginning of the 14th century, traveler and geographer Ibn Battuta provided a vivid description of this route from Kaffa to Sarai, and from there to Urgench and then to India [Collection of Materials Relating to the History of the Golden Horde, 1884, pp. 280–314]. These were also not just routes for the movement of material valuables, but also information, cultural and technological achievements, and religious preachers. It is no wonder that

caravanserais often served as a vacuum for some Sufi communities, or that a hospice for preachers and dervishes would appear next to a caravanserai.

Another important condition was the creation in Ulus of Jochi of a somewhat stable monetary fiscal system. Even in the mid-13th century, its own monetary-weight system was formed here, the basis of which was the silver dirham ('yarmak') weighing 1,156 grams. Later, this system was organised by Tokhta Khan in 1310–1311 and, in its altered form, existed till the country's collapse, and in some regions even after that (for more details see: [Muhamadiev, 1983, pp. 41–140]). At the same time, copper coins were minted that were proportional in value to a silver coin. They circulated within the country and outside of it, and in some states (for example, in the Grand Principality of Moscow) this became the basis of the new monetary-weight system. The stability and solvency of Ulus of Jochi's traders contributed not only to the consolidation of their connections with the Mediterranean, but also to the emergence of progressive forms of credit systems, including banks and bills. In a similar way to China's yuan, paper money, or government bills, circulated on the territory of Ulus of Jochi.

Undoubtedly, apart from pure economics, the swift growth of Sarai and other cities was achieved through the importance of the khan's power. Originally created as administrative and political centres, the surroundings of which became inhabited by the aristocracy, cities quickly became places for economic activity related to the concentration, processing and redistribution of the products and wealth that flowed in from all parts of the Horde. Serving the nobility's needs became a strong incentive for a rapid upsurge in the economic and cultural lives of cities at the end of the 13—the first half of the 14th centuries, or the period of the peak power of ruling khans. However, such a tight link to the central power was eventually harmful for urban life. In the varying periods of the empire's crisis and decadence, cities started to decline due to unstable influxes of raw material and wealth, and at last completely disintegrated. The conservative lifestyle of

the majority of the steppe population who were nomads with their herds in the arid steppes, and who did not actually depend on Sarai's khans, added to this downfall in a lot of ways. Therefore, amidst weakening centralisation, power was transferred from cities to nomadic hordes that became a concentration of political and military forces.

§ 3. Cities and lands of the Middle Volga Region

Bulgar city in the 13–15th centuries.

Iskander Izmaylov, [Murad Kaveyev]

Research on the Bolgar Archaeological Site has been conducted since the 18th century. In 1722 the town was visited by Peter I, who ordered to take measures to preserve the architectural monuments. In the 19th century, Bulgar and its monuments were studied by F. Erdman, N. Kaftannikov, I. Berezin and S. Shpilevsky et al. [Berezin, 1853; Shpilevsky, 1877]. Episodic excavations were begun in 1864. V. Tiesenhausen, V. Kazarinov, A. Shtuckenberg, P. Ponomarev, P. Krotov, M. Khomyakov, V. Smolin, and A. Bashkirov et al. conducted research of separate architectural monuments, ancient cemeteries, etc. A systematic study was started in 1938 by an archaeological expedition led by A. Smirnov (before 1973), and A. Efimova, O. Khovanskaya, B. Zhiromsky, T. Khlebnikova, M. Poluboyarionova, Yu. Krasnov, M. Kramarovskiy, P. Starostin and others participated in it at different times (see the history of research on the town here: [Khlebnikova, 1987, pp. 32–44]; the summary of these works

is available here: [Smirnov, 1951, pp. 105–152, 168–228; Gorod Bolgar, 1987; 1988; 1996; 2001; Kaveyev et al., 1988; Fedorov-Davydov, 1994; Kaveyev, 1995, pp. 93–103; Poluboyarionova, 2003]).

Bulgar city was one of the most ancient and significant cities in Volga Bulgaria and an important trade point on the Great Volga Route, which contributed to the rise of the Bulgarian state and its international recognition. It was one of the very first cities foreigners got to know, and even in the first third of the 10th century descriptions of the city became customary for the Eastern geographical tradition. In the latter half of the 12th century, Bulgar apparently lost its leading political and economic position in the country to Bilyar, though it still remained a large city [Khlebnikova, 1987, p. 55].

The Mongol conquest impacted the city greatly, and traces of destruction and burning have been found by archaeologists at 40 excavation sites. The layer of charred ruins consists of decayed coal 5–20 cm thick, and up to 50 cm in holes and scorches. The items found in this layer and the buildings destroyed during

View over the central part of the Bolgar Archaeological Site

the attack are fairly poor, including broken pottery, single household items, and craft waste. Thus, for example, animal bones, fragments of ceramics, an iron knife, a clay spindle whorl, a fragment of a blue-glazed Middle Asian bowl made of a composite white frit material dating to the 12–the beginning of the 13th centuries, and half of a pear-shaped jingle were found in the burnt house destroyed during the fire of 1236 during the excavation XCV carried out in 1987 [Kaveyev et al., 1988, pp. 67–68]. It is interesting that no human remnants have ever been discovered in this layer during its research. It is also possible that the population knew of the city's impending destruction and abandoned it. Lastly, this might be explained by the fact that the city did not put up as a fierce resistance as Bilyar, for example.

Bulgar's beneficial geographical location in the centre of a rich farming area near the confluence of the Volga and Kama rivers contributed to its quick recovery, but this time as the residence of the khan and his administration. The fact that by the mid 13th century Bulgar city had already earned this special status as

capital is proven by Marco Polo [Marco Polo, 1955, p. 45]. In the 1240s, the minting of Golden Horde coins was started in exactly this city. This is indicative of Bulgar's role in the mid 13th century as an economic and political centre of the Jochids' state. Starting in the 1260s, anonymous coins and coins with the names of Golden Horde khans were minted in Bulgar, and coins continued to be minted here up to the 1330s. [Fedorov-Davydov, 1987, p. 160, 163 et seq.].

During these years the city was entirely reconstructed. Ramparts were flattened and ditches were filled with earth, while the city's territory after the fire was scrupulously leveled and covered with river sand or clay loam. This can be observed clearly when examining the city's archaeological stratas.

In the latter half of the 13–the beginning of the 14th centuries, Bulgar city experienced the most successful period of its history. The size of its upper terrace expanded to 900 thousand square km, and suburban towns were built adjacent to the city. At the same time, the lower part of the city behind the Melenka River start-

ed to become inhabited. The thickness of the early Golden Horde layers reached 20–80 cm there. The strata in the central part of the city is saturated with shave and wood ashes, which is indicative of the developed construction of traditional wooden hoses [Efimova, 1958]. The remains of iron and bronze productions were discovered here as

well. It seems that local bronze craftsmen specialised in the production of bronze houseware, first and foremost kettles and lockers. Leather workshops also existed, the products of which were popular among the citizens of the time. A well-crafted mesh leather called 'Al-Bulgari' enjoyed particular popularity.

Starting in the latter half of the 13th century, the area located to the east of the pre-Mongol city's border, as well as the area on the other side of the river, became settled. A great number of earthen dugouts and half-dugouts occupied by craftsmen and possibly workers were built there. Craft workshops which had existed earlier started to be reconstructed (like, iron, copper and jewellers' workshops), and other new shops were opened that specialised in blacksmithing, bone-cutting and masonry [Khlebnikova, 1987, pp. 64–65]. It appears as though potters producing houseware, fire tubes and service pipes were traditionally settled on the other side of the river. Clay items were stored in holes near houses, and other holes were used for broken and ruined products.

At the same time, a white-stone Jami-mosque (Cathedral mosque) was erected in the city centre. Its construction was completed at the beginning of the 14th century. It served as the main capital mosque of Bulgar city, and quite possibly of the whole region. In terms of its architecture it was similar to Seljuk hall mosques with their multi-row pillars. The Jami-mosque was a sub-square building with 20 inner octagonal columns supporting a wooden roof. On the southern side, opposite the entrance, a mihrab was built. It was decorated with rich, ornamented stone carving. A minaret

Belt onlay. 13th century. Bronze. Bulgar city.
Bulgarian State Historical Architectural Reserve

was adjacent to the northern facade, and inside of it a spiral staircase led to the bypass gallery. A sentence from the Quran was engraved in the middle of the minaret. The mosque was reconstructed in the 30s. Additional supportive columns were installed, and decorative niches were added on the western and eastern facades (for more details see: [Aksenova, 2001; Aydarov, 2001]).

At the end of the 13th century, two mausoleums were erected for a couple noblemen. One was placed opposite the northern facade, and the other was placed in front of the eastern one. Based on their types, they may be referred to as Islamic mausoleums, which were widely spread throughout Middle Asia, Near and Middle East. The inner rooms were half-spherical. Clay cavities that created an acoustic effect were installed in the upper part of the wall, and archaeological excavations inside of the eastern mausoleums revealed seven crypts in the form of rectangular chambers covered with rubble work held together by a lime solution. A wooden coffin was apparently placed in these chambers. Although, these burials were destroyed in the 17th century, according to the orientation of the crypts, all the deceased were buried in accordance with Islamic ritual.

South of Jami-mosque another stone building was erected in the mid 14th century in the form of a two-storeyed premise surrounded by side chambers. The second storey was a domed hall with plastered and richly ornamented walls. According to certain theories, this was a court building or an underground prison, which were typical permanent buildings for Islamic

cities. Fiscal administrative authorities were usually housed in them as well.

Starting in the beginning of the 14th century, the inhabited quarters of the eastern part of the city were renovated, and the area was settled by wealthy citizens. Houses with wooden household premises were built, the floors were wattle and daub, and heating channels made of sun-dried earth brick were installed under the floors. One or two channels came out of the upper part and were connected by the heating system under the floor. Apart from the usual household items, the inhabitants of this area used luxuriant glazed crockery imported from the Trans-Caucasus, Iran and Byzantium, celadon vases from China, and vessels made of decorative glass from Egypt and Syria.

The first stone-brick banya in Bulgar city was built, judging by the excavations, in the mid-13th century on the northern slope of the terrace. Later, the number of public banyas notably increased and became an indivisible part of Bulgar as a typical Eastern city (see: [Sharifullin, 2001]). The most exemplary is a red-brick banya that has been named the 'Red chamber', built not far from Jami-mosque on the left bank of the Melenka River under a steep slope on an area with tight-fitting plates, in the centre of which there was a fountain with a pond. It was made of brick with walls plastered with a red lime solution. A lancet arc decorated the entrance to the banya. Its inner rooms, the central hall and four corner rooms, were covered by half-cylindrical vaults and half-spherical domes. A fountain was erected in the centre of the hall. Niches were cut in the central hall's walls, where three ceramic tubes were installed: two for hot, and one for cold water. Then there was what was most likely the hottest area, a sweat room in which stone benches were placed. Tubes providing hot and cold water were installed in one of its walls, and in both halls gutters were built into the floor. There was also a service room with a stone reservoir filled with cold water, a copper boiler for boiling water and a furnace for heating. This banya, just like others, had a construction typical throughout the Near and Middle East. Banyas played an important role not only in the improvement of cities,

but also fulfilled an important public function. For example, in a number of cases they were waqfs for mosques and hospices. Every quarter, along with craft or trade workshops, tried to build its own banya because they served as meeting points or as a type of club. It comes as no surprise that galloping dominoes and chess figures were discovered here among the other findings.

Construction along the high bank was possible only if it was strengthened against erosion and siphoned out wastewater. For this purpose, drainage pipes were laid along the streets that led to water collection wells that swallowed up melt waters and sewage [Efimova, 1954, pp. 369–391]; Baranov, 2001, pp. 321–342], while the coast itself was supported by a system of oak platforms, or frames that stretched along the entire slope (see: [Efimova, 1952, pp. 41–45]).

Bulgar was a rich and prosperous city. During periods of political stability it was a treasure for its citizens, but during times of trouble and internecine feuds, it was their curse, as the threat of war was especially increased in the political unstable environment of Ulus of Jochi in the latter half of the 14th century. Inhabitants had to take care of their defence, and for this purpose a whole system of fortifications was constructed (see: [Krasnov 1987, pp. 99–123]). They stretched from the steep river terrace to the south, turned north-eastwards and then on to the north towards the river bank, creating an irregular triangle. The length of ramparts and ditches was 8 km surrounding an area of approximately 4 million square km. Builders attempted to use natural obstacles, such as ravines and lakes, to their fullest. In areas where they were lacking, the number of fortifications was increased. Ditches and ramparts were the main elements of the city's defence system. Along the ridge of the ramparts there was a tall wooden wall made of log frames 2 meters thick, which was fortified with towers in the key points of defence (there were 17 of them along the perimeter of the wall). Sharpened spears hampering the movement of siege equipment were often hammered either into the ditches filled with water, or in front of them.

The city could be entered through any of the three gates in the southern, eastern and western walls. The entrances were strengthened by forts constructed with a whole system of cranks shafts and towers with gateways. The city's fortified area protected rich trade-and-craft quarters and the aristocracy's houses, as well as the sacred and public part of the city, including Jami-mosque, cemeteries with mausoleums, quarter mosques and banyas.

What was known as 'Little town' was built near the southeastern gates of the city. This town could have been a caravanserai for receiving guests and accommodating merchants (see: [Belyaev, 2001]). It is a wonderful monument both of utilitarian (trade, military) value and a repository of culture which was left unfinished. In fact, the remains recorded by archaeologists represented only the initial stage of building an entire complex of premises. Unfortunately, since they were unfinished and did not function, it is difficult to say anything definite about their purpose. In general, we may assume that they included both caravanserais and some cult facilities, including mosques and khanqahs (dervish lodges or hospices).

In the city's western part there was an Armenian Sloboda with a foundation that was likely laid back in pre-Mongol times, at least in the 12th century. But its genuine golden age peaked in the 13th and 14th centuries. Since religious tolerance was characteristic of the population of Bulgar, just like in other Ulus of Jochi's cities, Armenians could freely profess their religion, the Monophysite doctrine of Orthodox Christianity, and could also construct cult buildings. One unique fact is that the Orthodox cathedral, referred to as the 'Greek chamber', was likely examined in that part of the city. It belonged to the types of Armenian mortuary temples where the lower tier served as a mausoleum, and the upper was a church used by citizens of this Armenian community. A chapel was located to the southwest of the cathedral, while a Christian cemetery was found to the east. Before being buried, the deceased were dressed and covered in silk and brocade fabrics embroidered with gold and silver threads, and decorated with floral ornamentations, along with pictures of people and

Khum for storing water and grain.
13–14th centuries. Bulgar city.
Bulgarian State Historical Architectural Reserve

animals. Golden and silver earrings, temporal rings, and pearl pendants were never taken away from the deceased. Gravestones with epitaphs were erected over graves (for more details see: [Dzhanpoladyan, 1984]).

Bulgar's trade dock and the settlement of Aga-Bazar were located on the cape near the route to the Volga (see: [Zhiromsky, 1953, pp. 55–63; 1954, pp. 325–339]). In the 14th century, this area was one of the richest, and was inhabited by successful merchants and craftsmen. Here, along with wooden houses, stone buildings ornamented with wooden glazed tiles that were heated and equipped with water pipes, were also constructed. Its population consisted of craftsmen and merchants. It is most likely they sold and produced various household and luxury items, including circular pottery, iron items, bronze jewels (belt coverings, earrings, temporal rings, rings, etc), and also sold glazed vessels imported from Transcaucasia and the Middle East, celadon vases from China, and jewelry made of Baltic amber. Copper and silver pulis and dirhams minted in Bulgar and other mints of the Volga Region, Crimea and Khwarezm on behalf of Ulus Jochi's khans was circulated here (see, for exam-

ple: Yanina, 1962, pp. 153–178]). Here, in the piedmont area, were the quarters inhabited by migrants from various countries, such as Jews, Russians and others.

During the city's rise in the 14th century, various crafts, trade, and the construction of monumental buildings witnessed intense development here. The territory was widened at the expense of developing suburbs and neighbouring areas. Archaeologists discovered traces of iron production, bone-carving, leather, pottery, masonry and other crafts. Dwellings were discovered as the remains of ground wooden houses with under-floor and adobe furnaces, half-dugouts, and noble houses made of gummy and burnt bricks with an under-floor heating system. Remains have also been preserved of complex hydro-technical constructions featuring water pipes and canalisation made from clay tubes. The findings characterise expansive trade connections between Bulgaria and the different countries of the Old World.

The rise of the region's economy and the increase of Bulgar's economic strength logically boosted its role in Ulus of Jochi's political life. It began to be regularly named as one of the most important trade and religious centres of the Volga Region. During the Time of Troubles in the mid-14th century, the city suffered several sieges and conquests, including the campaign of Bulat Timer of 1361, the siege by the army of Moscow prince Dmitry Ivanovich in 1370 and 1376, and the raids of Novgorod Ushkuiniks in 1366 and 1374. They all took a considerable toll on the city, resulting in several suburbs falling into desolation.

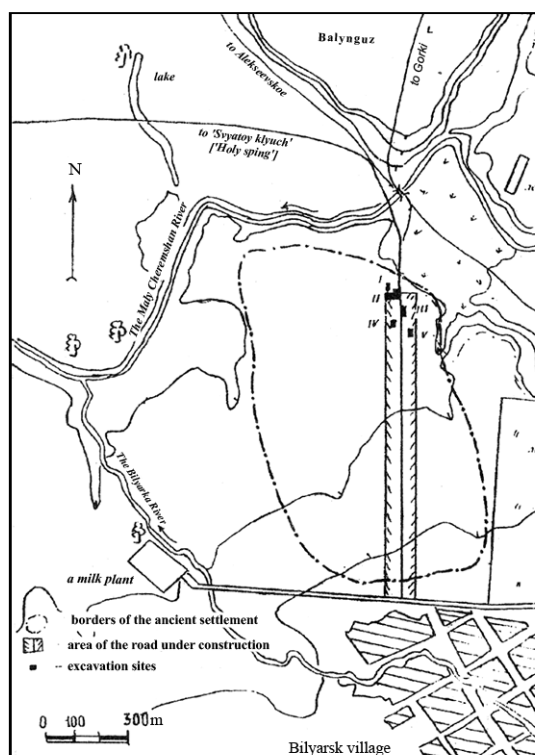

Nevertheless, in the 1370–80s, the city gradually returned to its normal pace of life. Jami-mosque was reconstructed for the second time, two door and four window embrasures were constructed, corner towers were erected on the building's corners, and decorative niches on the side facades were etched in. Definite changes also happened in the interior, where there were inner portals built near three entrances. A third layer of flooring was also added, and the inner props were increased to 36 columns standing six in a row. A square was built around the cathedral, while all wooden buildings and the cemetery were removed. The

'Red chamber' was reconstructed, but some other banyas were abandoned.

Craft and trade quarters were gradually revived, especially in the piedmont area, which was especially vulnerable to attack. New houses and trade shops were rebuilt on the site of the previously destroyed and burnt workshops and houses. New, more developed forges appeared, and an increase in the production of various items can be observed for the period. The craft quarter was moved out from the city centre, while houses belonging to rich citizens with buildings of burnt brick were constructed on their foundation using sun-dried brick.

The tradition of constructing monumental cult and public buildings continued. Starting in the mid-14th century, the eastern part of the city ceased to be inhabited. A cemetery with white-stone tombs made of lime blocks covered with plates and decorated with exquisite carvings appeared on this territory instead. They were apparently the family crypts of rich citizens. Funerals were carried out according to the Islamic custom, and an additional part of the deceased were buried in coffins.

Among these tombs, four can be distinguished in particular. They were connected to form a single block construction with separate entrances. The central mausoleum was similar to the (earlier) others, which were located near Jami-mosque. The northwestern room was originally used as a commemorative mosque in tombs. Outside, below floor-level there was a furnace with heating channels extending out from it. Later, the furnace pit was filled in, while its building was turned into an ancestral tomb in which eight bodies were buried. Brick gravestones were placed above some of them, and a minaret was built. Although it was not as great as the minaret of Jami-mosque, it was still a significant structure that made it to our time (the 'Small minaret'). The cubic foundation with triangular bevels was connected with an octagonal tier which, with the help of similar bevels, went into a round cylinder narrowing towards the upper part of the minaret with spiral stairs inside of it. On top, the minaret had a bypass area along the perimeter and the ending with a conical roof. The surface of the minaret was coated with lime slabs. A decorative arc

Plan of the Bilyar III ancient settlement

Jar with a stamped ornament.
13–14th centuries.
Bilyar III ancient settlement

niche richly ornamented with carved floral ornamentation was located on the western part, and the entrance located in the north led to the spiral stairs.

There was an ordinary city cemetery located nearby. Small stone crypts were erected above some of the graves, while gravestones with epitaphic inscriptions were constructed above others (see: [Aksenova, 2001; Mukhametshin, Khakimzyanov, 1987]).

Although the city continued to develop, its economic and political significance gradually decreased, while its functions were passed to other urban centres of the Bulgarian vilayet, for example, Kazan. At the beginning of the 15th century, Bulgar city suffered several strong military defeats that predetermined its fall and led to its complete collapse. In 1399 Moscow troops of prince Yury Dmitrievich were devastating Bulgarian cities for three months, including Bulgar, while in 1431 the campaign of the Moscow army under the command of prince Fedor Pestriy of Paletsky Principality completely destroyed the city. After this, the centre of Bulgarian lands moved to

Kazan, while Bulgar became a small trade-craft town and a traditionally important centre of religious life.

Bilyar and its surroundings

Svetlana Valiulina

After the conquest of Bilyar, the population left alive apparently moved to ancient settlements that continued to exist during the Golden Horde.

The area's centre in the latter half of the 13–the first half of the 14th centuries was Bilyar of the Golden Horde, an unfortified town with a size of nearly 70 hectares located on the left bank of the Maly Chyremshan River, 1.5 km to the northwest of the pre-Mongol ancient town [Valiullina, 2000, pp. 273–287]. A new city emerged on the uninhabited free territory only partially covering pre-Mongol monuments. The city is known according to written sources and the discovery of coins of Bilyar coinage in treasures from the 1270s–80s [Muhamadiev, 1997, p. 57; Singatullina, 1998, p. 62]. The analysis of numismatic and epigraphic inscriptions has

Bilyar III ancient settlement.
Bilyar Reserve Museum

allowed us to suggest that not only the city, but an administrative unit called 'Bilyar' existed during that time [Mukhametshin, 1997, p. 61]. Based on the existing right for coin minting, the Bilyar of the Golden Horde was one of the largest cities of the Horde and a centre of vast provinces in which the executive, administrative and tax apparatuses effectively propped up the central power [Egorov, 1985, pp. 139–141]. The surroundings of this city within a radius of 20 km included fairly large Bulgarian villages that had cemeteries with tombstones on the right bank of the Cheremshan and to the southwest of Bilyar [Khalikov, 1994, p. 85].

The collection of monuments discovered during the excavations of 1994–1998 and the annual collection of materials included household items, craft and trade items, and weaponry. The urban character of the settlement's culture is clear from the presence of expensive prestigious items.

Unglazed cookware demonstrates that their pottery traditions were continued from the pre-Mongol period. Traditional plaster and ceramic foodware spun on a wheel generally amounts to 54.4% of all known samples. The most representative is ceramic, which is characteristic of the Rodanovo culture, who inhabited the Cis-Kama Region in the 13–14th centuries (the 18th group according to T. Khlebnikova). A significant number of plaster ceramics of the 'Juketau' type were also found.

A group of monuments from the Golden Horde period and the time of the Kazan Khanate including the Balynguz Archaeolog-

ical Site, ancient settlements, a cemetery and mausoleums, is located opposite Bilyar of the Golden Horde on the right bank of the Maly Cheremshan River [Arxeologicheskie pamyatniki, 1990, pp. 77–79, no. 719–724].

The ancient town of Balunguzskoe is located on the high bank. It is surrounded by a line of ditches and ramparts along the entire perimeter, although it still produces an impression of incompleteness in many areas (low ramparts, ditches with bridges), and in the southern part there are cemeteries from the 14–15th centuries distorted by mausoleums. The cultural layer of the ancient town was thin and was poorly saturated with findings.

In the latter half of the 14th–the first half of the 15th centuries, the most significant settlement in the area was the Balynguzskoe (Toretskoe) III ancient settlement. This monument occupies the flat right bank of the Toretsky spring and the right tributary of the Maly Cheremshan River, and is located on the southeast slope of the hill on the floodplain terrace.

Excavations have revealed inhabited, economic, production, and burial objects and buildings here, along with a rich collection of archaeological, osteological, anthropological and numismatic materials. The workshops of metallurgists, blacksmiths, locksmiths, jewelers and potters have all been studied from this area [Valiulina, 2004, no. 12 (1213), pp. 157–191].

Metal products vividly reflect the high level of the settlement's craft culture and characterise it as an urban-type craft settlement.

Another important function of the urban centre is international trade, which can also be easily observed in the discovered materials, including parts of weights, lead seals, imported expensive cookware (porcelain, glazed, stamped), glass products, amber and coins. Expensive prestigious items reflect an 'urban culture' or lifestyle which, in comparison with the rural style, bore special features in its architecture and dwelling design. Single findings of mosaic tiles made of composite white frit material with turquoise and cobalt glaze have been

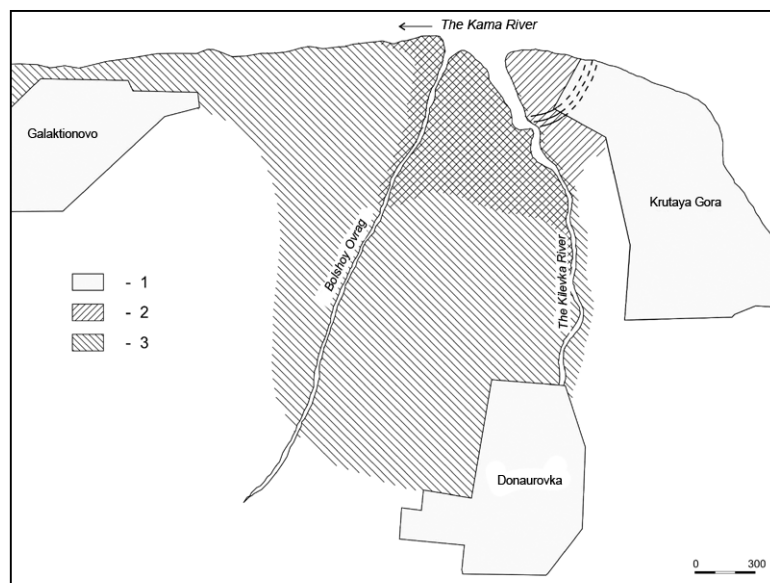

found every year during excavations. However, over 150 of them were discovered in one of the buildings. It is obvious that its interior and sufa were decorated with a poly-chrome mosaic.

Agriculture undoubtedly played a huge role in the settlement's life, which is evidenced by multiple discoveries, both archaeological (sickles, scythes, coulter, millstone, parts of harnesses, shackles, etc. [Mardanshina, 2004, pp. 122–132], and osteological [Asylgaraeva, 2001, pp. 79–83]. Excavations have provided scientists with exemplary materials that provide evidence of hunting, fishing and crafts.

A large collection of coins was discovered in the ancient settlement minted during the first quarter of the 15th century. The most ancient is the coin of Vasily the Blind.

Therefore, the monument may be dated to the latter half or the end of the 14th century—the first half of the 15th century, and may be considered transitional from the Golden Horde period to the Kazan Khanate.

The populated localities we have examined reflect the continuous nature of the colonisation of the area of the Bilyar Archaeological Site from the pre-Mongol period to the period of the Kazan Khanate. Even with the fall of the state's pre-Mongol capital and main centre of the micro-region, life in its surrounding areas

Plan of the ancient town of Juketau. Territories: 1—of present-day villages, 2—of the Golden Horde city, 3—the Bulgarian city

did not stop. Indeed, its economic and cultural potential was in demand and actively used by the population in the 13–15th centuries.

Juketau

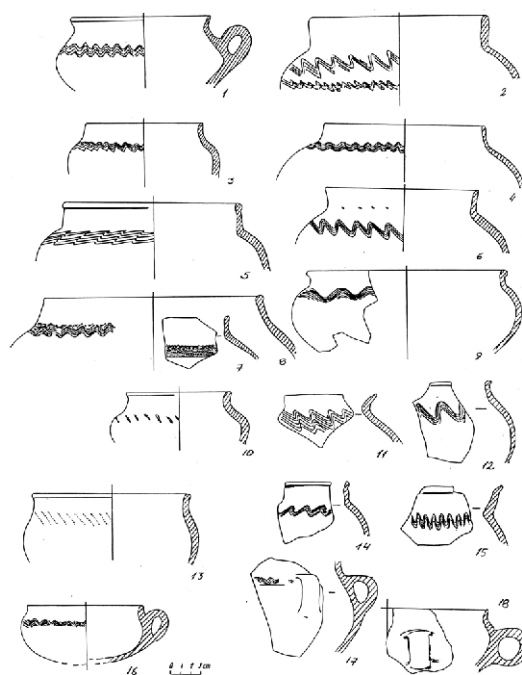

Nail Nabiullin, Fayaz Khuzin

One of few Bulgarian cities located in the Trans-Kama Region that did not cease to exist after 1236 is the historically well-known and reliably localized Juketau, the archaeological remains of which are situated on the left bank of the Kama River at the western edge of the present-day city of Chistopol, the Republic of Tatarstan.

In the mid 13th century, the city was conquered and destroyed. In a number of areas of the ancient town and the 'Western posad' (the Donaurovskoe II ancient settlement) located on the opposite bank of the Kilevka River, the pre-Mongol layer is overlapped with a small dark layer of burnt wood, crushed, decomposed coal and calcined sand. It cannot be excluded from theory that fragments of human remnants discovered in the arable layer and in the filling of one of the household's holes on the ancient settlement's territory are connected to the historical events of 1236. In the stratigraphical sense, the borderline of the carbonic layer be-

Archaeological materials from the
Donauvskoe II ancient settlement.
Excavations by N. Nabiullin

'Juketau' ceramics from excavations

tween the pre-Mongol and Golden Horde layers, its spread throughout a significant territory of the complex, and the discovery of rare but weighty materials such as 'notched' arrowheads, allow us to treat it as the archaeological traces of the Mongol conquest of Juketau [Khlebnikova, 1975, pp. 234–251].

In the wake of military acts it was impossible to avoid their economic consequences: the population started moving to safer northern regions, and connections between the city and neighbouring districts were broken. However, the city's significant potential in the preceding period and the total absence of large rival-cities nearby led to a certain influx and concentration of the population in Juketau and to the revitalisation of its economy.

Throughout the examinations of Juketau's fortified area, researchers noticed a weakness in the Golden Horde layer and a plainness of discoveries of that time [ibid]. It is typical that the ancient town's fortifications functioned only during pre-Mongol period [Nabiullin, 1998, pp. 219–223]. The absence of the Golden

Horde layer in the town can be explained by the fact that its territory was not really beneficial for economic activities. It was a high area far from water with its ground saturated by small stones, etc.

Lands on the opposite side of the Kilevka River (the archaeological Donauvskoe II ancient settlement) were more convenient for the population's activities. Their development was begun during the initial stage of the pre-Mongol period (during that period it was the historical 'Western posad' of the city), and the absence of sterile layers between them points to the continuous nature of their accumulation.

The set of unglazed ceramics from this layer is typical for the Golden Horde. Apart from the quantitative and qualitative changes that happened within pottery groups of a large chronological scale like group I ('common-Bulgarian') and group XIII ('Juketau') [Khlebnikova, 1984; Vasilieva, 1993; Kokorina, 2002], entire groups typical of the former epoch ceased to exist, while new groups began to appear. The increase of dishware produced according to

mixed traditions can be observed ('common-Bulgarian' forms and ornament with a coarse-sand and medium-sand paste and polished surface, the loss of the tilt in the multiple-row 'Juketau' wave, etc.). Imported 'stamp' ceramics and local copies of it appeared, and the glazed ceramics of composite white frit metal are mostly dated to the Golden Horde period.

Fragments of cast-iron cookware, bronze plate bracelets, mirrors, glazed crockery of composite white frit metal, buttons and whorls, and certain types of iron arrowheads were found in the layer dated from that period as well [Nabiullin, 2000, pic. 3]. Moreover, a number of redeposited and lifted items, as well as those found inside the layer, would be better to date to the 13–14th centuries. Some samples of keys and lockers were also among them.

Coin findings are considered to belong to a large diapason from the 1240s to the 1380s. Several treasures of silver coins totaling 600 units were also discovered [Fedorov-Davydov, 1963, IV, pp. 165–221, no. 57, 58, 58a].

Juketau of the Golden Horde grew southward and westward by widening the territory of the former 'Western posad', which then became the main and immediate part of the 'open-type' city. At the end of the 14th century, its size reached 150 hectares. A number of objects of residential, general economic and craft-production purposes are studied here. The cemetery continued to stretch southwards during the Golden Horde period [Khlebnikova, 1975, p. 258, 249]. Researchers of the 19th century were already noticing gravestones near the village of Donaurovka, and according to locals, they repeatedly found human skulls here. In this respect, we should pay attention to the somewhat uncertain messages of 19th century researchers about gravestones 'opposite the ancient town', and possible burials on the cape of this ancient settlement [Khuzin, Nabiullin, 1999, p. 97]. The 'Zhukotino headstone', known in the 19th century but now lost [Fakhrutdinov,

Golden bracelets from the Juketau treasure

1975, no. 1081], is also a remnant of Juketau's cemetery of the Golden Horde period. Therefore, the Juketau of the Golden Horde lost its perceptible boundaries by 'spreading out' into the terrace, especially along the Kama River, for several kilometers.

It is noteworthy that the remains of the Golden Horde's Juketau are an ancient settlement in the archaeological sense, in which there are traces of large craft industries, trade equipment, coins, rich treasures, and 'city' ornaments, as well as items of remote import and items from foreign cultures [Nabiullin, 2001, pp. 53–74].

Juketau was one of the largest craft centres of the area beyond the Kama River. We can trace a notable concentration of discovered factory buildings from the iron and non-ferrous metal industries, as well as the metal-forming industry, as well as obvious indicators of production, including raw materials and billets, slag and iron balls, spoilage and production waste. The cultural layer of Juketau's unfortified area is generally saturated with traces of industrial activities, especially slag and small fragments of brick. In the general set of cultural remains, tools and objects of artisans labour are widely represented (puncheons, chisels, an anvil; crucibles, moulds, etc.). The remains of pottery furnaces are recorded at a significant distance from the former pre-Mongol territory of the city (closer to the present-day village of Galaktionovo) [Khuzin, 1994, p. 141; Khuzin, Nabiullin, 1999, pp. 90–113; Nabiullin, 1999, pp. 101–126]. There is also a wide range of un-

glazed ceramics, while the production of glazed crockery and glassmaking, much the opposite, did not gain development, which can probably be explained by the lack of these traditions in the former period of the city's history and the Bilyar's monopoly.

In any event, Juketau's citizens were involved in farming and cattle-breeding; hunting played an insignificant role in the economy, while fishing was also important.

Among the ceramics, the traditional dishware of the 'Juketau style', which on average represents about half of the monument's entire ceramic discoveries, continued to occupy a special place. In the pre-Mongol period, the existence of a special group of dishware was in many ways related to the authenticity of the ethnic groups that produced it. In the Golden Horde period, examples of ceramics bear a craft/production element.

Juketau was not simply just one of the largest centres of local, regional and interstate trade. This city also controlled the neighbouring bridges across the Kama. In general, this must have been one of the most significant centres of the Kama trade route. When Volga Bulgaria was annexed to Ulus of Jochi, many former international connection routes of Juketau became de facto interstate roads. However, we should not exaggerate Juketau's role and significance state-wide and on an international scale (the city did not mint coins, etc.). As early as in the latter half of the 14th century this is recorded in foreign sources, including the Russian chronicles, the Catalan Atlas and the maps of the Pizzigani brothers (*Sacetim*, *Sachatim*).

The strengthening of centrifugal tendencies and 'separatism' is related to the weakening of Ulus of Jochi in the latter half of the 14th century. As we can assume, in the second half of the 14th century there was a range of lands/'principalities' distinguished here. The degree of their dependency varied depending on the power of one Golden Horde khan or another, and the capabilities of the current governor. The lands that might have been the second most significant kingdom after Bulgar appeared to be 'the principality of Zhukotino', known from the Russian chronicles. The chronicles of the second half of the 14th–the beginning of the 15th century mention *the city*

Plan of Kazan. The spread of the medieval city's cultural layers

of Zhukotin (*Zhyukotin*, *Zhyukonin*, *Zhukontin*, *Zhikotin*, *Zhukon*, *Zhyukomen*), its citizens ('the Zhukotins', 'the Zhukotnits') and 'Zhukotino' 'princes'. The gradual decline and desolation of this large city happened due to deeper reasons, the first of which was its economic characteristics. It is obvious that the well-known, general historical events and phenomena of this time, including changes in trade routes, the redistribution of markets, the migration to the Cis-Kama Region, etc., gradually took a toll on Jekatau. Buried treasures which were unique 'indicators of the population's anxiety' seem quite logical in such an uneasy and unstable environment. Among them, the Juketau jewelry treasure containing coins (golden dinars of India's Patan sultans minted in 1340/41) found in 1924 is especially famous [Smolin, 1925; Nabiullin, 2006, pp. 31–36]. This rich treasure, which contained golden bracelets, a 'brooch', a 'case for a talisman', as well as pearl jewelry, was unfortunately stolen, so further full-scale scientific study is impossible.

The heavy distortion of Juketau's upper archaeological stratas and poor development in the narrow chronology of the late and post-Golden Horde antiquities makes it difficult to determine the end date in the city's lifespan. Based on the most recent numismatic discoveries, it is most likely that it falls somewhere in the end of the 14–the beginning of the 15th century.

We should pay special attention to the localisation of medieval monuments on the territory and surrounding areas of the present-day town of Chistopol. Medieval materials were found there in the central part of the modern urban area. The assumed widening of the posad's territory southwards during the Golden Horde period is observable in the Epigraphic inscriptions of the first third of the 14th century on the contemporary Islamic cemetery of the city located upwards on the river. It is noteworthy that according to the content of several published [Khakimzyanov, 1987] and newly discovered monuments, members of the aristocracy were buried here.

Kazan in the Golden Horde era

Airat Sitdikov, Fayaz Khuzin

The epoch of Ulus of Jochi is an important stage in the development of Kazan and its further history. At the time of the conquest and destruction of Volga Bulgaria's largest cities by the Mongols, Kazan was most likely left untouched. No archaeological facts evidencing the city's collapse in 1236 have ever been found.

However, scientists are inclined to relate the arrowheads belonging to the collection of findings discovered after the Kazan Kremlin was excavated that started appearing in Eastern Europe during the period of Mongol conquests, as well as the charred ruins in the Golden Horde layers to Mengu-Timur's campaign against Volga Bulgaria [Drevnyaya Kazan', 1996, p. 324].

Circular pottery. 12–14th centuries. Kazan

When Volga Bulgaria and the Russian principalities were united in the common administrative and political system of Ulus of Jochi, the role of Kazan as a near-border fortress was lost. However, it did not cease to be the area's administrative centre, and continued to control settlements in the basin of the Kazanka River. The influx of populations from southern regions that continued throughout this period was a serious factor in the strengthening of this region. A new turning point in the region's history became the formation of the migrant feudal nobility. This is evidenced by the headstones found on the territory of the ancient town of Kabanskoe. Kazan's economic significance in the region gradually increased, and its role in the political life of the Golden Horde's Bulgarian Ulus was consolidated.

By the end of the Golden Horde period, Kazan turned from a marginal town into one of the most noticeable economic and political centres of the Middle Volga Region [Khuzin, Sitdikov, 2005, pp. 87–94]. The city developed dynamically and gradually expanded southwards along the ridge of Kremlin hill. By the mid-15th century, the city's unfortified posad reached its southern edge. A craft posad was formed in the area of the Virgin Monastery. This place is known in Piscovaja knigas as an 'Old ancient town' ('Staroe gorodishche'), and

unfortunately the remains of its assumed fortifications have not yet been discovered. Materials from the Golden Horde period are sporadically discovered in the process of security and rescue works that have recently been being carried out on the city's streets, and even on the left bank of the Bulak River.

During this period, craft production also penetrated into the fortified part of the city, which is evidenced by the melted refractories found in the Tezitsky ditch traditionally associated with high-temperature production.

The fortifications of the Kazan fortress on Kremlin hill were maintained throughout the entire Golden Horde period in the same scale as during pre-Mongol times. However, by the first half of the 15th century they started to fall apart because they had not been repaired for a very long time. On the southern side, the ditch was gradually filled with earth, construction and household debris.

Residential and household constructions on the fortified territory dating to the latter half of the 13th century were arranged along the central street without any definitive system. Due to the influx of new populations, building within the fortress became more intense, which thus predetermined the formation of more regulated building in the future and the creation of new streets.

By the end of this period, an internal layout appeared in the Kazan fortress that existed with its main features up till the end of the 17th century [ibid]. Apart from the central stone passage, two more streets paved with wood can also be dated to the Golden Horde period. One of them, just as before, led from the southern gates to the descent in the northeastern edge of the fortress. Another street laid perpendicular to the central one and led from the fortress' western wall to the northwestern edge of the modern building of the Annunciation Cathedral. All three streets crossed near the southern gates, which created a small square in this part of the city.

The revival of stone buildings after the pre-Mongol period is dated to the end of the 14–the beginning of the 15th century, as we may judge by the extant data. Fragments of glazed faced tile coloured blue, turquoise and ultramarine are often found in the Golden Horde layer. They are associated with the ex-

ternal polychrome facing of stone buildings. Such constructions are known in many Golden Horde cities, and similar buildings were apparently erected in Kazan as well.

The city was inhabited by a mixed population in the social and ethnic senses [ibid]. The bulk of material from the Golden Horde layer is different from the discoveries of the preceding time. Ceramic cookware is represented here by fragments of vessels that had their closest analogues in the materials of the Lower and Middle Volga cities of Ulus of Jochi. The roots of this dishware can be traced to the high-tech, pre-Mongol and Bulgarian Middle Asian pottery. The presence of migrants from neighbouring Russian principalities in Kazan is proven by the special white-clay cookware that was characteristic of North-Eastern Rus', as well as separate findings of cross and icon-pendants. Ceramic material also evidences the local Volga Region Finnish population living among Kazan's residents.

The general historical processes of this period had a mostly favourable influence on the city's development. The small Bulgarian settlement of the pre-Mongol period gradually grew, turning into a significant political and economic centre of the Middle Volga Region by the end of the 14th century. The weakening of Bulgar city, especially after the events of 1361, led to the consolidation of Kazan as a fairly large city and its recognition as a political centre. Russian chronicles started mentioning it at the end of the 14th century [Complete Collection of Russian Chronicles, 6, p. 130; 8, p. 72; 10, p. 169; 20, p. 219; 24, p. 167; 28, p. 89].

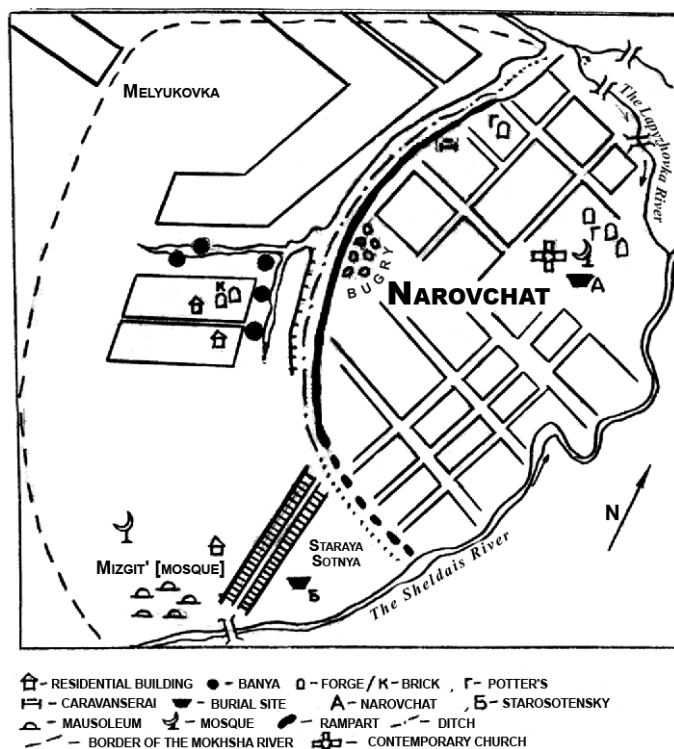

And it was in this period that Kazan started to play a more intensive role among other Bulgar-Tatar cities of the Middle Volga Area. It became a new centre on the former outskirts of Volga Bulgaria. This is proven by the coins minted at the turn of the 14–15th centuries on behalf of Ghiyas al-Din with the indication of the place as 'Bulgar' or 'Bulgar al-Jadid' (New Bulgar) [Muhamadiev, 2005; 1999, p. 253].

The consolidation of Kazan's role as a trade centre with international connections found its reflection in Western European maps of the first half of the 14–15th centuries. Many of them indicate the city of *Castrum* (Sazla-

Plan of Mokhsha (Nurijan)
(according to G. Belorybkin)

ta, Castarina) or 'Fortress' to the north of the Volga and Kama inter-fluve, on the site of modern Kazan [Drevnyaya Kazan', 1996, p. 324; Khafizov, 2000]. The development of international trade is proven by the archaeological materials, including glazed crockery with polychrome painting imported from the craft centres of the Lower Volga Region, the Caucasus and Middle Asia, fragments of celadon bowls from China, and separate discoveries and treasures of Jochid coins from the 'Golden Horde' layer of the Kremlin.

The location of Kazan on one of the most crucial transit trade ways on the Volga River undoubtedly contributed to its further development. In the Golden Horde period, it transformed from a small near-border fortress on Volga Bulgaria's outskirts, having mainly military/trade functions, into a fairly large regional centre. By the

time Ulugh Muhammad and his sons arrived, it might have already been in control of other Bulgarian principalities. The historical circumstances undoubtedly made the city's transition into the Kazan Khanate's capital inevitable.

§ 4. The Ulus of Mokhsha

Gennady Belorybkin

At the turn of the 13–14th centuries, Mukhsha Ulus was formed within the Golden Horde on the border with Rus'. The Russian chronicles called it the *Naruchad Horde*. It was located in the Moksha River midstream, at the border of present-day Penza Oblast and the Mordovian Republic. The ulus' capital was the city of Nurijan (Naruchad), which was located on the territory of present-day Narovchat village, in which traces of Narovchat ancient town were discovered. The latter was located between the Sheldais and Lapyzhovka Rivers and occupied an area of roughly 250 hectares.

Mokhsha city was discovered in the 1920s by A. Krotkov and later studied by A. Alikhova in the 1960s, and then in the 1990s by Yu. Zele-

neev and G. Belorybkin [Krotkov, 1928; 1938; Alikhova, 1948; 1959; 1969; 1973; 1976; Poleskikh, 1970; 1977; Zeleneev, 1991; Belorybkin, 1995; 2003; Belorybkin et al., 1999; Belousov, 1995]. Following the examination of the ancient town and the neighbouring monuments from the 12–14th centuries, scientists managed to reveal the main landmarks in the history of the city and Mukhsha Ulus.

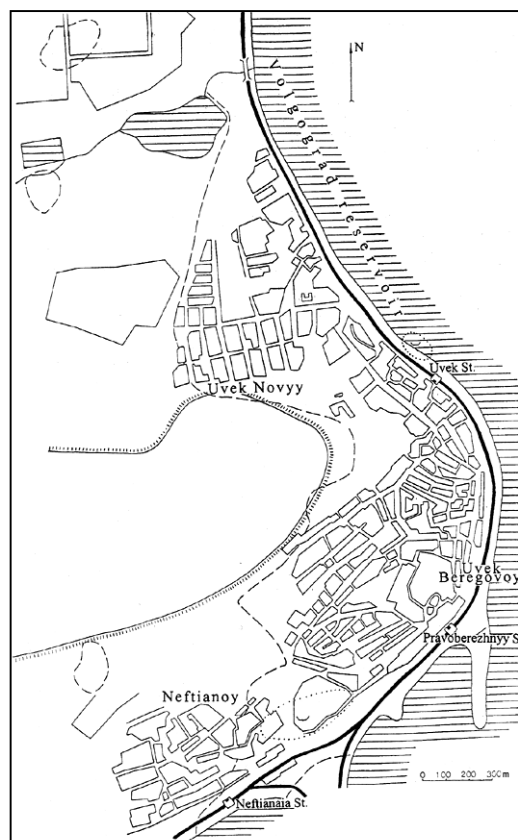

The city was probably built in the 11–12th centuries and partly destroyed during Batu's raids against Rus' in the 1230s–40s. A part of the population was killed, some people moved away, and others became part of the Mongol army [Complete Collection of Russian Chronicles, 10, p. 211].

of khans and emirs Tokhta, Öz Beg, Kildi Beg, Tagai, and Bulat-Timur are found on their faces [Belousov, 1995; Belousov, Golubev, 1998]. The coins are also evidence of extensive contacts between Ulus Mukhsha and other regions of the Golden Horde. Multiple coins from other cities were found in Mukhsha, while Mukhsha coinage has been discovered in other cities as well.

By the 1330s–50s, Mukhsha reached the apogee of its development. The ulus' territory stretched out in the east to the Sura River, in the west to the Tsna River, in the north to the basin of the Tesha River, and in the south to the Khoper. This is evidenced both by the products of Nuriyan (Mukhsha) city, and by the coin treasures found throughout the area [Polesskiikh, 1970]. When the 'Great Troubles' began in the Golden Horde, Mukhsha found itself in the centre of military and political opposition.

In 1361 the city was conquered by Tagai. In 1365 he undertook a successful campaign against the Ryazan Principality, but was defeated by Russian troops on his way back near Shishovsky forest and had to escape. He was also forced to leave Ulus Mukhsha.

In 1367 the city fell under Bulat-Timur's control, but not for long, as Mukhsha's ruling elite had decided to enter into an alliance with Ryazan. The loss of traditional connections with southern and eastern cities and states meant that coins stopped entering into Mukhsha because of the battles being fought within Ulus of Jochi, which contributed to an orientation towards the Russian lands. But Mukhsha did not manage to stay separate from the turmoil in Ulus of Jochi, either. Undoubtedly, the city had to suffer through difficult times: workshops and buildings fell into disrepair, and

Plan of the Uvek archaeological site

people left their native homes and departed to safer lands, mostly to the north.

Aksak Timur made the final blow to Mukhsha's existence. In 1395, while chasing after Tokhtamysh, he destroyed the city of 'Mashkav' [Safargaliev, 1960], causing the whole ulus to collapse. The influential feudal lords gradually started to leave Ulus of Mukhsha (the Naruchad Horde), and enrolled into the service of Moscow princes.

§ 5. Ukek and its surroundings

Leonard Nedashkovsky

The area of Ukek city (which was located in the central part of present-day Saratov Oblast) occupied an important strategic position in the Volga Region between the Bulgarian cities in the north and the Lower Volga agglomeration in the south.

The ruins of the Golden Horde city of Ukek (the ancient town of Uvek) are located on the right bank of the Volga, in the southern suburb of Zavodskoy district of present-day Saratov, near the villages of Uvek and Neftyanoy. Today, the ancient town is

Dirham of Tokhta Khan. Reverse side
with an inscription: 'Sultan/ supreme Gias /
Tokhtogu (the line is written with an Uighur script) /
the Just, let his life be long'; reverse side:
'There is no God except for / of Allah,
Muhammad Rasul / of God. Coinage / of Ukek'.
Circa 706–707 AH (1306–1308)

almost completely covered with construction.

In the east, Ukek was bordered by the Volga, in the west by Mount Kalancha (135 m high), and in the north by the Uvekovka (Uvesha) River. The ancient town of Uvekskoe had a ditch and an earth rampart as its fortifications, which extended from Kalancha to the Volga. In the south, vast cemeteries with mausoleums and stone tombs were located adjacent to the city.

The ancient town of Uvekskoe measures over 3.3 km from north to south, and almost 1.4 km from west to east. Today the ancient town's area is over 205 hectares, but it has been being washed out by the Volga for centuries, thus Ukek's size was much larger during the existence of Ulus of Jochi. Judging by the territory, we may assume that the city's population in its golden age included approximately 910 thousand people, which was a fairly significant number for a medieval city.

Ukek was one of the earliest and largest cities of the Golden Horde (its foundation can be dated to the end of the 1140s–50s). Similar to other Ulus of Jochi cities, it minted coins (between 1266 and 1312) which is an indicator of the city's important political role. Based on the discovery of coins, we may assume that it was most economically active from 1270–1360s. In the last third of the 14th century, the city, just like many other Golden Horde centres, fell into decline caused by decades of internecine wars and the weakening of the khan's power. The link between the city's collapse and its destruction by Tamerlane is proven by the written, archaeological and numismatic sources, which

Vessel cover with an inlay and an amiable inscription.
Ukek

evidence that Ukek as a city ceased to exist at the very end of the 14th century.

The proportion of dirhams from 1266–1291 for the ancient town of Uvek amounts to 10.6%, which exceeds the corresponding indicators of other cities of Ulus of Jochi by several times. The proportion of Tokhta silver coins is also extremely high at 19.2% of all discovered dirhams. The proportion of Öz Beg dirhams in the ancient town amounts to 25.2%, while Janibek silver coins are found in a smaller number in Ukek than in other large cities of Ulus Jochi (25.8%). There are 25 (16.6%) dirham samples dated from the time of internecine feuds at the end of the 1350s–the beginning of the 1380s. Almost all of them were minted on behalf of the khans reigning in a narrow chronological period between 1357 and 1367. Dirhams from the end of the 1360s–70s are only represented

by a single specimen (Kaganbek, 777AH) in the ancient town of Uvek, which points to a decline in silver coin circulation in Ukek during this period. There are references to only 3 Tokhtamysh silver coins dated from 785–788 AH. This allows us to speak of a final decline in dirham circulation in Ukek at the end of the 1380s–90s.

The active circulation of pulis began in Ukek only during the reign of Öz Beg Khan (17.3%), and the majority of copper and silver coin discoveries were from Janibek's rule (54.7%). The proportion of copper coins from 1357–1368 in Ukek amounts to 27.4%.

Significant contributions to the study of this Golden Horde city were made by H. Fraehn, G. Sablukov, P. Ponomarev, A. Krotkov, B. Zaykovsky and F. Ballod. Archaeological excavations of the ancient town of Uvek were repeatedly carried out in the 1890s—the first quarter of the 20th century. The materials of the excavations from 1913 and 1919 are the most famous, and are published in great detail. During those two research periods, the ruins of a brick mausoleum with nine aristocratic burials in it, a furnace for baking the tiles used to build the mausoleum, as well as neighbouring constructions and crypts were all excavated. Starting in 1993, Ukek and its surroundings have been examined annually by a team from Kazan State University led by L. Nedashkovsky

A whole range of settlements and burial sites—both from the settled and nomadic population—were discovered in Ukek's surroundings. The suburbs of Golden Horde Ukek were formed back in the last quarter of the 13—the beginning of the 14th centuries and existed until the city's collapse at the end of the 14th century. The settled population prevailed over the nomads during the time in this area. The nomadic world dominated on the Volga's left bank, where the domain of the Golden Horde's khans was situated and where, judging by the data from written sources, their main camps nomadised. Traditions of sedentism were instead stronger on the right bank. Nomad burial sites were also often arranged close to settlements, which is indicative of an interpenetration and symbiosis of the nomadic and settled lifestyles in Ukek's surroundings. However, the inventory of items from nomadic burials on the terri-

Mirrors produced by the Golden Horde. Bronze.
Ukek. 13–14th centuries.

tory under consideration is markedly different from other settlements, which is undoubtedly conditioned by the different economic systems: nomadic cattle-breeding on the one hand, and settled farming and crafts on the other.

A significant part (possibly, the majority) of the population professed Islam by the mid-14th century: over half of all burials researchers have access to were carried out in accordance with Islamic customs. This can be judged by the multiple discoveries of crosses, stone and bronze icons, and details of chandeliers (corona lucis) from Orthodox Christianity, which penetrated in from Rus', while Catholicism also made its appearance from Western Europe. The Mongol elite of Ukek who remained in power at least until the third decade of the 14th century adhered to their shamanistic beliefs, which can be assumed based on the discoveries of metal figurines of men ('iltahans', which symbolised the human soul and were attached to ongons, or images of Mongolian deities) and from other details of the material culture.

Both in Ukek's surroundings and the city itself, a significant amount of materials of alien (non-Golden Horde) culture can be traced. These mostly include items considered to be from the old-Russian and old-Mordovian monument group. According to burial materials, we may see that apart from the Kipchaks, the Central Asian (Mongolian) population dominated among Ukek's aristocracy.

We should also note that Mordovian materials were present in 6 settlements. However, they are not as numerous as Old Russian items, and were found only on the right bank of the Volga (and only in the northern and central parts of the area of our interest, which were closer to the Morvodian monuments of the 13–14th centuries).

A number of weights and their details were found in the ancient town of Uvek. The fact that trade was highly developed in Uvek is evidenced by 11 coin treasures (10 more treasures were discovered in the city's suburbs), more than 1,450 registered findings of various coins, as well as products of non-local production, which were also found on its territory. The discoveries of coins of the Hulaguids and Old Russian principalities, fragments of amphorae of Trabzon and Trilla origins, glazed ceramics from the Black Sea Region (made using the 'sgraffito' technique), the Middle and Near East (with luster painting and in the 'minai' style), and other items of Near and Middle Eastern, Central Asian and Western European production were discovered in Uvek.

According to the written records of the Golden Horde epoch, Ukek is represented as one of the most ancient genuine Golden Horde cities. The first proven mention of Ukek can be found as early as in the work of famous Venetian traveler Marco Polo, whose father and uncle visited this city in 1262. Western European documents (three of which are dated from the 1320s, 1330s and 1370s–1380s) point out that in the 14th century, one of the support bases for Catholic Franciscan monks was operational in Ukek. The name "Ukek" in Italian transcription is also indicated in Western European geographical maps of the brothers Domenico and Francesco Pizzigani (1367) and Fra Mauro (1459). Ukek is mentioned in the work of Eastern authors from the first third of the 14th century: 'Taqwim al-buldan' ('Survey of the Lands') by Abu al-Fida, and 'Vassaf's History'. Ukek is also noted in the geographical work of al-Umari, the Egyptian sultan's secretary in the first half of the 14th century. In the course of his travels throughout the Golden Horde in 734 (1333/1334), the city was also visited by Ibn Battuta: 'We were going to Ukak, a city of a medium size, but of beautiful architecture, and with abundant wealth and harsh frosts' [Collection of Materials Relating to the History of the Golden Horde, 1884, pp. 302–303].

Al-Qalqashandi (1355–1418), when characterising the Golden Horde's administrative

division, mentioned Ukek as part of the Crimean province with its capital in Solkhat, and also noted that the Egyptian sultan kept up a regular correspondence with the rulers of the Golden Horde, including Ukek's khan. Information he provided apparently refers to the 14th century. Mentions of Ukek can also be found in other sources from the 15–16th centuries ('Iskander's Anonymous', al-Ghaffari, Aali Efendi). Persian works of the first quarter of the 15th century that dealt with Tamerlane's raids against Tokhtamysh mention Ukek among the cities destroyed in 1395. Nizam ad-Din Shami, in particular, wrote that Tamerlane 'followed his foes till the region of Ukek... After devastating the entire region, (the troops) took many trophies' [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 121]. Sharaf ad-Din Ali Yazdi also mentioned '(the lands) of Ukek... with everything which belonged and referred to it' [ibid., p. 185], and this completes the only mentions of Ukek's surroundings in sources.

One important question is identifying the chronology of Golden Horde monuments in the central part of Saratov Oblast, and the further examination of the stages of formation and development of the surroundings of Golden Horde Ukek.

The best material at our disposal for accurate dating is undoubtedly Jochid coins (they are present in the materials of 65 of 159 registered monuments). Based upon the stages of monetary circulation in the Golden Horde, the numismatic materials allow us to confidently distinguish four main stages of the development of Ukek's surroundings. The first stage is from 1266 to 1310 (from the beginning of Mengü-Timur's reign to Tokhta's reform), the second lasted from 1310 to around 1365 (since Tokhta's reform to the beginning of mass cutting of old dirhams and the reduction of the weight of new coins), the third from 1365 to 1380 (the climax of internecine feuds in Ulus of Jochi), and the fourth from 1380 to 1395 (Tokhtamysh's rule).

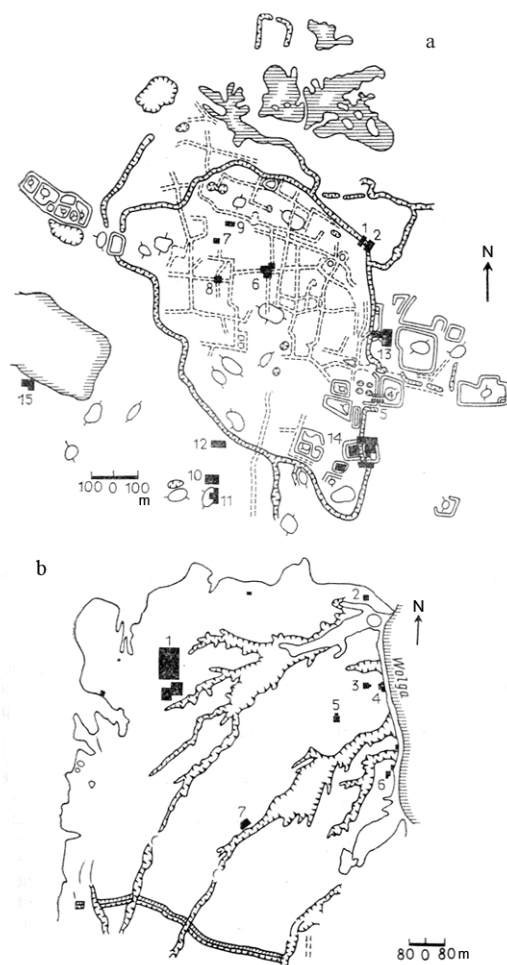

Coins minted in the first period (1266–1310) were found in 14 monuments. The earliest and most precisely dated are from 1273–1287, to the end of Mengü-Timur's reign and

Tuda-Mengü's rule. Nine more monuments contained coins from Tokhta's epoch (1291–1312). Based on this material, we can assume that Golden Horde Ukek's surroundings were formed in the last quarter of the 13–the beginning of the 14th centuries.

Discoveries of coins and treasures from the second stage (1310–1365) contain 41 objects. In addition, coin discoveries from the initial period of the feud (1359–1365) are traced in 23 of them. This means that the period of the golden age of Ukek's surroundings, just like the rise of the Golden Horde in general, fell during the time of Öz Beg's reign (1312–1342) and Janibek's reign (1342–1357), while during the internecine feuds initial stage the emerging decline was not yet as catastrophic as during the third stage. Dirhams from 1342–1365 (only one coin of the feud's period is dated from a later time: 774 AH) constitute 56.6% of all silver coins from Ukek's surroundings, while for the city itself the proportion of coins is only 42.4%.

Coins from the third period (1365–1380) were only found in three monuments apart from the ancient town of Ukek, one in each of them. Coin treasures of the third and first periods have never been discovered. This means that there are reasons to suggest that this was a time characterised by the significant desolation of its territory and by an economic crisis driven by decades of internecine feuding.

And finally, coins and treasures of the fourth stage (1380–1395) were found nine times, three of which were part of larger treasures, and two of which were single discoveries. Apart from the ancient town of Ukek, coins from this period were only discovered in three settlements. We may conclude from this that the economic rise of Tokhtamysh's epoch was not all that significant, though in certain aspects of Ukek it was rather noteworthy, for example, the proportion of puls from this time is higher in the Ukek surroundings than in the ancient town itself, though no dirhams have ever been located outside of treasures. It is notable that the latest Jochid coin discovered in the observed area is dated 797 AH (1395), which is the year when Tamerlane destroyed the Middle Volga cities that marked the decline and fall of not only Ukek, but the areas surrounding it.

Maps of ancient towns of the Ulus of Jochi: a—Parovskoe (Sarai al-Jadid), b—Vodyanskoe (Beljamen) (by G. Fedorov-Davidov)

The geographical arrangement of the monuments of Ukek's surroundings during different stages of their development is also of interest. At the first stage, 6 (42.9%) of 14 monuments dated by coins were arranged on the Volga's left bank. During the second period, monuments on the left bank even outnumbered those found on the right bank, where only 19 (46.3%) of 41 objects from that period were discovered. The situation radically changed during the third and fourth stages (it is logical to consider all of these monuments together because there are only 10 of them). Two objects (20%) were found on the Volga's left bank, and 8 (80%) on the right bank.

It is possible that the quantitative superiority of the left bank monuments over the right bank (where Ukek itself was situated) during the second stage (1312–1365) is related to the city planning policies of the Golden Horde khans. While the khan's power was strong, settlements on the left bank functioned as they stood on the route of the khan's main nomad camp in the latter half of the 13–the mid 14th centuries. When their power weakened and the main camp nomadised only in the lower reaches of the Volga during the third and fourth stages between 1365–1395, life near Ukek continued only on the right bank of the Volga, mainly in the immediate vicinity of Golden Horde Ukek, which was tightly connected to it in an economic sense.

§ 6. The Lower Volga Region and capitals

Iskander Izmaylov, Yuri Zeleneev

The Lower Volga Region was the heart of Ulus of Jochi. This particular region was 'wealthy in tilled areas' (i.e., in settlements.—*I.I., Y.Z.*), according to the words of Ibn Khaldun, an Arabian historian in the latter half of the 14th century [CWRHGH, 1884, p. 378 and there were two medieval metropolises in Ulus of Jochi: arai-al-Maqrus (Sarai Protected by God) and Sarai al-Jadid along with the other great cities of Hajji Tarkhan (near present Astrakhan), Beljamen (Vodyanskoe ancient town), Ukek (near present Saratov), Gulistan (appar-

ently, near present Volgograd), and Saray-Jük (present Saray-Jük village North of Guryev), which, along with dozens of small towns and settlements that surrounded them, formed a densely populated agricultural oasis, stretching along both banks of the Volga down to its lower reaches and also around the Don and Ural rivers. There was a political, economic, and cultural center of the empire here; a place where there was an accumulation of material and human resources mainly at the expense of regular raids on provinces and the development

of world trade. At the end of the 13th century, there had already been a significant rise and the cities prospered, especially the capitals.

After the Mongol conquest, the Lower Volga Region did not become the center of a newly formed state immediately. During the first decade after the return from the campaign in Europe, the winter base of Batu Khan was Bulgar, while the steppes of the Lower Volga Region were a district for the summer nomadic migrations of the Khan's court with his belongings and their herds. In the latter half of the 13th century and in the first half of the 14th century, the main area of summer nomadic migrations was the region bordered by the Lower Volga in the East, by the Lower Don in the West, and by foothills of the Caucasus in the South. The northern point in this region of nomadic migration was observed to be the place of closest convergence between the Volga and Don rivers, relative to one other.

From the beginning of the 1350's, the Lower Volga Region progressively transformed into a political and economic center of the empire. First and foremost was the presence of a sufficient quantity of natural resources for the maintenance of diversified agriculture. This crucial role was apparently played by settling practices that existed there without interruption even until the 8–9th centuries; in the 11–12th centuries, there were several cities with Saqsin as their center, being under the political influence of Volga Bulgaria.

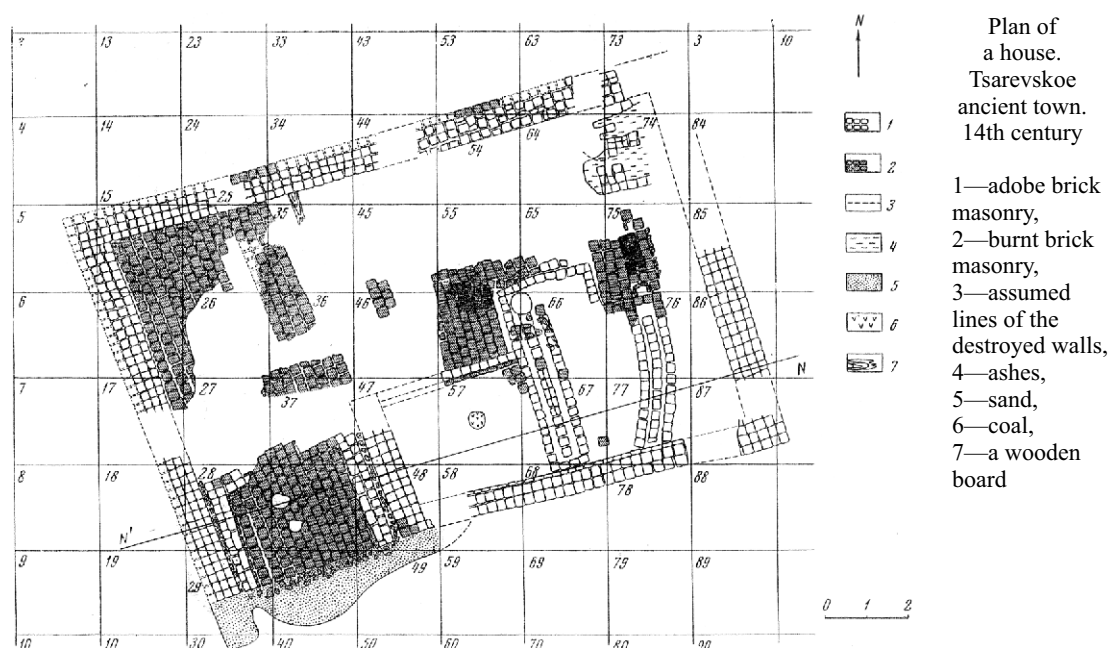

Farming, particularly melon harvesting, became possible with the support of the fertile lands and water resources of the Volga-Akhtuba floodplain. Hot summers and mild winters had already allowed for the cultivation of many vegetable and fruit crops by the Middle Ages.

Trade routes that had passed through the region since antiquity were of great importance for the economic development. The Volga trade route connected the Upper and Middle Volga Regions with fur and bread trading along with the pastoral Lower Volga Region and the markets of Transcaucasia, Iran and Middle Asia. Since the early Middle Ages, this route was used for transporting goods from Northern Europe to Asia and vice versa. A land artery connected Khwarezm and territories further East

with the Lower Volga Region, and through that with the Crimean Peninsula, and eventually with Southern Europe on account of increases in Italian trade activity in the Black Sea Region [Fedorov-Davydov, 1998; Fedorov-Davydov, 2001, p. 7, fig. 2].

Thus, the Lower Volga Region had all the prerequisites for the formation of an economic center. Only administrative resources were needed, without which the process would have been impossible. In addition, it should be noted that the period of the 13–14th centuries was characterised by propitious climate conditions with a heightened atmospheric moisture within the steppes of Eastern Europe. It created further opportunities for rapid economic development in the region [Sergatskov, 2002, p. 72]. Within the conditions of political and economic sustainability in Ulus of Jochi, yeast settlements sprung up in dozens of cities surrounded by a rural areas and lead to a supply of significant riches from various conquests and participation in international trade.

Along the bank of the Akhtuba, a tributary to the Volga, there was indeed such an urban center in the Jochid Empire. Two of the greatest archaeological monuments from the 14th century can be found here: the ancient cities of Selitrennoe and Tsarevskoe, which, and not without reason, were associated with the great metropolitan areas of the Golden Horde. Furthermore, we can find the remnants of the Horde cities there, which, though smaller in size, were possibly great settlements for their time. These are the city-monuments such as the ancient Akhtuba Gorodishche, Hajji-Tarkhan, the ancient city of Krasnoyarsk, and others. Between these settlements there were smaller ones in nearly all convenient places along the bank of the Akhtuba, boasting mansions and houses as well as cemeteries and mausoleums. These included the monumental mausoleums near the village of Lapas in Astrakhan Oblast, which feature the tombs of the most powerful Khans of Ulus of Jochi. It is not by chance that the Golden Horde's cities made deep impressions on both the travelers of the 14th century as well as on contemporary archaeologists in the Lower Volga Region as the boundaries of the settlements are highly conventional.

Today Sarai or Sarai-al-Maqrus, the first capital of the Golden Horde, is located on the left bank of the Akhtuba near the village of Selitrennoe (Astrakhan Oblast). The capital was founded by Batu Khan at the beginning of the 1250's at the Akhtuba's crossing point with the Volga. In any event, the Pope's envoy, William of Rubruck, had already seen 'the city built by Batu on Etilia...' [Puteshestviya, 1957, p. 330] in 1254.

According to Rubruk's description, Sarai and Batu's palace, which was situated on the left bank of the Volga River (or on its tributary), were founded by Batu Khan in 1254, i.e. more than 750 years ago. However, analysis of Rubruk's notes does not allow for precise placement of Sarai's location. Most likely, Sarai became Khan's permanent winter base shortly after its establishment. This apparently took place in the 1270's, evidenced by the advent of minting in the city. The coins of Sarai were first modelled after Bulgar coins of the Mengu-Timur period, thereafter being modelled after the coins of Khwarezm [Fedorov-Davydov, 2003, p. 13].

The transfer of the Khan's base into the Lower Volga Region gave a necessary impetus for the realization of favorable development conditions, which existed in the region. After

30 years, the city grew dramatically and began minting coins which indicate where they were produced—'Sarai' or 'Sarai-al-Maqrus' [Muhamadiev, 1983, p. 13–14]. The city apparently served mostly administrative purposes for some time, but trade eventually developed, primarily to satisfy the demands of its nobility. In the 14th century, however—thanks to the stabilisation of the situation in the Golden Horde—there was a surge in commercial and production activity. The city grew and transformed into a true giant with a central square of about 35 square kilometers [Ballod, 1923a, p. 31; Fedorov-Davydov, 1994, p. 24–27]. According to archaeological data, city blocks stretched over 20 square kilometers [Egorov, 1985, p. 115; Fedorov-Davydov, 1994, p. 26]. In the Middle Ages, Sarai was a densely-populated urban area. Its suburbs, vast gardens, and palaces of the aristocracy merged into a single mass, making a great impression on contemporaries with its massive scale and grandeur. Even a world traveler such as Ibn Battuta, described, rapturously writing that 'Sarai is one of the most beautiful cities, having achieved such extraordinary magnitude on the flat plains. It is overflowing with people, beautiful markets and wide streets. One day we went riding with one of its elders, intending to travel around it and

see how large it is. We lived at one end of it, and having gone out in the morning, drove to the other end only by the afternoon. After completing our midday prayers, we turned back and reached our homes no earlier than sunset. One time we left and passed through the entire city, returning after half a day. The city is a continuous row of houses where there are no empty places or gardens' [CWRHGH, 1884, p. 306].

According to its contemporaries, the city's population was about 75 thousand [Ibid., p. 550]. Not without reason, Sarai was considered the greatest city of Europe—perhaps even the largest city in the East—and could be compared with the likes of Baghdad, Cairo, and Rome of the period. Being an important political center, the city had high living standards. It had a centralized water supply and drainage system while the majority of palaces and public buildings were made of adobe bricks. Excavations show a number of extravagant buildings. One of them was more than 600 square meters and was the center of an entire estate. There was a grand reception hall at the heart of this building, at the front of which there was another large room with a brick floor and swimming pool in the center. Water flowed into and out of the swimming pool through a system of underground canals that were connected to the city's water supply. Behind the swimming pool, there was a brick platform with a canopy or a tent where the lord would have sat. From that room, the doors opened to the inner chambers, where there were living rooms with underground heating, sofas, and servant quarters [Fedorov-Davydov, 1994, p. 60–62]. The Khan had a similar but much larger palace, about whom al-Umari wrote: 'The Khan's place of residence is a great palace, at the top of which there is a golden new moon... The palace is surrounded by walls, towers, and houses, in which his emirs live. This palace is their winter base' [CWRHGH, 1884, p. 241].

Inside the city today, scientists have unearthed entire artisan blocks, the inhabitants of which specialised in their own production in metallurgy, metal-working, pottery, glass-blowing, jewelery and bone carving, etc. All of them created products not only for domestic consumption, but also for exporting [Fedor-

Fragment of a stone with a carved ornamental pattern. Ancient Selitrennoe settlement.

The 14th century.

Excavations by A. Burkhanov

ov-Davydov, 1994, p. 20–27]. Transit trade, however, was even more significant for Sarai's prosperity. The famous trade routes—by which silk, luxury goods and eastern spices arrived in Europe—went straight through Sarai in the 16th century [Fedorov-Davydov, 1998, p. 38–54]. Sarai was a true 'Golden Horde Babylon', in which the Mongols, Kypchaks, Alans, Circassians, Russians, Bulgars, Byzantines, and Italians lived. Each nation had its own district with its own places of worship, cemeteries and, most importantly, markets. On the whole, the main population of the city was generally Muslim and Turkic as in the other Lower Volga Region cities..

In the 14th century, another important economic center of the country was the city, the ruins of which are now located near the village of Tsarev (the Volgogradskaya oblast). In Russian historiography, it was considered—until recently—that the name of this city was Sarai al-Jadid. However, the idea of the existence of two cities in Ulus of Jochi with the name

of 'Sarai' has recently been questioned. Some researchers proposed to call this city 'Gulistan' after one of the great minting centers, the location of which is between Ukek and Sarai. The analysis of numismatic and archaeological data confirmed the claims of written sources concerning the rise of this city at the beginning of the 14th century, during the reign of Öz Beg Khan. It was not by chance that he ordered that he should be buried there [Fedorov-Davydov, 1994, p. 20–24, 27–31]. The city achieved great prosperity during the lifetime of his son, Janibek Khan, when the Khan's court moved there and minting began [Muhamadiev, 1983, p. 15–17].

Long-term excavations began in the middle of the 19th century by A. Tereshchenko and continued through the 1920's and 1930's by F. Ballod, A. Yakubosky, and from the 1960's to 1980's were carried out by V. Egorov, M. Poluboyarinova, T. Guseva, and Y. Zeleneeva [Guseva, 1985; Egorov, 1985, p. 112–114; Fedorov-Davydov, 1994, p. 20–45; 1998a, p. 3–15] were able to research the ancient city in quite a detailed fashion, having discovered the remains of the well-constructed and well-equipped city. The square area of the city within the walls and ditches created in the 1360's to protect the center of the city during a period of troubles, was about 2 square kilometers [Egorov, 1985, p. 113]. The center of the city was a broad square at the crossroads of the main streets, which radially diverged in all directions. Districts of aristocratic mansions and poorer blocks, residential and handicraft buildings, and places of worship were all identified here.

The sou-eastern part of the city is of particular interest, having featured a rather different ground plan. Here the space between streets was occupied by estates consisting of a great house, reservoir and household buildings, which were surrounded by a wall. As a rule, these estates were quite rich, decorated with Kashin majolica tiles with overglaze and underglaze ceramic ornaments, among which the most expressive are floral and arabesque ones. In the city's neighborhoods, especially those in the South and in the East, large-scale suburbs were discovered, featuring great castle-estates (some of them had squares up to 26 thousand

square meters large) around which small farmsteads and dwellings were concentrated. Estates of rich craftsmen and apprentices were discovered here and bone-carved jewelry pottery workshops were also found. In a jeweler's house, a crucible with golden drops, shards of golden plates, wires, half-finished products, bronze matrices, tools, finished items, and a jewelry forge were found. The same workshop likely produced incredible gold and silver vessels with gorgeous ornaments as well as belts and complicated, sophisticated decorations created in the skani and zerni styles. All of the castles had the same design: in the center of a quadrangular space, surrounded by a brick wall, they found the homes of the owners, gardens with a several small reservoirs. There were houses, and within the perimeter of the estate there were residential buildings and the homes of warriors, servants and slaves. The design itself and the rich findings from the castles indicate that they were the residences of the Horde aristocracy. Initially, this estate district was most likely the nucleus of the city.

Poorer districts and commercial trade blocks were gradually formed. The city districts that had narrow side streets and irrigation ditches were built up with small wattle and daub houses. Inside each block there apparently was a large house. All those districts were most likely inhabited by the common people. As in any Eastern city, the issue of water-supply was vitally important there. It was concluded that most of the streets had irrigation ditches that were connected by a network of canals with large, man-made lakes created in the northern outlying districts of the city. They were constructed to supply the city with water and for the struggle with melted water from the syrt, which threatened the city with floods [Fedorov-Davydov, 1998a, p. 10–11]. Characteristically, the city did not have a common fortress wall until the 1360's, showing just how powerful the Horde was. Only after the beginning of the Time of Troubles did a need to strengthen the capital arise. Around the city, there were also a several great Muslim cemeteries with mausoleum-dyurbes.

The initial planning of newly constructed cities has all the features of Mongol tradition.

Cup with a heterochromatic painting and relief under a very thin enamel. Kashin. Sarai. 13–14th centuries (sketch by N. Lisova)

In the second quarter and to the middle of the 14th century, the estates of the wealthy were not separately located along the steppe, but also among urban buildings. This is due to the gradual inclusion of free-standing estates into the reaches of the city as well as to the construction of some estates within the commercial trade portion of the city, which was an obvious distinction from Mongol tradition. For example, such an estate was excavated in the ancient city of Selitrennoe, in which the house had a central hall with a rise, upon which the lord could situate himself during the reception of visitors [Ibid., p. 107].

Mud huts were quite a wide-spread type of dwelling in commercial trade districts of the Golden Horde cities. They are from various periods of the existence of the cities. Huts in the ancient town of Tsarevo vary in size, but they generally share common constructive peculiarities. To the right of or in front of the entry, there was a 'sufa' with a heating system—'kanas,' which were adjacent to the walls of the hut [Zeleneev, 1998, p. 34, pic. 5]. In one case, the remains of a thatched roof were preserved. However, it is not yet possible to

determine the form of the roofs [Ibid., p. 2].

Aside from huts, commercial trade blocks of the Golden Horde cities were built up with above-ground houses. Their foundations were built out of adobe. Occasionally, adobe walls were also erected. In some cases, one can assume the presence of wooden walls, but adobe prevailed as the main building material in any case. The floor in such dwellings was wattle and daub or covered with adobe bricks. The base of the heating system was a furnace of burnt bricks or adobe bricks, from which canals could lead, which were also were built with adobe bricks. The trading quarter of Sarai al-Jadid began to be built up with such constructions from the middle of the 14th century. Houses constructed in this fashion

have been preserved among the people of the Volga-Ural interfluvium to the present day, but without a 'kanas' heating system.

The impression is created that Tsarevskoe survived a most devastating raid during the period of 'Great Troubles'. The traces of destruction were recorded by bones of the dead inhabitants, lying among the ruins [Zeleneev, 1995, p. 11]. In one grave, there were the bones of a 10-year old child, in which an arrowhead was stuck [Zeleneev, 1996, p. 18]. It is characteristic that there were not any adobe or burnt brick buildings within the upper levels of the ancient town of Tsarevskoe, which are dated to the 1360's according to coins of the time. As a rule, the buildings of that time were light, ground-based, wooden constructions that for the most part, have not been preserved well enough for reconstruction.

In the cities of the Lower Volga Region, different types of craftsmanship were developed. Base metal working and jewelry producing were the most developed. Various tools associated with these types of craftsmanship are quite often found in the ancient towns of the Lower Volga Golden Horde. Ladles were found in the

Tsarevskoe and Vodyanskoe ancient towns [Myskov, 2003, p. 8].

Pottery production was highly-developed. Different types of glazed crockery and non-glazed crockery were produced. The remains of potter's complicatedly constructed workshops with forges were uncovered in various Golden Horde ancient towns. In the greater cities (the ancient town of Selitrennoe), entire blocks were dedicated to them. The traditions of ceramic production in the Lower Volga Region cities of the Golden Horde were developed on the bases of East-European traditions of the preceding period (Volga-Bulgar, Alan) and on Middle Asian traditions while they were influenced slightly less by Transcaucasian traditions. Only some types of gray-clay basins and hums bore similarities to Mongol ceramics [Fedorov-Davydov, 2001, p. 200–202].

Like the other cities of Ulus of Jochi, the cities of the Lower Volga Region and its settlements were important trade points that attracted merchants from all over civilized world. In some cases, their locations can be strictly observed to be 40–60 kilometers away from one another other in different directions, i.e., the distance of a day's caravan route. During excavations, china and seladon, Byzantine icons, Italian glass-ware, enameled Syrian-Egyptian glass, Indian golden coins, and Arabian tissues were found. Practically until the end of the 14th century, the cities of the Lower Volga and the Black Sea Regions were the main gates through which a flow of Chinese silk and eastern spices arrived in Europe. Numerous caravans from the heart of Asia not only enriched Ulus of Jochi, but also allowed it to play a role in the exchange of worldly goods and ideas, making it an important part of the medieval Old World [Fedorov-Davydov, 1998, p. 38–59].

The cities of the Volga Region were also great cultural centers, where literature and art were developed and common-colloquial and literary languages were formed. The main

means of communication in the Golden Horde cities and steppe districts of Ulus of Jochi were various dialects of the Kypchak language. A common city language took root based on that language (the Oguz-Kypchack type of the Turkic language) in the Golden Horde. Evidence of this fact is, for example, the notes of 14-century Italian financier, Francesco Pegolotti, who in his trade manual recommended those going to pursue dealings in the Horde to have interpreters who spoke the Cuman (i.e., Kypchak) language [Pegolotti, 1936, p. 21–22]. The Codex Cumanicus dictionary, comprised in the 13–14th centuries in one of the cities of Ulus of Jochi, serves as evidence that the Kypchak language was a unique lingua franca in the cities of the Golden Horde [Radloff, 1887; Radloff, 1884, p. 52–53; Abdullin, 1974, p. 166–185; Nadjip, 1979; Makhmutova, 1982].

Archaeological findings bear witness to the character of this language and its distribution among the various layers of the urban population. An ox scapula from the ancient town of Tsarevskoe deserves special attention, where two faces were painted in Indian ink and contained words written in Kypchak:

Crockery with a heterochromatic painting and relief under a very thin enamel. Sarai. 13–14th centuries (according to N. Bulatov)

'This caricature, I swear by the name of Allah, was made by Ali.. son of Mohammed' [Vainer, Fedorov-Davydov, 1963, p. 245–246; Usmanov, 1963, p. 246]. Turkic verses were also preserved, scratched out on a large jug discovered in Saray-Jük:

'Having deprived me of honor and glory, you took a golden cup from me.

Having filled the cup with wine, you turned it to gold' [Samoylovich, 1913, p. 8].

The literary language of the Golden Horde–Volga Turki was based on this common-city Koine as well as standards of the literary Golden Horde language (and apparently on Bulgarian as well) [Samoilovich, 1927, p. 27; Usmanov, 1979, p. 101–106; Nuriyeva, 2004]. Such works of old-Tatar literature as 'Gulistan bit-Turki' by Sayf Sarai, 'Mukhabbat-name' by al-Khwarezmi, 'Khosrov and Shirin' by Qutb, 'Nakhdj al-faradis' ('The Open Way to Paradise') by Makhmud as-Sarai al-Bulgari, 'Kysas al-anbiya' ('The History of Prophets') by Rabguzi and many other famous pieces, though clearly not extant works of art, were written in this language (see: [Nadjip, 1989; The Medieval Tatar Literature, 1999, p. 63–91; Nuriyeva,

1999]). Distinctively, Mongolian edicts and diplomatic documents in the 13th century and at the beginning of the 14th century were partially recopied or duplicated in the Kipchak language (for instance, the outstanding charter by Öz Beg Khan to Venetian ambassador A.Zeno, written in 1332, was translated from 'Cuman' into Latin [Diplomatarium, 1880, p. 243–244; Grigor'ev, 1981, p. 81–83]. However, from the latter half of the 14th century and to the 16th century, only Turkic (Kipchak and Old Tatar) language was used in an official capacity [Usmanov, 1979, p. 1332 and the next]. Volga Region Turkic functioned as a literary language until the middle of the 19th century for the Tatars of Eastern Europe [Faseevv, 1966; Makhmutova, 1982].

Persian and Arabic—the languages of poetry and public worship—were simultaneously widespread among the intelligentsia and aristocracy. Their penetration was particularly widespread after the adoption of Islam during the reign Öz Beg Khan, when Arabic script began functioning as the main form of writing and Arabic and Persian became the official cultural languages of the Golden Horde. Not only were the translations of Persian poems into Turkic language well-known, but also Persian verses were found on glazed tiles and crockery:

'Oh, my heart! Perceive the world by your own desire.

Look, how people are exposed in it to trial like Noah was during

the 1000 years (of his life)

Look how many gardens and flowers are in the world.

Look how many colossal temples and strongholds have been erected worldwide.

Look how many satins and golden cloth (people) have worn.

And then destroyed them'

[Fedorov-Davidov, 1976, p. 204–205].

From the 13–14th centuries, there were notable writers and scientists who lived in Sarai, writing in Arabic and Persian: Sheikh Sad at-Taftazani, who wrote a number of rhetoric and law books (among them commentaries on 'Matn at-tahlis' by al-Qazwini), Mukhtar ibn Mahmud az-Zahidi (at the end of the 13th century), as well as the famous imam and noble

fakikh Ibn Bazzazi (at the beginning of the 14th century), who created 'al-Fatavi al-Bazzazi' ('The aphorisms of al-Bazzazi'), which were praised by contemporaries and many others [al-Kholi, 1962, p. 27–33].

The population of the Lower Volga Region at the beginning of the Golden Horde period was multi-confessional, which apparently reflected the religious situation of the preceding period. The process of islamisation, which had earlier occurred spontaneously, became more intensive in character after Öz Beg had personally adopted Islam and intended to make it the sole religion of the state. It should be emphasised that during the reign of Öz Beg, immigrants from Khwarezm—for instance shiekh Noman—had the greatest influence within the field of religious life. Missionary conversion of the Golden Horde nomads into Islam was also intensively conducted by the Khwarezmians [Malov, Malyshev, Rakushin, 1998, p. 110–112; Izmaylov, 2002b, p. 38–60]. The wall inscriptions, discovered in the Golden Horde cities, for example, 'Bukhari', 'Khwarezmi (Khwarezmi)' indicate a significant number of immigrants from Middle Asia [Myskov, 2001, p. 25, 39].

In the 14th century, burial structures that could be associated with the Muslim population became increasingly present. These were primarily burial sites with rectangular fences made of adobe. The canons of the Islamic burial ceremony can be observed in most of them. It is not difficult to observe that such burial buildings had a propensity for districts with a settled population, although further away from the Volga-Akhtuba region they were well-known. The most complete of such burials were studied in city cemeteries of the Golden Horde—near the ancient towns of Tsarevskoe and Krasnoyarsk. Such buildings were left by the city's Muslim population, possibly of Middle Asian descent. The variety of tombstones in city and suburb burial grounds points to different levels of islamisation of the population of Ulus of Jochi from the first half to the middle of the 14th century. By all accounts, a majority of the city population at the time was Muslim, but the fact that they were not orthodox allows us to assume that the overlord, 'Hanafi madhab', was quite loyal to some superstitions.

From the end of the 13th century to the beginning of the 14th century, the Volga and Volga-Don steppes were occupied by nomads who left burial mound sites, which several artifacts, for instance mirrors, can be traced back to that period [Zakharikov, 2003, p. 62]. The mound burial sites of that period—dedicated through pagan funeral rituals—were researched in the regions that were adjoined to Akhtuba, for example, the Bakhtyarovsk burial sites [Sitnikov, 2001, p. 43]. It should be noted that even in the latter half of the 13th century, a significant number of them (about 40%), consisted of burials that were quite close to their Muslim counterparts at the burial sites of the Don, Trans-Volga, and the Southern Cis-Ural regions. Obviously, they represent evidence of swift-spreading Islam among the nomads. During the second part of the 14th century, the burial mound sites gradually ceased to exist and were replaced by ground burial sites with burial ceremonies performed in the Muslim ritual.

In summary, it should be emphasised that different ethnocultural traditions were blended into the town-planning and material culture of the Golden Horde cities. This was for many reasons, but, first and foremost, because of the multi-ethnicity of any Golden Horde city. Nevertheless, it is obvious—especially beginning from the boundary of the 13–14th centuries—that the formation process of the united complex of culture in a Horde city was probably driven by language, confessional tradition, and the ethnocultural consolidation happening within it. All of the above influenced the ethnocultural processes in the entire state.

The Golden Horde civilisation is a bright page within the history of world culture. A magnificent imperial style was created in Ulus of Jochi. It absorbed the traditions of many peoples—not in a chaotic accumulation of different elements, but in a system of organically combined phenomena covered with powerfully sounding styles and movements that were different at various periods in the existence of the state [Vasilyev, Gorelik, Klyashtorny, 1993; Fedorov-Davydov, 1976]. Except for the syncretical background of the pre-Mongol cultures—some of which had a

developed metaphorical language, based on Islamic (Khwarezmian, Bulgarian) and Eurasian nomadic (the Kipchaks, Kimaks) traditions—one cannot help but note the Middle Asian and Far-Eastern elements of material and artistic culture in the traditions of Ulus of Jochi [Gorelik, Kramovsky, 1989, Kramovsky, 1989; Kramovsky, 1999]. The imperial culture of the Golden Horde was formed as a result of creative activity of practically all nations that were a part of the state and conquerors brought their development to the West. The brightest Chinggisid traditions manifested within a cultural circle of socially prestigious goods that were an accessory and feature of the military and service class nobility—from suit cut belts to breastplates, from weapons to horse equipment, as well as other accessories. Of course, this culture was not completely unified, because it was initially strictly socially oriented. However, at the beginning of the 14th century, a new urban, Eastern, medieval culture began developing in the cities in Ulus of Jochi, primarily in the Volga Region. It was a 'culture of glazed bowls and mosaic panels on the mosques of the Arabian astrologers, of Persian verses and Muslim spiritual learning, of interpreters of the Quran, mathematicians and astronomers, and of exquis-

sitely subtle ornaments and calligraphy' [Fedorov-Davydov, 1976, p. 118]. The specularity of fine and applied arts in the Golden Horde were ornamentation, polychrome in the usage of color spectrum, the presence of arabesque motifs, and so on [Ibid, p. 120–188].

In researching the historic topographic situation of the ancient settlement of Selitrennoe, archaeologists concluded that the greatest damage was caused to the city during the period of 'Great Troubles', likely in 1367 [Rudakov, 2002, p. 56]. Life in the greatest cities of the Lower Volga Region continued even at the end of the 14th and 15th centuries, i.e. at the period of Toktamys (the ancient town of Tsarevskoe) and after it (in the Selitrennoe, Vodyanskoe ancient towns) [Myskov, 2003, p. 2]. One may say that in spite of the decay in city-life, which started from the time of 'Great Troubles', the existence of the Lower Volga Region's cities continued for no less than one century. However, the devastation brought upon them by Timur, along with a number of other cataclysms, (including pestilences), led to the weakening of economic and political bonds inside the state, led to its weakening, and later on to the demise of settled city-life in the Lower Volga Region.

§ 7. Hajji-Tarkhan and its districts during the 13–14th centuries

Vyacheslav Plakhov

In the delta of the Itil (Volga) river, there was a well-known Hajji Tarkhan city in the 14th century. It was situated on one of the parts of ancient caravan crossings.

From the 13th to 14th centuries, Hajji Tarkhan was a staging post of international trade and an administrative center that managed the whole district. From the North, sables, foxes, ermines, linen, leather, honey and butter, metals, etc., were delivered through the city by the Volga Trade Route into Iran. A portion of those goods from Hajji Tarkhan went to the West and East. From the East and the South, silk, cotton, pearls, spices, weapons and armor were sent to the city. Venetian G. Barbaro wrote that silk and spices were sent from the East through

Hajji Tarkhan to Azak, where the Italian trading colony was situated [Barbaro and Contarini, 1971, p. 157]. Clothes, weapons, metals, amber, wine, and grain arrived from the West. The Hajji Tarkhan city itself exported fish and fish glue as well as animal products and large amounts of salt, and was a place of slave-trade [Travels, 1957, p. 90; Zaitsev, 2004, p. 21]. The goods, delivered from ports of the East coast of the Caspian Sea and Iran, were sent on ships up the Itil [Sharapova, 1975, s. 74–78].

There are many legends and works with varying opinions regarding the rise of the city [Zaitsev, 2004, p. 7–17]. However, the opinions are mainly speculative while artifacts and sources suggest the following...

In conducting land surveys, one can find different artifacts of antiquity from the left and right banks within the territory of present Astrakhan, which is crossed by the Volga river. Apparently, there has been a crossing point over the Volga here since antiquity. During the Khazar period, this crossing point was obviously used actively, i.e. within the territory of the left bank, in the center of the present city, Khazar vessels were discovered along with a bronze idol and coins. On the right bank were the Khazars burial grounds. In the 12–13th centuries, this area was located in the territorial region of Saqsin in the Lower Volga and Don River Regions [Fedorov-Davydov, 1969, p. 259].

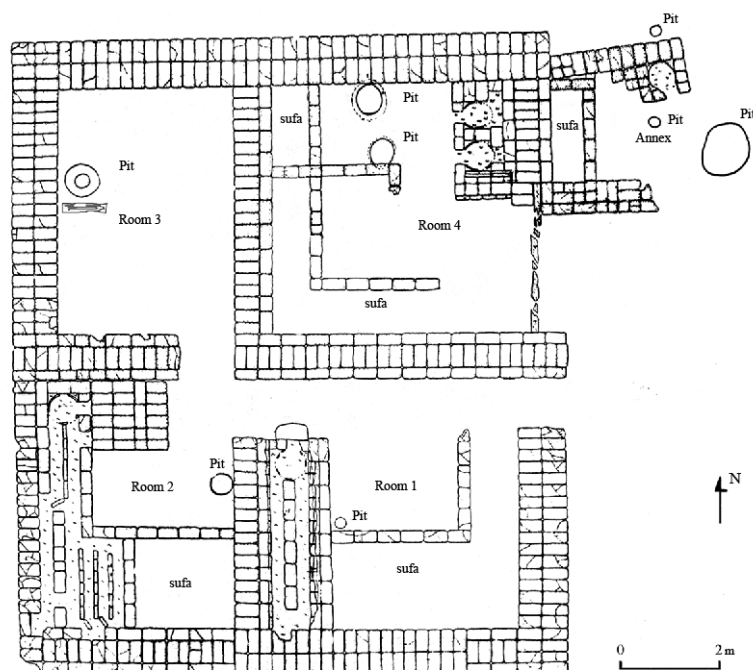

On the right bank in Astrakhan, there is a wavy ridge of geological risings 3 km higher than the present center on the left side of the Volga,—the Berovskie hillocks. This place has long since been called 'Zharennyie' or 'Sharennnyie' (burnt) hillocks because ashy lots, bones, crocks, coins, ornaments, sphere-cones, glazed tiles, and remains of buildings of burnt bricks tracing back to the Golden Horde Hajji-Tarkhani were constantly found there. [Obraztsov, 1925, p. 4–23]. Accumulations of modelled vessels in the Kipchak and Bulgar styles were uncovered. Furthermore, a coin of Seldjuk emir Mardin Nasir a-Din Artuk-Arslan, coined in 1214, was discovered here. The coin can be linked to the period of early existence in the settlement [Pietraszewski, 1843, p. 74]. Burials with peculiar decorations of that period of time were also discovered.

In 1254 while returning from Karakorum, William of Rubruck noticed that in winter that the nomads' camps of Batu were located on the eastern side of Volga while his son's were on the western side. They did not go further down the lower river delta. Here he found out that by order of Sartaq grandee-Nestorian Koyak, the construction a great church on the western bank of the river had begun along with that of a 'new' settlement, most likely located in the lower reaches of Volga. To this day, no points have been found that can really indicate the location of this building, except for one near Astrakhan [Travels, 1957, p. 185]. During construction projects of recent decades, coins from the second part of the 13th century and tools of the pe-

riod have been found. For example, a dastshui basin disk - a hand washing stand - were found on a number of lots on the right-bank of Astrakhan. Mausoleums of the 13th century have also been discovered.

Hajji Tarkhan came to prosper during the reign of Khan Öz Beg. In 1334, an Arab traveler by the name of Ibn Battuta visited the city and wrote: 'This city received its name from the Turkic Hajji, who was one of the pious men who settled there. The sultan gave him this place exempt from tax and it became a village, then growing into a city.' [Collected Materials On History of the Golden Horde, 1884, p. 301]. Ibn Battuta, however, was not interested in the reasons why Hajji had settled there and he described the events that had taken place 1334 years before. The Tatars kept this information until the 18th century: '...during the time of Öz Beg Khan, when the Tatars adopted the Mohammedan faith—Hajji, the first in command who came from the noble family of Tarkhan, was of this faith and land. On their return from Mecca, many hajjis would stay to live in Astrakhan to join this honorable man. Wherefore, Janibek Khan put Darkhan in charge of them and ordered to build a stone fortress at this place and named it Hajji Tarkhan, which generally means an abode of the hajjis' [Zaitsev, 2004, p. 12]. The construction of the fortress in Hajji Tarkhan might have started during the reign of Khan Janibek. The fortress encompassed the city centre, adjoining it to the river [Collected Materials On History of the Golden Horde, 1941, p. 184]. One can only assume that it occupied the northern part of Sharennnye Burgry, where a great number of coins, pieces of pottery, items made of metal and bone, glass and stone, vessels for mercury transportation, gold jewelry, and stonework remaining from the buildings with tile work could be found there up until the first half of the 20th century [Obraztsov, 1925, pp. 22–23]. The city centre's location on the right bank of the river was due to the stability in the government, which secured the safety of the cities' borders as well as to the steppe grassland, which was accessible to the city's inhabitants.

The city strip stretched along the Volga for 7 km. In its northern half was the most ancient

House of the third period (1340–1390)

part, surrounded by a wall, around which were 'ribats'—artisan quarters. The city was surrounded by a strew of estates with agricultural lands, followed by numerous settlements. To the west of the river bank, traces of settlements spread like tongues along fresh water lakes for considerable distances, sometimes for up to 3 km or more. According to archaeological findings, Hajji Tarkhan consisted of estates where the buildings were mainly built of mud brick. At the same time, there were traces of dwellings built of burnt brick.

The city's northern border was found to have started from the settlement of Streletsky (which also represents the northern border of the modern city). A complex of 22 ribat dugouts and ceramic furnaces was discovered there. The layout of the complex consisted of a chain of dwellings situated around oval-plan common yards. Four such yards were found. There were dwellings of the same type surrounding the yards. The dugouts were from 4 to 16 square metres in size. The entrance was either on the southern or northern side of each dwelling and was made of a ramp slope. The dugouts were divided into two main groups: those with a sufa and a hearth with kanas, and those

without a sufa and a hearth made of brick. The dugouts with hearths were made of brick have a lot in common with the Bolgar and Sarkel dwellings—Belaya Vezha of the pre-Mongol period. The arrangement of the dugouts with kanas show the influence of Middle Asiatic traditions; here we mean sufas and ramp entrances [Erzakovich, 1973, p. 166–182]. The people had left the dugouts before the city was ravaged by emir Timur in 1395. Numismatic material is represented by coins minted by different khans between 1313 and 1388. The bulk of the coins was minted during the reign of Khan Janibek (1342–1357) and in one of

the dugouts, a treasure numbering 44 coins relating to the last decades of the 14th century was found [Severova, 2003, p. 74–80].

Presently, the right-bank portion of the city is under intensive construction. In the northern and southern Sharennnye Bugry, large-scale construction projects are being carried out, which made it possible to identify the former locations of estates, bronze, iron and glass workshops, irrigation systems, pits with grape and millet seeds, as well as unique ceramic and metal wares. A former bazaar site was also discovered.

In 1984, during an excavation headed by V. Plakhov of an estate in a settlement situated in the city's west end, 5 chronological periods were revealed. They reflected the city's history. The first period was in the latter half of the 13th century. It included the remains of an aryk (an irrigation ditch) and two cellar huts. The cellar huts were rectangular, oriented from east to west. Framing remained on the walls of the huts made of mud bricks, which was of non-standard size for the Golden Horde period. A hearth pit and a waste pit dug out in the floor also remained, which is characteristic of the 13th century.

During the second period, the area already featured a yard with a fence around it, from which grooves intended for supporting the posts remained. In the yard, remains of a cellar hut and an outdoor hearth with a tandoor in the yard, as well as utility pits, were found. There were remains of a sufa and a hearth pit with a chimney hole that went outside the cellar hut.

Found in the dwelling and the pits in the yard were fragments of lamp-stands made from red clay, pots, kumgans, plates, chigirs, and the remains of bronze items: a cup, a boiler, bronze plates and shards, as well as badges. Items made of bone, a heterochromatic Kashin tile, a fragment of a spherical cone and a part of a foundry mould were also found there. These findings show that the cellar hut had been located in an artisan quarter, near a workshop. The coins that were found had been minted during the reign of Öz Beg Khan and were dated from between 1330 and 1340.

In the third period, a dugout and part of the yard were filled with earth and a house and cellar hut were built. The house was built of mud brick with the dimensions of 13 by 12 metres. Judging by their remains, the height of the walls was 2.5 metres. Remains of burnt floor beams were also found. The house had 3 rooms and one self-contained room, which joined the house and made the whole structure look rectangular. Two entrances to the dwelling were on the eastern side. The 3-room unit had 2 adjacent rooms with sufas and a kana heating. The third room joined them on the northern side and had a huma with holes drilled near the bottom, buried crown-deep in the ground. It may have been a storeroom with a cooler.

The self-contained room had a sufa, two tandoors and utility pits. On the eastern side, an extension in the iwan style with a tandoor was added. The rooms inside the house were plastered and whitewashed.

A layer of utility sediment contained small pieces of numerous jugs made from red clay, chigirs, pots, bowls, cups and lamp stands.

Fragment of an alabaster tombstone, 14th century

All the large pieces of broken crockery were found in the yard and the pits. There were also fragments of a dozen and a half heterochromatic Kashin cups and drinking bowls as well as walls made from Celadon, and glass vessels. Various items made of iron, bronze, lead, and bone, copper and silver coins and gold pendants made as large grains of rice were discovered. Judging by the remains of bones, their main food was sheep meat. There was considerably less horse and cattle meat. Camel, saiga, boar and duck bones were also found. The primary fish dishes featured sturgeon and beluga, and there were considerably fewer of those made from carp and more ordinary fish.

In the upper layers under the ruins of the walls, there were polychromatic tiles, which might have decorated the walls. The same layers, both in the yard and the house, revealed arrowheads among which there was 'a quarrel' from a crossbow. Judging by the coins, the house had existed before the city was captured by emir Timur in 1396. In the winter of that year, the houses in the city were intentionally burnt and destroyed.

After the conqueror's troops had left, the fourth chronological period began. One of the rooms in the house (Room 1) measuring 7.5 by 7 metres was fully restored together with

a sufa and kanas. On its western side, a small utility room was added and the house came to life once again. In the floor paddling, there were fragments of polychromatic Kashin cups and those made from red clay, as well as lamp-stands, items made of bone, parts of broken jewelry. In the rooms, coins minted by khans Bulat and Kerim-Birdi relating to the first decades of the 15th century were discovered. The estate's fifth period of life fell on the lifetime of the Khanate of Astrakhan which was established in the 1470s [Plakhov, 1985].

The eastern part of Hajji Tarkhan lay on the left bank of the Volga river, where the present-day centre of Astrakhan is located. It is situated on a set of elevations called Baer's mounds. During various excavation projects carried out on the mounds, a considerable number of 14th century objects were already recorded. The coins that are dated mainly trace back to the latter half of the 14th century [Schneidstein, 1979a, p. 4, 10–11]. In numerous trenches and foundation pits located on the Kremlin's grounds, the finding of objects from the Golden Horde period and burials of earlier periods was recorded.

There are works written in Tatar from the latter half of the 19th century to the early 20th century—not readily available and limited in circulation—which point to the locations of the most important objects which now exist in the territory of the city. These sources point to the location of a 14th century mausoleum, called Akrash Mashayakly, as well as to a graveyard with the mortal remains of Muslim saint, Ötemish-baba, and in the Kremlin—the place relating to the Golden Horde period where saint Kara-Daud and other hajjis were buried [Dzhumanov, 1999]. In one of them, a fragment of a tombstone made of alabaster was found.

Now, when construction projects are taken on within the city limits, remains of artifacts from the 14–16th centuries are destroyed without any research. This is due to Astrakhan administration's directive in considering the city to have been founded by Ivan IV's envoys in 1558.

While the Khan's power in the Golden Horde was strong, the city prospered. But in the 1360s, 'troubles began and Khans changed

from one to the other on the bloody throne' [Savelyev, 1857, p. 23]. Vigorous challengers for supreme power started to seize administrative city-centers. In the second half of the 1360s, 'Hajji -Cherkes, Khan Berdibek's commander-in-chief, seized the environs of Astrakhan and became the ruler of the Astrakhan appanage' [Collected Materials on History of the Golden Horde, 1884, p. 389]. In Hajji Tarkhan, he began to mint coins with the name of Cherkes-bek in 1374. In the late 1370's, Hajji Tarkhan was seized by Muhammad-Bulak, who was Mamai's proxy and minted his own coins [Zaitsev, 2004, p. 21]. After his accession to the throne in 1380, Tokhtamysh 'also conquered the appanage of Hajji Cherkes in Astrakhan' [Collection of Works Relating to the History of the Golden Horde, 1884, p. 391]. His attempt to bring the disintegrating Golden Horde together led to a war with the omnipotent emir Timur, who, on defeating the Tokhtamysh army on the Terek river, came to Astrakhan in the winter of 1395–1396. The city's fortifications were built 'on the bank of the river close to the water in such a way that (surrounding the city) they reached the river again. (In winter) using pieces of ice instead of brick and clay, they would build a wall on which they kept pouring water at night until all the pieces got frozen as one whole. Having thus built a high (wall), they connect the city wall with this wall by using one piece of ice and build a gate there. After the city had been seized and the people had paid their ransom to be spared, they were driven away and the city was burnt down. Then, according to Sharaf ad-Dīn 'Alī Yazdī's 'Book of Victory', Timur's army, upon crossing the Volga, seized the left bank portion of the city and, setting fire to it, burnt it down' [Collected Materials on History of the Golden Horde, 1941, p. 184–185]. In 1396, Astrakhan became the ulus of Temür Qutlugh, who was the grandson of Ak Horde Khan, Urus. In 1397, Temür Qutlugh, assisted by emir Edigu was proclaimed Khan of Ulus of Jochi. In 1402, his successor, Shadi Beg, began to mint dirhams in 'Yeni Hajji Tarkhan', that is in New Astrakhan [Markov, 1896, p. 94].

From that time on and depending on political situations, the city centre seems to have

been moved to the left bank as well. Hajji Tarkhan coins minted on behalf of the khans Bulat, son of Shadi Beg (1409–1410), Jalal ad-Din, son of Tokhtamysh (1411–1412), Keppek, son of Tokhtamysh (1414–1418), Chekrek (1415–1416), Dervish (1419), Kichi-Muhammad (from 1420) and Ulug-Muhammad (from 1427) have been discovered. In 1428, Devlet-Birdi (uncle of Hajji Giray, founder of the Crimean khanate), minted coins in Hajji Tarkhan. His coins had a tamga (a seal) engraved as a two-pronged fork with two dots, showing the local character of Hajji Tarkhan and Ordu-Bazar. [Zaitsev, 2004, p. 28–29]. After 1430, Hajji Tarkhan becomes the property of Kichi-Muhammad, grandson of Temür Qutlugh, khan of the Great Horde.

Around the city there were ancient settlements and villages, mainly lying along the caravan routes, which, together with travelers, provided the city dwellers with food. The travelers often carried items of religious worship. These settlements and villages were part of the city environs that we identify as those lying within a day's march from Hajji Tarkhan, including time necessary for crossing the river. Within 2 days' march from Hajji Tarkhan, one could already find other cities. The right to be part to one city or the other was disputed by both Sarai and Hajji Tarkhan up until the early 16th century [Ibid., p. 58].

At present, there are two settlements officially known to have their routes in early times. One is situated 20 km to the south of Astrakhan and is conventionally named for the towering of Khan-Tyube. While performing excavations during construction works, the layers from the Golden Horde period revealed layers of an earlier period with structures and ceramics tracing back to the 12th century and first half of the 13th century.

The second settlement, called Moshaiik, was about 15 km from Hajji Tarkhan, where the north-eastern part of the city is currently situated. Its central part lies on Berovsky mound. A house made of mud brick was unearthed here which partially survived. The house stood a metre deep in the ground. The heating system was original: on the outer side of the house, near its corner, a hearth was dug, from which the

Plan of a public bath. Majar.
Excavated by E. Zilivinskaya

warm air passed through the horizontal channels that had been left on the outer side of the walls during their construction. A coin minted in 1310 was found in the wall. A thin layer of sand from above the cultural layer contained in the house was uncovered, where there were remains of the settlement's life activity in the latter half of the 14th century. In a neighbouring mound, graves from the 10th to 14th centuries were found. Presently, the ancient site has been developed, with a housing estate, called Moshaiik, as well as dachas (weekend cottages) [Vasilyev, 2001a, p. 48, 51; Schneidstein, 1978, p. 8–13].

The number of quite large settlements that made the environs of Hajji Tarkhan increased particularly during the first half of the 14th century. During the reign of Janibek Khan, there were already over ten. However, they were not archaeologically investigated.

With the emergence of the Astrakhan Khanate, Hajji Tarkhan became a capital city. With the change in its political status, the nearest cities, lying about 50 km away (near the set-

Bath under investigation. Majar. Excavated by E. Zilivinskaya

tlement of Krasny Yar, near the settlement of Komsomolsky), transformed into large settlements. Judging from archaeological materials, they lost their political and economic significance and became remote environs of the

Khanate's capital. Their task was limited to providing the capital with foodstuffs, supporting caravan routes and crossing points, as well as maintaining mausoleums and holy places in the condition that they deserved.

§ 8. Golden Horde cities of the North Caucasus

Emma Zilivinskaya

The North Caucasus was already a densely populated area by the early Middle Ages. The Mongol invasion cut the lives of many Alan settlements short and prevented them from growing into well-developed medieval cities. During the Golden Horde period, instead of numerous settlements, here rose several large cities which became centres of trade and commerce, as well as those of administrative power of Ulus of Jochi's Khans. In the 13th to 15th centuries, the foothills of the Caucasus saw the birth and rapid development of the old Alan cities, such as Terek, Bulunguyev, Khamidie, Upper Chegen Archaeological Site and Nizhny Julat, which had advantageous geographical positions [Chechenov, 1969, p. 43, 46, 48, 60–61]. At the same time, they continue to maintain the original three-part structure

(the citadel, the fortified trading quarter, and an open ancient settlement).

Some small rural settlements which do not have such a complex layout, also change into city centres. Verkhny (Upper) Julat may serve as an example of such a city [Kuznetsov, 2003, p. 119–185]. At the same time, in the steppes as well as at the crossroads of trade routes, new 'khanate' cities are built such as Majar and the nearby cities, which acquired the names of Malye (Small) Majary and Verkhniye (Upper) Majary [Yegorov, 1985, p. 122]. These are typical Golden Horde cities, which, like the cities of the Lower Volga Region, arose as clusters of aristocratic manor houses as a result of the khans' short term town planning activity in unpopulated areas.

The most significant city centres of the Golden Horde period were the cities of Majar

(in Stavropol Krai), Verkny (Upper) Julat (at the settlement of Alkhotovo in North Ossetia) and Nizhny Julat (at the town of Maisky in Kabardino-Balkaria). The majestic ruins of these cities have attracted attention of researchers, philarchaists and travelers. From the 18th to 19th centuries, they were visited and described in plans and pictures by S. Gmelin, I. Guldenshtedt, G.-Yu. Klaprot, P. Pallas, V. Viller and many others. But the archaeological investigation of these monuments only started in the early 20th century.

The largest Golden Horde city in the North Caucasus was Majar. It was about 6 square kilometers in area. The site of the ancient settlement lies on the bank of the Kuma River, at the place where the tributary of the River Buivol flows into it. The city was built in the 14th century at the intersection of the trade routes connecting Ulus of Jochi's centre (Sarai and the Lower Volga Region) with the Caucasus and the western regions (Azak and Crimean cities). Currently, the largest part of it is built up by the city of Budyonnovsk. In the 18th and 19th centuries, the ruins of the site were visited by I.-G. Gerber, S. Gmelin, I. Guldenshtedt, G.-Yu. Claproth, I. Falk, P. Pallas, Ya. Schmidt, Sh. Gode, K. Baer, A. Firkovich, V. Miller and others. One can freely assert that none of the travelers, archaeologists or philarchaists who visited the Caucasus left having ignored this monument.

The first excavations, which were probably the most effective, were carried out by V. Gorodtsov in 1907 [Gorodtsov, 1911]. He drew a plan of the site and investigated it in different places. He uncovered 6 residential houses made of mud brick that looked typical of the Golden Horde. Inside the houses, they uncovered L-shaped wattle and daub sufes, tandoors and a kana heating system. The floors in the rooms were adobe or paved with brick, often with a built-in toshna. There were two types of uncovered houses: ones that were square in plan and divided into 2 rooms (the larger one used for living, and the smaller one used for household activities) and rectangular ones, divided into three narrow rectangular rooms. The set of graves uncovered by V. Gorodtsov belonged to two periods—the Sarmatian and the

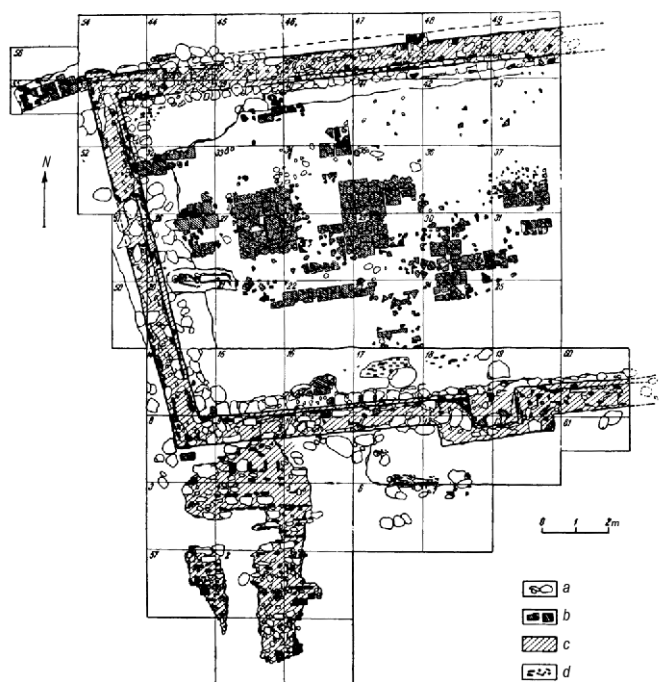

Tatartup minaret (according to O. Miloradovich)

Golden Horde periods. The burials were of different structures: from simple pits to those with shoulders, adobe brick foundation stones and thoroughly built vaults. V. Gorodtsov was the first to reliably prove that Majar was a Golden Horde city modeled after the cities of the Lower Volga Region and constructed on a new unpopulated site.

In the 60s–70s of the 20th century, E. Rtveladze and A. Runich carried out excavations on the Majar Ancient Town. In using stratigraphic investigation and observation of the uncovered materials, they defined the borders of the monument, identified separate parts of the city and affirmed the conclusions made by V. Gorodtsov that the Golden Horde city reached its height during the reign of Khan Janibek [Rtveladze, 1970; 1972].

On the Majar archeological site from 1989 to 1991, excavations were conducted on the left bank of the Kuma River within the boundaries

Plan of the Great Mosque in Verkhny (Upper) Julat (according to O. Miloradovich)
a—stones, b—bricks, c—cementing mortar, d—coal

Plan of the small mosque in Verkhny (Upper) Julat (according to O. Miloradovich)

of the town of Budyonnovsk [Zilivinskaya, 1994]. They showed that the cultural layer of the site in this part had been very much destroyed. Nevertheless, several residences, part of a street and a set of burial sites in the city necropolis were examined. All the examined burial sites had been made in accordance with Muslim rites. The people were buried without any personal belongings, their heads pointed westwards, facing southwards, stretched on the back and bent to the right. There were several kinds of graves: simple pits made in the ground, graves with a shoulder and a foundation stone, and finally, vaults made of brick or adobe brick, that is, they did not differ from those unearthed by V. Gorodtsov.

From 1993 to 1998, the excavations were carried out on the right bank of the Kuma River. The fields of a rather densely populated arti-

Plan of the mosque in Nizhny (Lower) Julat

san settlement were examined. The object of most interest here was a particular house. It was square in plan with wire-frame wooden walls coated with clay. A wall divided it into 2 rooms: a living room with a hearth, a kana and two sufas, and a smaller room, used for utility needs with two small storage cellars. Next to this house there were two more that were less preserved. Aside from the houses, numerous pits rich in different things were uncovered. In one of them, a small treasure was found consisting of 17 silver coins from the times of the Khans Tokhta, Janibek and Kulpa. The same field revealed remains of production complexes. Subsequent excavations were conducted in the same area on the very bank of the Kuma River. The remains of a large building made of adobe brick were uncovered. Its length was 12 metres. The walls, 100–120 centimeters thick, remained intact to the height of about one metre. The western part of the structure had been destroyed as part the bank of the Kuma River eroded. The structure was reconstructed several times. It dates back to the 20s–40s of the 14th century [Zilivinskaya, 1996].

Not far from that building, remains of a public bath, whose south-western part was destroyed as the Kuma River bank eroded were found. It consisted of rectangular-plan rooms which were situated in two rows. All in all, partial or full, 5 such buildings were uncovered. The bath was heated with a cylindrical stove whose walls were built of burnt brick and which was connected to an underground space. The walls of the bath were built of burnt brick laid on brick mortar. The foundations of the walls and the pillars of the underfloor heating system rested on the bottom of the foundation

Underground vault-mausoleum in Nizhny (Lower) Julat. Plan

Underground vault-mausoleum in Nizhny (Lower) Julat. Reconstruction

pit which was 0.5 m deep. The pillars were of one kind of brick and had no fewer than 10 courses of brickwork. They were covered with flat sandstone slabs. The walls and floors of the bath were covered with mortar. The water was fed through ceramic pipes [Zilivinskaya, 2001, p. 194–196]. Public bathhouses were very common in all Golden Horde cities. Nevertheless, the bathhouse in Majar is so far the first and only one found in the North Caucasus.

On the right bank of the Kuma River, copper smelting and pottery workshops were found. The largest amount of information was obtained about ceramics. [Volkov, 1991; Volkov, Zilivinskaya, 1996]. The ceramic com-

plex obtained in Majar testifies to the fact that there were 2 types of workshops. In the workshops of the first group, they made ceramics using Saltovo traditions of engobe and glossing. The firing of these ceramics was mostly done in three layers. The molding compounds used in the second group are characterized by a yellow or pink and orange colour, high porosity and total firing. Ceramics belonging to this group can also be glazed. The proportion of ceramics belonging to the imported groups shows that Majar shared the most intensive links with the capitals of Ulus of Jochi and East Crimean cities.

The Verkhny (Upper) Julat archaeological site is situated on the bank of the Terek River at 'Elkhotov Gate', a narrow passage connecting Eastern and Western Caucasia. In academic works, this monument is often called *Tatartup* [Kokiyev, 1929; Semenov, 1947]. In many ways, it drew the attention of researchers due to a Tatartup minaret, which had existed until not very long ago. At the end of the 18th century, it was minutely described by I. Guldenstadt, who was able to see not only the minaret but also the remains of a mosque near it as well as the ruins of another minaret, a smaller one, and two Christian churches [Guldenstadt, 1987, p. 503–508]. The systematic investigation of the monument began in 1958 with the North Caucasian expedition, headed by Ye. Krupnov. The excavations showed that the Golden Horde city arose on the site of an Alan settlement, which had existed over a long period of time. During the Golden Horde period, it became a major city—a centre of culture, trade and commerce.

The Tatartup minaret, which brought fame to the monument, consisted of a rectangular-plan base, (3.55 by 4.24 metres in size), on which sat a conical shaft [Miloradovich, 1963, p. 69–78]. The shaft consisted of two parts divided by a stalactitic girdle, which previously supported a small balcony intended for the muezzin. In the base section, there was a door with a semicircular end. The same kind of door led to the balcony. Inside, a pentagonal column was circled by brick stairs. The shaft of the minaret was decorated with several ornamental girdles, the main one made of a stalactite. Right under it, there were two strips of turquoise glazed

disks, alternating with diamond-shaped bricks. Between them, there was an ornamental girdle imitating Kufa inscriptions. The top of the shaft was also decorated with figured brickwork. The minaret reached 20.8 metres. The Tatartup minaret was part of the Great Mosque in Verkhny (Upper) Julat, but it stood separately from it.

Two-thirds of the Great congregational mosque have been preserved [Ibid., p. 66–87]. The rectangular-plan building, 22.8 by 11.4 metres in size, extended from West to East. Its walls were built of dressed stones, burnt brick and sandstone bricks and the floor was paved with large brick tiles, standard brick, and cobble stones. Some floor tiles had blue glaze on their surface. The floor in the mikhrab was decorated with glazed tiles, and its walls might have been too. The columns supporting the ceiling must have been made of wood and therefore didn't survive. In general, the plan of the Grand Congregational Mosque is quite typical of Ulus of Jochi, while the fact that the building is extended latitude-wise instead of longitude-wise (as are the majority of other mosques) is somewhat unusual. [Zilivinskaya, 1998].

About 250 m to the southwest, another mosque of smaller size was found [Miloradovich, 1963, p. 66–69]. The smaller mosque's long axis was longitude-wise oriented and had dimensions of 9.8 by 6.6 metres. Inside the mosque, there were the remains of 6 square piers in the corners of the room and in the middle of its eastern and western walls. They most likely served to support two domes that formed the roof of the building. A cubic minaret base was added to the northeast corner of the mosque. So far, the smaller mosque remains the only specimen of a building of public worship with a plan that existed in the Golden Horde.

A small rectangular Christian church of 7.7 by 5.6 metres in size, which looked like a side chapel having one apse, was uncovered in the same part of the city. Later, another side chapel, also with an apse was added to this church. Under the altar there was a square-plan crypt with a dome-shaped roof [Krupnov, 1963, p. 48–66]. Most likely, I. Guldenstadt saw this church with intact walls and roof [Guldenstadt, 1787, p. 503–508; Krup-

nov, 1963, p. 61]. Near the Great Mosque in Verkhny (Upper) Julat and inside the Christian church, gravesites were found. Examination of the skulls made it possible to conclude that the city's population belonged to the Caucasian race [Alekseyev, Beslekoyeva, 1963]. In 1960–1963, there were excavations which uncovered a 14th century mausoleum, two Christian churches, a house with outdoor facilities and a great number of Muslim and Christian graves. From 1976–1977, V. Kuznetsov, found a church with one apse and a 14th century vault near it [Kuznetsov, 2003, p. 136–146].

The Nizhny (Lower) Julat archeological site is situated in the northern part of Kabardino-Balkaria, where the flatlands meet the foothills, not far from the city of Maisky on the high right bank of the Terek River. The site was first examined by academician G.-Yu. Klaport in 1807. In his account, he described Julat as an ancient city, which, according to 'Derbent-name' existed as far back as the 8th century. He also briefly described the ruins of a mosque and a minaret and the numerous burials around them [Klaproth, 1812–1814, I, p. 430, 539; II, p. 359]. Subsequent researchers were mainly guided by this data.

Permanent excavations of Nizhny (Lower) Julat were conducted in the 1960s, headed by G. Ione and I. Chechenov. The digs were made on the site of the citadel and mainly involved the latest layers of the city's existence. It was here that the largest congregational mosque in the North Caucasus was unearthed [Chechenov, Zilivinskaya, 1999]. The mosque was a rectangular-planned building of approximately 25.7 by 17.65 metres in size. Its inner space was divided into 5 naves with 4 rows of columns. The columns rested on circular stone bases and were probably made of wood. The floor of the mosque was paved with brick—the mikhrab did not survive. There is reason to believe that the central entrance to the mosque was surrounded by a portal. The minaret, of which remained a rectangular-plan base, was added closely to the northern wall near the northwestern corner of the building. Thus, the mosque in Nizhny (Lower) Julat had a basilican plan typical of all large mosques of the Golden Horde.

An underground vault-mausoleum found within the mosque was of particular interest [Zilivinskaya, Chechenov, 2004]. The vault was below the ground level of the mosque. On its eastern side, there was a narrow corridor with eight steps leading to it. In general, the vault was a square-plan room, approximately 2 by 2 metres in size. All four walls had a pointed niche whose opening was nearly as wide as the wall itself. In the walls of all the niches, except for the eastern one, there were small false windows, which, looking like three small niches gradually diminishing in perspective, went outward behind the wall surface. The vault was covered with an octahedral dome-shaped roof. The vault was about 2 metres high. The inside of its walls were covered with white mortar. On the floor there were five graves, some of them featuring wooden coffins. Two skulls were subjected to anthropological examination [Alekseyev, 1967, p. 177–182]. One of the buried people belonged to the narrow-faced Caucasoids (Alans), and another belonged to South Siberian Mongoloids.

Architecturally, the vault is original. Cross-shaped mausoleums and vaults consisting of square-plan rooms with niches on all the four sides are quite common. However, the vault in Nizhny (Lower) Julat has niches which are almost as wide as the walls, and the shape of a cross can hardly be discerned. The fact that the southern niche was made so large that, in fact, it represents a second additional room, which is also quite unusual.

The digs made in the citadel, in the middle of the fortified part of the site near the ditch and ramparts, produced various materials in abundance, which is indicative of the intensive and versatile activities that took place on the site for one and a half thousand years (from the 1st century BC until the 14th century). On the site of the citadel, the cultural layer reached 3.5 metres, and nearly 1 metre thereof falls on to the Golden Horde period. The investigation of the citadel's rampart made it possible to make interesting conclusions about the political life of Nizhny (Lower) Julat. Built in the pre-Mongol times, the rampart was destroyed in the second half of the 13th century.

In the early 14th century, it was restored and completed. The last destruction of the citadel might have been during Timur's invasion and dates back to the late 14th century [Chechenov, 1967]. In the artisanal part of the city, the remains of dwellings, yurtas (nomad's tents), numerous unility pits and production complexes were uncovered. The data obtained during these investigations made it possible to form an idea about the population's occupations, which were farming, cattle breeding, and various crafts.

Aside from the three largest sites situated in the North Caucasus, there are other monuments from the Golden Horde period. For

example, in Pyatigorye, not far from the city of Yessentuki, eight mausoleums were uncovered—six of which are arranged in a row [Rtveladze, 1969; Palimpsestova, Runich, 1974]. These excavations made it possible to suppose that it was the site of a large settlement which was mentioned by Ibn Battuta [Ibid., p. 237–238]. E. Rtveladze believes that the name Yessentuki itself comes from the name of Tatar emir Essen-tuk who owned this land [Rtveladze, 1969, p. 263]. Another city centre with large buildings of obvious public character was found near the stanitsa (Cossack village) of Starogladvskaya on the Terek River [Dautova, 1981] but it was not examined.

§ 9. The Kok Horde

Aleksandr Kadyrbayev

The Golden Horde, the state belonging to Khan Jochi's descendants, occupied the whole of the Great Steppe stretching from the Danube in the west to the Irtysh River in the east. The whole state called Ulug Ulus ('Great Ulus') was divided into two wings, the left wing, or Kok Horde, and the right wing, or Ak Horde, and a great number of smaller appanages, which in turn were called uluses and hordes. The domains of all princes from Jochi's house were subordinate to the Golden Horde's khans based in Sarai who, before Khan Berdibek's death, were lineal descendants of Batu Khan. But sometimes this subordination was nominal. For example, descendants of Batu Khan's elder brother Orda Ejen, who were rulers of Kok Horde (Eastern Horde) or Eastern Desht-i Qipchaq, recognized the authority of the Khan in Sarai de jure, and didn't even attend the Kurultai—an assembly of families representing Jochi's descendants [Klyashtorny, Sultanov, 2000, p. 214]. Rashid al-Din, a contemporary of the Mongol epoch writes: 'From the very beginning, it never happened that somebody from the Orda family who had overthrown him, would go to the Khans of the Batu family, as they had distanced from each other and they are independent sovereigns of their own ulus.

But it was their custom to consider the person who succeeds Batu their sovereign and ruler, and they write their names at the top of their yarlyqs [Rashid ad-Din, 1960, II, p. 66].

In Eastern Desht-i Qipchaq, there were also the domains of Shiban and his descendants, his younger brother Batu and Orda Ejen. By the 14th century, they had covered areas of the Middle Irtysh River Region.

The questions 'When did Kok Horde arise and under what circumstances? What lands did it actually occupy?' have been often been a point of contention in scholarly publications. Though, there are no definite answers to these questions to this day, which could be proved by written or other sources. The scholars were unanimous only in thinking that the term Kok Horde means a part of Ulus of Jochi. As for the questions concerning which part of the Golden Horde in particular was called Kok Horde and when this Horde was formed, there is no definite answer in scholarly books. Muslim sources mainly contain information about Kok Horde, which is known to oriental historians, though it has not been sufficiently studied as far as the sources are concerned. Due to this fact, they have not been able to map out the historiography of the Golden Horde [Klyashtorny, Sultanov, 1992, p. 189–190].

In old Russian chronicles—where Jochid Ulus is called ‘the Golden Horde’, or simply ‘the Horde’ or ‘the Volga Horde’—the steppe expanses to the east of the Urals, Eastern Desht-i Qipchaq, were recorded under the name of ‘the Blue Horde’, that is, Kok Horde or ‘Zayaitskaya Horde’ (that is, lying east of the Yaik River, now the Ural River) [Complete Collections of Russian Chronicles, 4, p. 82–83; 9, p. 27, 123]. Supposedly, Kok Horde included the eastern part of Jochid Ulus, namely, Eastern Desht-i Qipchaq (where Kazakhstan is now), the area to the east of the Ural River (excluding Semirechye) and to the north of the Aral Sea and the Syr Darya River.

The Kok Horde was predominantly populated by Turkic tribes and small populations of Mongol steppe tribes, including those that lived there before the Mongol invasions, such as the Kipchaks and the Kangly, and those that came together with Chinggis Khan’s Mongols—the Naimans, Keraites, Karluks, Kongrats and Merkits.

The chronological tables of Muslim dynasties give the names of the Kok Horde khans in the following order: Orda Ejen, Kunkiran, Sar-taqtai, Kuinji (Konichi), Bayan, Sasy-Buka, Erzen, Mubarak-Hoja, Chimtay, Urus Khan, Koyrichak and Barak [Rashid ad-Din, 1960, II, p. 67].

According to Rashid al-Din, Jochi Khan’s yurt ‘was within the Irtysh River area, and therein was the capital of his state’. [ibid] Abu-l Ghazi asserts that ‘Jochi Khan’s residence was in Dasht-i Kipchak, in a place called Kok Horde’ and that it is this part of his extensive domain that passed after his death to his son Orda Ejen. Abu-l Ghazi says nothing about his sources, but the information he gives is confirmed by a contemporary of Jochi Khan’s sons, the brothers Orda Ejen, Batu and Shiban. This is Giovanni da Pian del Carpine, the Pope’s ambassador to the court of the great Mongol Khan, who in 1246 travelled through all the steppe areas of the Ulus of Jochi. According to his account, he rode for a long time with his companions along the bank of ‘a certain sea’ (Lake Alakul, not far from the upper reaches of the Irtysh River). ‘This is the land where Orda lives, who is Batu’s superior; moreover, he is the oldest of all the Tatar princ-

es; there is also a Horde, or the court of his father, where one of his wives lives and rules’. [Travels, 1957, p. 3, 218, annotation 194]. Orda Ejen inherited the residence of his father Jochi Khan as his appanage; it was situated in the upper reaches of the Irtysh River near Alakol Lake. According to a legend told by the Muslim author Ötemish Hajji, when the question arose over the inheritance of the dominion of Jochi Khan, Chinggis Khan commanded that a blue yurt should be erected for Orda Ejen, or, in the words of the source, a ‘Kok Horde’.

Borderlines between the domains of the Jochids were roughly defined; depending on the military and political situation, they were either narrowed or widened. In the latter half of the 13th century, the city of Sygnak on the Syr Darya became the center of the rulers of the Blue Horde where they relocated their capital. They continued to be politically dependent on the khans of the Golden Horde, though only nominally, up to the first half of the 14th century. During the rule of Mubarak-Hoja, the rulers of the Blue Horde only made one attempt to become the sovereigns of an independent state. Mubarak-Hoja took the liberty to mint coins in 1328–1329 in Sygnak with the inscription: ‘Mubarak-Hoja is the just sultan, and God will extend his reign’. Coin minting was the exclusive right of the sovereign ruler, so this led to countermeasures by Öz Beg, the khan of the Golden Horde, who was considered the lawful supreme ruler of the entire Ulus of Jochi. His actions were aimed at returning the descendants of Orda Ejen to their original vassalage to Sarai; the separatist strivings of the latter for total political independence caused the Time of Troubles (Smutnoye Vremya), which Muin al-Din Natanzi, a Timurid author of the early 15th century, said ‘is still remembered in Desht-i Qipchaq’. In this struggle, the ruler of the Blue Horde, Mubarak-Hoja, was defeated, fled, and wandered the Kyrgyz regions and Altai for several years until his death.

After the death of Janibek Khan, disorder and palace coups gripped the Golden Horde. Several khans claimed the throne at the same time and each of them minted their own coins. Centrifugal tendencies strengthened and the Blue Horde became de facto independent. Its rulers actively struggled for supreme power in the empire of

the Golden Horde and from 1361, the descendants of Orda Ejen from the Blue Horde ascended to the throne of the Ulus of Jochi, one after the other. They were: Timur-Hoja, Orda-Sheikh, and Murid. The ruling upper circles of the Blue Horde strove to use the situation in the Golden Horde to unite all the dominions of the Ulus of Jochi into one empire under their reign. After the death of Berdibek Khan, an official invitation to take the throne in Sarai was made, for example, to the Khan of the Blue Horde Chimtay (1344–1361), who declined it. However, his sons, especially Urus, actively struggled for the throne of the Ulus of Jochi.

Urus became the Khan of the Blue Horde in 1361. The Muslim chroniclers Muin al-Din Natanzi and Kadyr Ali Jalairi describe him as a strong and powerful ruler with a resolute character. Under Urus Khan's rule, the authority of the khans was strengthened in the Blue Horde, and he started actively seeking the throne of the Golden Horde [Fedorov-Davydov, 1973, p. 151–152]. Urus Khan, with support of the 'pillars of the nation and nobility of the court', initiated a campaign against Sarai in 1368 and seized it in 1374–1375. He also besieged Hajji Tarkhan (Astrakhan) and conquered the Cis-Kama Region, which was called the 'yurt of Urus Khan' in the sources. But his successes were temporary, and in the next year, he was forced to leave the Volga Region for his native steppes in Eastern Desht-i Qipchaq. Though Urus Khan was a Chinggisid and a 'legitimate' candidate for the throne of the Jochid Ulus, he was unable to defeat Mamai, the temporary ruler of the Golden Horde, who was supported by the owners of the right hand ('wing'), or the White Horde, despite the fact that Mamai was not a Chinggisid.

That which Urus Khan, Orda Ejen's descendant, failed to do, was accomplished in the 1380s by another representative of the Blue Horde, the young Mangyshlak tsarevich Tokhtamysh, the descendant of Tuqai-Timur and the youngest son of Jochi. In 1378, Tokhtamysh, supported by the most powerful ruler of the East (Emir Timur, the ruler of Samarkand), was enthroned as a khan in Sygnak, the capital of the tsarevitches of the Blue Horde, the left hand ('wing') of the Jochid Ulus. From Sygnak, Tokhtamysh campaigned in the west and seized Sarai, the capital of the

Golden Horde, with Timur's support. Soon, he joined all the Jochids' possessions together into a united empire and restored the khan's strong authority [Bartold, 1968, p. 139]. The alliance of the Russian principalities headed by Dmitry, the Prince of Moscow, unintentionally helped him by defeating the army of his rival Mamai on Kulikovo Field, though this did not save Moscow from Tokhtamysh's invasion in 1382. He burned the city and obliged the Rus' to pay tribute to the Golden Horde again up to 1480, and to take debts on the tribute not paid to the Ulus of Jochi for their six years under Mamai's rule. But in 1395, Tokhtamysh came into conflict with his patron Emir Timur and lost in a war that lasted for several years, which cost him the throne of the Golden Horde. He never returned to the Blue Horde as 10 years later he died in the lower reaches of the Terek River in the North Caucasus. After Tokhtamysh, nobody managed to gain the authority that would be acknowledged in the entire Jochid Ulus. The Golden Horde began to split. Emir Timur appointed his proteges from the Blue Horde in Sarai, which by this time was de facto controlled by the ruler of Samarkand. They were mainly representatives of Urus Khan's clan, such as Koyrichak and Temür Qutlugh. But they failed to restore the former greatness of the Ulus of Jochi.

Koyrichak's reign of the Golden Horde was short. Soon after Emir Taimur had left the lands of the Golden Horde Volga Region with his main forces, his protege Koyrichak was dethroned and killed. The Blue Horde was also weakened due to the wars with Emir Tikmur. In 1423–1434, Urus' grandson and Koyrichak's son Barak overcame his rivals and seized the reins of the Blue Horde, which by this time had lost the middle reaches of the Syr Darya region and its capital Sygnak to Timur's descendants. But Barak did not limit himself to his grandfather's yurt. According to the Russian chronicles, he invaded the Golden Horde Volga Region in 1424 and defeated Khans Khudaydat and Ulugh Muhammad. As diplomatic correspondence shows, the latter was seen as the legitimate ruler of the Golden Horde by foreign rulers, though he only controlled the central part of the former Jochid Ulus, known then as the Great Horde. As Russian and Muslim chroniclers report, Barak cap-

tured Sarai and 'ascended to the khan's throne in Desht-i Qipchaq'. However, Barak khan failed to hold on to power for a long time in the centre of the former lands of the Golden Horde. By 1427, Ulugh Muhammad managed to win back Sarai and drive Barak out to the borders of his possessions in the Blue Horde. Barak refused to fight for the throne in Sarai and gathered his forces against the rulers of Samarkand, the Timurids. Barak may probably be considered to be the last khan of the Blue Horde. In 1425–1426, he campaigned against Timur's grandson, the ruler of Samarkand, Ulugh Beg, and regained Sygnak together with several settlements at Syr Darya. 'The pastures of Sygnak', Khan Barak said, 'belong by the law and customary right to me, as my grandfather Urus Khan erected the construction in Sygnak' [CWRHGH: Collection of Works Related to the History of the Golden Horde, 1941, p. 197]. But these were the last years of the existence of the Blue Horde. Since 1428, after the death of Khan Barak, Orda Ejen's descendant, authority in east Dasht-i Kipchak passed to the descendants of Shibān, who symbolized the steppe state. They were recorded in history under another name—the Öz Beg Ulus, and became the successors of the Blue Horde in the area of east Dasht-i Kipchak.

But the history of the Blue Horde doesn't only consist of wars and internecine feuds. Although the descendants of Orda Ejen first fought with the Chagataid Ulus, the Mongol state in Middle Asia, and then with the Timurids, for the cities in the Syr Darya region and the pastures in east Dasht-i Kipchak, the rulers of the Blue Horde sought to restore trade and economic relations between the nomadic world of east Dasht-i Kipchak and the settled population of the Syr Darya region oases. The rulers of the Blue Horde relocated their capital from the upper reaches of the Irtysh River to the southern borderline of their lands, the city of Sygnak, for good reason. While preserving and supporting extensive livestock farming in the steppe areas from the Irtysh to the Syr Darya and from the Altai to the Ulytau Mountains and the Aral Sea, they also secured the existing order of nomad movements to summer and winter pastures with consideration for tradition. The khans of the Blue Horde took steps towards restoring economic and cultural

life in the settled agricultural oases in the middle reaches of the Syr Darya, Talas and Chu rivers. Muin al-Din Natanzi reports that the khan of the Blue Horde Erzen modernized Sygnak and built many buildings: 'most of the madrasah, khanqahs, mosques and other charities in Otrar, Sawran, Jend, Barchkend' [Ibid., p. 129], urban settlements in the Syr Darya region oases. Erzen's grandson Urus Khan erected buildings in Sygnak following the example of his grandfather. According to the Muslim chronicler Mahmud ibn Vali, the other political centre of the Blue Horde under the rule of Urus Khan was the city of Saray-Jük in the lower Ural, which was considered together with Sarai to be the capital of the entire Jochid Ulus. By the end of the 14th century, the khans of the Blue Horde had been minting coins with their own names. Turning the middle reaches of the Syr Darya region into the centre of the Blue Horde with a capital in Sygnak encouraged the expansion of relations between the nomads from east Dasht-i Kipchak and the settled cultures of Khwarezm and other regions in Middle Asia. These relations were significantly influenced by the fact that urban life in the centre of the Golden Horde, the Volga Region, faded away due to the invasions of Emir Timur, and as a consequence, trade routes shifted to the south-east to the oases of the Syr Darya region.

Thus, the Kok Horde was already known as the official term for the region located in the upper reaches of the Irtysh near the Alakul lake, already during Khan Jochi's lifetime. After the death of Jochi Khan, the term referred to the descendants of his son Orda Ejen and their dominions, which covered a distance from the upper reaches of the Irtysh and further westwards to the rivers Ili and Syr Darya, at times probably up to the Ural. In the sources, the Jochids from the Blue Horde were called 'tsareviches of the left hand ('wing')', and their dominions were furthest east of the Jochid Ulus. In the latter half of the 14th century, the term 'Kok Horde' was replaced by Öz Beg ulus and ceased to exist. It should be mentioned that the last khan of the Blue Horde, Barak, had a daughter and three sons, one of whom was named Abu Said, 'also known as Jani Beg', who was one of the founders of the Kazakh Khanate.

§ 10. Shibān's Ulus

Vladimir Kostyukov

The border between the right and left wings, between The White and Blue Horde, was likely situated along the Volga-Ural Watershed area. The southern Urals and the steppes of western Siberia up to the Irtysh belonged to Shibān, Jochi's son, and his closest descendants (about this ulus see: [Kostyukov, 1998, p. 210–224]. The lands of the Eastern Aral Region and the lower reaches of the Syr Darya, together with the cities of Jend, Sygnak, and Sayram, were apparently the dominions of Shibān, but already during the rule of Orda Ejen, these lands were merged into his own ulus. Initially, he owned the original dominions of the Jochids in the upper reaches of the Irtysh and near the Alakul lake, where the history of the Ulus of Jochi actually started (about the history of the left wing of the Ulus of Jochi and genealogy of its rulers see: [Allsen, 1985, p. 5–40]).

While the Jochids were dividing the conquered territories after the completion 'of the seven-year campaign', the fifth son, Shibān, received one of the largest appanages. Shibān's great-grandson, Abu-l Ghazi, tells about this grant as follows: 'When Sain Khan returned from this campaign and stayed in his place... he gave his younger brother Shibān Khan... as the appanage from the conquered states, the Korel region; and he gave from the family dominions four peoples: the Kushchis, Naimans, Karluks and Buyrak, and told him: the yurt you are going to live in will be between mine and my elder brother's Ichen: in summer live at the eastern side of the Yaik, along the rivers Irgiz-suuk, Or, Ilek, up to the Ural mountains, and during winter live in Arakum, Karakum, and along the banks of the Syr, Darya, by the deltas of the rivers Chu Su and Sari-su. Shibān Khan sent to the Korel region one of his sons accompanied by good begs and people. This yurt was constantly under the authority of the sons of Shibān Khan; the present day the Korel sovereigns are said to be the descendants of Shibān Khan;... Shibān Khan spent summers and winters in the designated regions

and died after several years' [Abu-l Ghazi, 1906, p. 160].

The fact that Shibān received nomad camps in the Ural-Kazakhstan steppes is confirmed by contemporary records of events: in the report on his mission to Karakorum, Giovanni da Pian del Carpine briefly notes that in the vast expanse northwards of Middle Asia, 'lives Shibān, the brother of Batu' [Giovanni da Pian del Carpine, 1993, p. 64]. It is not clear what was actually hidden behind the report to assign Shibān the country 'Koral', that is Hungary. Perhaps this meant a mission to organize the final conquest of Hungary, but it is much more likely that it was the result of identifying the powerful general (temnik) Nogai with the Shibān's second son, Bahadur in Shibān 'historiology' [Şaqərim Qudayberdiuli, 1990, p. 98]. Regardless, Shibān's descendants never consolidated in Hungary, but were able to establish their rule in the Ural-Kazakhstan steppe for several centuries.

On first glance, it may seem that the baghatur and his warriors, who gained glory on the battlefield, retired and received favorable and quiet nomadic territories in the depths of the Jochid country. However, Shibān's corps had to subjugate the Kypchaks again in the northern periphery of the Ural steppe. Their place within Shibān's ulus should be highlighted. According to archaeological data, before the Mongol expansion to the West, the Kypchaks and their related Kanglies were merely formal owners of the territories assigned to Shibān. The Kypchaks and the Kangly offered stiff resistance to the Mongols and were cruelly killed after their cities were conquered [Rashid al-Din, 1952, I, 2, p. 198–199, 206, 208]. Those who survived scattered in all directions, many of them went to the northern periphery of the steppe to the Bashkirs, or the Ishtyaks as Abu-l Ghazi calls them [Kononov, 1958, p. 43]. Sources provide no information about the future of the refugees who searched for rescue in the harsh northern regions. Although it is clear that the

Khan and his court. Miniature. Iran.
16th century

fate of those who were subjected by the Mongols or found refuge in the nooks was rather unfortunate. The former were conscripted into the army and placed at the front of each battle and died first. A big family burial-ground, discovered in the forest-steppe zone at the borderline between the Chelyabinsk and Sverdlovsk oblasts, provides certain information about the latter. Radiocarbon dating and ceremonial Islamic burials with specific Khwarezmian features confidently associate the necropolis with the Kypchaks from the period of the Mongol expansion. The authors of the publication note that the population which left the settlement lived in unfavorable conditions: all the buried people had pathologies of infectious and/or dystrophic origin [Koryakova and others, 1999, p. 88].

The return of the surviving Kypchaks to the steppe was probably only possible when Batu needed manpower for the inevitable struggle with Güyük. But considering the bad experience acquired by the Kypchaks after the previous propositions of peace and alliance by the Mongols and the extent of their losses, it

is doubtful that the returnees made up the majority of the nomadic population of the Golden Horde. It was not the Kypchaks, but the Turkic and Mongol tribal groups which originally formed the ethnic basis of the Shiban's ulus, who were from the Irtysh River Region, southern Siberia and Central Asia. All information about the tribal nomenclature dating back to the latter half of the 13th century until the 15th century does not provide evidence of an ethnic Kypchak revival [Kostyukov, 1998]. This is also evident in the large collections of archaeological materials from the 13–14th centuries. In particular, burial sites within a single necropolis exhibit an extreme diversity of details of the burial rite, eloquently showing the ethno-cultural complexity of the ulus populations [Kostyukov, 1997].

The Naiman, Karluk, Kushchi and Buyrak 'Omaks', consisting of fifteen thousand families and provided to Shiban, were apparently the basic units in his tumen who went through all the travails of the 'seven-year campaign' (marks of healed wounds were found on many skeletons from the discovered burial sites of the Golden Horde period in the Ural-Kazakhstan steppes). It was reasonable for Batu to keep corps of experienced veterans in the vanguard, in view of the likelihood the conflict with Güyük which could enter into a military phase. Although the conflict never turned into an open collision, Shiban was perhaps directly involved in its resolution. William of Rubruck reported that on his way to Karakorum he was put up by the widow of Batu's brother 'Stikan', which is easily associated with Shiban. She said that Shiban headed a delegation sent by Batu to Güyük to prepare a face-to-face meeting of two of the most powerful Chinggisids. In the course of the negotiations, Shiban and Güyük appeared to have had a quarrel and they struck each other dead. This dramatic story sounds rather plausible, but William of Rubruck doubted its veracity, and heard other versions, saying that Güyük was simply poisoned by the agents of Batu [William of Rubruck, 1993, p. 118]. The eastern sources also maintain a version about the poisoning of Güyük, moreover, they place the name Shiban among participants of a meeting at which candidates for the position

of the new emperor were discussed. One thing is clear: by the time of William of Rubruck's travels, Shibān was already dead. This is indirectly proved by the fact that in 1251, Batu put Berke and Tuqa-Timur, whose previous military merits were not mentioned in the sources, at the head of his huge army, sent to support his candidate for the Karakorum throne, instead of the experienced commander Shibān.

However, it seems that mutual disaffection between Güyük and Batu did not influence the intensity of contacts intended to organize the efficient use of conquered lands and income distribution. In this aspect, it was extremely important that the zone of the Kazakh steppes was the shortest summer route between Karakorum and Batu's quarters [Ivanin, 1998, p. 236]. A trip from the center of the Ulus Jochi to the capital of the Empire across the high steppe ranges took little more than two months, whereas a journey through Middle Asia took from three to four months. But in order to get such a significant benefit in time, it was necessary to create a reliable functioning system of yams on the northern route, where couriers, government officials and ambassadors could get fresh horses and necessary food. This was probably one of the most important tasks entrusted to Shibān. If all the geographical landmarks and summer and winter camps named by Abu-l Ghazi were actually mentioned in the patent, the scrupulousness of their enumeration reveals Batu's main subject of attention. In 1246, as is revealed from the trip of Giovanni da Pian del Carpine, the yam service within Shibān's dominions was not functioning well yet. But already in 1254, on his way back from Karakorum, William of Rubruck notices certain advantages of the northern route. This information enters 'Opus Majus' by R. Bacon, who notes the two-fold time difference between the southern and northern routes [Matuzova, 1979, p. 215]. Thus, before the mid-14th century, as long as strong authority remained in Sarai and as long as it maintained regular relations with Karakorum and with Khanbalīq, the Shibānids were responsible for keeping the yams in working condition.

Unfortunately, written sources only allow us to draft a general picture of the ulus' history from its foundation to Abu-l-Khair's rule. Fac-

tual material is reduced to genealogical tables sometimes accompanied by short remarks about the personal features or destinies of certain personalities, as well as sporadic chronicle references to members of the Shibānids, which were usually related to military events. The terseness of the chronicles seems to prove Mahmud Ibn Vali's approving words about the Shibānids, who 'girding themselves with the belt of obedience to Batu Khans descendants, did not allow themselves to express a criminal desire and aspiration to ignore the customs of subordination' [Materials on the History of Kazakh Khanates, 1969, p. 346]. Of course, not everything was reflected in the pages of the chronicles, and the political ambitions of the Jochid sultans to whom the Shibānids belonged were a fluid substance which first of all depended upon the strength and influence of the central power. Nevertheless, we may consider it true that Shibān's clan expressed loyalty to the reigning rulers before the 1360s. As a rule, this behaviour guaranteed the preservation of the sultans' rights and privileges, but surely, within the frame established by tradition. We may conclude that Shibān's offspring occupied an unimportant position in the political system of Ulus of Jochi if we observe the composition of the kurultai held in spring 667 AH (from 10 October 1268 to 30 August 1269) 'at meadows of Talas and Kendjek'. The most important territorial issues touching Shibān's interests (and to a greater extent, the interests of Orda Ejen's house) were solved here. However, representatives of these uluses were neither mentioned in the events which had caused this kurultai, nor among its participants [Rashid al-Din, 1946, III, p. 71].

Anyhow, the Shibānids' attachment to lands which were not particularly wealthy and enviable in comparison with the appanages of other Chinggisids was not left without recompense. According to V. Bartold's just remark, 'a nomadic lifestyle mostly prevailed in the domains of Shibān's descendants. Nevertheless, even here, for over 200 years, power could be concentrated in the hands of members of one and the same khan clan, which was a rare phenomenon among nomads. Shibān's offspring who had been scarcely impacted by the urban culture remained loyal to the military traditions

of nomads and therefore could play the role of conquerors in the time when the strength of Chinggis Khan's dynasty was almost on the wane everywhere' [Bartoldt, 1968, V, p. 135]. A modest nomadic living contributed to the preservation of the values bequeathed by Chinggis Khan's Great Yasa and first of all—of familial subordination and solidarity which provided the most favourable political perspectives by the 15th century, because '... Shibanid sultans, due to their multiplicity and obvious numerical superiority, differed from other khans of the Jochid origin' [Materials on the History of Kazakh Khanates, 1969, p. 354].

After Shiban's death, control over the ulus passed to his second son Bahadur (out of 12 sons) and would always remain in the hands of his offspring. According to Mahmud Ibn Vali, Bahadur 'after ordering the closest relatives, tribes and the Kauchins to gather together,... chose the Ak Horde, also named the Yuz Horde, for spending winters and summers' [Ibid., p. 347]. It is curious that the name of Shiban's youngest son, who was to inherit his father's yurt and did not leave heirs, was Kunchi. 'Northern king Kanchi', whose possessions were described by Marco Polo, is usually identified as Kuinji, Orda Ejen's grandson. However, the vivid northern flavour of Kanchi's lands where 'neither cities, nor castles were present' [Marco Polo, 1955, p. 225–226] hardly corresponds to the true geography of Kuinji's possessions, who was also named Rukn al-Din Baybars, 'the ruler of Ghazna and Bamyan' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 118].

Mahmud Ibn Vali's mention of 'four Kauchins', together with a report of 'four Omaks', is evidence of the fact that the basis of governing the ulus was formed by the universal Turkic-Mongol tradition, according to which four non-Chinggisid emirs formed a kind of a 'state council' representing the interests of four large groups of the population united on an ethnic basis [Schamiloglu, 1993]. The Shibanids had to serve in the place assigned to them by the khan; his will regulated the borders of nomadic territories. Thus, the Shibanids' prosperity was possibly not entirely guaranteed during the reign of Berke. Mengu-Timur's return

('according to Batu Khan's orders') of several Ak Horde possessions to Bahadur, which was described by Abu-l Ghazi, implies that these possessions had been annexed by Berke [Abu al-Ghazi, 1906, p. 152]. Moreover, for some reason, Berke refused to take Shiban's fourth son Balakan under his patronage, who ruled Jochid tumens in Iran together with Kuli and Tatar, the sons of Orda Ejen and Buval [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 188–189, 380; 1941, p. 57, 67–68].

If the Shibanids' disgrace is indeed hidden behind the above mentioned facts, its reason was likely a dispute on a religious basis. On the one hand, all sources note Berke's strict adherence to Islam, on the other, the right-wing Shibanids were possibly inclined to Christianity. It could also have had family roots which are found, for example, in the Christian etymology of Shiban's name [Pelliot, 1949, p. 44–47] or in a friendly greeting of William of Rubruck by Shiban's widow [Rubruck, 1993, p. 118]. It could have also been driven by the confessional situation in the ulus, a part of population of which was represented by migrants from the tribes which had been long involved in the orbit of Nestorianism and Buddhism. According to the Catholic missionary Johanca, in 1320, 'judges of the Bascards', that is, representatives of the Jochid administration in the lands of the Bashkirs, strongly followed Christianity and even started to organize missionary activities of Minorites in Siberia [Anninsky, 1940, p. 92–94], while at the beginning of the 15th century, the Bavarian Johann Schiltberger had an opportunity to see Buddhist joss houses in the Trans-Ural Regions [Schiltberger, 1866, p. 35]. It is well-known that at the end of Batu's rule, the nomadic territories of Berke and the Shibanids neighboured each other, and this neighbourhood hardly favoured the relations between the zealous neophyte Berke and Shiban's family, who had a liking for Christianity, and could have even been Christians. Besides, some circumstances of Berke's 'expelling' from the Ciscaucasian Steppes to beyond the Volga area convince us that its reasons were religious predilections of the ulus's future ruler. Berke's antipathy to his brother's family could have also been ignited by the zeal Shiban

expressed when devastating Islamic Volga Bulgaria.

In the time of Mengü-Timur's and Tokhta's reign, chronicles mentions the son of a Balakan who died in Iran—Tokta-Murtad or Tama-Toktai (the titular term 'Tama' means that Tokta-Murtad was a commander of a corps detached from the general army and deployed in a certain area). He commanded troops in several battles against the Hulagu-ids, then he was ordered to guard what was the most important border territory of Ulus of Jochi—the area of Derbent. In the final part of Tokhta Khan's struggle with Nogai, Tokta-Murtad supported the former and appeared to be the key figure in the battle, ending with Nogai's death. As we know, one of the reasons for the complete breakup between Tokhta Khan and Nogai was the demand of the powerful general to deliver Tokhta's uncle Saljidaï Gurgan. This was followed by Nogai's 'seduction' of 'several thousands belonging to Toktai' and finally, Nogai started to demand the delivery of not only Saljidaï Gurgan and his son Yaylak, but also of Tokta-Murtad. Then Tokhta, after inviting Tokta-Murtad, decided to engage the adversary in one more battle, which at last brought him victory over the autocratic ruler [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 71–72]. It is possible that the reason of this disgrace was Tokta-Murtad's raid against the Ilkhans' possessions at the time when Nogai attempted to make friendly relations with Arghun [Rashid al-Din, 1946, III, p. 117]. Meanwhile, it is curious that when describing these events, Rukn al-Din Baybars for some reason portrayed Shiban's grandson as an 'apostate' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 113]. It seems that this characteristic reflects the close relations between Nogai and Tokta-Murtad, which were either official or more likely, familial.

The Shibanids' loyalty to Batu's heirs was generously rewarded when Öz Beg Khan ac-

Plan of Saray-Jük ancient town

ceded to the throne. According to Ötemish Hajji, among all the sultans, Öz Beg made an exception only for Shiban's descendants: he 'granted them the Buirak and Karlyk which form a two-part tribe, and made them autonomous' [Ötemish Hajji, 1992, p. 103–105].

At the beginning of the 'Great troubles', the Shibanids seem to have limited themselves to a demonstration of independence from Batu's heirs; the latter had already lost influence and real power. However, their ambitions could only be satisfied by the conquest of Sarai. Khidr Khan was the first among the Shibanids who took the Horde's capital. He ruled there for one year and a half until his son Timur Hoja killed him. In the 1360–70s, some other Shibanids managed to occupy the city for a short period. But at the beginning of the 1380s, when Tokhtamysh established himself in Sarai, they were forced to accept the situation. Later, during Timur's campaign against Ulus of Jochi in 1391, when he reached the South Ural steppes, the Shibanids decided not to tempt fate in the notoriously unequal contest and, according to Mahmud Ibn Vali, retreated behind the Irtys River, to their ally, the Kirghiz [Klyash-torny, Sultanov, 1992, p. 196].

Only after emir Edigu's death, the Shibanids' fortunes turned again and soon the vast steppe spaces in east Dasht-i Kipchak, as well as many regions of Middle Asia, fell under their control.

§ 11. Saray-Jük and settlements of the Volga-Ural interfluvium

Albert Burkhanov

The region of the Volga-Ural interfluvium, a steppe and semi-desert zone, was used in the Golden Horde era mostly for the nomadic economy [Fedorov-Davydov, 1966; 1981; Kriger, 1984; Garustovich, and others, 1998; Yaminov, 2003]. Rare sedentary settlements were arranged nearby rivers. They were discovered thanks to the results of small archaeological expeditions, while their Golden Horde names are not known.

Standing mausoleums of the 14th century built of brick and stones were preserved in the steppes of the southern Urals and north-western Kazakhstan. In particular, in the mid-stream of the Buzuluk River, two mausoleums and a ceramic furnace were dug out [Castagné, 1910, p. 41–43; Popov, 1971a, p. 177; 1971b, p. 139–144; Fedorov-Davydov, 1994, p. 37; Vasiliev, 2003, p. 144–145]. Mausoleums were constructed as singular or family tombs of major Golden Horde aristocrats from the nomadic society, which supports the fact of the wide proliferation of Islam throughout Ulus of Jochi's steppe zone [Rakushin, 1998; Izmaylov, 2004, p. 99–107; Malov, Malyshev, Rakushin, 1998].

One of the most important administrative-political and trade-craft centres of Ulus of Jochi was the city of Saraychuk (Saray-Jük). Its name is well-known from written sources and coins minted here in the 14th century.

Remains of the ancient city which are known today as the ancient town of Saray-Jük are 50 km north of the Kazakhstan city Atyrau (Guryev until 1991) on the right bank of the Ural (Yaik/Zhayyq) River [Agapov, Kadyrbaev, 1979, p. 187–193; Goncharov, 2001, p. 179–183; Tasmagambetov, Samashev, 2001; Fedorov-Davydov, 1981, p. 231; 1994, p. 37, and others].

Scientific examinations of Saray-Jük's ruins have more than a two centuries-long history. Interesting data on the city has been left by P. Rychkov, P. Pallas, A. Levshin, J. Castagné, V. Grigoriev and others [Rychkov, 1759; Levshin, 1823, p. 10; Grigoriev, 1908, p. 183–193; Castagné, 1910, p. 95–97]. Archaeologi-

cal studies of the ancient town have been carried out by N. Artyuzov (1937), A. Margulan (1950) G. Patsevich (the 1950s), and L. Galkin (the 1970–1980) [Artyuzov, 1949, p. 126–135; Margulan, 1951; Patsevich, 1956; 1959; Pachkalov, 2003, p. 173].

Since 1996, large-scale stationary investigations at the ancient town have been conducted by the Western-Kazakhstan archaeological expedition of the Institute of Archeology named after A. Margulan (led by Z. Samashev) [Samashev, 1998; Aitova, Samashev, 1998, p. 35–41; Samashev, Kuznetsova, 2000, p. 84–100; Tasmagambetov, Samashev, 2001; Goncharov, 2001, p. 179–183].

Saray-Jük, as one of the most important administrative points of Jochi Ulus, was founded in the latter half of the 13th century. In the first half of the 14th century it became a large political and trade-craft centre of the Golden Horde [Egorov, 1985, p. 124; Fedorov-Davydov, 1994, p. 37; Goncharov, 2001, p. 180]. It happened due to the fact that Saray-Jük was located in a strategically key point, providing safety for part of the transcontinental caravan route from European countries and Ulus of Jochi's capital part—the Lower Volga Region—to the cities of Khwarezm and Middle Asia, Iran, India and China. There is much extant information provided by merchants and travelers about the direction of this route and modes of transportation, about the nature and price of transported products. The trade route from the Lower Volga Region to Khwarezm through Saray-Jük was provided with comfortable caravanserais and wells. According to contemporaries, including Francesco Balducci Pegolotti, in the 13–14th centuries, this road was the main and safest way connecting Eastern and Western countries [Grigoriev, 1908, p. 183–193]. A convenient geographical location played a huge role in Saray-Jük's development: castles, mosques, madrasahs, caravanserais, banyas and other architectural constructions were built there. The city had a strictly elaborated planning with straight

streets and wide squares. Buildings were erected by talented architects, including representatives of the most famous architectural schools of the East.

A mention of this Golden Horde city is found in the work of Ibn Battuta, who visited the area in 1333/1334: '... after departing from Sarai, we arrived in Saraydchuk (Saray-Jük)... The city was located on the bank of a full-flowing large river called Ulusu (Ural) the meaning of which is a "great river". A bridge of boats, similar to the one in Baghdad, was thrown athwart it... In this city, a zawiya of a righteous Turkic monk who is called an Ata (father) is situated. He feasted and blessed us. This city's qadi also received us' [Ibn Battuta, 2000, p. 38–39; Collection of Materials Relating to the History of the Golden Horde, 1884, p. 307–308]. As we see from the words of the Arab merchant and traveler, before setting off on a long journey along the caravan route, people were blessed in Saray-Jük by Islamic holy people who lived near saints' graves.

Saray-Jük's fame and greatness are related not only to the burial places of Islamic sheikhs, but also to the fact that it was one of the main pantheons of the Jochids. According to Khiva Khan Abu-l Ghazi, Golden Horde khans and aristocrats were buried there [Grigoriev, 1876, p. 320; Tasmagambetov, Samashev, 2001, p. 58]. However, this is only a hypothesis. According to one version of the Tale of emir Edigu, the head of Tokhtamysh, who had died in Siberia, was possibly buried in Saray-Jük in 1406. The graves of a number of Nogai princes and murzas, the epic heroes Yer-Targyn and Kambar, as well as the Kazakh Khan Kasym are also situated here [History of Kazakhstan, 1997; Tasmagambetov, Samashev, 2001, p. 58].

Results of multi-year archaeological works allowed researchers to distinguish three basic stages in the life of the medieval city [Samashev, 1998; Tasmagambetov, Samashev, 2001, p. 59; Goncharov, 2001, p. 179–183; Pachka-lov, 2003, p. 171].

The early stage constitutes the first decades of Saray-Jük's existence. In this period, the city had a central part which was built up with adobe brick houses. The suburban part was lo-

Ceramic fragment with a stamped ornament.
Saray-Jük

cated to the south, closer to the river and along it. It was 300 meters wide and filled with yurts and light framed buildings.

The second stage began in the 1330s and lingered for the rest of the 14th century. Saray-Jük's golden age falls exactly in this period. The city started to be organized and broadened: brick constructions were erected in the city. Saray-Jük extended into the isle between the Yaiks' estuaries, thus controlling all movements along the river in this part. Based on the data provided by Fra

Mauro and information from authors of the 19th and the beginning of the 20th century about the ancient town, as well as the contemporary state of the historical-cultural landscape, Saray-Jük's size amounted to over 1200 thousand square meters (2000 meters long from west to east with a width of 600 meters).

The third stage in Saray-Jük's development was between the 15th and 16th centuries. In that period, the city's topography gradually decreased in size and shifted southeastwards, towards Sorochinka channels' branching from the Yaik. Between the 18th and 20th centuries, the Yaik changed its corridor many times. During high water, the river seriously destroyed the ancient town's cultural layers. Currently, the remains of Saray-Jük, excluding the neighbouring territory with an ancient cemetery, have a size of 360 thousand square meters (600x600 meters).

Household items made of bone. Saray-Jük

Household items made of iron. Saray-Jük

All three stages of the city's history are well traced from archaeological materials, especially thanks to recent research by Kazakh archaeologists.

When Saray-Jük was built, the traditions of nomadic urban development were taken into consideration and thus works were done according to a single plan. Houses were constructed mainly of adobe brick and consisted of two to four rooms, each with dimensions of 4x5 meters. Bench-sufas, 1.5–2 meters wide, which were characteristic of an Eastern house, were always placed along three walls of the room. These sufas were heated by horizontal flue channels, or 'canalias', which were installed inside of them. All walls and sufas were plastered and whitewashed. The floor was made of compacted clay. Coverings of reed mats were preserved in a number of quarters. Walls above sufas had arched niches in which candelabras, expensive cookware and other household items used to be placed. Apart from living areas, houses also had household premises in which holes for storing millet and

barley, as well as plums, apples, grapes and almonds were located. Dried onions were also discovered here. Storage facilities were fenced from heated living areas by walls made of a wooden frame and adobe bricks inserted in them in the form of a spruce. Such constructions were decorative and served for the natural ventilation of storage places.

In general, the architectural system of Saray-Jük houses and their interiors show the influence of traditions of the medieval cities in the Lower Volga Region, Khwarezm and the Syr Darya River [Fedorov-Davydov, 1994; Baypakov, 1998, p. 58–59; Akishev, Baypakov, Erzakovich, 1972; Baypakov, 1999, p. 35, 39, 42, 47–55; Burkhanov, 2001, p. 69–71; Zilivinskaya, 2001a, p. 67–69; Egorov, Poluboyarinova, 1974, p. 44–68].

A space was unsealed in one of the houses in which, apart from a tandoor and sufa, remains of the original construction were found—smokehouses for fish and meat products.

Pottery of various forms of local production was discovered in the rooms. Vessels

'Horse' pendants made of bone. Saray-Jük

made of composite white frit material covered with shiny turquoise enamel are of interest. There were also imported products, such as stone boilers from Khwarezm and Khorasan, glazed vessels from the Lower Volga cities and Chinese celadon items.

Apart from the central part, the city's suburbs were also developed and built-up in the period under consideration. Out-of-town estates were 5 km away from Saray-Jük, near river channels. Flower and vegetable gardens and sowings were located near country houses. Camels and horses used in the caravan trade were kept in the Yaik floodplain. Chichir constructions were used for vegetable gardens and orchids. Vegetable and horticultural crops, as well as grain were cultivated here.

Similar to many Golden Horde cities, fortifications were absent in Saray-Jük, however, citizens lived calm and peaceful lives. At the second stage of the city's development, since the second quarter of the 14th century, due to the high water in the Yaik River and flooding of the outskirts, Saray-Jük's inhabitants had to settle more densely. This rearrangement made the city higher, but kept the basic streets and quarters. New houses were built in place of older ones. Multi-room houses with household spaces located under the same roof as inhabited spaces were built.

As before, the main part of the residential area was occupied by a U-shaped or L-shaped sufa with a furnace and channels in one of its parts. Internal walls served either as a shield or a frame. Walls and sufas were plastered, then

whitened and adorned with kiizes and carpets. In many houses, floors were laid of burnt brick. A tashna (in the form of a vessel) was placed near the furnace, in which utilized water was poured out to be absorbed by the ground.

Remains of a banya consisting of several rooms having different functions were also discovered. Water was heated in cast iron boilers.

The basic water-supply in the city was carried out via the transportation of river water in jars by araba carts and by means of deep wells in yards. It is possible that in certain cases, water was received from irrigation channels and through the water-supply.

In the mid 14th century, crafts reached high development; goods produced here provisioned citizens of the city and steppes. Multiple discoveries of ceramic vessels and other products, and the remains of workshops and furnaces speak of a high level of pottery in the city [Patsevich, 1956; Samashev, Kuznetsova, 2000, p. 84–100; Tasmagambetov, Samashev, 2001, p. 63].

Clay of three types was used in the production of ceramics. Red-clay products included jars, saqiya vessels, big khoums for storing products, bowls and chirag lamps. The second type of ceramics consisted of teabowls, cups, jars and vases artistically decorated with composite white frit material and adorned with diverse floral and zoomorphic ornaments. The third type included stamped grey pottery jars and canteens. Their surface was decorated with a relief ornamentation and symbolic

pictures of fish, birds, plants, stars and Arabic texts of a philosophical and religious content.

Saray-Jük was one of the centres of bone carving. It is vividly evidenced by various multiple discoveries: buckles, covering plates for bows, ornament details of quivers, knife handles, rings for archery, instruments for textile and leather industries, so-called 'horse' pendants, etc. Talented craftsmen made leather objects: bags and belts, boots, heeled boots, coats, wineskins, saddles...

Multiple glass products were extracted from layers from the 14th century. These were locally produced beads and rings, various bowls, and plates of coloured window glass.

A variety of discovered iron and bronze objects is evidence of developed metallurgical production in Saray-Jük. Local blacksmiths were skillful and produced items meeting the needs of citizens, merchants and nomads. Harnesses for horses, knives, arrowheads, scythes, grub hoes, etc. were among the results of their production. Bronze casters cast art products: buckles, cups, and lockers in the forms of horses and mirrors of various themes on the reverse side. Stamps covered with the Arabic script designed for the production of leather frontpieces were also found here.

Local jewelers worked on production of unique pieces of art; discoveries in the ancient town include: rings with multicoloured insertions, bracelets decorated with rich carvings, exquisite earrings and golden galloons.

According to written sources, the economic life of Saray-Jük's citizens was influenced by the fact that the caravan route went through the city. In this regard, they bred excellent horses and hardy camels. According to ibn Arabshah, an Arabic author of the 15th century, caravans from Khwarezm through Saray-Jük to the Lower Volga Region and to the Crimea travelled for three months 'without any fear and caution'. 'Caravans did not carry any products or food for horses. Neither did they take a guide with themselves due to a multitude of (local) peoples and sufficient security, food and drinks which had people (living there)'. [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 460]. As judged by discovered findings—inscriptions

on dishes, bronze objects, etc.—we can speak of spreading literacy among Saray-Jük's inhabitants.

This Golden Horde city, situated on the cross-roads of the main caravan routes, was involved in the international trade. Active trade was carried out with Eastern countries—China and India, Middle Asia and Iran, Eastern Europe and the Caucasus, Crimea and Western European states.

Ceramics of the jade green colour from China, or celadon, were found among multiple imported items. Stone boilers, peculiar vases, keses and plates made of pure clay and covered with grazed ornament were brought from Khwarezm. Iran and Middle Asia provided necklaces of glass, cornelian and crystal beads, as well as inserted pieces of turquoise for rings. Amphorae filled with wine and oil were imported from Trabzon through the Crimea. Gorgeous glazed bowls and vases made by Saray-Jük craftsmen were in turn exported and adorned other cities of the Golden Horde [Fedorov-Davydov, 1994, p. 37; Tasmagambetov, Samashev, 2001, p. 65].

Saray-Jük was one of the most important political and religious-ideological centres of the state, and thus was always in the orbit of the Golden Horde's aristocracy. At the beginning of the 1370s, it was part of the domain of Aibek from the Shiban clan, who also minted his own coins here. In the middle of the 1370s, the city was taken by Urus Khan (1361–1380), an descendent of Orda-Ichen, while at the end of the 1370s it was occupied by another Shibanid, Arabshakh [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 241]. According to numismatic data, a new but short-lived period of construction started at this time. Monumental constructions were erected in the city, according to archaeological data [Samashev, 1998, p. 137–162; Tasmagambetov, Samashev, 2001, p. 66–67].

Tokhtamysh's war with Emir Timur, which devastated Ulus of Jochi, did not touch Saray-Jük [Egorov, 1985, p. 223].

Numismatic materials detected in the ancient town of Saray-Jük are unique and interesting, and are dated to the period from the end of the 13th to the 16th century [Aitova, Sama-

shev, 1998, p. 35–41; Tasmagambetov, Samashev, 2001, p. 68–69; Goncharov, 2000, p. 180–181; Pachkalov, 2003, p. 171; Fedorov-Davydov, 2003]. A great number of Sarai coins of the initial period of Öz Beg's reign were found here. Coins contained the ancient Turkic good wish—'Kutluğ Bolsun'.

During the unrest of the 1360s–80s, the capital's court continued to mint coins with names of the khans struggling for the throne—Khidr, Khair-Bulat, Keldibek, Tulunbek Khanum and others. A great number of Khwarezmian coins also circulated in the city which were notable for their coinage, big weight and decorative images. Unique coins from Hajji Tarkhan, Crimea, Orda al-Muazzam and Sygnak were also discovered.

According to the coin discoveries, Saray-Jük experienced an economic and cultural renaissance between 1310 and 1370. In the times of troubles of the 1360s–80s, monetary circulation of the Golden Horde was supplied by Saray-Jük coins. In its ancient town, even golden coins of the 14th century were discovered.

During the period of Tokhtamysh's reign, the local market was replenished by coins from Sarai, while at the end of the 14th century and the beginning of the 15th century, various copper pulis of the coinage of Saray-Jük itself appeared. A multi-petal flower is depicted on one of the local coins, while the reverse side indicates that the coin was minted in Saray-Jük city. Another coin has an animal resembling a lion with a brightly decorated tail on its obverse and a forked tamga on the reverse side.

In the course of the Golden Horde's collapse, a struggle for power and an attempt to revive the bygone power of the state began.

Settlements of Kunya-Uaz I and Kunya-Uaz II (according to Ye. Nerazik)

Among the claimants, there was Urus Khan's grandson Barak who in the 1420s conquered the throne in Sarai and, after losing it, died in internecine feuds. His head brought the winner the position of Saray-Jük's daruga [Klyash-torny, Sultanov, 1992, p. 208–212].

After the 1420s, Saray-Jük gradually became the centre of the Mangyt Yurt, which later turned into an independent state—the Nogai Horde [Trepavlov, 2001; Ovchinnikova, Akhmetzyanov, 2004, p. 281–287].

Currently, the ancient town of Saray-Jük is quickly disappearing and it is first of all caused by the change of the Yaik's course. Therefore, it is extremely important to continue the active archaeological research initiated in 1995, which is continuing to this day by Kazakh scientists with the participation of scientists from Moscow and Astrakhan. In September 1999 a historical-cultural complex was opened in Saray-Jük, which includes the mausoleum 'Khan Orda', an archaeological museum and a mosque. Saray-Jük ancient town was assigned the status of an archaeological-cultural monument of national significance. In the coming years, opening and preserving the main objects of Saray-Jük's protected area are planned. Moreover, the city's improvement, the provision of necessary communications, the creation of tourist infrastructure, and the reconstruction of the ethnic image of the medieval city are imminent.

§ 12. Settlements of Khwarezm

Albert Burkhanov

Ulus of Khwarezm was situated on the southeastern borderline part of the Golden Horde. The consequences of the Mongol invasion of this Middle Asian region were grinding: the country was desolated, the capital Gurganj (Urgench) was foraged and flooded, many cities and settlements perished from fire, while the irrigation system was knocked out of service for a long time [Gulyamov, 1957, p. 165–166; Tolstov, 1958, p. 14–15; Vakturskaya, 1964, p. 110–111]. However, the country started to gradually recover already at the end of the 13th century, but not in all territories [Nerazik, 1976, p. 123–157; Vakturskaya, 1964, p. 110–111; Andrianov, 1969, p. 175].

So far, research does not suggest that the irrigation system of Khwarezm in the latter half of the 13th century was completely restored. But in the first half and the middle of the 14th century, a new boom of the region's economic life is seen, especially in northwestern parts of Khwarezm which became part of Ulus of Jochi.

New archaeological data from northwestern Khwarezm shows that the region's inclusion into Ulus of Jochi contributed to the strengthening of cultural-ethnic connections between its citizens and the population of the Syr Darya basin. In this respect, the history

of the Kongirat tribe, who were fathers of the local Khwarezmian dynasty of Sufi, is of special interest [Fedorov-Davydov, 1958b, p. 93; Vaynberg, 1959, No. 5, p. 104–114].

Ethno-cultural influences from abroad started to appear during the Golden Horde period, such as in distinctive patterns of settlement which had no roots in the local Khwarezm environment, the appearance of dwellings, and some irrigation-farming skills. The instability of the river regime in the basin of the lower Amu Darya is exemplified by such facts as the abundance of chigir installations, a great number of howzes, and traces of dams. Apart from artificial irrigation channels, natural river corridors were also put to use, both manipulated and lengthened. Water rose to high marks in basins and then, when needed, flowed naturally to fields [Andrianov, 1969, p. 182; Nerazik, 1976, p. 124; Burnakova, 2001, p. 84–89].

Rural outskirts started to gradually recover at the end of the 13th century and the beginning of the 14th century, as made evident by the appearance of various populated places—villages and settlements. The bulk of populated localities was arranged along irrigation mainlines, stretching in narrow lines reaching 10 km in length [Nerazik, 1976, p. 140].

The findings of archaeological surveys allow us to suggest that in the Golden Horde

time, a significant number of settlements existed in Ulus of Khwarezm [Ibid., p. 123–157]. At the same time, vast territories were left neglected and uncultivated. They stretched for hundreds of kilometers, as evidenced by Ibn Battuta, who rode for 18 days from Khwarezm to Bukhara and saw 'neither a village, nor a single city' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 314; Mamedov, Muradov, 2000, p. 38–46; Ibragimov, 1988].

The suburbs of the ancient town of Kunya-Uaz were covered with a dense irrigation network, both in ancient times and in the Golden Horde period. However, few settlements of this epoch were preserved. The settlements Kunya-Uaz I and II are located in sands 1,5 km north of the ancient town.

The settlement occupied a small territory and was located at the bottom of a building with massive rammed clay walls. The settlement's houses were one or two-roomed and had yards. This village had no more than 10 houses and was compact: buildings were located 10–30 meters away from each other. Furrows of arable lands stretched immediately after the outermost houses. A cemetery adjoined the village from the east. A vast rectangular territory (100x125 meters) surrounded by an adobe wall was found 150 meters away from the village. Traces of irrigation ditches forming a system of 'beds' were preserved inside. A cemetery was situated nearby.

The remains of large settlements of the 14th century were preserved in the area of the ancient channel 'Shamurat'.

The ruins of the fortress Akcha-Gelin are situated here, on the eastern slopes of Tuz-Gyr. Settlements, divided by small gaps, stretch along the channel and sometimes it is difficult to distinguish one settlement from another. Akcha-Gelin I settlement, which has a vivid dispersed character, extended for 5 km along the southern corridor of the Shamurat. Here, 40 constructions are arranged in compact 'nests'. Smaller 'daughter' groups are seen within them. A peculiar feature of each of them is a vast territory fenced by an adobe wall (occupied by vineyards, horticultural crops or melon fields) with irrigation ditches

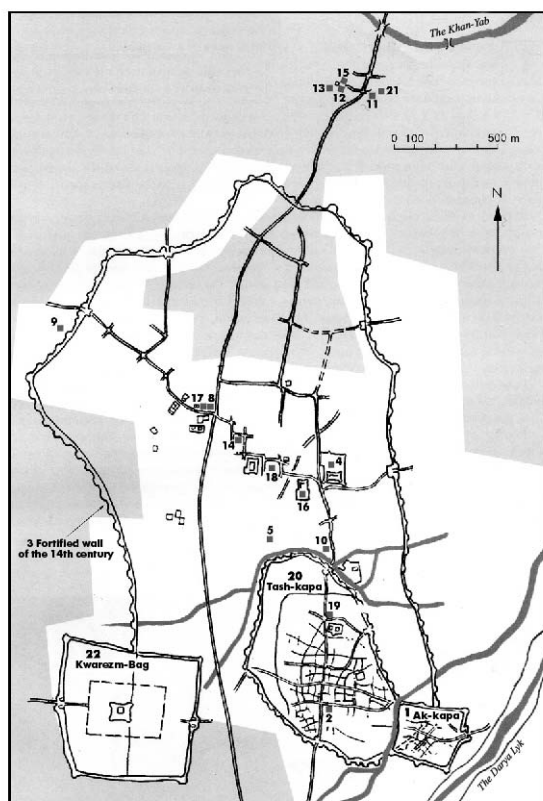

Pottery from settlements of Khwarezm
(according to Ye. Nerazik)

neighbouring it. An inselberg of a small pedimental construction in the form of a small one-room tower was placed in each of its corners. The sizes of the territories are from 300x150 meters to 200x100 meters. The fences of the territories were preserved at a height of 1.5 m.

Inside each 'nest', there was either one house or a group which was part of single house and was usually of a large size. For example, one of houses consisted of 5 rooms and corridors dividing it into two parts. The western one was occupied by storage rooms, while the eastern part was occupied by residential rooms. One of the rooms had its floor elevated for the most part and formed a low adobe sufa with a hearth which was smeared into it made out of old khumcha [a jar] and a rectangular deepening in front of it.

Discoveries show that the settlement's inhabitants used various glazed and unglazed crockery. Pictures were made with red-brown,

Plan of Kunya-Urgench ancient town

brown, green, yellow and rarer—black and white inks upon a yellowish or greenish priming colour, then covered with a colourless glaze. There is also glazed cookware made of a composite white frit material with a white-green picture drawn against a grey dotted background.

Settlements of the rural type were also discovered near Shakhrlık ancient town, located 90 km southwest of the centre of Kunya-Urgench (Turkmenistan) [Nerazik, 1976, p. 138; Durdyev, Khodzhanizayov, 1973; Vakturskaya, 1963, p. 45]. Shakhrlık's square is around 15 hectares and the city had no fortified wall. Traces of pottery, glass-making, copper-smelting and iron production were found at its ruins. As N. Vakturskaya mentions, 'all the surroundings of Shakhrlık up to Ak-kala... in the northwest and to Yarbekirkal in the southeast are paved with ruins of medieval rural settlements and are cut across by a small irrigation system with traces of old fields along it' [Vakturskaya, 1963, p. 45].

Khwarezm-bag. Wall fragment

Two quadrangular fences—orchid-garden plots (160x160 m, 110x80 m)—were registered not far from Shakhrlık. They are conveniently located near the estuary of the Northern Daudan's duct and a large channel. At the end of the 14th century, the population experienced great difficulties with water and therefore widely used chigir installations.

In Ye. Nerazik's view, settlements in the area of Shakhrlık represented a kind of a 'khutor' or hamlet—a group of buildings gravitating to one or several garden plots fenced with a wall.

In general, 44 constructions were studied in the vicinity of Shakhrlık; the size of most did not exceed 200 square meters. For example, one of the studied buildings consisted of a single residential area, though it was divided into sections, which suggests that living cells had to be isolated. Rooms were usually not connected to each other and were divided by blank walls. They were usually residential and were traditionally furnished: the larger part of the room was occupied by a sufa. Rooms were richly ornamented with alabaster and glazed tiles. Two water reservoirs made of brick were found in one of the rooms. They must have been baths. Several furnaces were discovered in the houses, some of which resembled tandoors. It is vivid that a great number of tandoors is likely related to worship of a saint's mazar [tomb] located nearby and the necessity to bake a large amount of flatbread for pilgrims [Nerazik, 1976, p. 149].

The houses usually contain fragments of hums of a reddish firing with shelf-like rims covered with brown engobe; grey water-bear-

14th century. General view

ing jars; grey bowls and bowls made of kashin [a white frit material] with a grey-blue-green painting on a light background. Discoveries in settlements mostly include glazed and unglazed ceramics; different jewels and objects are also found.

Golden Horde settlements in the zone of the Darya Lyk were also archaeologically discovered and studied. Among them are the Ak-kala fortress and surrounding settlements which are abundant in the remains of fields and orchards and are surrounded by low adobe fences of a rectangular form, as well as traces of small and large channels. In the 14th century, this territory was well inundated. Besides, along with channels, natural ducts manipulated by people also served as water arteries. Over 60 rammed clay constructions were located on this territory. The settlement's centre was a large house with a farm surrounded by an adobe fence. The remains of other large houses were seen nearby. A small cemetery with the remains of headstones and mazars [a saint's tomb] were discovered within the residential area.

Fragments of glazed and unglazed crockery and other findings were discovered in buildings in the settlement's central part. Around 100 coins dated from the 14th century were found in the settlement and its surroundings. Part of the coinage was made on behalf of Golden Horde khans, mostly, Janibek Khan.

As archaeological research has shown, a dense network of populated localities developed in Ulus of Khwarezm in the 14th century, which allows us to speak of the rapid rise of the region. The irrigation system revived and developed. An important role was played by the domestic and international caravan trade in which Khwarezm merchants themselves took an active part. The local ruler Temür Qutlugh (the Golden Horde governor) and his wife Tyurabek-Khanum also played a large role in the development of the economy and culture, as well as the construction of populated localities and the cult-memorial architecture of Khwarezm and its capital Urgench in the first half of the 14th century. Evidence of this is found in the written sources, as well as extant ruins of architectural objects and ar-

Kunya-Urgench. Tyurabek-Khanum Mausoleum. On the left is a section made according to scaling by A. Vinogradov. On the right is a reconstruction by M. Tuktarov

chaeological findings from Urgench and other Khwarezmian settlements.

The remains of the former capital centre of the city of Urgench are located near the modern velayat centre Kunya-Urgench (Turkmenistan).

The ancient settlement, fortified with a massive wall which covered the Golden Horde city of the 14th century (shakhristan or a citadel) of 430 hectares (according to other data—640 hectares), eclipsed the size of pre-Mongol Urgench and was adorned with beautiful monumental constructions [Yakubovsky, 1930; Vakturskaya, 1958, p. 471; Fedorov-Davydov, 1958a, p. 505–529; Monuments of Turkmenistan's Architecture, 1974, p. 159–2174; Khalimov, 1991; Mamedov, Muradov, 2000; 1998, p. 31–32]. The date of the city's foundation remains controversial [Vakturskaya, 1958, p. 468; Monuments of Turkmenistan's Architecture, 1974, p. 166–167; Khalimov, 1991, p. 7–9; Armachuk, 1998; Yusupov, 1993; Mamedov, Muradov, 2000, p. 12–16]. During the reign of the Khwarezm-shahs, the city was called Urgench (Gurgench, Gurganj, Jurjaniya). In the period of Ulus of Jochi, its name is known as 'Khowarizm' according to Khwarezmian coins. Ibn Battuta who visited the city, called it 'Khwarezm', while Russian chroniclers called it 'Ornach' [Collection of

Materials Relating to the History of the Golden Horde, 1884, p. 308; Complete Collection of Russian Chronicles, 15, 1965, p. 57, 67; Medieval Written Sources About Old Urgench, 2000].

Despite the catastrophe of 1221 caused by the Mongol invasion, the extremely convenient location of Urgench allowed the city to recover, and already at the end of the 13th century it regained its economic and cultural significance in the system of large trade cities of Middle Asia. In the 14th century, Urgench, according to Ibn Battuta, was 'one of the largest, most significant and beautiful cities, rich with glorious bazaars, spacious streets, multiple constructions and select beauties'. He mentions a number of large buildings in Urgench which include the madrasah built by Temür Qutlugh, a cathedral mosque and Tyurabek-Khanum's khanqah, a khanqah near sheikh Najmuddin Kubra's grave, a hospital, a palace which has 'a wooden coloured dome, walls decorated with multicoloured cloths and a ceiling adorned with gilded silk' [Medieval Written Sources About Old Urgench, 2000, p. 29–30], etc. In A. Lkubovsky's opinion, for Urgench, the period of Temür Qutlugh's reign became 'the most brilliant time in its history' [Lkubovsky, 1930, p. 18].

Golden-Horde period Urgench provides us with several architectural constructions of

the cult-memorial and fortification type, as well as objects discovered during the course of archaeological research in the ancient town, which are preserved until today on the territory of Kunya-Urgench.

Urgench's fortification wall relates to these constructions. It is a powerful fortification surrounding the Golden Horde citadel (shakhristan) of the 14th century, which is 430 (640) hectares in size. The wall was preserved in the form of a rampart 10 km long (in some parts it is sectioned by agricultural lands). The best preserved part was the 2 km-long eastern rampart.

The majority of Urgench's monuments are located within the ancient town surrounded by a wall, with a towering minaret located in the centre of the ancient town. The wall itself was almost completely destroyed after Timur conquered the city in 1388. After the destruction, the city's territory was demonstratively sown with barley. However, three years later, one quarter was restored on the orders of the Samarkand conqueror; it existed in the 15–17th centuries [Fedorov-Davydov, 1958a, p. 505–528; Egorov, 1985, p. 126].

Khwarezm-Bag is a rectangular fortress on the southwestern outskirts of Urgench (400x500 meters), surrounded by a tall rampart and divided into two halves by a wall, on the middle of which a large hill is located. In S. Tolstov's opinion, this could have been a suburban castle of rulers from the Golden Horde period [Tolstov, 1958].

Jami-Mosque's minaret is one of Urgench's main sights. A brick inscription on its surface relates it to the names of Temür Qutlugh, the ruler of Golden Horde Khwarezm, and Öz Beg, Ulus of Jochi's sultan. The inscription on the minaret fulfilled in the Kufic script says the following: 'Ordered by his serene Highness, the king of two worlds, whom Allah has favoured with His mercy and opened him the gates of the truth, he is the mighty king, the ruler of the Arabs and Ajams, the brilliance of the earthly world and faith, the salvation of Islam and Muslims, Temür Qutlugh, the son of great emir Najm-ad-Dawal-va-d-Din, let Allah continue the rise of Islam through his patronizing nature, and thus the construction

Kunya-Urgench. Mausoleum of Najmuddīn-e Kubrā. The northern facade and plan (according to I. Notkin)

was erected in the days of the rule of mighty sultan Öz Beg Khan, let Allah prolong his power' [Yakubovsky, 1930, p. 36; Khalimov, 1991, p. 38–40]. Following A. Yakubovsky, researchers date the date of its erection to the 1320s–1330s [Yakubovsky, 1930, p. 36; Monuments of Turkmenistan's Architecture, 1974, p. 191–194; Khalimov, 1991, p. 31–91; Mamedov, Muradov, 2000, p. 58–65].

The minaret represents a conical column 59.9 meters high from the level of the present-day pavement. During the reconstruction, its original height reached 62 meters. It is considered that this minaret belonged to a cathedral mosque which Arabic traveler Ibn Battuta related to the name of Tyuranbek-Khanum, the wife of ruler Temür Qutlugh.

The ornamental ring-like layout of polished bricks (30x30x5cm) beautifully emphasizes the height of the construction. On the minaret's top, nests left after wooden beams are preserved. A lantern used to be placed on the beams, which opened in all directions and

Tile fragments from the gravestone
surface (according to I. Notkin)

was topped by a decorative cornice. From this lantern, a muezzin used to call to prayer.

144 steps lead to the minaret's top in the internal spiral staircase. The staircase begins near the entrance, at a height of around 7 meters from the ground level, which was possibly equal to the level of the mosque's flat roof.

The conical surface of the minaret (the diameter of its bottom is around 11 meters and it is 4 meters at the lantern level) is vertically sectioned into 17 wide belts of ornamental masonry made of double bricks, divided in a checkerboard pattern by figures carved into vertical brick 'bows'. The belts are divided by rings of vertically placed bricks highlighted by a 'ligature' of a narrow brick ornament. In some upper belts, the 'bows' are covered by blue glaze.

At the entrance level, the minaret is encircled by a wide Kufic relief inscription made of polished brick. On its top, the minaret is also edged by three belts of poorly preserved inscriptions. After restoration works, this text was restored. It reproduces ayat 255 of the Quran's second surah. The first belt says: 'In the name of God, merciful and compassionate! There is no God but Him, living and omnipresent. Neither slumber nor sleep may overcome Him. Everything in heaven and on earth is at

His mercy. Who... ' The second belt: '... can stand before Him without His will. He knows what is before them and behind them. They grasp His wisdom in the degree. He allows. His throne is vast... '. Then, the third belt is reconstructed in the following way: '... of earth and heavens. The Almighty and All-powerful is right' [Mamedov, Muradov, 2000, p. 61–62].

400 meters northwest of Temür Qutlugh's minaret, the **mausoleum of Turabek-Khanum** is situated. It is the most famous monument in Kunya-Urgench, combining an elegance, monumentality, a unique space-planning composition and gorgeous decor.

Despite the attempt in recent years to reconsider the date of construction, the majority of researchers continue to think that the mausoleum was constructed during the reign of Temür Qutlugh, his wife or soon after them, that is, in the second quarter of the 14th century [Monuments of Turkmenistan's Architecture, 1974, p. 191; Khalimov, 1991, p. 42–43; Armachuk, 2001, p. 188–210; Mamedov, Muradov, 2000, p. 51–58]. This fact is also proved by Ibn Battuta's historical records. In his description of Urgench in the 1330s, he mentioned Turabek-Khanum's and Najmuddīn-e Kubrā's khanqahs. It is possible that the above mentioned constructions spurred the travel-

er's special interest, because he named them along with the Jami-Mosque and madrasah. Buildings in Kunya-Urgench related to their names have been preserved until today. Therefore, we may observe the grandiose building of Turabek-Khanum's mausoleum exactly as the khanqah that Ibn Battuta described. As a consequence, this building could have been adapted for the burial of Turabek-Khanum herself to become the dynastic tomb of Khwarezm's Sufids.

These thoughts are proved by the building's composition, which is absolutely unusual for Middle Asian architecture, especially—its three-part plan built along the main axis. Behind the tall and deep portal there is a small dome room with entrances into a small hujra (to the left), to the spiral staircase (to the right) and to a broad six-corner hall with a size of around 100 square meters (straight). Afterwards, a small annex (which is destroyed today) used to stand on the same axis behind the hall. Between 1960 and 1960, a crypt with burials was opened in the main hall, which is evidence that the building bore the functions of a mausoleum. Although a combination of the mausoleum itself with a memorial hall, a ziyarat-khana, can be found across the Islamic world, such a three-chambered mausoleum with an accurate axis arrangement is unique in the history of Middle Asian architecture.

The building's inner part is constructed in the form of a hexagonal prism, with deep arch ogival niches and window openings embedded into its verges. On the outside, deep niches are located on a dodecagon of the main volume. On the southern side, a tall and very proportionate portal is located. A constructive gallery is made in its upper part which provides its spatial stability.

This building used to be topped by a high blue pavilion which rose upon a high drum decorated with mosaic hexagons in an accurate terracotta framing. The pavilion broke and left only a small fragment on the eastern side after itself which is supported by the extant fragment of the cornice ornamented with splendid tiled stalactites.

The mausoleum's visible outer dome with remains of brick ribs aimed at supporting the

pavilion is protective. The dome's inner surface bears a precious decoration in the form of a continuous mosaic piece of fine work. Stalactite and arched canvases of twelve- and twenty four-hedrons create a logically constructive and decorative transition from the hexagonal prism of the base to the rim of the pointed dome.

The mosaics of stalactites, domes and panels at the drum's edges were preserved better than the inferior mosaic decoration. Polished brick of natural pinkish-yellow colour is skillfully used for laying out the form-defining lines—corners and verges of walls, the portal, and dividing strips of mosaic frames.

Today only fragments of mosaic bands are preserved from the ornamental decoration of walls and the portal. But still, the construction did not lose its splendour and artistic impact. The composition of the mosaic dome of 12 meters in diameter is marvelous: the basis of the ornament constitutes a plaiting pattern of nine- and five-pointed stars combining in varieties and decreasing in size towards the dome's zenith.

The dome's centre is shown as a precious core in the form of a lush twelve-petal flower painted inside of a twenty four pointed radial star. Blue, white, turquoise, black, green, yellow, red and brown colours with gold create an incomparable mosaic painting in the dome.

Thanks to the pattern's subtlety and general blue background, the colour variety creates a polychromatic harmony and gives integrity both to the surface of the dome and to the under-the-dome drum which is cut by twelve lancet windows.

Great significance is attached to this mausoleum and a lot is done today for its restoration and preservation because this construction of the Golden Horde's Urgench is the highest art achievement of craftsmen from Khwarezm's famous decorative school. Later, foremen and craftsmen, whom Tamerlane had brought from Urgench, expressed their artistic skills in building architectural objects in Mawarannahr and Khorasan in the 15th century. But Yuranbek-Khanum's mausoleum is the primary example in which builders with great skill and ability combined a constructive form

Antonovka ancient town. Photograph
of a wealthy man's estate

Antonovka ancient town.
Plan of a wealthy man's estate

with a rich decoration without violating the structure's tectonics.

The khanqah of Najmuddin Kubra consists of four dome rooms: an antechamber, two meeting rooms and a guruhana [a vaulted room or a tomb]. A voluminous composition responds to the character of planning. The composition is highlighted by a harmonic pishtak of the main facade with slightly inclined pylons and an ogive, as well as with a stalactite cornice. The surface of the whole pishtak was paneled with majolica tiles, the bulk of which are forever lost, but preserved elements include an inscription in the Diwani script and, specifically, floral elements which are characteristic for local architectural ceramics.

The mausoleum contains unique headstones. According to a legend, one was set above the ashes of a preacher, the other in the form of a high (approx. 2 m) four-sided prism is the burial place of his head.

The inscription on the portal mentioning Temür Qutlugh's name and Ibn Battuta's evidence allow us to date the mausoleum-khanqah to the third decade of the 14th century [Yakubovsky, 1930, p. 60–61]. Sultan Ali's mausoleum is interesting first of all in connection with Najmuddīn-e Kubrā's tomb.

Several constructions at Urgench may be considered close to this object in character and chronology. Among them are: Pir Jar Wali's mausoleum (14–16th centuries) 15 km west of Najmuddīn-e Kubrā's khanqah; Ibn Hajib's two-chambered mausoleum (the 14th centu-

ry) with a summer mosque and madrasah's hujras which were built later; Ali ar-Ramitani al-Bukhari's mausoleum (14–16th centuries) located south of Temür Qutlugh's minaret; Sayyid Ahmad's two-chambered mausoleum (14–16th centuries) situated between this minaret and Tyurabek-Khanum's castle [Mamedov, Muradov, 1998, p. 31; Khalimov, 1991, p. 66–67, 83–89]. All of them represent a simplified type of a portal-dome tomb which was also widespread in other Khwarezm cities, as well as regions of Jochid Ulus and Middle Asia.

In the course of archaeological works carried out on Urgench's territory, some objects of the Golden Horde epoch were discovered which shed light on Ulus of Khwarezm's economy and cultural life.

The historical significance of Khwarezm monuments is great because they represented the samples which made a huge impact upon the culture and first of all, upon the architecture and ceramic production of the Timurid empire, mostly in the field of decoration. It is most likely that Khwarezm gave birth to the type of gantry structures which became traditional for Middle Asian architectonics beginning with the Golden Horde period.

The uniqueness and originality of Urgench's buildings, their exclusive technical quality and huge artistic effect allow us to name them among the best monuments of the architectonics of Turkic peoples and Islamic culture.

§ 13. Cities of the Lower Syr Darya

Karl Baipakov

The development of the medieval urban culture of southern Kazakhstan reached its golden age in the 11–12th centuries but was interrupted by the conquests of Tatar-Mongol troops. The cities on the Syr Darya River were conquered one by one, including: Sygnak, Uzgend, Barchynlygkent (Barchkent), Ashnas and Jend [Bartoldt, 1963, I, p. 481–484; Petrushevsky, 1977, p. 123]. The list of cities invaded and ruined by the Mongols in southern Kazakhstan is short. However, archaeological research on medieval ancient towns suggests that in reality the number of devastated cities and settlements was much greater. The population was dramatically reduced: part was physically destroyed, others were brought to Mongolia, and many died of hunger and epidemics. Traditional economic connections between cities and the nomadic steppe, which had also been severely impacted in the course of the invasion, were disrupted.

Giovanni da Pian del Carpine, who crossed these lands a quarter of a century later, wrote of the destroyed cities, ruined fortresses and ravaged villages [Travels, 1957, p. 127].

All the conquered territories were divided between Chinggis Khan's elder sons, as a result of which southern Kazakhstan and Semirechye appeared to be politically fragmented. There were no accurate borders between the uluses

and from time to time the Chagataids spread their domains into the lower reaches of Syr Darya, while the Jochids widened their possessions at the expense of cities in the Middle Syr Darya [Bartoldt, 1963, II, p. 59–61].

Two tendencies towards the conquered sedentary and urban population were seen among Mongol khans and aristocracy. Some of them sought state decentralization, stood against sedentism and were ready to endlessly rob citizens. Others, together with the main part of the local nobility, merchant class and clergy, aimed at establishing a strong power, protecting citizens and sedentary inhabitants of oases from arbitrary levies and foraging, thus making their intense exploitation possible. The latter idea was supported by Möngke Khan and the merchant-ruler Masud Bek. Möngke Khan canceled non-normative levies and taxes, brought the poll tax under regulation and decreed the coinage of golden dinars [Davidovich, 1972, p. 33–36]. In 1269, a kurultai was held on the banks of the Talas River, at which princes were obliged to limit fixed tributes collected from the sedentary population and urban citizens, avoid robbery, and leave the arable lands in peace [Bartoldt, 1963, II, p. 69].

Masud Bek's reform of 1271 provided the state with a silver coin and created premises for the development of urban life and monetary

trade [Davidovich, 1972, p. 96–114, 141–151]. Further economic development was contributed to by the monetary reform of Kebek Khan in 1321.

The gradual economic recovery of cities was accompanied by the strengthening of the economic and political position of the local Turkic aristocratic elite. Using the fact that the masses were dissatisfied with the Mongolyoke, the Turkic feudal nobility in the uluses of Jochi and Chagatai fought for establishing their own political power. As a result, at the end of the 1350s, the Chagatai state broke into several domains. Control over areas of the Middle Syr Darya was taken by Ulus of Jochi's khans, while Semirechye became part of Moghulistan, formed on the territory of south-eastern Kazakhstan [Pishchulina, 1977, p. 33–40].

In the 1370s, a war began between the khans of the Kok Horde and Timur. In the course of the feudal wars, the first to suffer were cities and sedentary people, who were pillaged and robbed. In 1387–1388, Tokhtamysh sent troops to Mawarannahr which, after uniting with troops of Moghulistan's emir Kamar al-Din, passed through Sygnak, besieged Sawran, and pillaged the surroundings of Sayram, Yasi, Tashkent, Samarkand and Bukhara. The response of Tamerlane and his raids deep into Dasht-i Kipchak in turn led to the plundering of the Kok Horde's population.

A struggle for the Syr Darya cities broke out again after Timur's death. In spring 1405, Otrar was conquered by sheikh Nur al-Din, who kept it for four years. Afterwards, the city was occupied by Khalil Sultan. In 1410, Mongol troops under the command of Shah Jahan besieged Sayram, Karasaman and Otrar.

In the 1420s, the scramble for the Syr Darya cities was now led by Ulugh Beg and Barak, and only help from the side of Shahrukh retained the former's control over the Syr Darya region. By the mid 15th century, Turkestan's cities became subordinate to the nomadic Uzbeks of Abu-l-Khair [Istoriya Kazaxstana, 1997, 2, p. 96–130].

The middle of the 13th century marked a revival of the urban life southern Kazakhstan. Cities were restored, economic ties between districts were revived, a number of cities were

involved into the orbit of international trade and diplomatic connections. Written sources of that period mention cities located on the Syr Darya River: Sayram, Otrar, Zernuk, Sawran, Yasi, Sygnak, Suzak, Syutkent and Jend. The itinerary of the Armenian king Hethum I, who in 1256 came through southern Kazakhstan, includes the names of Pergant (Barkent), Sukhulkhan (Sugulkent), Urosokhan (Urosogan), Kaikant (Kumkent), Khuzak (Suzak), Sygnak, Kharchuk (Karachuk), Asan (Yasi), Sawri (Suri), Otrar, Zurnukh (Zernuk) [Gandzak, 1976, p. 224]. Undoubtedly, the revival of the caravan route, which went along the northern hills of Karatau, contributed to the rise of these cities.

Evidence from archaeological research shows that in the mid-latter half of the 13th century, life was continued and renewed in such ancient towns as Sayram, Karaspan, Otrar, Turkestan, Sawran, Sygnak, Syutkent, Kaugan-ata, Mairam-tobe, Ak-Kurgan, Uzgend, Asanas, Jend and Yangikent. However, the pace of restoration of the urban centres was not equal everywhere.

Sawran and Sygnak, which had been centres of Ulus of Jochi's Kok Horde, rose fairly quickly.

Undoubtedly, the rise of the economy and urban culture was spurred by the fact that at the beginning of the 14th century, the south of Kazakhstan became part of the Kok Horde. Seeking the restoration of economic ties between nomads and the sedentary population, its rulers made Sygnak its capital. In that period, especially during Ilbasan Khan's reign, intensive development was carried out in Sygnak, Sawran, Otrar and Barchkent [Istoriya Kazaxstana, 1997, 2, p. 194].

Stabilization of the political environment during the reigns of the khans Sasy Buka, Ilbasan, Mubarak and Chimtay contributed to the cities' economic growth. This is seen in layers of the 14th century which were preserved almost in all of the ancient towns identified with respective Golden Horde cities.

In southern Kazakhstan, massifs of urban development from the 13th century to the first half of the 15th century cut arterial streets which connected the city gates. Block streets with

dead ends, around which the quarter's houses grouped, extended from the gates. Cities also had squares faced by the facades of mosques. The suburban area was occupied by craftsmen's constructions and citizens' estates with orchids and melon gardens. All agricultural settlements were bound to channels [Akishev, Baipakov, Erzakovich, 1987]. At the time, large cities included Sayram, Yasi, Otrar, Sygnak and Sawran, Jend and Kumkent.

Excavations of Otrar and Turkistan provide an idea of cities' buildings, urban dwellings, public and cult constructions as well as fortifications. Cities were densely built up with quarters. The quarter of the 13–

14th centuries in the southwestern part of Otrar's shakhristan or citadel occupied a territory of 1500 square meters and included a street 32 meters long and 2–2.5 meters wide. All 9 houses of the quarter faced the inner-quarter street and a small dead end in the quarter's northern part. It is noteworthy that quarters of the 13th century do not repeat the planning of urban quarters of earlier times. City planning was completely changed and only arterial streets of the former time were preserved. However, buildings of a later period, from the 14th to the first half of the 15th centuries, mostly inherit the planning of quarters from the 'Mongol' time. Only the arrangement of houses within these quarters was changed. Otrar's rabad [a trade-production suburb which was adjacent to a shakhristan] was characterized, according to excavations, by sparse development. Houses and workshops of potters, brick-makers and blacksmiths were located here.

New types of urban dwellings appeared from the latter half of the 13th century to the first half of the 14th century. Two- or three-roomed houses with a yard located on the same axis belong to the first type.

The second includes dwellings consisting of four rooms arranged on intersecting axes. It is a cruciform or four-part scheme, where a house has a sub-square planning, while pantries are located left and right of the iwan, yard or living room with a tandoor.

There are several variants of this scheme. Such a room may have a larger number of

rooms than four, five or six. Houses were from 40 to 60 square meters.

Houses consisting of two and more sections refer to the third type. Each section consists of two or three rooms, one of which is always residential. Such houses could have up to 15 rooms, while their size could reach 200 square meters.

Significant changes were seen in the interior design of dwellings. A narrow sufa placed along walls of L- and U-shapes was substituted by a sufa occupying the larger part of the room. A small area in front of the tandoor was usually paved with bricks and defined the floor level. Remains of a scaffold smeared into the wall, a log, a brick pavement and a stone slab, which were found in the room's centre along the sufa's edge, are evidence of the fact the roof was supported by one column installed in the centre. Thus, a four-column covering, spread in former times, disappeared. No fireplaces installed into walls of that time were found, but there were still rectangular fenced fireplaces of an open type. The tandoor now bore functions of a universal hearth. It served as a means of heating and a furnace for cooking and baking. Tandoors were characterized by the appearance of a chimney, a 'kan', installed into the sufa and extended along the shortest section of the house's wall, where it connected to the vertical well through which smoke came out.

There is an essential difference between the chimneys of Otrar tandoors and classical kans. Channels of the former were always made extremely short and in most cases never exceeded 1.5–2 meters. The primary task of such chimneys was to release smoke, while classical kans of Golden Horde cities installed along the building's perimeter were made with the purpose of keeping smoke under the sufa as long as possible in order to heat the building.

The type of heating through a universal tandoor with a chimney and an increased size of the sufa—which was widespread among Ulus of Jochi's urban dwellings—was a novelty. This phenomenon is evidence of common processes happening in the development of the society and ethno-cultural connections between regions.

The new city wall in Otrar was built only at the end of the 13–beginning of the 14th century.

Excessive taxes, road levies, and different kinds of obligations exhausted the settled population. No wonder one of Mengu Khan's decrees said the following: 'Violence and oppression reached the highest point, besides, farmers are especially exhausted by various kinds of severities and the burden of emergency taxes so that the benefits they received did not equate with half of the levies (in the form of duties)' [Rashid al-Din, 1960, II, p. 141].

Therefore, a collapse of the sedentary culture in Semirechye began immediately after the Mongol invasions and, if large cities which were centres of the transit trade and craft production seemed unharmed in the mid 13th century, the agricultural areas which fueled them

were devastated, which in turn led to the deaths of the cities [Baipakov, 1978, p. 8–10].

Thus we may suggest that from the 13th century to the first half of the 15th century, urban culture revived in southern Kazakhstan after the Mongol conquests, while the latter half of the 13th century marks the rise of urban life, international trade, crafts and agriculture.

Among large cities, we can name Sayram, Otrar, Yasi, Sawran, Syganak, Suzak, Kumkent and Jend. In Zhetysu (Semirechye), a downturn of the sedentary and urban culture started, although no demolition or destruction happened at the end of the 13th century. The number of cities in the Talas and Chuy Valleys sharply decreases, urban life degrades in the 14th century, while the number of cities shrinks and by the mid–15th century they are desolated and turned into settlements.

CHAPTER 2

Economy, Crafts and Trade

§ 1. Cattle-breeding and the System of Nomadism

Iskander Izmaylov, Leonard Nedashkovsky

For a long time, cattle-breeding was one of the most important economic bases of the Golden Horde state. This economic-cultural type of nomadic and semi-nomadic cattle-breeding not only kept its potential after the state's collapse, but even developed and strengthened. The socio-political significance of cattle-breeding is proved, *inter alia*, by the fact that the residences of the tribes, including Ulus of Jochi's supreme aristocracy, which formed the Tatar army, were located in the steppes.

The population's involvement in cattle breeding and processing of livestock products was first of all related to the ecological conditions of the environment. Vast territories of Northern Eurasia which were part of the Ulus of Jochi were located in an arid area that was severe for human life. It was located on the edge of the steppes which gradually turned into deserts and semi-deserts in the south—hot in the summer and cold in the winter. Steppes and semi-deserts differ in seasonal and daily temperature contrasts with strong overheating of the earth in the summer and a sharp cooling in the winter, with a large diurnal variation between day and night temperatures (up to 30 degrees C in the summer). As a rule, rainfall on the plains does not exceed 200 mm per year, and in the desert it is less than 100 mm. The northern steppe zone belongs to the temperate climatic zone (with a summer maximum of rainfall) and the southern territory is subtropical. The Lower Volga Region and the Aral Sea Region can be said to combine two different climates: their summer is hot and dry, while winter is cool with a sufficient amount of rainfall. Severe winters (with low temperatures and strong winds) occur

in the northern border of Eurasia's steppe zone, forcing cattle-breeders to drive herds of sheep and horses southwards. Moisture in the desert falls very unevenly. Dry years are not rare (they happen every 3 or 4 years) and in some years they occur even more often, which turns the steppe into a semi-desert [Mordkovich et al., 1997]. This was particularly highlighted by contemporaries. Thus, al-Ayni informed that in 1302–1303, 'a murrain, drought and costliness came to Tokhta's lands due to the fact that they (the inhabitants) sowed for 3 years in a row and nothing grew, and all their cattle died' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 513].

At the same time, this is a region with a mighty mountain system stretching across the continent, including the Ural mountains, the spurs of the Southern Urals, the northern part of the Tien Shan, the western ridges of the Altai and the Tarbagatai. There are also fairly high uplands in the Eastern Caspian Sea Region—the Ustyurt Plateau. The Caucasian Mountains covers a steppe zone in the south between the Black and Caspian Seas. Differences between plains and mountains (and foothills) are especially significant in the soil covering. In the mountains, desert plants grow up to 1000 meters above sea level; sagebrush and grass steppes are located higher (up to 2400 meters); they are interspersed with mountain meadows and rocky tops. Fescue and feather grass-fescue steppes are spread in the Southern Urals and the Irtysh River Region. These steppes are used at middle altitudes and in lowlands as spring pastures. The vegetation covering of deserts mostly consists of shrubs, subshrubs

Farriery. Mongolian Veterinary Manuscript.
18th century

and herbs. Arrays of ridge and hilly sands are suitable for grazing sheep and camels during winter-time or even all year round. In the arid lowland, the vegetation is suitable for grazing cattle in autumn, winter and early spring.

The natural conditions made human lives peculiar, dictating ways of economic management. Thus, regular seasonal migrations in the meridional direction parallel to the flow of large rivers were characteristic of cattle-breeders of Northern Eurasia. In summer, nomads moved along river basins northwards in search for optimal living conditions, to set up summer camps ['yaylau'] which were situated in steppe and forest-steppe areas [of the Dnieper River Region, the Middle Volga and Trans-Volga Regions, the Cis-Kama Region, the South Ural and the Irtysh River Region], and in autumn they chose places for winter camps moving along the same route [to the Steppe Crimea and the North Caucasus, the Lower Volga Region, Mangyshlak Peninsula, the Aral Sea Region and Balkhash Lake Region]. At the same time, groups of foothill cattle-breeders made vertical

migrations, in winter sheltering cattle in deep mountain valleys and in summer, ascending to high-mountain pastures.

The system of nomadism in Golden Horde times was strictly regulated by the khan's power. All territories and first of all pastures and steppes were distributed within the state in accordance with its military-administrative and clan divisions. Every superior officer ordered their subordinates to nomadise in certain territories and along certain routes. Giovanni da Pian del Carpine recounts: 'No one is allowed to stay in some country unless the emperor orders so. However, he himself decides where leaders must stay. Leaders order where a thousand-squad commander stays, while the latter orders the same to centurions and centurions to foremen' [Travels, 1957, p. 45]. William of Rubruck who passed through the lands of Ulus of Jochi in the middle of the 13th century wrote: 'They [that is, Mongolian khans.—*I. I., L. N.*] divided Scythia between themselves which stretches from the Danube to the sunrise, and each leader knows the limits of his pastures judging by the amount of people he has under his command. He also knows where he must graze his herd in the winter, summer, spring and autumn. It is in winter when they descend to the south, to warmer countries. In summer they ascend northwards, to colder ones. In winter they graze herds in places lacking water but convenient for pastures—when there is snow, because snow replaces water' [Ibid., p. 91]. According to a tradition which has been preserved since the 11–12th centuries, Turkic-Tatar nomads occupying the steppes of the Trans-Volga and the Southern Urals and Southern Siberia also made seasonal migrations. All of them used the Bugulminsk Plateau and the Southern Ural for summer pastures, while in winter they nomadised with their multiple herds to the low reaches of the Syr Daria, Volga and Aral Sea Region. This way of nomadism was preserved among the cattle-breeding population of the Trans-Volga and South Ural steppes until the 18th century. The 14th century author al-Umari managed to keep extremely important and unique information on this system of living in the medieval epoch. In his description of Ulus of Jochi he indicated: 'Kipchak khans spent winter in Sarai, while

their summer pastures, just as those of the Turan kings, were located near the Ural mountains' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 243]. Undoubtedly, the Arabic historian means the medieval nomads of Asiatic Steppes under the traditional term 'Turan'.

In full compliance with the ecological conditions of Ulus of Jochi's different steppe areas, inhabitants generally bred sheep and horses, and in some lands abundant in foodstuff, bovine cattle and goats, while in deserts and semi-dried areas, they bred camels. This is proved by written sources. Thus, in his narrative about the Mongols, Giovanni da Pian del Carpine noted that 'they have cattle in great amounts: camels, bulls, sheep, goats and horses. Such a large number of pack animals they have cannot be found in the whole world, while they have neither pigs, nor other animals at all' [Travels, 1957, p. 28]. The Italian merchant and diplomat Giosafat Barbaro who visited the Azov Sea Region in the 15th century exclaimed in surprise describing the multiplicity of cattle: 'What can I say about the great and even abysmal number of animals in this horde? Would anyone believe me?' [Barbaro and Contarini, 1971, p. 149]. The same is mentioned by Egyptian ambassadors who took a trip across Ulus of Jochi from Sudak to Sarai. They crossed steppes of the Volga-Don interfluvium in 20 days, 'across a plain occupied by tents, sheep and herds' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 192].

Horse breeding in the steppes was of a military significance: every warrior was to have several horses with himself when marching off. According to the Arabic historian and geographer al-Umari, every warrior had to take 'thirty heads of sheep and five heads of horses' with himself [Ibid., p. 402]. If we keep in mind that the army constituted 250 thousand warriors,

Stirrups. Iron, Ukek. 13–14th centuries.
National Museum of the Republic of Tatarstan
(according to I. Izmaylov, L. Nedashkovsky)

the army's horse herd reached 750 thousand horses and 7.5 million sheep. At the same time, this giant herd did not exhaust Ulus of Jochi's horse resources. Tens and hundreds of Tatar knights participated in other campaigns and wars which evidence the great amount of cattle bred in the steppes of Dasht-i Kipchak and first of all, the steeds. Ibn Battuta provided a curious fact, recounting that he bought a wonderful bay for 35 silver dinars [Ibid., p. 312].

Apart from the military role, horses found a wide application in various household needs, in particular—in coachman service and the transportation of people and goods. Bulls and camels were also used as beasts of burden. Thus, William of Rubruck amusingly described a large cart with a yurt [nomadic tent] which was dragged by 22 bulls at once—'11 in a row along the cart's width and 11 more—in front of them' [Travels, 1957, p. 91]. It is clear that yurts of a lesser size were drawn by smaller animals in a smaller amount. Ibn Battuta wrote, for instance, that his araba cart was pulled by one horse, and at the time of encampment, 'the horses, camels and oxes were unharnessed and released to graze freely during the night and day' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 127].

Meat, milk and dairy products were the main and traditional food of Ulus of Jochi's population due to the great amount of cattle and the ethnographic peculiarities of the nomadic population's national cuisine—which was also characteristic of nomads of Northern Eurasia in general. For example, al-Umari wrote that meat food was spread among the Tatars

and about a tradition of presenting meat as a gift among them: 'Their nutrition includes their own animals: horses, cows and sheep. ... Those living in the steppes neither sell nor buy meat. When an animal starts to wither in one family or another, be it a horse, a cow, or a sheep, the host slaughters it, cooks and eats a part of it together with his family members and presents its [another part] to his neighbours. In a similar way, when his neighbours have a poor sheep, they slaughter it and present a part of it to those who had made a gift to them. For this reason, meat [never] lacks in their families. This [custom] became so firm in their houses, as if presenting meat as a gift is an obligatory provision' [Ibid., p. 230–231].

In summer time, nomads mostly consumed various dairy products [storing butter, dried curd and cheese, as well as jerked meat for the winter], and ate meat products in winter time [Travels, 1957, p. 95–96]. Apart from it, they made kumiss from horse milk—a traditional beverage of the steppe nomads. Nomads paid tribute with cattle and kumiss [Fedorov-Davydov, 1973, p. 39–40].

Cattle-breeding was developed not only in the nomads' economy which was its basis, but also among the sedentary population who applied a pasture-stall type of grazing. As we may judge by osteological data, beef, mutton and horse meat absolutely prevailed in the nutrition of the Lower Volga Region's population in the Golden Horde time. Apart from the bone remains of cows, bulls, oxes, goats and horses, Golden Horde settlements on the Lower Volga also contained bones of camels, pigs, dogs,

Hand-mill and tine points. Bulgar. 13–14th centuries.
Bulgarian State Historical and Architectural Museum-Reserve

cats, domestic chickens and ducks. Small ruminants were slaughtered in the age between 2 months and 3 years and older, bovine cattle—between 5 months and 6 years and older, horses—from 1 to 12 years and pigs—from 1–2 years and older. Cattle were bred not only for meat, but also to receive milk, wool and skins. Bulls and oxes served for cargo transportation [along with camels and horses] and for tillage [Petrenko, 1988, p. 258–259; Tsalkin, 1967, p. 117, 129].

The Golden Horde exported cattle in great amounts. Thus, a huge number of horses for household purposes was brought to India. Ibn Battuta who wrote about exporting horses from Ulus of Jochi to Indian lands described a steppe zone of the Golden Horde state: 'There is a huge amount of horses in this land and they cost a trifle... They [Turks] eat them; in their lands, they are as abundant as sheep in our territories, and even more. One Turk may have [several] thousand of them. One of the rituals carried out by Turks-horse breeders inhabiting this area [is] that they place a piece of felt, a span long, into the araba carts used by their wives. This piece is then bound to a thin stick, a cubit long, located in the cart's corner; one [such] piece means the host possesses a thousand horses. I saw that some of them had 10 pieces and others—even more [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 286]. Gio-safat Barbaro also gives a detailed account of the cattle trade: 'There are horse traders among this people; they bring horses out of the horde and drive them to different places... I happened

to come across merchants during my journey who drove such a number of horses that they covered the whole space of steppes... The second type of animals which this people breed is beautiful big bulls, even more, in such an amount that enough are left for Italian slaughterhouses. They are driven to Poland, while a part of them is directed to Transylvania through Wallachia; they are also brought to Germany and from there—to Italy... The third type of animals they keep is tall shaggy Bactri-

an camels. They are driven to Persia and sold there for 25 ducats each' [Barbaro and Con-
tarini, 1971, p. 149]. Nomads supplied large and small cattle in the mass into neighbouring sedentary regions, for example, into the Middle Volga Region [Petrenko, 1988, p. 258, 260, 271] and to Ruthenia where cattle was of a smaller number—a medium size of large horned livestock of the Golden Horde was on average 10 cm taller than the cattle bred on the territory of Rus' [Tsalkin, 1967, p. 120].

§ 2. Agriculture and village crafts

Leonard Nedashkovsky

Traditionally, historians have described Ulus of Jochi as a nomadic state with poorly developed agriculture. However, this view appears to be wrong in the light of new archaeological data.

The Golden Horde included such old agricultural regions as Bulgar, Khwarezm, the Crimea and the North Caucasus along with the nomadic steppes.

Common wheat, spelt wheat, club wheat, millet, barley [of hullless and hulled forms, as well as a phialine one], oats, rye, peas, vetch, lentil, cucumbers, apples, lint and hemp were found in the Golden Horde layer of Bulgar [Krasnov, 1987, p. 218]. Moreover, during excavations in Selitrennoe, the seeds of grapes and watermelons were discovered [Fedorov-Davydov, 2001, p. 231].

L. Nedashkovsky was the first who during his excavations between 2001 and 2003 carried out a flotation of the cultural layer and the filling of examined constructions of Golden Horde landmarks located in the settlements of Bagaevskoe, Kolotov Buerak, Khmelevskoe I and Shiroky Buerak—all in the Saratov District of Saratov Oblast. 39 samples were extracted from the lower non-excavated horizon of the cultural layer and the filling of constructions in Shiroky Buerak settlement; 66—from Bagaevskoe ancient settlement, 17 samples were taken from Kolotov Buerak, while 6 more were extracted from pre-inland layers of excavation III in the Khmelevskoe I ancient settlement [the analysis was fulfilled in E. Lebedeva's laboratory of

natural methods of the Institute of Archaeology RAS]. The fact that millet (53.4% of all crop remnants) prevailed over rye (20.1%), wheat (19.6%), barley (5.9%), oats (0.7%) and pea (0.3%) taken together is not a coincidence. We registered millet seeds in Khmelevskoe I ancient settlement in the filling of a hole of 2 excavation I-1999 which had represented a household facility of a complex 8-shape; the hole's eastern part where the seeds were found was the deepest and possibly served as a bell-shaped cellar with a stepwise descent into it.

Medieval authors inform us that millet was cultivated in the Golden Horde. Giovanni da Pian del Carpine and William of Rubruck pointed out in the middle of the 13th century the fact that millet was used in food in the Mongol Empire (mentioning only rice and barley among other crops which served for making beverages) [Travels, 1957, p. 36, 95, 124, 138, 146, 148, 154; The Journey of William of Rubruck, 1900, p. 10, 62, 68, 132, 166, 173, 183, 186]. Millet ('tari'), oats ('ous'), wheat ('coptaluc'), spelt wheat ('suulu'), barley ('arpa'), rice ('tuturgan', 'bri[ng]'), pea ('brizac', 'noghuc') and lentil ('maruimac') are mentioned in the Polovtsian part of the dictionary 'Codex Cumanicus' (which was originally written in 1303 based on the materials of the end of the 13th century) compiled for Italians visiting Ulus of Jochi [Codex Cumanicus, 1981, p. 130–131; Drimba, 2000, p. 109]. 'Vassaf's History' accounts a sacket of millet sent by Tokhta Khan to Hulaguid ilkhān

Gazan in 702 AH (1302/1303) as a symbol of the numerical strength of the Golden Horde's army [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 83]. Al-Umari in his geographical work described farming in the Golden Horde this way: 'They have a small amount of crops, the least of all are wheat and barley, while no beans are found at all. Most often they seed millet, they eat it and their food is usually a product of millet' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 230]. According to al-Umari idem, wheat, barley, millet of two sorts—he speaks of pearl millet [or dokhn] and 'javers [a sort of millet] which is similar to the trefoil grain and lentil—were sold at Sarai's bazaars [Ibid., p. 242]. Giosafat Barbaro also mentioned that the Horde people used millet in food and for sacrifices; apart from it, he only spoke of wheat and oats used for feeding horses [Barbaro and Contarini, 1971, p. 142, 146, 149–150]. Ambrogio Contarini who crossed the Lower Volga Region in 1476 already mentioned only rice and crackers cooked of 'a fairly good wheat flour', as well as onion and garlic [Ibid., p. 221, 224].

William of Rubruck mentioned vineyards and wine in the North-Eastern Caucasus [Jones, 1957, p. 186; The Journey of William of Rubruck, 1900, p. 262]. 'Codex Cumanicus' contains the names of an orange ['nainč', 'nouma'], a lemon ['limon'], a peach ['saftalu'], a pomegranate ['nardan'], an apricot ['mismis'], a plum ['eric'], a fig ['ingir'], grapes ['xuxun'], large-fruited muscadine grapes ['churu xuxun'], a cherry ['chiras'], a date ['ghorma'], a cucumber ['chear'], a melon ['coun'], a turnip ['salgan', 'samuc'], a cabbage ['laghan'], a beetroot ['čagundur'], a pumpkin ['cabuc'], an onion ['sorgan', 'youa'], a garlic ['sarmisac'], a spinach ['yspanac'], a parsley ['mangdan'], a lettuce ['marul'], a dill ['raxiana'], a pear ['armut', 'chertme'] and an apple ['alma'] in the Cuman varian [Codex Cumanicus, 1981, p. 125–127; Drimba, 2000, p. 106–107]. Al-Umari provided curious information about fruits, nuts, vegetables and a melon when telling about the Golden Horde: 'Various trees and different fruits [grow] there: grapes, pomegranates, membrillos, apples, pears, apricots, peaches and nuts. There is a fruit which in the Kipchak language is called 'batenk' ['badendzhan?'] [that is, 'baklazhan' or 'aubergine'.—L. N.], which resembles a wine berry... As for the melon, it is consumed [?] there in large amounts and especially the yellow sort. They enjoy it and store it throughout [the whole]

year. It is extremely sweet and has a pleasant taste, while they say a lot about its abundance and cheapness. Some make a juice and boil a halavah [sweetness] out of it. In their cities, they grow multiple vegetables, such as a rutabaga, a turnip, cabbage and the like' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 233–234]. Ibn Battuta, who personally visited Khwarezm, excitedly described Khwarezmian water-melons: 'There is not a single melon in the world that would be similar to those cultivated in Khwarezm, neither in the East, nor in the West... Its skin is green, while its core is red. It [the melon] is extremely sweet and at the same time, it is hard. Its surprising features [lie] in the fact that it is cut, then dried in the sun and placed in baskets... and brought from Khwarezm to the remotest lands of India and China. Among all the dried fruits, none is better than these [melons]' [Ibid., p. 313]. Vineyards, orchids, mills and farms in the surroundings of Crimean Sudak, as well as barn duties and payment for threshing floors are described in the tarkhan yarliq of Temür Qutlugh dated 1398 [Radlov, 1889, p. 21, 33].

The dictionary of 'Codex Cumanicus' also contains the name of a plough ['saban'], as well as a number of words and phrases related to its use and structure: a plougher ['sabanci'], to plough ['saban surarmen', 'saban surdum', 'saban sur'], a ploughshare ['saban temir'], arable land ['tarlov', 'saban ieri'] [Codex Cumanicus, 1981, p. 8, 90, 180; Drimba, 2000, p. 40, 87, 127]. The Egyptian historian Rukn al-Din Baibars [died in 1325] also mentioned a sokha or an ard, in its description of the conflict between Tokhta and Nogai [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 110].

The plough had a heavy iron symmetrical [or with a right-sided asymmetry] share and a colter [Krasnov, 1987, p. 213–214; Savchenkova, 1996, p. 8–10]. The sokha in the Golden Horde period, judging by extant materials, was two-forked and supplied with asymmetrical shares and a politsa (an instrument for casting off dirt) [Krasnov, 1987, p. 211–213; Savchenkova, 1996, p. 10–11]. Hoes were also used for tillage, while sickles and small scythes were needed for harvesting [Savchenkova, 1996, p. 11–12].

Axes. Ukek. 13–14th centuries. National Museum of the Republic of Tatarstan

Interesting information about agriculture in the steppe zone of the Golden Horde was provided in 'Travels to Tana' written by Giosafat Barbaro, who lived between 1436 and 1452 in Tana, a Venetian colony in the Don estuary:

'Around the new moon in February a call is issued across the horde that anyone who wants to sow should prepare everything necessary, because the sowing will take place at the new moon in March in such-and-such a place, and everyone will set out on such-and-such a day. Afterwards, those who plan to sow themselves or who want to charge somebody with this duty, load their carts with seeds, take the animals they need and, together with their wives and children or with a part of the family, set out for the appointed place, which is as a rule a two-day journey from where the horde was camped at the moment the call to sow was made. They plow and sow and live there until they finish what they have come for. Then they return to the horde.

The khan treats his horde as a mother treats her children during a walk: keeping an eye on them. That's why he rides around these sowing places now here, now there, never going (away from his people) farther than a four-day journey.

This continues until the corn ripens. When it has ripened, he doesn't go there with his horde, but sends there only those who have sowed and those who are willing to buy the wheat. They go with their carts, oxen and camels and other things they need, as they do in their village.

The earth there is fertile and brings a fifty-fold yield of wheat, which is as high as Paduan wheat, and a hundredfold yield of millet. Sometimes the harvest is so abundant that they leave it in the steppe' [Barbaro and Contarini, 1971, p. 150].

Judging by the quotation above, a fallow farming system prevailed in the steppe zone, while in the Middle Volga Region, 'a random sowing of crops with an absence of any rotation and a two-field rotation of crops together with fallow soil' was prominent [Krasnov, 1987, p. 223].

Bone remnants of wild animals were found at Golden Horde sites: hare, mottled polecat, fox, wolf, bear, badger, boar, beaver, marten, squirrel, hamster, elk, red deer, reindeer, roe, kulan, saiga, aurochs (?), eared seals, turtles, and birds (grey goose, grouse, partridge, bustard, seagull) which proves, along with written sources, the auxiliary role of hunting in the population's economy. However, the ratio of wild mammals' bones found in the settlements, if they were present at all, was insignificant. Judging by the amount of meat which may be extracted from one unit of different animals, beef, mutton and horse meat prevailed in the nutrition of the Lower Volga Region's population in the Golden Horde time. Marco Polo provided information about hunting ermines, sables, squirrels, black-brown foxes and marmots in the eastern part of the Jochid state [The Book of Marco Polo, 1956, p. 225–226; The Book of Ser Marco Polo, 1903, II, p. 481]. 'They hunt very well mostly using bows',—Giosafat Barbaro says about Ulus of Jochi's population [Barbaro and Contarini, 1971, p. 142]. Furs (of sables, ermines, martens, weasels, foxes, lynx, squirrels, hares, beavers, otters, groundhogs, polar bears) which was mostly imported from northern areas was one of the most important export articles of the Golden Horde [Ibid., p. 51, 57–58, 66, 217; Travels, 1957, p. 88; Emanov, 1995, p. 23–28, 34, 64, 80, 84, 97, 147, 149; Karpov, 1990, p. 152–154;

1991, p. 191; 2000, p. 183; Collection of Materials Relating to the History of the Golden Horde, 1884, p. 297–298; II Libro Dei Conti, 1956, p. 386; Pegolotti, 1936, p. 24, 150; The Journey of William of Rubruck, 1900, p. 44].

According to the tradition established by the Yasa, battue hunting [see: (Travels, 1957, p. 99; The Journey of William of Rubruck, 1900, p. 71)] was a peculiar school of military training and somewhat of military maneuvers. Hunting was one of the traditional entertainments of the Jochid aristocracy. The yarliqs of Mengu-Timur of 1267, Berdibek of 1357, Tyulyak of 1379 and Temür Qutlugh of 1398 mention falconers and leopard-keepers [Grigoriev, 1990, p. 64, 74, 82–84, 102; Radlov, 1889, p. 21, 25; Yarliqs, 1955, p. 465, 467, 469]. Hunting for falcons, merlins and golden eagles (?) is mentioned by William of Rubruck [Travels, 1957, p. 98, note 59]. Russian chronicles of 1283 tell that Golden Horde falconers bred swans [Priselkov, 1950, p. 340–341; Complete Collection of Russian Chronicles, 7, p. 177; 25, p. 154–155; 28, p. 62, 222]. Tokhta's ambassadors in 702 AH [1302/1303] presented Ilkhan Gazan hunting falcons, skins of 'Kirghiz squirrels, Karluk weasels [fennecs], Slavic ermines and Bulgar sables' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 325–326, 438]. Falcons are mentioned among gifts presented by Öz Beg Khan's embassy [717 AH or 1317/1318] to the Egyptian sultan [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 325–326, 438] Öz Beg sent merlins to China's great khan of the Yuan dynasty [Cathay, 1866, p. 238]. Janibek's ambassadors who arrived in Egypt in Sha'ban 758 AH [20 July–18 August 1357] presented gifts which included furs of sables and wild birds [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 441]. On 30 January 1385 Tokhtamysh's embassy to the Egyptian sultan presented him 7 falcons [Ibid.]. Hunting with falcons and merlins, as well as hunting deer, geese and goldfinches are described by Giosafat Barbaro [Barbaro and Contarini, 1971, p. 147–148].

The development of the fishing trade on large and small rivers is indicated by finds of fishing hooks, boat braces, plummets, as well as bone remains and fish scales, discovered at Golden

Horde sites. Judging by the types of plummets and hooks, they were familiar with the use of dragnets (both small and large) and stationary nets (both seine nets and multi-wall nets), trawl lines and fishing rods (including live-bait fishing). Dragnet fishing was much more popular than the use of stationary nets [Nedashkovsky, 2001]. In Golden Horde settlements one can find the bones of sturgeons, hausens, starred sturgeons, sterlets, pikes, pike-perches, catfish and carps. At some sites, the amount of bones is very significant, and the consumption of fish had a material impact on nutrition of the local populace. Sun-dried and salted fish (including sturgeons and sturgeon balyks) as well as caviar were exported from the Golden Horde by Italian merchants [Barbaro and Contarini, 1971, p. 50–52, 57–58; Emanov, 1995, p. 79, 100–102, 104, 122–124, 146, 149; Karpov, 2000, p. 183; Ustav, 1863, p. 803; Shrayner, 1981, p. 218; *Il libro dei conti*, 1956, p. 416, 676, 701; Pegolotti, 1936, p. 24, 102, 380]. William of Rubruck speaks of the purchase of dried sturgeons, breams 'and other fish in innumerable quantities' by Constantinople merchants [that is, obviously Italian ones, since at the time the city was the capital of the Latin Empire] [Travels, 1957, p. 88] near the embouchure of the Don, the inhabitants of whose banks are described by the traveler as having great amounts of dried fish [Ibid., p. 109; The journey of William of Rubruck, 1900, p. 97]. Johann Schiltberger characterizes Azak as a town 'on the bank of the Don that abounds with fish, taken away on large ships and galleys to Venice, Genoa and the Archipelago islands' [Schiltberger, 1984, p. 44–45]. Giosafat Barbaro, when speaking of the Volga and the Caspian Sea, states that 'in the river and in the sea there are fish beyond count' [Barbaro and Contarini, 1971, p. 157].

Contarini's narration speaks of the fishing trade [involving sturgeons and starred stur-

geons] and seals in the area of the Caspian Sea [Ibid., p. 216, 218].

Salt production was tightly connected to the procurement of fish. The existence of such trade in the Golden Horde and salt exports to Rus' are confirmed by the reports of Barbaro, Contarini [Ibid., p. 157, 219] and William of Rubruck while the latter also speaks of significant proceeds to the Khan's treasury from control over salt making [Travels, 1957, p. 90–91, 107; The journey of William Rubruck, 1900, p. 52, 92]. On the 1459 map of the cosmographer Fra Mauro, a mountain near the Ural River is accompanied by an inscription 'the salt mountain' [*Il mappamondo di Fra Mauro*, 1956, p. 56, XXXIII].

The beekeeping trade was also of certain importance. Honey and wax were exported by the Jochid Ulus, and honey, herbs, roots were collected and used as food by the general populace [Barbaro and Contarini, 1971, p. 51–52, 57, 66, 142, 153, 220; Travels, 1957, p. 95; Emanov, 1995, p. 32–33, 79, 84, 95–97, 104, 111, 128–129, 147, 149; Karpov, 1990, p. 131; 1991, p. 195, 210; Collection of Works Relating to the History of the Golden Horde, 1884, p. 234; Pegolotti, 1936, p. 24, 43, 150; The journey of William of Rubruck, 1900, p. 62]. The 'Codex Cumanicus' contains the names for a nut ['cox'], hazelnut ['catlauc'], almond ['badam'], pistachio ['pistac'], chestnut ['castana'], rue ['sadaf'], mint ['gischic'] and sage ['salg'] in the Polovtsy's region [Codex Cumanicus, 1981, p. 125–126; Drimba, 2000, p. 106]. They could also be collected. Herbs were also collected for medicinal purposes, for example, the flower heads of wormwood were exported from the Black Sea and Azov Sea Regions to Western Europe and the Middle East [Barbaro and Contarini, 1971, p. 147, note 69; Emanov, 1995, p. 84, 119; Pegolotti, 1936, p. 69, 138, 429–430].

§ 3. Urban crafts

Svetlana Valiulina, Leonard Nedashkovsky

Certain historians have expressed their opinion concerning the insignificant degree of development of Golden Horde crafts [Saraf-

galiev, 1960, p. 76–78]. However, even as early as in the 15th century, we have the following report of Giosafat Barbaro on the Golden Horde

Tableware. Ukek. 13–14th centuries
(according to L. Nedashkovsky)

army: 'Their army has craftsmen—weavers, blacksmiths, armorers and others, and in general all the necessary trades are represented' [Barbaro and Contarini, 1971, p. 147].

The uniqueness of products of Golden Horde crafts is such that it allows for the differentiation of them from products of manufacturing centers of other medieval states.

Craftsmen in cities of Ulus of Jochi lived in dedicated quarters and estate-based crafts were also well-developed.

Among all the types of crafts developed in the Golden Horde, pottery is worth special mention. Unglazed, red-clay crockery is the definitive material for monuments of the Golden Horde circle. 'The unglazed ceramics are characterized by greater standardization, the definition of shapes and simplicity of ornaments, mainly amounting to linear and wavy ornaments' [Fedorov-Davydov, 1981, p. 235]. For household purposes, ceramic goods of a wide range of shapes and dimensions were used, including cauldrons, pots, jugs, bowls, cups, plates, basins, flasks, 'holes' ['tagora'], amphorae, large and small storage vessels,

spheric cones, money boxes, tuvaks [sunaks], lids, lamps, candlesticks, devices for installing and relocating lamps, digirs, whistles, rattles and other toys, roof tiles, water pipes [kuburs], vessels in the shape of a blunted cone, fishing plummets, spindle whorls, balls, vessels with a net, stoppers, disks with holes, potter's wheels and 'non-spillable' jugs [see (Fedorov-Davydov, 2001, p. 7–199)]. As a rule, they did not contain any artistic decorations or complex ornaments, but were characterized by high technical properties. Also, pressed to shape gray-clay pottery was used. The typical properties of this pottery, manufactured in various Golden Horde regions—Azak, Volga Region, Majar, Khwarezm, Eastern Crimea [Kaffa, Sudak, Solkhat] and South-Western Crimea, were discovered by I. Volkov [Volkov, 1992, p. 4–12, 20–21].

Pottery kilns for unglazed pottery-ware have been discovered at the Vodyanskoye, Selitrennoe, Tsarevskoe [Fedorov-Davydov, 2001, p. 6–7], Bolgarskoye, Narovchatskoye and Uvekskoye archaeological sites, as well as in other settlements of the Volga Region (Bolshoy Shikhan, Zubovka, Krasniy Yar, Lapas, Russkiy Urmat, Sukhorechenskoye, Tatarskaya Bashmakovka, Sharenii Bugor, etc.) and provincial regions of Ulus of Jochi. At the Selitrennoe archaeological site, the complex of pottery kilns and supplementary structures 'comprised a large craft workshop like a "karkhan" that occupied the whole block' [Fedorov-Davydov, 1981, p. 232]. Numerous finds of objects relating to the manufacture of ceramics have also been made, such as furnace refractors (including clay supports) and burnishers.

A peculiar phenomenon of the culture of the Golden Horde was the production of glazed ceramics. This artistic craft has for a long time been of particular interest for researchers. Currently, the complete characteristics are presented and strict classification has been developed for Golden Horde glazed pottery, based on a technological principle, the composition of the paste and the nature of the glaze [Bulatov, 1968; 1976; Skorobogatova, 1983; Fedorov-Davydov, 1976; 1994; Fedorow-Dawydow, 1972; Fedorov-Davudov, 1984].

The problems of dating individual varieties of glazed ceramics, determining the volume and dynamics of the arrival of imported products, their influence on the Golden Horde ceramic manufacture are still relevant [Koval, 2003, p. 58].

Golden Horde glazed ceramics are also studied as an artistic craft—an integral part of the art of the Golden Horde and a very informative historical source.

As G. Fedorov-Davydov remarked, it expressed 'those artistic phenomena that were related to the tumultuous epoch of the foundation and development of the Mongol states. It served well to demonstrate the syncretism and mixed nature of Golden Horde urban culture. Glazed ceramics were the most wide-spread artistic product, reflecting social psychology and tastes and having a significant impact on them, filling markets and homes. Those were the products of a well-developed craft, equipped with every technical achievement of Middle Eastern pottery' [Fedorov-Davydov, 1994, p. 78].

Under the influence of leading medieval artistic pottery schools—Middle Eastern, Middle Asian, Transcaucasian, Byzantine and Far Eastern—a distinctive style and unique nature of glazed ceramics formed in the Golden Horde.

According to the composition of the base, Golden Horde ceramics can be divided into Kashan ceramics (earthenware) and red-clay ceramics. Golden Horde potters demonstrated great skill when using various technical and artistic devices for decorating their products. Kashan ceramics were decorated with an underglaze polychromatic painting with a relief, an underglaze polychromatic painting without a relief, an underglaze black painting and turquoise glaze, an underglaze cobalt painting, an underglaze black-turquoise-blue painting and delicate decorations, turquoise and ultramarine glaze and relief and overglaze painting. Red-clay glazed ceramics were decorated using two methods: underglaze painting using engobe and engraving, and reserve (sgraffito).

Multiple colorful ornamental compositions of Golden Horde glazed ceramics comprised a limited number of elements. It has also been noted that the shape and decorative features of most of the vessels correspond to each other.

Labour instruments. Ukek. 13–14th centuries
(according to L. Nedashkovsky)

Where the shape is concerned, Golden Horde glazed crockery can be divided into the following sub-groups: bowls, plates, pots, pot-like vessels with a conical spout or with a spout and fluted additions—'gulyabdan', jugs, bottles, apothecary vessels (albarello), lamps, flagons, ink stands, etc.

Smithcraft and iron-making was also well-developed. The commencement of production of cast iron in Europe is related directly to Golden Horde craftsmen. Structures related to iron processing are known not only in towns (Bolgarskoye, Tsarevskoye and Vodyanskoye archaeological sites) but also in many rural settlements of the Golden Horde period. A wide range of technologies was known to the Golden Horde—goods were manufactured not only from bloomery iron, but also from raw and whole steel, pack metal; hammer welding techniques were also used along with techniques of welding a steel plate in the base of the blade, end, side and V-shaped welding a steel plate onto the blade, cementation, tempering and copper bonding.

The range of blacksmiths' products was extremely large: colters, ploughshares, openers, politsas, mattoks, ketmens, sickles, scythes,

Glass articles. Volga Region. 13–14th centuries
(according to N. Busyatskaya)

axes, adzes, chisels, knives, scissors, augers, cutting irons, driftpins, awls, needles, pincers, kochedyks, skillet handles, devices for cattle branding, fishing hooks, snaffle bits, stirrups, rings for the tackle, saddle ornaments, ice-walking pins, fire strikers, chain armor, plate armor, helmets, arrowheads, spearheads and dart tips, sabers, maces, morning stars, daggers, quiver hooks, buckles, syulgams, onlays, hash marks, badges, cartridges, belt tips, bucket bails, candlesticks, rushlight holders, boxes, chains, wire, wedges, nails, brackets, cramp irons, latches, handles, door onlays, locks and keys. Cast iron was used to cast cauldrons, chalices and hubs for cart axles [Ryazanov, 1997].

Non-ferrous metallurgy was also highly developed—numerous casting moulds, melting pots, ladles for metal, jeweler's anvils and hammers, chisels, locksmithing scissors, matrices, production waste, substandard products have been discovered. Waste from the bronze-making industry have been found not only in towns [Tsarevskoe and Vodyanskoye archaeological sites] but also in rural settlements of the Golden Horde. The Tsarevskoe archaeological site offered the opportunity to study not only a bronze-casting shop but also a jeweler's store. Jeweler's facilities have also been examined in Old Orhei and Cheboksary. A goldsmith Shahidulla is mentioned in the text on a 1317 tombstone found in Archaeological Site.

Products of non-ferrous metal processing are represented by a large number of various types of goods, including buckles, hairpieces, onlays, belt rings, belt tips and distributors, badges, cartridges, pendants, medallions, jingles, bells (a large bronze bell was also found at the Tsarevskoe archaeological site), buttons, clasps, hat tops, beads, chains, temple rings, earrings, kolts, ear picks, pincers, rings for bracing a bow, bracelets, hair pins, syulgams, mirrors, ilt-akhans, mace tips, cauldrons, basins, dippers, chalices, ewers, lids, phials, mortars, pes-

tles, spoons, lanterns, lamps, pen cases, ink stands, kalams [writing sticks], fasteners for horse hobbles, wheels for pulleys, spindle whorls, thimbles, needles, cups for scales, weights, sealing weights, saber guards, sleeves and facings of knives, fire steel handles, facings for whetstones, door handles, bindings, wire, decorative nails, locks and keys.

The Golden Horde jewelers used silver and gold to produce chalices, goblets, dipper (including those attached to belts), plates, trays, ball-shaped vessels, spoons, parts of belt sets, tops of hats, charms, phylacteries, paizas, buttons, beads, earrings, rings, bracelets, hair pins, hair clasps, chains, combs and cases for them, wafers, nails, foil, wire, medallions, pendants and badges. The famous Monomakh's Cap—the Moscow Grand Prince's and later tsar's ceremonial headwear—is the product of toreutics experts of the European portion of Ulus Jochi of the late 13–early 14th centuries (the cross and fur trim were added to the cap at a later date) [Kramarovskiy, 2001]. The techniques of granulation and filigree were widely used in jeweler's art.

Glass-making was another artistic craft exclusive to the urban environment. Glass ornaments, tableware and window glass were known in all Golden Horde towns [Busyatskaya, p. 38–72; Poluboyarinova, 1988; Fedorov-Davydov, 1994, p. 170–174]. The main

argument in favor of the proprietary glass-making production is the availability of workshops. At present, workshops for the production of glass ornaments—beads, bracelets, rings—have been discovered at the Selitrennoe archaeological site [Galkin, 1984] and in Bulgar [Poluboyarinova, 2006]. Possibly, glass goods were also manufactured in Solkhat [Kramarovsky, 1998, p. 123].

Ornaments, predominantly beads, are the most common finds among glass goods [Busyatskaya, 1976, p. 39; Poluboyarinova, 1988, p. 213; Valliulina, Nedashkovsky, 2005, p. 256–260].

Beads found at Golden Horde sites were produced by winding a glass cord around a rod, as the beads were mostly spherical, zoned, ring-shaped, biconical, bitrapezoidal and cylindrical, and they could be monochromatic or polychromatic [mosaic, dotted, with a spiral-wavy decor]. Pendants had particularly original and decorative shapes, dimensions and ornaments.

Rings, bracelets and ring inserts have been discovered in smaller numbers. Out of all the Golden Horde towns, the most glass rings have been found in Bulgar [Poluboyarinova, 1988, p. 193; 2006].

Glass tableware is most frequently discovered in materials from the Selitrennoe, Tsarevskoe and Bolgar Archaeological Site, Azak, as well as Crimean sites, and has a general Eastern appearance and is not really varied. The main classes of such goods are glasses, phials with spherical and conical bodies, ewers, basin-like vessels of various sizes, tuvaks and lamps.

The discovery of window disks are mostly attributed to the ruins of monumental facilities only in large centers of the Golden Horde.

Most of the tableware and window glass products were made from colorless glass with bluish, greenish or yellowish tint, while goods made from light and dark blue and yellow glass are more rare [Fedorov-Davydov, 1994, p. 172].

When producing tableware and window disks, the main method used was free blowing, and sometimes, blowing in a mould was used, and some vessels were decorated with attached strings, strips and drops of glass.

Glass beads. Volga Region. 13–14th centuries
(according to N. Busyatskaya)

The chemical composition of the Golden Horde glass has not been sufficiently studied. It is obvious that different regional manufacturing centers formed a part of the same artisanal tradition and used their own chemical composition in accordance with the character of the raw materials in each geo- and biochemical province.

The greatest number of Golden Horde glass products is attributed to the chemical lass of sodium, alkaline glass—in the analytical sample from Ukek and its surrounding area its share reaches 77% [Valiullina, Nedashkovsky, 2005, p. 263]. According to the raw materials used, this class can be divided into two types: sodium-calcium-magnesium-aluminum-alumina glass and sodium-potassium-calcium-magnesium-aluminum-lead-alumina glass [Fedorov-Davydov, 1994, p. 170].

The principal colorants were iron, copper and lead compounds. Nontransparent glass was dampened using stannic oxide. Black beads, pendant beads, rings were colored by iron sulfide [Naumov, 1973, p. 225].

N. Busyatskaya remarked upon the closeness of the chemical compositions of Golden Horde glass and Middle Asian glass. She believed that this had been caused by the use of

Casting moulds for jewelry casting. Ukek.
13–14th centuries (according to L. Nedashkovsky)

common recipes of the working mass, similar sources of raw materials, and the participation of Middle Asian craftsmen in the work of glass-making workshops of the Golden Horde as well as master glass-makers from the Near East [Busyatskaya, 1976, p. 65].

Products of stone-cutting are widely represented in materials of Golden Horde sources. However, there are few survey works on this type of manufacturing [Poluboyarinova, 1991; Fedorov-Davydov, 1994, p. 179–180].

Currently, traces of workshops for processing semi-precious and ornamental stones and the production of ornaments from them are being found in large centers of the Golden Horde (Bolgarskoye, Selitrennoe and Tsarevskoe archaeological sites) [Poluboyarinova, 1991, p. 111; Fedorov-Davydov, 1994, p. 179–180]. The ornaments—beads, pendants, insets, rings, as well as parts of belt sets, seals, chess sets—were made from rock crystal, carnelian, opal, coral, turquoise, alexandrite, jade, mother of pearl, nephrite, amethyst, amber.

The manufacturing complexes of stone cutters of other specialties are as of yet unknown. The initial stage of the production cycle, the production of construction units, tombstones, millstones and other stone products, is represented by the remnants of ancient mines on the right bank of the Volga, opposite Bulgar. There, in the opinion of R. Shrifullin, the stone and gypsum necessary for the construction of Bulgar structures were stockpiled. 'Large slabs of pink and red sandstone for building stoves and under-floor chimneys were also broken out there' [Sharifullin, 1999, p. 49].

The range of stone products from Golden Horde sites, apart from jewelry, the details of belt fixtures and seals, comprises millstones, whetstones, spindle whorls [mostly shale ones and sometimes slate ones], slate crosses and icons, known in Bulgar and the Lower Volga capitals [Poluboyarinova, 1978, p. 60], construction stone and architectural elements [Aydarov, 2001, p. 8–11].

Millstones and whetstones are probably the most frequent finds. Whetstones are sometimes large and were used for sharpening knives, sickles, scythes. Miniature grinding stones with a groove and a hole drilled for suspending them on a cord served as sharpening needles and for setting razors, small knives and jeweler's tools.

Casting moulds of Golden Horde Bulgar as well as those of other centers were mostly made of limestone, slate and fragments of pot stone vessels manufactured in Northern Khorasan and Khwarezm [Polyakova, 1996, p. 161; Poluboyarinova, 2004, p. 316–323].

Touchstones used by jewelers and alchemists to determine the purity of gold since high antiquity, in pre-Mongol monuments of Eastern Europe mostly originated from the Western shore of the Caspian Sea [Valiulina, 1998, p. 90]. Obviously, the same source supplied touchstones to craft centers of the Golden Horde [Fedorov-Davydov, 1984, p. 95, fig. 8, 9; Valiulina, 2004, p. 161, fig. 6, 21].

One of the most obvious indications of the high level of stone cutting is the architectural decor of primarily religious structures, and the tombstones known in Crimea and the Middle Volga Region, as well as headstones of a strictly regulated, canonical shape: a stela in the shape

of a flat parallelepiped with a Quranic formula or a carved rosette in the tympan. Sometimes monuments with a semi-circular top are can be found [Mukhametchin, 2001, p. 100].

The raw materials, assortment, nature and volume of the finished goods of stone cutters make it possible to judge the development of this industry in the Golden Horde and they also reflect its international connections.

Certain categories of stone products, such as vessels [Poluboyarinova, 2004, p. 316–323], slate spindle whorls, crosses and icons [Poluboyarinova, 1978, p. 69], chess sets, and touchstones were imported. Jewelry—beads, pendants, rings, inserts, as well as seals, belt plates—were both imported and produced locally from imported raw materials. Undoubtedly, whetstones, most casting moulds [Poluboyarinova, 1993, p. 28, fig. 7.1; Fedorov-Davydov, 1994, p. 179], millstones, construction stones, architectural decor and tombstones were produced locally.

The bone-carving craft had reached a high level of development, using a number of technologies, including the processing of products on a mechanical lathe and their polishing. Bone-cutting shops were discovered at the Tsarevskoe, Selitrennoe and Bolgar Archaeological Site.

Bone was used to manufacture belt buckles, onlays, tabs, badges, cartridges [Valiullina,

2000, p. 280, fig. 7.1], buttons, beads, rings, charms, writing sticks, chess sets, checkers sets, game pieces for playing dibs, dice pieces, piercing pieces, bast shoe weaving tools, combs, ear picks, spoons, scales, needle cases, whip handles, bodkin handles, handles, sleeves and butt plates for knives, onlays for saddles, fastenings for horse hobbles, rings for bracing a bow, whistling onlays on the stems of iron arrowheads, bone arrowheads for hunting, bow elements and ornamented, decorative facings of quivers (that were frequently painted in different colors).

Leather was used to produce bags, purses, pouches, casings, charms, bow coverings, quivers, belts, wide trousers, boots, headgear, cases for mirrors and needle cases. Saddles were also covered with leather.

Fabric was used to sew clothing and headgear, to produce belts, purses, cases for mirrors. Felt was also used.

Wood-processing crafts are also worth mentioning. Due to the bad state of preservation of wood at Golden Horde sites, archaeologists have discovered only some types of the products of wood carvers who used turning lathes in their work, such as saddles, quivers, bows, arrow shafts, sheaths, whip, knife and bodkin handles, bases for bork hats, needle cases, charms, boxes, cups, bowls and plates, kobyz (a sting musical instrument), combs and spoons.

§ 4. International and domestic trade

Leonard Nedashkovsky

In the 13th century, as a result of the conquests of Chinggis Khan and his successors, the principal portion of Eurasia was included into the Mongol Empire. The Northwestern part of this enormous territory was governed by the descendants of Jochi. The state of the Jochids stretched from the Danube in the West to the Ob basin in the East, and from Khwarezm and the North Caucasus in the South to the Cis-Kama Region in the North. In the latter half of the 13–14th centuries, the main trading routes connecting Western European countries with Eastern Asia [sometimes also called The Great

Silk Road] shifted north and passed through the territory of the Golden Horde. This was due to the Europeans' loss of the old trading routes passing through the Near East after the utter defeat of the Crusaders in Palestine in the 12–13th centuries, as well as in relation to the continuous wars of the Iranian House of Hulaqu with the Egyptian Mamluks.

Ulus of Jochi was one of the largest Medieval states existing in the latter half of the 13th to the second quarter of the 15th centuries. This state was, in particular, characterized by a high level of development of coin circulation,

Ways Tatars cross rivers.

Engraving for the first edition of the book by W. Rubruk. 1735.

including small-scale retail trade. During the Golden Horde period, towns and crafts flourished thanks to the protection of the Khan's power. The same can be said about trade.

The nomenclature of bureaucrats of Ulus of Jochi included positions related to the management of trade: weighers, tutkauly (toll-gate masters collecting road travelling fees), mail masters (yamshchiks), stage masters, carriers (ladeyshchiks), bridge holders, and bazarde turkhany (bazaar attendants) [Fedorov-Davydov, 1973, p. 95–100].

The trading connections of the Middle and Lower Volga Regions, that is, regions comprising the economic and political center of Ulus of Jochi, the amalgamation of all trading routes of the state, were particularly important. The Lower Volga Region was the domain of the Golden Horde khans and their headquarters travelled there. Also, the very Volga trade route was a major artery both for the Golden Horde itself and for Ancient Rus' connections with the East.

Practically all the trading connections that had existed in Eastern Europe during the pre-Mongol period remained in place during its reign. However, there was a great difference between Volga trade in pre-Mongol times and that during the Golden Horde, namely, during the Golden Horde period, the Volga Region

found itself in the center of an enormous state, inside of which it was easier to trade than with the numerous minor states surrounded by nomadic hordes. This difference became the reason for an unprecedented boom in trade connections in the Volga Region during this time. Golden Horde khans and aristocrats promoted the trade that brought them large profits. There were also merchant associations that arranged large-scale caravan trade.

In the 1240s, the Golden Horde began to overcome the effects of Mongol

massacres and destroyed towns were being restored, and the conquerers relied on them when establishing their power. The Volga Region became the political and economic center of the Jochid state and remained such until its disintegration. At the same time, the recovery of expansive trade connections, damaged by the Mongol invasion, began to occur. For example, the famous traveler and papal legate Giovanni da Pian del Carpine, who in 1246–1247 passed through the territory of Ulus of Jochi, mentioned Western European merchants who arrived to Kiev from Constantinople 'through the land of the Tatars' [Voyages, 1957, p. 82]. Those were merchants from Genoa, Venice, Acra, Pisa and possibly other cities.

According to Juwayni, Batu Khan himself took steps to restore trade connections: 'Merchants from [various] countries brought him numerous goods and all this, whatever it was, he took and gave a price exceeding its value by several times for each item' [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1941, p. 22].

On rivers, special settlements were created, whose residents were obligated to transport ambassadors and merchants from one bank to the other. William of Rubruck, who passed through the territory of the Golden Horde in 1253–1254, spoke of these settlements. Two

of these settlements, inhabited by Russians, were located in the upper and lower reaches of the Don [Journeys, 1957, p. 109–110], and one, settled by Russians and Muslims—on the Volga [Ibid., p. 118]. Residents of these settlements had 'a privilege granted by Batu, namely, they had no obligations to do anything but to transport those leaving or arriving' [Ibid., p. 109], that is, they were exempted from all taxes and duties. Moreover, they were granted the right to collect a large fee from merchants [Ibid.]. Possibly, Batu offered all these benefits to the residents of the settlements in order to restore trade connections as soon as possible, in particular, by arranging organized river crossings of large rivers.

The appearance of three settlements on the Don and the Volga indicates the creation of a new trade route across the steppes. They provided services to merchant caravans. This route went from the West to the town of Sarai—the new capital of Ulus of Jochi, which had been founded by the Jochids on the Lower Volga.

It was first mentioned by William of Rubruck who visited Sarai in the autumn of 1254 [Ibid., p. 185]. Starting from 1240–1250, the Golden Horde khans started actively to build towns in the Volga Region. In particular, Rubruck mentioned the construction of a new settlement with a church on the right bank of the Volga by Sartaq, the son of Batu [Ibid.].

Along with the newly-founded towns, Mongols actively used the old towns that had been most influential during the entire latter half of the 13th century. However, the new towns founded by the Jochids themselves on the lower Volga gradually started to play an increasingly important role.

Along with the restoration of old trade links from the 1240s to the first half of the 1260s, brand new areas of trade were in the making in the Volga Region.

As early as in the middle of the 13th century, the towns on the shores of the Black Sea in Crimea (Sudak, later Kaffa, etc.) became more significant in regard to the Volga Region's trade relationships with Sinop, Constantinople, Trebizond, and, via them, with Mediterranean ports. Among the goods shipped by sea from Sudak, Rubruck mentioned 'ermine, squirrels

and other precious furs' as well as 'cotton fabrics, flannel, silk materials and aromatic roots' [Ibid., p. 89]. The first group of these products was transported from the North, the second—from Middle Asia and, possibly, China. In any case, it is unlikely that all these goods, which were the main items of trade even during the pre-Mongol period, would be shipped to Sudak avoiding the Volga Region or without the active participation of the local merchants.

During the rule of Berke Khan (1257/58–1266), new trade and diplomatic relations were established between the Golden Horde and Mamluk Egypt [Zakirov, 1966]. This not only resulted in the creation of a military alliance (from 1262) of the Jochids and Egyptian sultans opposing the state of Hulagu, but also in the improvement of trade links between the two countries. It is worth noting that the Golden Horde traded with Egypt even while negotiations were being conducted between Baybars and Berke, as the Egyptian sultan sent one of his letters to Berke Khan from Cairo in the presence of Alanian merchants [Collection of Works Relating to the History of the Golden Horde, 1884, p. 55].

In 1240–1260, the Volga Region's traditional trade links with Middle Asia and Transcaucasia began to be restored (though contacts with the latter area were made difficult during the period of conflicts between Berke and Ilkhan Hulagu). Along with the revival of old links, new ones also arose during this time, for example, through Crimea to the towns of Asia Minor and Constantinople, giving access to the Mediterranean Sea.

During the rule of Khan Mengü-Timur, towns became ever stronger, especially those in the Lower Volga area. This is indicated by numerous finds of coins minted by the khan both at major and at peripheral archaeological sites in the region.

The khan authorities' development of trade also promoted the development of trade links of the Volga Region. Even then, it was a central point where trade routes from all over the vast Ulus of Jochi met.

Sometime between 1266 and 1270, Novgorod merchants gained the right 'to visit Suzdal lands without restriction, as permit-

Pieces of cloth from the condottiere of Cangrande's (Verona) tomb, who died in 1329.

ted by the tsar's charter' [Charters of Veliky Novgorod and Pskov, 1949, p. 13], that is, in a yarliq by Mengü-Timur that has not survived, but a mention of which was recorded in the charter of the treaty of Novgorod with Grand Prince Yaroslav Yaroslavich.

In 1266–1272, Mengü-Timur sent a special yarliq with a message to Yaroslav Yaroslavich, the Grand Prince of Vladimir. In that yarliq, the Jochid khan invoked Yaroslav to 'grant German guests access to his volost' [Ibid., p. 57], possibly to facilitate their onward journey to the central lands of Ulus of Jochi. Such a provision for the safety of 'German guests'—in this case, Riga merchants—from the Baltic States region through the lands of Novgorod and Vladimir-Suzdal to the Middle and Lower Volga Regions was intended to intensify trade between the Volga Region and The Baltic and Western Europe.

Immediately after the Golden Horde's war with Iran in 664 AH (1265/1266), trade relations between Ulus of Jochi and the Hulaguid

state were restored, and 'caravans from both sides started to travel back and forth again' [Collection of Works Relating to the History of the Golden Horde, 1941, p. 76]. The Golden Horde's trade with Hulaguid Iran became more safe after the Caucasus campaign of Mengü-Timur in 1277/1278 when he finally subjugated the Alans as well as some other highland people.

During the rule of Mengü-Timur (1266–1280), the Genoese established themselves in Kaffa; in 1274—in Sudak; and in the late 13th to early 14th century, in Tana. In 1289, the Genoese established a consul in Kaffa [Safargaliev, 1960, p. 63].

The early 14th century saw an intensification of policies to expand trade in Ulus of Jochi. One significant event was Khan Tokhta's monetary reform in 710 AH (1310/1311) that ensured a further blossoming of Ulus of Jochi's economy. This was a truly grandiose reform that was supposed to unify the coinage system of the entire vast Golden Horde State. For this purpose, all coins of previous issues were prohibited, and a new, silver coin was put into circulation. It had a set weight that remained unchanged until the late 1360s, and was uniform across the entire Ulus of Jochi.

The heyday of the Golden Horde was directly related to the rule of Khans Öz Beg (1312–1342) and Janibek (1342–1357). Active urban construction was carried out during the period. Öz Beg continued the tradition of the khan's patronage of trade in Ulus of Jochi, foreign trade in particular. That, combined with the internal unity of the state, led to an unprecedented boom in the Golden Horde's trade and its economy in general during the rule of Khan Öz Beg.

The towns of the Lower Volga played an increasingly prominent role in the Volga Region's foreign trade links in the first half of the 14th century, even though the significance of the other Volga centres, mainly Bulgar, remained unchanged.

This period saw a rapid growth in the importance of towns, both politically and from a trade and craft perspective. The role of the Lower Volga towns became particularly important, even though the rise of urban life was

witnessed also in Volga Bulgaria, Khwarezm and the lower reaches of the Syr Darya.

Even in the early 14th century there were trade links between the Volga Region and India, confirmed by stories of goods (swords, flax and linen cloth) brought from Rus' to India in the works of authors from the first half of the 14th century—Amir Husrau and al-Umari [Zakhoder, 1955, p. 17; Limonov, 1961, p. 59]. Egyptian merchants reached as far as Bulgar on their travels (they traded with more distant North-Western lands via Bulgarian merchants) [Collection of Works Relating to the History of the Golden Horde, 1884, p. 235, 240].

Apart from the trade with Egypt, Iran and India, in the early years of Öz Beg's rule trade with the West also developed—mostly though the cities of Kaffa and Azak located at the mouth of the Don. There were Italian colonies in these settlements: in 1322, the first Venetian consul appeared in Tana [Grigoryevs, 2002, p. 10].

The scale of trade by Italian merchants in the Golden Horde during the rule of Tokhta and Öz Beg was reported by Francesco Balducci Pegolotti, who in his treatise 'The Practice of Commerce' (completed in 1340–1342, based on real journeys the author had made for business purposes, starting in 1310) described the trade route from Azak (Tana) to China. This route was described by Pegolotti in minute detail and very thoroughly: he travelled from Tana to Hajji Tarkhan on wagons drawn by oxen or on carts drawn by horses or camels, from there he went upstream by ship on the Volga to Sarai, then by land or water to Saray-Jük, then by land to Urgench, Otrar, and then to Almalyk and China [Grekov, Yakubovsky, 1950, p. 158–159; Pegolotti, 1936].

Ulus of Jochi became an intermediary in the trade between Western Europe and China, but the trade itself had become much greater in scale, as can be seen from the very fact that guidelines were compiled for merchants travelling from Tana to China through the Lower Volga towns, which at the time were major trading and craft hubs as well as being cultural and religious centres of the Golden Horde.

The rise of foreign trade in the Golden Horde, and the Volga Region's integral role in

the early 1330s, was vividly depicted by Ibn Battuta (1304–1377). According to him, Kiram (that is, Crimea and Solkhat), 'a large and beautiful town' [Collection of Works Relating to the History of the Golden Horde, 1884, p. 280], Sudak, whose harbour was 'one of the largest and best harbours' [Ibid., p. 303], and especially Kaffa, having 'a wonderful harbour' with numerous ships [Ibid., p. 280] played leading roles in Ulus of Jochi's foreign trade. In Ibn Battuta's view, the principal portion of the population of Kaffa comprised the Genoese who had their own 'emir', that is, consul [Ibid.].

Ibn Battuta describes Majar, 'a large city, (one) of the best Turkic cities', as one of the major foreign trade centres [Ibid., p. 287]. In this city's market, Ibn Battuta met a Jewish man who had arrived from 'the Andalucian (Andalussian) Lands' [Ibid., p. 288], that is, from Spain, who had reached Majar by way of Constantinople and Transcaucasia in just four months. This may be an indication of the existence of close trade relations between the Volga Region and lands as distant as Spain. Lower Volga archaeological sites sometimes produce fragments of 14th century Spanish lustrous pottery [Fedorov-Davydov, 2001, p. 207].

There was another route from Azak to the Volga Region towns that was frequently used by traders—the river route. It involved travelling upstream on the Don and dragging vessels over to the Volga in the vicinity of modern-day Volgograd. It is probable that the town of Beljamen was located on this skid road during the Golden Horde period. On the Pizzigani brothers' map, the description 'bazaar' was added to the name of Beljamen, unlike other towns.

Ibn Battuta also left interesting materials regarding trade with 'the country of darkness', that is, the people of the north. The Arab traveler could not help being interested in this trade since it provided the Golden Horde merchants with most of their furs, one of their primary exports. Bulgar was the centre of Ulus of Jochi's trade with 'the country of darkness'. From there, the merchants used dog-drawn carts to travel to the north. According to Ibn Battuta, once the merchants arrived there, a primitive, 'speechless' exchange would take place, where they received 'sable, squirrel and ermine' furs in

Two-handed jug. Ukek. 13–14th centuries.
State Historical Museum

return for their goods (probably hunting equipment and ornaments) [Collection of Works Relating to the History of the Golden Horde, 1884, p. 297].

In his travels in the Golden Horde, Ibn Battuta also visited the town of Hajji Tarkhan in the lower reaches of the Volga. According to the traveler, 'this is one of the best towns, with large bazaars' [Ibid., p. 301]. Ibn Battuta also provides fascinating information about how, when the Volga froze in winter, the locals, on the orders of the khan, put several thousand cartloads of straw on the ice. In such a way, the Volga and its tributaries were turned into fairly direct and convenient caravan roads, which were 'used to travel on carts on distances of up to three days' journey' [Ibid.]. The importance of this winter road is also indicated by its use in early spring when some caravans sank and perished [Ibid.]. It is possible that the organised movements of caravans on the ice of the Volga, as described by Ibn Battuta, were even more typical in the Middle and Lower Volga upstream of Hajji Tarkhan, where the ice was stronger due to the harsher climactic conditions.

On his way from the Lower Volga Region to Constantinople, Ibn Battuta visited the Volga town of Ukek. This was a town 'of medium size but beautifully built, with many fine attributes and strong frosts' [Ibid., p. 302–303].

Ibn Battuta tells us that silver ingots—sau-mas (that is, sommas), 'used to sell and buy (goods) in this land'—were brought from Rus' to Ukek [Ibid., p. 303].

Ibn Battuta was immensely impressed by the city of Sarai—the capital of the Golden Horde. With regard to foreigners in Sarai, the traveler writes that Byzantines and natives of the Near East lived in the city. In particular, he mentions: 'Each people lives separately in their district; their bazaars are also there. The merchants and foreigners from both Iraqs, from Egypt and Syria and other places live in (a special) area, where a wall guards the merchants' property' [Ibid., p. 306]. Ibn Battuta is in fact referring to genuine trade colonies in Sarai, whose operation during Öz Beg's reign indicates that the Lower Volga Region's foreign trade links were highly developed at this time.

After a 10-day horseback ride from Sarai, Ibn Battuta and his companions arrived at Saray-Jük. Nearby, they crossed over to the left bank of the Ural River on a bridge made of boats. From there, in carts drawn by camels, they followed the ancient caravan route to Khwarezm (Urgench), where all the principal trade routes from the Golden Horde to India and China met. 'This is one of the largest, most influential and most beautiful Turkic cities, rich in glorious bazaars, spacious streets, numerous edifices, select amenities' [Ibid., p. 308]—this is how the Arab traveler characterized Khwarezm.

According to Ibn Battuta's information, the export of horses from the Kipchak steppe to the Indian lands was of huge importance. Ibn Battuta wrote the following about the steppes of Ulus of Jochi: 'There are great numbers of horses there, and they cost very little' [Ibid., p. 286]. According to him, the horses were moved from the Golden Horde to India in enormous caravans—in herds numbering around 6 [Ibid.].

The monetary reform of 725 AH (1325/1326) in India and the start of its exporting of gold,

on the one hand, as well as the significant reduction in customs duties by the Delhi sultan Muhammad bin Tughluq (1325–1351), on the other, caused a boom in the development of trade links between India and Ulus of Jochi, in particular with its central Volga lands.

Ibn Battuta also confirms the increase of trade volumes, in particular horseflesh, of Ulus of Jochi with India after the reforms of Muhammad bin Tughluq. This trade, according to Ibn Battuta, brought large profits to merchants [Ibid., p. 287].

Fur animal skins (sable, ermine), mostly purchased by Bulgarian merchants from the people of the north or brought from Rus', were also transported to India from the Golden Horde. The fur trade, as well as the horse trade, was a profitable business. According to Ibn Battuta, an ermine coat cost 1000 dinars in India [Ibid., p. 298]. This was a considerable amount even when compared to the high prices paid for Golden Horde horses—even the best of those cost about 500 dinars in India [Ibid., p. 287], half as much.

Ibn Battuta does not say what goods were brought from India to the Golden Horde. However, it is arguable that the Golden Horde merchants received, in particular, gold in the form of coins in exchange for horses and furs, and that the gold was later sold in Ulus of Jochi towns, primarily in the Volga Region.

It was profitable to bring gold from India to Ulus of Jochi because it was valued above silver in the European part of the Golden Horde State [Fedorov-Davydov, 2003, p. 65–66].

A large number of gold Indian coin discoveries have been made in the Volga basin—both isolated finds and as part of treasure troves [Ibid., p. 62]. Most of the Indian coins found on Golden Horde land have been discovered in the Volga Region. A silver coin minted by the Delhi sultan Ghiyath al-Din Tughluq dating back to 722 AH was found at the Tsarevskoe archaeological site [Lebedev, Klovov, 2005, p. 58, 60, fig. 1.9]; the other Indian coins from the Volga Region are made of gold. Near Astrakhan three coins minted by Delhi sultans who reigned before Muhammad bin Tughluq were also found at the Suvar archaeological site [Bykov, 1969, p. 79; Fasmer, 1927, p. 45, 50–52]. As early as

Pieces of glazed ceramics with underglaze ornamentation in the sgraffito technique. Ukek. 13–14th centuries. NM RT

in 1849, during excavations at the Tsarevskoe archaeological site, A. Tereshchenko discovered a treasure trove consisting of eight gold dinars from the Tughluq dynasty [Grigoryev, 1850, p. 336–351; Fedorov-Davydov, 2003, p. 62]. The most recent coin in the trove was minted by Firuz Shah (1351–1388).

In 1884, near the Bolgar Archaeological Site in the vicinity of Tenishevo Village, seven Indian gold coins were found on the bank of the Volga [Fasmer, 1927, p. 50], also seemingly comprising a single trove. The most recent coin is dated 742 AH (1341/1342) which means it was hidden during the rule of Janibek. In 1893, in the same place, four more gold Indian coins minted by Muhammad bin Tughluq were discovered [Ibid., p. 51]. Similar coins were also found in 1924 near the village of Danaurovka on the territory of a Golden Horde town called Juketau [Ibid.].

Via the Volga Region, Delhi gold coins also reached the former Perm Guberniya, the North Caucasus, Crimea and the Prut River basin [Bykov, 1969, p. 78, 80; Nudelman, 1975, p. 99; Fedorov-Davydov, 2003, p. 62].

Apart from coins, India was the source of unprocessed ivory found among the materials at the Selitrennoe archaeological site as well as

Iranian bronze pitcher. Bulgar. 14th century
Bolgarskoye Historical and Architectural Reserve
(according to V. Baranov)

cowry shells and corals from the shores of the Indian Ocean. A filigree bone plate depicting an elephant and a monkey was discovered at the Tsarevskoe archaeological site is possibly of Indian origin [Fedorov-Davydov, 2001, p. 215].

Talcochlorite vessels (mostly cauldrons) and sulfur clay ceramics were bought from Khwarezm to the Volga Region, reaching as far west as Dniester and Azak. Tableware from the Volga Region can in turn be found in Khwarezm and Ustyurt [Volkov, 1992, p. 13–14, Table 2. 17; Fedorov-Davydov, 2001, p. 210–213, 221, Tables 105–106]. Khwarezmian coins were in circulation in the Volga towns of the Golden Horde.

Silk and porcelain (encountered, in particular, in material found at the Bolgarskoye and Tsarevskoe archaeological sites) were brought from China, as were bronze mirrors and nephrite goods. The Selitrennoe archaeological site fragments of Chinese porcelain and even 14-century Korean celadon have been found [Poluboyarinova, 1991, p. 108–109; 2003, No. 2, p. 155–164; Fedorov-Davydov, Bulatov, 1989, p. 204].

The existence of well-developed trade links between Golden Horde towns and Western Europe, and the familiarity of its population with the geography of the Volga Region, are demonstrated by the European maps of Angelino Dulcert (1339), Francesco and Domenico Pizzigano (1367), the Catalan Atlas (1375), Mecia de Viladestes (1413), and Fra Mauro (1459), which show numerous 14th century Volga Region towns.

Fish of the sturgeon species [Emanov, 1995, p. 122; Pegolotti, 1936, p. 380], caviar, furs and salt were brought from the Volga Region to the Black Sea Region, then to the Mediterranean and Italy. Volga Kashi pottery, red-clay glazed, unglazed and stamped ceramics arrived at Azak, Crimea and the Northern Black Sea Region [Volkov, 1992, p. 13–14, Tables 2, 18–19; Fedorov-Davydov, 2001, p. 210]. Venetian and Genoese merchants from the latter half of 13th

century to the 14th century traded in the Lower Volga Region and then further East, reaching India and China [Emanov, 1995, p. 95–96; Fedorov-Davydov, 2001, p. 205–206, 213]. They brought expensive Eastern silk fabrics to Italy.

Among the finds from the Lower and Middle Volga Regions are fragments of Trapezond, Trillian, Crimean, Azak amphorae and amphora-shaped jugs, which shows that the Golden Horde imported wine and oil. Fragments of what are presumed to be Cretan pithoi, glazed crockery from the Black Sea Region, have also been found [Bulatov, 1969, p. 54, 57–59, Fig. 2.1, 3,2.5; Volkov, 2001a, p. 20, 22; Koval, 2003, p. 62, 66, fig. 2,4; Nedashkovsky, 2000, p. 98–99, 102–106, 120–121, Fig. 27,6, 28,2–6,9; Fedorov-Davydov, 2001, p. 208; Nedashkovsky, 2004, p. 56, 59–60, 69–73, 233–234, 238–239, 244, 249–250, fig. 68–69, 74, 75,6, 81,2–6,9, 86, 88]. The Uvek archaeological site produced a Western European bone statuette in the shape of a resting lion, while a bronze frame or vessel handle of Mediterranean origin was found at the Vodyanskoye archaeological site [Fedorov-Davydov, 2001,

p. 207]. In the 13–15th centuries, bronze water vessels were transported through the Volga Region from Western Europe to Siberia, while a French-made bronze statuette of a knight was brought to Kazakhstan [Ibid.]. A 14th century Venetian ducat was found near Astrakhan [Fedorov-Davydov, 2003, p. 62], and in 1863, a gold florin dating from the latter half of the 13th century or 14th century was discovered in Bulgar. The Karatun trove contained a Trapezund coin and a Prague grosz [Ibid., p. 96–97].

The Volga Region also had connections with Byzantium. This was confirmed by the discovery of a copper Byzantine coin dating back to the rule of emperors Andronikos II Palaiologos and Michael IX Palaiologos (1294–1340) at the Bolgar Archaeological Site, and of an *iperperon* of Andronikos II (1282–1332) in the village of Samosdelka in Astrakhan Oblast [Goncharov, 2003, p. 240; Fedorov-Davydov, 1987; p. 179, 202]. Certain types of glass bracelets were also brought to the Volga Region from Byzantium. At the Vodyanskoye archaeological site, a copper coin was found dating from the reign of Trapezund Emperor, Michael II (1341–1349) [Lebedev, Klovkov, 2005, p. 59–60, fig. 1,13].

Egypt was the most common destination for slaves who were transported out of the Golden Horde. A famous Arab author al-Umari (1301–1349) recorded the arrival of slaves from Ulus Jochi. He stated that most of the slaves that were transported out of the Golden Horde were children of nomadic steppe herdsman, sold into slavery by their parents 'to pay their debts (taxes)' [Collection of Works Relating to the Golden Horde, 1884, p. 235]. Egyptian merchants themselves bought children as slaves from the Ulus of Jochi population. One of them, al-Kerbelaï, 'reached Akcharkerman and the Bulgarian country' for this very purpose [Ibid.], and then told al-Umari about what he had seen.

Transparent glass lamps with multi-coloured enamel paintings as well as other glass vessels and certain types of Kashin ceramics were brought from the Near East to the Middle and Lower Volga Regions. It is possible that the marble candlestick with Arabic inscriptions discovered at the Tsarevskoe archaeological site originated in Egypt [Busyatskaya,

1972, No. 2, p. 85, 90; 1976, p. 53–54, fig. 2, Table 8; Koval, 2003, p. 59–60, 67–68, fig. 1,1, 4,4; Poluboyarinova, 1988, p. 207–211, fig. 91–95; Fedorov-Davydov, 2001, p. 209–210; Fedorov-Davydov, Vayner, Muhamadiev, 1970, p. 168, Table 7,1–4]. At one of the burial sites near the village of Komsomolskiy in the Krasnoyarsk area of Astrakhan Region, a Cairo dinar minted by the Mamluk Egyptian sultan, al-Malik al-Zāhir Rukn al-Din Baibars al-Bunduqdari (1260–1277) [Pavlenko, 2001, p. 75–76; Fedorov-Davydov, 1994, p. 35; 2003, p. 62], and the Selitrennoe archaeological site produced a Damascus dinar dating from the Mamluk dynasty of 771 AH [Lebedev, Klovkov, 2005, p. 57, 59–61, fig. 1,2]. Artisanal brass vessels with silver and gold inserts were brought to the Middle and Lower Volga Regions from the Near and Middle East.

The scale of the trade between the Golden Horde Volga Region and Iran is indicated by finds of Kashi pottery at the Bolgar Archaeological Site, and of fragments of Iranian Minai ceramics and vessels with luster painting in the Lower Volga Region. Red-clay glazed ceramics were brought to the Volga Region from Transcaucasia [Koval, 2003, p. 67–68, fig. 4,3; Fedorov-Davydov, 2001, p. 214–216, Table 107, 3–4].

Finds made in the Volga Region of coins from southern states (predominantly, Hulaguid, Jalairid and Timurid coinage) dating back to the 13–15th century are also of interest as they are indicative of close trade relations with the Golden Horde [Singatullina, 2002, p. 166–167; Fedorov-Davydov, Vayner, Muhamadiev, 1970, p. 136; Yanina, 1970, p. 208, No. 67–68]. Archaeological finds of similar coins are known to have been made in the Lower Volga towns [Lebedev, Klovkov, 2001, p. 41, 50, fig. 3, 189–190; 2004, p. 30, 46, 52, 60, fig. 6.6, 14,57].

The respective coins have been found in large numbers and as part of treasure troves of Jochid coins discovered in the Middle and Lower Volga Regions. Hulaguid, Jalairid and Timurid coins have been discovered in large troves that can be attributed to a merchant's capital.

In Transcaucasia, in its turn, there have been finds of both silver and copper coins dating

from the time of the Jochid khans, Öz Beg to Kildibek, that were minted in the Volga Region [Fedorov-Davydov, 1963, p. 212, No. 590–593]. Silver coins minted in the Golden Horde are also found in Transcaucasian treasure troves [Fedorov-Davydov, 1960, p. 166, No. 181–183; 2003; p. 103, 111, No. 180a, 257b].

Hulaguid and Jalairid coin finds (in particular copper coins that were not valuable for their metal) are indicative of the wide trade links between this region of the Golden Horde and Iran. These connections remained despite regular military conflicts. Even Rashid al-Din in several of his letters spoke of Russian goods (fabrics) and of squirrel and sable coats and furs brought to Hulaguid Iran [Poluboyarinova, 1978, p. 47; Rashid al-Din, 1971, p. 55, 125–132, 233–234, 236–238, 240, 280, 287–289, 292, 415], undoubtedly through the territory of Ulus of Jochi. Ibn Battuta speaks of the sable collars on the clothing of merchants from 'Persia and both Iraqs' [Collection of Works Relating to the Golden Horde, 1884, p. 298]. A Persian historian, Hamdallah al-Qazwini, in 1340 even speaks of ships that came to the island of Nim Murdan (Mazanderan) from Rus' along the Volga and down the Caspian Sea [Poluboyarinova, 1978, p. 45; Rashid al-Din, 1971, p. 55].

Trade between the north-eastern regions of Rus' and the East took place along the Volga Trade Route. Ibn Abd al-Zahir (qadi Muhammad ad-Din Abu-l-Fadl Abdallah, the son of abd az-Zahir), the secretary of the Egyptian sultan al-Malik al-Zāhir Rukn al-Din Baibars I al-Bunduqdari (1260–1277) who died in 1293, in his composition 'The Visible Garden in the Life Story of al-Malik az-Zahir' wrote about the Volga in relation to the arrival of the Mamluk sultan's ambassadors to the Golden Horde Khan Berke in the Lower Volga Region in 1263: 'The vessels of the Russians (travel) along it' [Collection of Works Relating to the Golden Horde, 1884, p. 63]. Salt was also exported to Rus' along the Volga. Barbaro, who lived in Tana from 1436 to 1452, describes this: 'Annually, people from Moscow sail in their vessels to Astrakhan for salt' [Barbaro and Contarini, 1971, p. 157]. The Russian merchants had been charged a fee, as Giosafat Barbaro states: 'It

must have been about twenty five years since the Russians paid a toll for their journey (along the Volga) to the Tatar khan' [Ibid., p. 158].

Khwarezm stone cauldrons, glass rings, glass and Kashin beads, unglazed, glazed and stamped Golden Horde pottery, found during the excavations of many Russian towns from Novgorod to Beloozero, were brought to Rus' in large quantities [Golubeva, 1973, p. 168, 186–188, fig. 61,1–3, 66,3,5–6,13; Dubynin, 1956, 65, p. 127; Koval, 1995, p. 170–171, fig. 1,1; 1997, p. 153–166, fig. 1,4–5,12–13, 2,1–8; 2003, p. 61, 63; Medvedev, 1963, p. 271–274, 276–286; Mongayt, 1948, p. 70–73; 1961, p. 324–326, fig. 146; Poluboyarinova, 1978, p. 48; 1993, p. 106–107; Rybina, 1978, p. 50–51; Fedorov-Davydov, 2001, p. 220]. The Riga Book of Debts of 1286–1352 mentions 'double Bulgarian pieces' of wax [Limonov, 1961, p. 63]. Cornelian stone, rock crystal and lazurite [Rybina, 1978, p. 52; Fedorov-Davydov, 2001, p. 221], Iranian, Syrian, Middle Asian and Transcaucasian glazed ceramics [Koval, 1997, p. 156–157, fig. 1,6–11; 2003, p. 59–60; Kolyzin, 2001, p. 100–101, fig. 40,3], Chinese celadons [Koval, 1997, p. 158–159, fig. 2,9; Poluboyarinova, 2003, p. 157, 163; Fedorov-Davydov, 2001, p. 220], Near Eastern glass tableware [Busyatskaya, 1972, p. 85; Kolyzin, 2001, p. 98–99, fig. 37,2–3; Stolyarova, 1997, p. 104–105, fig. 8,1] were brought to Rus' through the Middle and Lower Volga Regions. The Novgorod birch-bark charter No. 125 written at the turn of the 14–15th centuries includes a phrase: 'buy me some good cotton fabric', mentioning the cotton fabric known as 'zenden' ('zandanichi'), named after the village of Zandana (Zendene) near Bukhara [Artsikhovskiy, 1969, p. 281]. Boxwood from the Caucasus and cowry shells from the shores of the Indian Ocean were traded along the entire length of the Volga and beyond, even as far as Novgorod [Rybina, 1978, p. 45, 49].

Golden Horde coin troves have been discovered around Moscow and Nizhny Novgorod. Occasionally, they also have links with the merchant class [Volkov, 2005, p. 63; Kolyzin, 2001, p. 106, 156, 160–161, 179, 210–213, fig. 52,3, 53–54; Fedorov-Davydov, 2003, p. 47, 88–89, 106–107, 113, No. 95d, 97b, 208b,

214b, 217a, 312a–312b]. Also, isolated finds of Jochid dirhams and puls have been made on the territory of the former Moscow, Tver and Suzdal-Nizhny Novgorod Principalities [Volkov, 2005, p. 64–65; Fedorov-Davydov, 1963, p. 203–204, No. 479–480, 488–493].

Starting from late 14th century, when minting of coins recommenced in Rus', Russian money frequently made up part (from 0.1% to 13.4%) of Golden Horde coin troves in the Middle and Lower Volga Regions. Judging by the sizes of the troves containing the Russian coins, they are likely to be the savings of merchants who conducted trade in Rus' [Fedorov-Davydov, 2003, p. 56, 95–99, 105, No. 151a, 152g–152d, 202e]. In 2001–2002, at the Selitrennoe archaeological site, a trove was discovered containing over three thousand silver coins hidden in a fragment of a Golden Horde red-clay water pipe, stoppered by a piece of fabric. The identifiable coins were predominantly minted by the Suzdal-Nizhny Novgorod Principality. Apart from them, the treasure contained 13 coins dating from the reign of the Grand Prince of Moscow, Vasily II Vasilyevich, five 15-century Golden Horde dirhams, including some dating from the reigns of khans Timur, Ghiyas al-Din and Ulug-Muhammad, and two coin blanks [Trostyansky, 2004, p. 237–268].

There was a decline in foreign trade relations of the Volga Region during the reign of Janibek, as of the Golden Horde as a whole.

In 1343, the conflict between Ulus of Jochi and the Italians took place in Tana. Military operations and the loss of Tana immediately brought about 'in Byzantium a shortage of grain and salt fish, and in Italy prices for spices and silk doubled' [Tikhomirov, 1961, p. 15]. The conflict was resolved in 1347, first with Genoa and then with Venice, which was confirmed by the *yarliq* granted 26 December 1347 [Grigorievs 2002, p. 79–121]. The wars between Venice and Genoa, 1350–1355 and 1376–1381, also had a negative impact on the trade of the Italian maritime republics with Ulus of Jochi.

A major blow to the Golden Horde economy, including its trade, was dealt by an enormous plague that came from the East. In 1347, the plague raged among the Golden Horde troops

besieging Kaffa. The plague quickly spread from Ulus of Jochi to Western Europe thanks to well-established trade routes.

An especially significant blow to Volga trade, as well as to the cities of the Central and Lower Volga, was caused by the Golden Horde internecine feud in the 1360–1370.

During the period of the internecine feud, merchants' property was looted repeatedly. There is also evidence of murder and robbery of Russian merchants in the Volga Region by the order of Khan Arabshah (in 1378) [Complete Collection of Russian Chronicles, 11–12, p. 28; Poluboyarinova, 1978, p. 45]. Merchants often had to hide their savings, burying their treasures, but afterwards they were not always able to recover them due to the constantly shifting political and military situation.

Slaves—prisoners of war who were captured more and more during internecine wars—were exported from Tana and Kaffa into Italy [Fedorov-Davydov 2001, p. 223]. However, soon Italian merchants realized that the Golden Horde, torn apart by strife, would not be a reliable trading partner. The Venetians, realizing the low profitability and high risk of trading in Tana, began looking for other ways to trade with the East. Thus, in 1364 and 1367, Venice concluded trade agreements with the Trebizond Empire, through which ties with the Jalairid State were forged [Karpov, 1981, p. 62–64]. The Venetians' actions show that trade with the Golden Horde was becoming less and less profitable for them.

At the initial stage of the Toktamysh reign, unification of monetary reform took place, which was designed to recreate a single monetary circulation in all of the Ulus of Jochi and significantly undermined by internecine wars. However, the reform of 782 AH (1380/1381) had not created a unity of monetary circulation throughout the entire Golden Horde [Fedorov-Davydov, 2003, p. 16–17, 54]. 'Silver, to a greater extent than before, is leaving the urban sphere of trade and the local money circulation into the sphere of transit trade and merchant capital. Hoards of this time are mainly in the river ways—above all, in the Volga, the Dnieper, and along the Oka' [Ibid., p. 54].

Nevertheless, even in 1393, in a *yarliq* letter to the Polish king Jagiello, Toktamys̄h calls for the development of trade relations between Poland and the Golden Horde and for the resumption of journeys by Polish State merchants across Ulus of Jochi, 'Let thy merchant cooperatives travel as before' [Radloff, 1889, III, p. 6].

However, at the end of the Toktamys̄h reign, major Golden Horde towns, which were the main centres of international and domestic trade, declined or even completely ceased to exist because of Timur's campaigns on Ulus of Jochi. In 1388, Timur razed Urgench to the ground, and in 1395–1396, Volga Region towns such as Sarai al-Jadid, Hajji Tarkhan, Beljamen, Ukek, as well as Azak, Majar and others suffered terrible destruction.

The main trade routes between East and West finally shifted to the south and ceased to pass through the territory of Ulus of Jochi. Gio-

safat Barbaro colourfully describes it, talking of Hajji Tarhan: 'Now it's an almost ruined town, but in the past it was a large and famous city. In fact, before Tamerlane destroyed it, all the spices and silk went to Astrakhan, and from Astrakhan to Tana (now they go to Syria). Only from Venice to Tana did they send six or seven large galleys to pick up those spices and silk. And in those days neither the Venetians nor the representatives of other overseas nations traded in Syria' [Barbaro and Contarini, 1971, p. 157].

However, the trade in Sarai even in the 15th century brought considerable income to foreign merchants. A report of Shams al-Din Muhammad has been preserved, a Shiraz merchant who sold out his goods in Sarai and bought Chinese raw silk, silk damask, skinner's satin, European cloth and Russian canvas there, in 1438 [Zakhoder, 1955, p. 14–19].

§ 5. Trade between the Ulus of Jochi and the countries of the Mediterranean

Uli Schamiloglu

The territory of the Ulus of Jochi—especially Crimea, the northern Black sea coast, and the lands along the Volga River—has always played a very important role in the transregional trade of Eurasia. This area was in constant overland contact with neighbouring regions. However, historically, the most important feature of the economies of all medieval states in this region was the Black Sea trade. If we consider the Golden Horde from the standpoint of the region's history, we should expect that the Black Sea trade was probably the most important feature of the Ulus of Jochi economy. In fact, this is confirmed by studies of the Italian trade in the Black Sea Region in this period (general works of the Black Sea trade at this time, see: [Heyd, 1959; Bratianu, 1929; Thieret, 1959; Skrzinskaja, 1968, p. 3–45; Lane, 1973; Berindei, Veinstein, 1976, p. 110–201; Balard, 1978; Abu-Lughod, 1991; Karpov, 1990. Skrzinskaya, 2000]. An impressive number of academic publications on this subject shows that the Black Sea trade route was undoubtedly

the most important trade artery of the Golden Horde, linking its territory to the Mediterranean world in the 13th and 14th centuries.

However, the traditional historiography has ignored the important role of the Black Sea trade in the economic and commercial history of the Golden Horde. It overlooked the important role of this region, which since ancient times had been comprehensively represented in the documents. As a result, the historiography devoted to Ulus of Jochi ignores what was one of the most important articles of the Golden Horde economy, namely the large volume of its agricultural exports (including wheat). The reason for this is that the traditional historiography approached the Golden Horde with the a priori assumption that the main sphere of this nomadic state activity was the extraction of resources from settled states (especially Rus') through taxation, etc. (See: [Roublev, 1970, p. 29–64]). It therefore did not take into account the agricultural surplus of the areas that formed part of the core territories of the Golden Horde and

the settled agricultural population that created them. Even those works that refer to the Italian colonies on the Black Sea do not consider them in connection with the economy of Ulus of Jochi. However, the level of commerce was so high that the Black Sea trade represented a significant part of the Italian maritime republics' trade in this period. The goods imported by them from their colonies in the Golden Horde territories were actually the exports of the Golden Horde. This approach gives a completely new perspective on the Ulus of Jochi economy.

As we know, before the Mongol conquest, not only nomads inhabited the territory of the future Golden Horde. At the beginning of the 13th century, numerous towns flourished as commercial centres of Western Eurasia. These commercial hubs in Bulgar, the Lower Volga and Crimea and other places linked Western Eurasia with other centres in Central Asia and beyond it as far as China, representing a network of trade routes, usually known today as the Great Silk Road.

On the eve of the Mongol invasions, there was a considerable Italian presence in the trade with Western Eurasia through the Black Sea, a region which the Kipchaks controlled. Ibn al-Athir wrote that Sudak was an important city of Kipchaks, through which they received their goods from vessels filled with clothes sold for girls; slaves, furs and other goods from their land [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 26].

Mongol campaigns beginning in the 1220s leading to the formation of the Ulus of Jochi, probably meant the temporary interruption of commercial activities in Western Eurasia, since all the towns attacked during campaigns of conquest, were the largest trading centres. However, commercial activity expanded rapidly as soon as the Chinggisids had firmly established their control over Eastern Europe in the late 1230s. Shortly after the formation of the Golden Horde, foreign merchants visited its various centres and centres of adjacent territories subordinated to it, and not just Soldaia in Crimea, where the Venetians were present already in 1206. There was nothing unusual in this: merchants travelled across western Eur-

asia in earlier centuries—long before the Polo brothers made trans-European trade known in the West.

Reports from Latin travellers who came into Jochid lands along the same routes as merchants are an important source on the routes taken by those who took part in the lively trade between the Golden Horde and other countries. Giovanni da Pian del Carpine [John of Plano Carpini], who was returning through Kiev in 1247, mentioned merchants from Bratislava who accompanied him on the road. He also noted that upon his return there were merchants from Poland and Austria. Giovanni da Pian del Carpine names merchants from Constantinople on their way to Rus' through the Golden Horde whom he met in Kiev, including Michael the Genoese, Manuel the Venetian, James Reverius from Acra and Nicholas Pisani [Mission to Asia, 1955/1980, p. 71]. This is clear evidence of the Genoese and Venetian merchants' presence in Kiev in 1247, only a few years after its alleged destruction. Obviously, they had arrived in the Golden Horde in the same year or before by the Black Sea, which once again confirms the argument that in the 13th century Italian merchants could travel about their business in the Pontic Region, despite the lack of concessions or trading posts (see also: [Balard, 1978, p. 28–29, n. 44]). Giovanni da Pian del Carpine's mention of the merchants from Bratislava, Poland and Austria whom he saw in Kiev, points to the importance of trade with Eastern Europe, on which topic the sources are sparse (on western trade, see also: [Allsen, 1989, p. 83–126, especially p. 84]).

A more specific description of this route can be found in William of Rubruck, who sailed from Sinopolis (present-day Sinop) along the Black Sea coast of Anatolia, and arrived on 21 May 1253 in the region of Gazaria, as he called Crimea [Mission to Asia, 1955/1980, p. 89–93]. First, he went to Soldaia (Sudak), although he does not mention whether he met with some Venetians there at the time. According to William of Rubruck, all the merchants coming from Anatolia and wanting to go north go through Soldaia, as do merchants undertaking such a journey in the opposite direction. In the 14th century, Ibn Battuta traveled the same

Map by Angelino Dulcert, 1339

route from Sinop (Sanub) to Kerch (Karsh), then to Kaffa, Kiram, Sugdak (Sudak), and then to Azaq [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 279–288]. William of Rubruck explains that Cumans had previously lived in the steppe part of Crimea and forced Crimean towns to pay tribute to them. But at that time Mongolian prefects were in Soldaia (a term that Giovanni da Pian del Carpine [John of Plano Carpini] uses to translate the word *bastaki*, that is, the Golden Horde title *baskak*) [Mission to Asia, 1955/1980, p. 40], although they had already left for the court of Batu, taking with them the tribute from Soldaia. Even in this case, if the deputies of the *baskaki* were there for William of Rubruck to report his desire to visit Sartaq, who he believed was a Christian, and they were offered a cart with oxen or packhorses for transporting cargo. Obviously, at that time it was standard procedure for merchants wishing to travel from Crimea.

William of Rubruck also describes the salt springs of Crimea, from which salt could be ex-

tracted. He explains that Batu and Sartaq had a large income from these salt sources, obtaining two lengths of cotton at a price of 1/2 hyperpera for each cartload of salt, and that many ships came for it by sea and paid much more than was the practice. Matrica was situated to the east of Soldaia across the Kerch Straits leading to the Azov Sea (former Tmutarakan). Heavy ships could not enter the Sea of Azov, but the lighter ships going to Matrica reached the mouth of the Tanais, that is, the Don River, for the purchase of large numbers of sturgeon, bream and other species of dried fish [Ibid., p. 96]. We can assume, although travellers note that the rivers are full of fish [Ibid., p. 5, 210], that the rulers of Ulus of Jochi were probably happy to encourage exports of this food [Ibid., p. 114].

The scholarship includes a number of very high-level works on the Italian trade on the Black Sea in the 13–14th centuries. For this reason, consideration of Italian commercial activities in the Black Sea Region is a prerequisite for a deeper understanding of the economic history of the Golden Horde.

Usually, historians attach great importance to imports of luxury goods [Martin, 1978, p. 401–422; *Treasure of the Land of Darkness*, 1986; Allsen, 1989, p. 111–112, 122]. However, the Pontic Region to the north of Crimea, the Black Sea coast from Crimea to the mouth of the Prut and the Danube Rivers and the forest-steppe zone of Western Eurasia also served also as a granary for different states [Bratianu, 1929, p. 15–41].

Three Italian maritime states dominated trade in the agricultural products on the Black Sea, shipping grain, salt, dried fish and many other food products and commodities not only to Byzantium, but also to Italy. At first glance, this may seem impractical, but the costs of water transport over long distances were actually much smaller than of overland transport from neighbouring areas (on the development of the Venetian marine technology, see: [Lane, 1973]; the main observations of the relative costs for land transportation, see: [Bulliet, 1975]). Venice became a leading centre of grain distribution in Northern Italy; but, as it itself produced a small amount of grain, this supply was largely made from Romania (a broad geographic term including Crete, Greece and all the Black Sea). In fact, it is believed that from the 13th century the entire apparatus of the Venetian state was involved in the management, protection and exploitation of their colonies in Byzantium, Egypt and the Black Sea Region [Nicol, 1988, p. 284].

On 13 March 1261, just a few months before a new conquest of Constantinople, Michael VIII Palaiologos concluded an agreement with Genoa that prohibited all enemies of Genoa from entering the Black Sea, except for the Pisans. As a result, between 1260 and 1270 (according to one translation—in 1266), the Genoese founded a trading post in Kaffa—Crimea, which henceforth was to serve as a centre of Genoese commercial activities in the Black Sea [Balard, 1978, p. 41, 114–118]. Although the Venetians from that time lost their monopoly on the Black Sea, by 1265 they were able to conclude an agreement, confirmed in 1268 and renewed in 1277, again giving them the right to trade in the Black Sea [Nicol, 1988 p. 200]. This new agreement allowed the es-

tablishing of trading posts on the Black Sea in the field of their choice, with the result that the Venetians had established or restored their shops in Soldaia, Tana (Azak) and Trapezund [Skržinskaja, 1968 Lane, 1973, p. 76, 80, 127; Chrysostomides, 1970, p. 267–329; Nystazopoulou Pélékidis, 1973, p. 541–582, especially p. 552–553]. It is assumed that after 1267 Genoese merchants first began to remain in Soldaia, but after 1268, they faced competition from the Venetians there. This was the reason that between 1270 and 1275 the Genoese sought and received permission to establish themselves in the Bay of Theodosia; the first mention of the Kaffa consul was dated 1281 [Balard, 1978, p. 117–118]. It is clear that commercial rivalry in the Black Sea became a source of several confrontations between Genoa and Venice [Lane, 1973, p. 72 et seq., 127], fueled by constant attempts of Constantinople to 'balance' the Italian maritime republics with each other, and over the course of the 13–14th centuries this rivalry only intensified.

One of the reasons that wheat and possibly other cereals had become a particularly important product for northern Italians during the 13th and 14th centuries was the relative onset of cooling. It led to many cases of grain shortage because of fields flooding and other phenomena, provoking years of increased cost of grain, and often to starvation (especially at the end of 13–beginning of the 14th century). In response, the northern Italian states pursued a policy to support grain imports and restrict exports [Peyer, 1950]. There were two main areas that produced grain and that interested the Italians. One was Byzantine Thrace, which after the loss of Egypt, Constantinople was seriously dependent on as its main granary. Indeed, a poor harvest in Thrace could lead to famine in Constantinople. Another region of interest was the Black Sea basin. Demand in Venice served as an incentive for Venetian Black Sea grain procurement. It is believed that direct Venetian inclusion in the Black Sea grain trade began during the famine in 1268; the importance of this trade was probably recognized in the agreement between Byzantium and Venice, in 1277, giving the latter the right to duty-free transportation of Black Sea grain through its territory [Chrysostomides,

1970, p. 316]. The Genoese also visited various regions of the Black Sea from Varna and Kilia to the North along the coast to Kaffa and Tama. Wheat, imported from Thrace, considered the best in the whole of Romania, was valued higher than wheat brought from Crimea. In the 14th century, wheat delivered through Kaffa was considered the best throughout the Black Sea, although grain purchase depended on the goodwill of the Solkhat Tatars. There were also other areas scattered around the Black and Azov seas and which were distinguished by their good quality wheat crop [Balard, 1978, p. 752–754]. Byzantine control and other obstacles to exports from the Byzantine territories continued to make the grain brought from the Black Sea ports even more desirable, especially when the agreement in 1304 had suspended Genoa's exports from Byzantium, but gave to Genoa the right to export through Constantinople all the grain produced outside Byzantium. Ultimately, the loss of the Thracian and Anatolian wheat left Byzantium dominated by the Genoese, who began to control its Black Sea export [Chrysostomides, 1970, p. 316–317; Balard, 1978, p. 754–756].

Italian sources dealing with maritime states provide information on the Black Sea trade which is unusually detailed for the Golden Horde itself due to thousands of preserved documents.

There was an entire fleet of heavily laden vessels, which mostly carried wheat from the East to Genoa (breaks in the trade caused famine in the city) in the last two decades of the 14th century. In 1384, 31,919 mines from Romania, 31,344 mines from Kaffa, and 3,710 mines from Anatolia made up 77% of known Genoese imports. Thus, Kaffa supplied 36% of Genoa's crop import that year (which naturally does not apply to the crops exported to Venice). One of the reasons why this complicated international trade was possible is that it was still cheaper to buy crops after harvest in Gazaria (probably in Crimea and in the adjacent area), when sent by sea, than to purchase it near Venice or Genoa for land transport. When the cost of sea transport dwindled in the late 14th century, the initial crop procurement price made a higher percentage of the ultimate cost, which

ultimately caused price fluctuations [Balard, 1978, p. 765–768].

Genoa also imported a wide range of other products from the Black Sea. Beginning in the late 13th century, it became common for Genoese people to visit fish markets in the mouth of the Kuban River in April or May and to purchase sturgeons and other fishes caught by local (Greek and Tatar) fishermen in Tana from July to August Balletto, 1976, p. 10–27; Balard, 1978, p. 706–707]. Salt as an essential food preservative was another key Italian commodity [Lane, 1973, p. 57]. Sources report at least 400 saline lakes, including the historically famous Lake Saki, to have existed between Kaffa and Tana. Genoese people participated in the trade, along with Alans and Armenians, in Kaffa and Solkhat. They also profited greatly from reselling salt bought in the north and transported by the Black Sea on markets like Trapezund [Balard, 1978, p. 708–711]. From the 1270s, Mediterranean markets imported spices from the Black Sea. Kaffa became engaged in the trade in 1284 and continued to be part of it for the rest of the entire 14th century, except for the last two decades [Ibid., p. 719–723]. The trade in silk [Ibid., p. 723–733], wax [Ibid., p. 734–737], leather [Ibid., p. 737–738], fur [Ibid., p. 738–741], cotton [Ibid., p. 741–742], mastic [Ibid., p. 742–749], metal and mineral [Ibid., p. 769–784] was also important. Scholars assume that the production of cotton, which was a very valuable commodity, spread to the territory of the Ulus of Jochi during the rule of the Chinggisids [Mazzaoui, 1981, p. 23].

Human beings were another valuable 'commodity' on the Black Sea market [Verlinden, 1950, p. 1–25; 1977; Balard, 1978, p. 785–833]. Quite naturally, slaves could not have been exported from the Black Sea without a demand for them across the Near East, the Mediterranean, and West Europe. The trade began far earlier than the founding of the Golden Horde and might have lasted for a long time after it was dissolved [Verlinden, 1977, II, p. 978–998]. From 1270–1275, a large number of Circassian, Abkhazian, Bulgarian, Turkic, Lazian, Hungarian, Russian, Cuman, and Tatar people were transported to Alexandria and Liguria, while in the last quarter of the 13th

century Genoa controlled all of the Oriental slave trade [Balard, 1978, p. 785]. The slave trade affected a large number of diverse ethnic groups until the mid-14th century. However, Tatars became predominant after 1350 [Ibid., p. 788]. Slaves from the Pontic Steppe, mostly aged 14 to 25, made up 40% of the total Genoese human trade, the Russian percentage being as small as 1/5 until 1350. The Cumans (Kipchaks) became numerous from 1300–1320. However, the last mention of a Cuman slave is dated 1354. Circassians (or Zikhian people) were nearly as numerous as Russians and Cumans; but their percentage increased after 1350. Some slaves belonged to other Caucasian ethnic groups, including the Lezgins and the Alans.

Most of Oriental slaves in the 14th century were Tatar. According to surviving reports, 90.9% slaves exported from the Pontic Region from 1351 to 1380 and 80% of those exported from 1381 to 1408, out of approximately 900 people, were Tatar. It was not until 1453, when Mehmet II conquered Constantinople, that a recession took place in the trade. Though it is usually unclear to what ethnic groups the term 'Tatars' applied in that period, we at least know their names because most of them had non-Western names until 1350. Even after 1350, only 10% had Christian names, which probably indicates baptism after sale. Male slaves had such names as Tabogar, Aspertius, Smerlionius, and Yacomasiu, while women, who made 65.4% of all slaves, were named Cotralo, Cocolo, Ars Hatom, Karahoza, Meliha, Kali, Bahirigni, Taktabei, Kologoz, Korgatan, Jiborra, Beliha, Hita, Bihaka, Jaireta, and Toktomis. Being very numerous, Pontic slaves made 80.9% of all slaves reported from 1300 to 1408 [Balard, 1978, p. 794–796]. It is rather counter-intuitive that slaves from the territory of the Ulus of Jochi (and the adjacent slave-supplying territories) were brought to Spain (Catalonia, Aragon, and Mallorca) [Verlinden, 1977, I, p. 334–350], France [Ibid., p. 765–781, 783–785], Venice [Verlinden, 1977, II, p. 566–642, 650–651], all across Italy [Ibid., p. 220–227] and the Mediterranean world. In fact, they were so numerous in some regions that, according to an estimate for 1381, 4–10% of the Genoese

population were slaves, many of which had been brought from the Black Sea [Balard, 1978, p. 817]. Slaves were mostly exported from the Black Sea by vessels arriving from Tana. Such vessels could carry 3 slaves per crew member until 1381 and 4 slaves per crew member after 1381. Thus, a 400-ton vessel with a crew of 50 members could carry 200 slaves. Vessels of such size were evidently crop- and slave-laden in Tana [Lane, 1973, p. 133; see speculations on the vessel: p. 122–126].

It is critically important to find out what role the Ulus of Jochi played in the trade and what effects it had on the Golden Horde. We can assume that the Jochids initially wanted to get control over luxury trade. As the state grew stronger, the governments obtained control over the country's resources to produce luxury goods and increase the production of goods to be traded for imported luxury articles. It is no wonder that the infrastructure of the Golden Horde was initially arranged in a way to support governmental trade. By understanding this we can explore some additional aspects of the influence that the Black Sea trade had on the Golden Horde.

The Latin travellers, just like earlier Arab geographers, do not shed light directly on the crop trade in the period between the 1240s and 1250s, though there is evidence that it was not interrupted. In particular, Venetian sources confirm this by mentioning fleet activities in the Black Sea in 1206 and 1232. It is therefore beyond doubt that crops were exported, even though there are no direct indications of it.

It is harder to obtain information about Batu Khan's agricultural policy because there are no direct descriptions. As for the period when the Mongol Empire was being established, we can only assume that there was none.

If we analyse some instances that Latin travellers provide in this context, they provide an insight into the issue. According to Giovanni da Pian del Carpine [John of Plano Carpini], who travelled through the Golden Horde in the 1240s, peasants kept their crops in the barns of their master, who allowed them to sow them and left them enough food to make a more or less decent living [Mission to Asia, 1955/1980, p. 42]. Giovanni da Pian del Carpine [John of

Plano Carpini] adds in another place that they could hide their crops (that is, wheat) out of fear of attack [Ibid., p. 48]. Taken together, the two statements can indicate that wheat was actually an agricultural product which was at least of certain interest for the Mongol rulers, who were probably involved in controlling agricultural production. William of Rubruck confirmed it by reporting that large owners had villages in the south that supplied them with millet and flour for the winter [Ibid., p. 100]. Thus, it can be assumed that the government of the Ulus of Jochi were interested in crop supplies in the period between the 1240s and 1250s and probably controlled them, at least in some part of the Golden Horde if not across the state. It is not clear, however, whether the crops were meant for domestic consumption or export.

The military campaigns of the 1260s can also be viewed as additional indirect evidence of the Golden Horde's commercial policy because the Caucasian wars between the Jochids and the Ilkhans had a number of economic causes. The struggle largely focus on controlling Derbent as an important duty collection centre. We should also remember that it was a period when crop exports were beginning to increase and that the west of the North Caucasian Region was a major crop-producing area [Ibid.]. Other campaigns must have been directly connected with control over crop-producing regions. The Golden Horde's campaigns which would otherwise have been pointless include the raids against Danube Bulgaria, Hungary, and Poland in the 1280s, those against Adrionople in 1319 and Thrace in 1324, and other East European invasions in the 1330s. The campaigns, especially those against rich agricultural countries along the western shore of the Black Sea, the mouth of the Danube, and down up to Thrace, were not merely pointless attacks at sedentary settlements. They should rather be viewed as attempts at bringing major crop-producing areas under the control of the governmentally supported trade of the Golden Horde.

There might have been a connection between the campaigns and climatic changes which could have had an adverse effect on wheat production in the Golden Horde, defi-

nately causing the demand for wheat to grow in certain parts of Europe. We should not forget that 1315–1322 was a period of great famine in South England [Appleby, 1980, p. 643–663]. Probably the khans of the Ulus of Jochi just wanted to increase crop production under their control to meet the growing demand. However, it is also possible that the crop-producing areas of the Golden Horde were affected by the reduced rainfall after 1280, followed by a moderate restitution during the first two decades of the 14th century and another reduction in 1320, followed by another restitution in the late 14th century, causing crop yields to dwindle in the southern territories of the wheat-growing Jochid areas.

The nature of the relations between the Golden Horde and Italian merchants deserves more than a passing mention. Importantly, the Italians could only establish colonies along the northern Black Sea shore subject to a permission by the Golden Horde's rulers.

Valuable evidence of the relations between the Italian commercial centres and the elite of the Golden Horde is contained in the records of meetings of the Venetian Senate, the earliest of which are dated 1329 [see: Thieret, 1958–1961, I, p. 5–17]. Concerning the late period of Öz Beg Khan's rule, we know the Senate to have resolved to send two ambassadors to the khan's court in 1341 and his death to have raised difficulties for the trade centre of Tana [Ibid., p. 120, 138]. Following the Tana trouble, Venetians were prohibited from trading in the Golden Horde; as a response, they decided to send an embassy to Janibek Khan (January–February 1344; 28 April 1344; 26 January 1345) [Ibid., p. 162, 169, 175]. However, they decided that it was no use negotiating with them, so the Venetian ambassadors in Tana were ordered to return by 1 April 1346 [Ibid., p. 185]. Yet, the Senate canceled its earlier prohibition of trade in Janibek's domain, dated February 1344, on 24 April 1347. Venetian merchants were allowed, at least for a limited period, to purchase wheat in Janibek's land because of a critical need for it [Ibid., p. 196]. Besides, the Senate resolved on 19 June 1347 to send two ambassadors to remind Janibek how beneficial trade

relations with Venice would be and ask him to reintroduce, if possible, earlier trade privileges [Ibid., p. 201, 203]. On 28 August 1350, the Senate approved an order under which the consul of Tana was to send a good mediator to Janibek and his mother's court and inform the Venetian merchants who were still staying in Kaffa that they were to reside under the territorial protection of the Venetian community [Ibid., p. 247].

Additional documents suggest that the khan had only a limited influence on the actual daily decision-making on trade centres. On 28 July 1355, a Venetian messenger was ordered to introduce himself to the ruler of Soldaia, Ramadanov (Ramadan) and purchase a factory provided that Venetians would have to pay not more than 3 centanarios instead of 5 (in Tana). Besides, the ambassador was instructed to arrive at Janibek's court to explain the conditions of their peace with Genoa. The Venetians were expected to express eagerness to restore their trade relations after a three-year break and ask Janibek to ensure favourable terms for them and ask Ramadan of Soldaia to set free two merchants who were kept under arrest there [Ibid., p. 273]. On 7 July 1356, the Senate ordered a galley captain in Romania to head for Provato, Crimea, and inquire about the local terms, because the Senate had just found out that it was not in Soldaia but in Provato where Ramadan had granted them a concession [Ibid., p. 299]. On 22 March 1358, the Senate resolved to send two ambassadors to Janibek once again to recover the former licences [Ibid., p. 324–325].

An analysis of the relations between Genoa and the Golden Horde [Vasiliev, 1936, p. 177–188], established by the ruler of Solkhat (Cherkes in 1380, Ilyas Qutlubuga in 1381), acting in his own name and on behalf of the khan, confirms that the local nobility controlled the colonies in the late 13th and throughout the 14th century. The fact that the agreements of the 1380s enabled Genoa to control large Crimean territories suggests that the Golden Horde had been weakened considerably by that time. The period was that of the Time of Troubles in the Golden Horde, caused by the Black Death and an internecine war.

It is beyond doubt that crops, especially wheat, was the principal and probably most important export commodity produced in the Golden Horde. Others included fur and the less impressive, but no less valuable, cotton and salt. It can be assumed that the trade was largely continuous from the pre-Mongol period to the 14–15th century.

In turn, the Ulus of Jochi imported wine, weapons, tools, other articles, as well as French and Italian textile. Galleys heading to Romania were reported to have delayed their departure until those from Flanders, carrying textile (fabrics) and amber, arrived [Nystazopoulou Pélékidis, 1973, p. 559]. Following merchants' advice, William of Rubruck took along fruit, Muscat wine, and top quality biscuits from Constantinople [Mission to Asia, 1955/1980, p. 92]. He also reported travellers from the north to bring squirrel, ermine, and other valuable fur types, while those going to the north carried cotton materials, silk, and spices [Ibid., p. 90].

CHAPTER 3

Monetary Circulation and Financial System

Alfira Singatullina

The money, money making, and monetary circulation of the Ulus of Jochi have been studied extensively for over two centuries. Works by Ch. Fren, P. Savelyev, V. Grigoryev, A. Likhachyov, A. Markov, S. Yanina, G. Fedorov-Davydov, A. Muhamadiev, and many other scholars have yielded many important findings. This issue cannot be studied without the information and conclusions provided by the scholars concerning the four periods of monetary circulation, marked by three all-state monetary reforms, metrological data on the areas of circulation and spreading of dirhams and puls, general and local money making customs, coin designs, coinage cities, imitations, typology, etc. It is reasonable to refer to the findings of the key works by G. Fedorov-Davydov [1960; 1961; 1963; 1965; 1987; 2003].

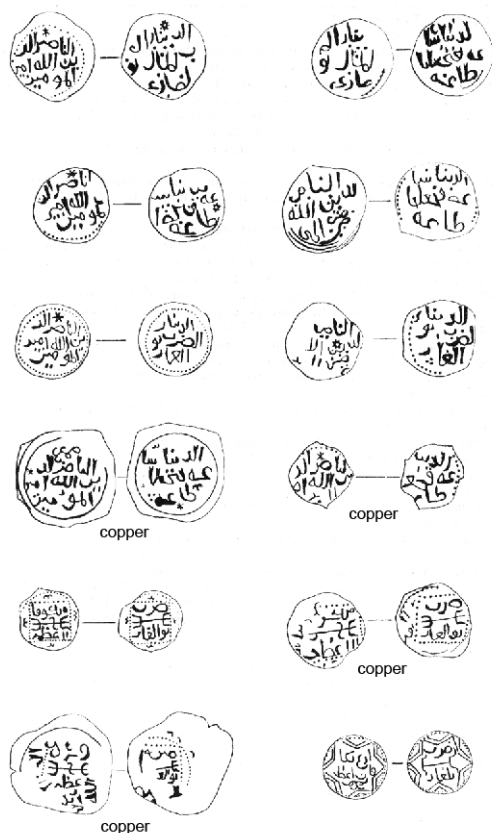

First Period (mid–13th century to the reform of 1310)

The city of **Bulgar** was rebuilt soon after the Mongol invasion of 1236. It became not only the first Jochid capital but the first and, for some time, only mint of the Ulus of Jochi. As it was 200 years before, coinage began here. However, unlike the few name-bearing Bulgarian dirhams of the 10th century, the first Jochid coins do not bear the names of the first rulers of the Ulus, Batu or Berke. The mysterious silver and copper coins reading *al-Nasir li-Din Allah*, specifying Bulgar as the mint, are often discovered in the territory of the former Volga Bulgaria, especially at the Bolgar Archaeological Site, but are hardly present in other regions. The absence of dates and the Chinggisid tamga on them, as well as their bearing the name of Caliph al-Nasir (1180–1225), caused two opposing opinions on the coins to appear back in the early 19th century.

Scholars who believe the undated coins bearing the name of al-Nasir to be of pre-Mongol origin attribute them to the Bulgar court of the early 13th century, judging by the caliph's life period (Ch. Fraehn, P. Savelyev, A. Likhachyov, A. Muhamadiev). The other theory is that Caliph al-Nasir's name is no dating element, the coins being Jochid (Ch. Fraehn, S. Yanina, G. Fedorov-Davydov, A. Singatullina). This question has not yet been settled and thus deserves more than a passing mention.

One of the arguments for a pre-Mongol origin of the coins is their bearing no tamga 'of the Kipchak Ulus or the great kaan's tamga' [Muhamadiev, 1983, p. 29–30]. However, Chagataid coins (until the mid–13th century) do not bear a tamga either [Davidovich, 1972, p. 10–13, 15], those of the Ikonik Sultanate (until the late 13th century) [Dzhalaganiya, 1958, p. 38], Georgia (until the early 1250s), Azerbaijan (the period of Mongol sovereignty) [Pakhomov, 1926; 1938; Dzhalaganiya, 1958, p. 42, 44–46]. Some Jochid coins from Bulgar dated 686 AH and those bearing the name of al-Nasir from Sarai [Singatullina, 2003, p. 85, No. 57, p. 126, No. 244], all dirhams from Ukek, etc. also bear no tamga.

G. Fedorov-Davydov's main argument against the theory that the coins are pre-Mongol is 'the complete absence of any such coins in the cultural layer of Bilyar, which existed as a major city up to the Mongol invasion, and a large number of such coins discovered in Bolgar, where an early Mongol layer is present' [Fedorov-Davydov, 2003, p. 10]. The most possible coinage date is the 1240s—the period of Batu Khan's rule before Möngke (Mengu) Kaan enthroned (1251). About 200 such silver coins, weighing from 1.2 to 2.5g, have been found. The weight of copper coins bearing the name of the same caliph varies between 1.00

Silver and copper coins.

Bulgar, 13th century.

National Museum of the Republic of Tatarstan

and 8.19g, though only 13.5 of all the coins weigh over 4g. Al-Nasir's silver coins bear a nominal of 'dinar'; copper ones bear no nominal or issue data but only the name of al-Nasir and a pious inscription, 'Life is an hour, so make it virtuous'.

An abrupt change of coins took place in Bulgar in the early 1250s. Those bearing the name of al-Nasir were withdrawn from circulation; silver was remolten, and copper reminted to bear the name and tamga of Kaan Möngke (1251–1259), who was friendly to Batu. It is no coincidence that Batu, as the oldest and most powerful representative of the 'Golden clan', helped Möngke Kaan to come to power and set the standard of respect for the superior authorities by introducing the Bulgar coins. It appears that the change of coins took place within a very short period because all the copper coins of Kaan Möngke were minted on al-Nasir's copper ones without removing the old inscrip-

tions, which are often quite legible. The kaan's silver coins were made of al-Nasir's remolten 'dinars' and, together with puls, made the complete monetary circulation of the Volga Region.

Khan Arig Buga's (1259–1264) silver coins, which came the next chronologically, have a clear upper limit, 1264 as the year when the kaan was defeated and captured by Kublai. However, it can also be 1266 as the year when Arig Buga or Khan Berke died. Berke could have issued the coins to express his negative attitude rather to Kublai's ally Hulagu, an old enemy of the Jochid khans. There is another possible reason why the great kaans' tamga appeared on Bulgar coins: 'The entire area (Bulgar—A.S.), part of it or only one city, probably a city quarter with a mint' belonged to Tolui's descendants Mengu and Arig Buga [Petrov, 2005, p. 171].

Silver coins bearing great khans' names and tamgas weigh much less than al-Nasir's dinars—1.00–1.25g (for Möngke) and 0.40–0.55g (for Arig Buga). They are sometimes found together in hoards. Scholars used to confidently interpret 1 al-Nasir's coin as equal to two of Möngke Kaan and four of Arig Buga's. However, G. Fedorov-Davydov inferred from his observations on the weight of coins in three early hoards that 'the first issues of coins bearing the name of Arig Buga had a weight similar to the last issues of Möngke's coins' [Fedorov-Davydov, 1991a, p. 186]. That is, the weight of the first Jochid coins reduced continuously even over short period, to which large weight ranges of not only the kaans' coins but those of al-Nasir are attributable.

The issue of al-Nasir's coins is far from being resolved. New datings of the mysterious coins have appeared in the recent years. However, most scholars attribute them to the Jochids. For instance, al-Nasir's coins were not prohibited and continued to function during the rule of Möngke and Arig Buga; half fractions (bearing Möngke's name) and a smaller one (bearing that of Arig Buga) were introduced into monetary circulation [Trostyansky, Yegorov, 2005, p. 30].

Independent coinage began during the rule of Mengu Timur. Such coins always bore the tamga of the Batu House. It is present on

all name-bearing, anonymous, unepigraphic Jochid coins of the 13th century. The first dated name-bearing and anonymous coins from Bulgar date back to 671 AH (1272/73). However, it is possible that anonymous undated coins weighing 1.2–1.27g, bearing the tamga of the Batu House, which is emphasized to be the 'Principal' or 'High' tamga, were the first coins to appear during the rule of Mengü Timur. Some scholars, however, believe the coins to have been issued between 1257 and the beginning of the diarchy during the rule of Arıg Buga Kaan (early 1260s) to express the anti-kaan sentiment of Berke Khan, who attached his own tamga to them [Muhamadiev, 1983, p. 48]. If we accept the new definition of the tamga (that of Berke), there is no explanation why it is not present on coins by Batu's descendants, because Berke Khan is believed to have usurped the power by neutralizing Batu's descendants. The tamga, to which numismatists traditionally refer to as 'the tamga of the clan or House of Batu', does not have to be renamed.

Silver coins began to be issued under a new weight standard of 1.45–1.6g (two daniqs, 0.78g each) in the early 1270s. The weight of each coin type remained stable throughout the coinage period. Two key coin groups, which are represented in the same hoards, co-existed. However, no early Jochid coins bearing the names of al-Nasir and Kaans Möngke and Arıg Buga have been discovered in hoards containing Mengü Timur's coins. Some silver coins by Mengü Timur bear a nominal of one dirham. Those are coins weighing 1.45–1.6g. However, the nominals of their contemporary coins weighing 1.3–1.4g and 1.04–1.08g remains unknown. Anonymous undated coins of the same time, namely the dirham (1.45–1.6g, having a diameter of 12–21mm) and the coins termed 'the double dirham' (3–3.04g, a diameter of 24–25mm) and 'the half dirham' (0.72–0.76g, a diameter of 15–16mm), are of interest [Singatullina, 2003, p. 81, No. 43–45]. Such dirhams were found in the Hoard of Almenevo (National Museum of the Republic of Tatarstan, No. 3230), which contains early coins by Khan Mengü Timur.

The standard coin weight did not change significantly in Bulgar during the rule of Khan

Tuda Mengü (1282–1287). His coins weigh 1.45–1.56g and sometimes bear a nominal of a 'dirham'. There is a silver coin in the Hermitage Museum (No. 15085), which is similar to the widespread dirham of Tuda Mengü but weighs 0.28g. It is probably 1/5 of a dirham [Ibid., p. 83, No. 51, 52]. There are no Bulgar-made coins bearing the names of the khans who succeeded to Tuda Mengü—Tula Buga (1287–1290) and Tokhta (1290–1312). Anonymous and unepigraphic coins began to dominate the market of Bulgar in the mid-1280s.

A reform was probably carried out in the early 1290s to reduce the weight of the dirham to 1.28–1.39g.

Among the few types of undated coins of the period, dirhams bearing the name of *al-Nasir li-Din* without the title 'the ruler of the faithful' dated 692 AH (1292/93), bearing the tamga of the House of Batu and an inscription 'dirham' [Fren, 1832, p. 4, No. 18]. The dated coins have much in common with the first Jochid coins of the 1240s. In addition, undated silver and copper coins from Bulgar bearing the same name and tamga as well as silver coins of the same name from Tamga bearing a nominal of a 'dinar' and the same tamga have been discovered. Some authors date undated 'late' coins bearing the name of Nasir at Mengü Timur's rule, that is, the 670s AH [Trostyansky, Yegorov, 2005, p. 31].

Even though the coinage volume was smaller than as compared to the 14th and 15th century, Bulgar coins of the first period of monetary circulation come in many types, nominals, and weights. What they all share is the tamgas of the great kaans or Batu's House. Scholars have noted that on most Bulgar coins by Mengü Timur, with few exceptions, the crossbar is on the right, while those by Tuda Mengü have it on the left. The monetary circulation area expanded greatly during the rule of Khan Mengü Timur. new mints opened in the Volga Regions. In particular,

Bilyar issued anonymous undated silver coins bearing an inscription 'coins of Bilyar', unlike that on Bulgar ones—'coinage of Bulgar'—in the 1270s–early 1280s. Like most Bulgar coins of that time, they weigh 1.45 to 1.6g. Such coins are usually dated by occurrence

Dirhams. Bilyar coinage. 13th century (according to A. Singatullina)

in hoards of the 1270s–early 1280s—those of Almenevo and Bulgar III [Fedorov-Davydov, 1986] and absence in more recent ones, dating back to the 1980s–early 1290s, namely Bulgar I and II [Fedorov-Davydov, 1972]. The Bulgar monetary reform of the 1290s did affect Bilyar. A new weight standard of 1.20–1.25g was introduced for anonymous dirhams of 692 AH (1292/93). The design on such coins issued in 692 AH has much more in common with their contemporary Bulgar coins than with earlier, undated Bilyar ones made in the 1270s. The mint of Bilyar closed after 692 AH. However, the city lived on.

Kerman/Kirman (K-r-man) became famous due to coins in the Almenevo Hoard, which was discovered on the fringe of the village Almenevo, Kozlovsky District, Chuvash Autonomous Soviet Socialist Republic, in 1938. A search at the hoard site in 1942 revealed a large ancient town with a floor area of 340,000 square kilometres. It was apparently Ke(i)rman—the northernmost settlement of the Bulgar Ulus [Kalinin, Xalikov, 1954, p. 85, 93–94]. Some scholars have been associating Kerman with today's Kazan recently [Muhamadiev, 1999, p. 255–256]. The scholar used to maintain that the coins of Kerman belonged to Khan Berke and interpreted the inscription as the khan's name 'Berkai' [Muhamadiev, 1983, p. 50]. The Kerman coins were only issued for

a short period and had a batch coinage. The weight of most of the coins was within 1.4–1.70g. Chronologically, the undated anonymous coins belong to the early coinage period during the rule of Mengü Temür. 130 out of the 132 Kerman coins that have been discovered were in the Almenevo Hoard (National Museum of the Republic of Tatarstan, No. 3230), while two items are kept in the Hermitage Museum (No. D/8948, D/12193). All Kerman coins have the tamga leg on the right.

The state's newly built capital **Sarai** began to issue coins in 671 AH [Lebedev, 1998, p. 65–66]. Sarai coins of the 1270s are more similar to anonymous Bulgar ones of the same period, the mint name being the only difference. This is attributable to the involvement of Bulgar coiners in the activities of the newly founded Sarai mint.

By the early 1270s, the first mint of the Ulus of Jochi in Bulgar had already been active for over twenty five years. Elements in the Kufic script found on Bulgar and Sarai coins could have resulted from a transfer of Middle Asian coiners to Bulgar and later, along with Bulgar ones, to Sarai. Sarai issued coins until 682 AH (1283/84) to resume its operations after a pause in 686 AH (1287/88). It used the Bulgar standard weight of 1.5–1.55g (two daniqs, 0.78g each). It should be noted that all early Sarai coins are anonymous. No copper coins from Sarai have been found; small light-weight silver coins, termed 'half dirhams', were used as small money in Sarai as well as in Bulgar. Just like Bulgar, Sarai issued undated silver 'anonymous' coins bearing the name of *al-Nasir li-Din* and a nominal of 'dinar', which were very similar to those of Bulgar. There is evidence that the al-Nasir Sarai coins were first issued at the end of Berke's rule, during the first years after Mengü Temür came to power, that is, approximately 1265–1267 [Lebedev, 2005,

p. 16]. Some scholars believe that al-Nasir Sarai coins could have been issued during the rule of Mengu Timur and Tuda Mengu by Bulgar coiners copying 'their' design [Evstratov, Gumayunov, 2005, p. 106].

A new stage of Sarai coinage began in 690–696 AH (1291–1297), when the first name-bearing Sarai coins by Khan Tokhta appeared. They bore no tamga and, most importantly, were heavier. A standard weight of 2.25–2.3g was introduced in the Volga Region. A Khwarezmian ratl of silver weighing 458.64g was used to produce 200 or 202 coins [Fedorov-Davydov, 1961, p. 85]. No Sarai coins dated 697–709 AH (1297/98–1309/10) have been discovered so far. The common features of the Sarai coins with those from Bulgar and Khwarezm, which many scholars have noted, resulted from 'the cultural mix of diverse cultural elements belonging to subordinated peoples that formed the urban culture of the Golden Horde' [Fedorov-Davydov, 1964a, p. 4]. The fact that 13th century's coins are hardly represented at the Selitrennoe archaeological site (only four out of 11,000 coins collected there and introduced into scientific use are dated at the 13th century) has enabled V. Lebedev to infer that 'we should expect the 13th century's Sarai to be localized accurately when archaeologists or amateurs get to the bottom of the Akhtoba' [Lebedev, 2005, p. 20].

Ukek (located in the place of Saratov), which the Mongols also built from scratch, began to issue anonymous silver coins, somewhat similar to the 13th century's Bulgar ones, though bearing no tamga, at the very beginning of the 14th century. Khan Tokhta's name-bearing dirhams acquired the set phrase used to refer to Jochid khans on coins of the 14th century, 'Sultan/ supreme Giyath / Tokhtogu the Just' in 705–707 AH (1305/06–1307/08). The standard weight of Ukek coins was above 1.5g. As well as in Bulgar and Sarai, 'half dirhams' of the same type as the dirhams were used. We can assume that Ukek began to issue coins after Sarai coinage was abandoned. Ukek coins dating back to the early 14th century are generally similar to neither Sarai-minted dirhams by Tokhta, dated 690–696 AH (1291–1297), nor the 13th century's Bulgar dirhams, nor those

Dirhams. Silver. Bulgar. 13th century NM RT

from Khwarezm dating back to the early 14th century. A certain similarity of inscription position, as well as the common title of Sultan assigned to Tokhta by Ukek coins of 706–707 AH and Sarai dirhams of 710 AH (1310/11) apparently suggests that the coiners and equipment were transferred to Sarai after the Ukek mint closed. I. Evstratov believes that it was in Ukek that the first copper coins in the Lower Volga Region were issued in the late 13th century—first decade of the 14th century [Evstratov, 2004, p. 78–80]. L. Nedashkovsky has been recently studying Ukek coins with considerable success [Nedashkovsky, 2000, p. 16–26].

The Ulus of **Khwarezm** began to issue coins in 669 AH (1270/71). The date is contained in a chronogram that has been deciphered recently [Lebedev, 1998, p. 65–66]. The first Khwarezmian coins, just as those from Sarai, were anonymous and bore the tamga of the House of Batu. During the rule of Khan Mengu Timur, their standard weight was not significantly different from that in

Dirhams. Silver. Khwarezm. 13th century. National Museum of the Republic of Tatarstan

Bulgar and other European centres of Jochid coinage of the 13th century. Khwarezmian coins have an outstandingly sophisticated and ornate design as well as peculiarly positioned legends suggestive of century-long coinage traditions in Middle Asia. In 686–690 AH (1287/88–1291), anonymous dirhams with a new standard weight of 2.25–2.30g were issued [Fedorov-Davydov, 1961, p. 85].

Coins bearing Tokhta's names appeared in Khwarezm later than they did in Sarai. As it was in Sarai, the tamga of the House of Batu ceased to occur when the coins acquired the khan's name. Khwarezmian anonymous dirhams were replaced by name-bearing coins by Toktu Bek in 693 AH (1293/94). However, the change of coin type did not affect its standard weight.

Coin weight was reduced materially in 706–709 AH (1306/07–1309/10)—all discovered Khwarezmian dirhams dating back to that period weigh under 2g. The city began to issue anonymous copper coins in 708 AH (1308/09). Khan Tokhta's reform of 710 did not affect Khwarezm, which carried out a monetary reform different from those in European cities. A standard dirham weight of 1.897g (5/12 mithqal) was established and remained effective until Khan Tokhtamysh's reform [Fedorov-Davydov, 1965, p. 206].

Crimea became the second mint after Bulgar and an important minting centre of the first monetary circulation period in Ulus of Jochi. The first coins to be issued there were name-bearing dated coins by Khan Mengü Temür that appeared in 665 AH (1266/67) and always bore the tamga of the House of Batu. The first coins weighed 2–2.2g, which was probably half a mithqal of 4.26g. In the 1280s, the weight of Crimean coins was reduced to 1.6–1.63g (200 coins per Byzantine tibra of 327.425g or 100 coins per full Russian libra of 163.726g). A new reduction to 1.45 followed in the 1290. The coins weighed as little as 1–1.05g in the early 14th century [Fedorov-Davydov, 2003, p. 13].

In the 13th century, Crimea issued silver anonymous and name-bearing coins by all the khans—Mengü Temür, Tuda Mengü, Tula Buga, Tokhta (Bulgar did not issue name-bearing coins by Khans Tula Buga and Tokhta). In the late 13–early 14th century, Crimea issued a lot of copper coins, rarely dated but always bearing the tamga of the House of Batu. The first dated Crimean copper coins are dated 674 AH (1275) [Kramarovskiy, 1997, p. 102]. Name-bearing copper coins by all the khans from Mengü Temür, including Tokhta, have been discovered [Lebedev, 2000, p. 11–14]. Undated copper coins bearing the toponym 'Solkhat' were issued not later than in the latter half of the 13th century [Ibid., p. 9; Kramarovskiy, 1997, p. 103]. Rare undated Solkhat coins bear an image of a sun face and a double tamga (that of the House of Batu with the trident tamga of the temporary ruler Nogai on the common head) and a legend 'Khan Tokhta the Just' [Severova, 2002, p. 78].

Silver and copper coins bearing the name of the city of **Isaccea** (in the lower reaches of the Danube, Romania) were issued in the late 13–early 14th century. Some of the copper coins bear a double tamga, the sun face like that on the Solkhat coins, and the name of Tokhta Khan. Either Nogai's trident tamga 'is

combined with the state tamga accompanying the name of Tokhta, or coins having bearing both tamgas or anonymous, or coins only have that of Nogai but mention Tokhta in the legend. By placing his own tamga on the Isaccea coins, Nogai declared his actual power over the region' [Ibid.].

The key centres of the first monetary circulation period were Bulgar and Crimea. Coinage was insignificant and local in Ukek, Sarai, Khwarezm, Bilyar, Kerman, and Saqchi. 13-century hoards hardly contain any coins but local ones. Monetary circulation in the Volga Region consisted of silver coins of different nominals—dirhams, half dirhams, quarter dirhams. Their local names of that period are unknown. A single batch of double dirhams was issued in Bulgar. Bulgar only produced (and reminted) a lot of copper coins in the 1240s–1250s. Crimea issued copper coins, both anonymous and bearing the names of the khans from Mengu Timur to Öz Beg, continuously.

The first monetary period of the Ulus of Jochi also includes the first decade of the 14th century, when pre-reform coins by Tokhta (anonymous in Bulgar), name-bearing and anonymous in Sarai, Ukek, Crimea, and Khwarezm, were issued.

Second Period of Monetary Circulation (Khan Tokhta's Reform of 710 AH (1310/1311))

The monetary reform began when old coins were prohibited and a large number of coins by Khan Tokhta were issued in Sarai-al-Maqrusin 710 AH. This is why pre-reform coins are not present in 14th century hoards. The maximum weight of such coins is 1.48–1.54g. Their theoretical standard weight was probably established at 1.52–1.56g, that is, 1/3 mithqal or two daniqs (0.78g each) [Fedorov-Davydov, 2003, p. 15].

Some numismatists have been recently denying any all-state monetary reforms. For instance, 'Tokhta did not carry out any all-state monetary reform in 710 AH. No uniform dang weight standard for local mints in the Golden Horde was introduced at that time! Each region addressed all issues in relation to re-

forming their monetary products on its own' [Petrov, Studitsky, Serdyukov, 2005, p. 146]. However, we will study the four monetary circulation periods, chronologically separated by the monetary reforms by Khans Tokhta, Tokhtamysh, and Shadi Beg, as suggested by G. Fedorov-Davydov.

Name-bearing coins by Khan Tokhta do not bear the tamga of the House of Batu. No name-bearing or dated anonymous dirhams by Tokhta minted in Bulgar have been found. Apart from the capital Sarai (Sarai-al-Maqrus), local mints in Bolgar al-Makhrusah, Azak (Tana), Crimea, and Mukhsha were active during the rule of Khan Öz Beg (1312–1341). In the early 14th century, Azak and Crimean coins weighed about 1.02g. It increased to 1.3–1.5g in Azak during Öz Beg's rule [Fedorov-Davydov, 2003, p. 14]. The first silver coins in Azak are dated 1317. Most of copper coins with an inscription, 'Supreme order' and an image of 'a lion under the sun' were issued in 732–734 AH (1331/32–1333/34). According to N. Fomichev, the fact is representative of a developing trade between the local population and an Italian (Venetian) colony, while the influence of the developing trade route to China via Tana (Azak) caused Sarai to issue copper coins with the same image [Fomichev, 1981, p. 239–240].

Crimea continued to issue name-bearing silver and copper coins by Khan Tokhta with the tamga of the House of Batu on them. No reformed Crimean coins by Tokhta have been found so far [Lebedev, 2000, p. 11]. Name-bearing dirhams by Öz Beg, as well as name-bearing and anonymous dated pulis issued during his rule began to appear in 713 AH. They also bear the tamga of the House of Batu, while dirhams dated 720 AH (1320/01) state the coinage place to be 'Crimea al-Makhrusa'. No Crimean coins of 1325–1375 have been discovered [Ibid., p. 7, 16–17].

Only the Bulgar mint remained active in the Middle Volga Region in the second monetary circulation period. Undated anonymous and unepigraphic coins bearing the tamga of the House of Batu could have been issued and circulated here in the first decade of the 14th century as well. No name-bearing coins by Tokhta have been discovered in Bulgar. However, it

issued those by Öz Beg, bearing the tamga of the House of Batu, the date, and stating the coinage place as 'Bulgar al-Makhura', meaning 'God-protected Bulgar', in 721–731 AH (1321–1331). Öz Beg's name-bearing dirhams issued in Sarai-al-Maqrus in 722 AH (1322) also bore the epithet 'Protected by God' but did not have a tamga. A dirham type by Khan Janibek dated 749 AH (1348/49) is known to have been issued in Sarai al-Makhrusa [Fraehn, 1832, p. 12, No. 85].

Anonymous dated pul of 734 AH (1333/34), issued during the rule of Öz Beg, were a mass type of Bulgar coins. Such coins are very common in the cultural layer of the Bolgar Archaeological Site. Puls with a 'lattice' but without a tamga were probably issued during the rule of Öz Beg or somewhat earlier [Fedorov-Davydov, 1987, p. 176–177].

The non-central mint of the **Ulus of Mukhsha** issued silver dirhams during the rule of Khan Öz Beg, from 713 AH (1313/14), only. Ch. Fraehn was the first scholar to describe Mukhsha coins [Fren, 1832, p. 6]. The minting centre was later associated with the Narovchat archaeological site in Penza Oblast and the city of Nuriyan [Krotkov, 1923, p. 27–31]. Anonymous Mukhsha copper coins were issued in the 1330–1350; name-bearing Mukhsha copper coins bear the name of Kildibek Khan only (1361–1362) [Belousov, Golubev, 1998, p. 31–33]. Öz Beg's dirhams from Mukhsha, as well as those from Bulgar and Crimea, usually bore the tamga of the House of Batu, which the citizens and their ancestors had been familiar with since the mid-13th century.

Local minting centres almost ceased to issue coins of their own during the rule of Khan Janibek (1342–1357). Numerous silver and copper coins from **Sarai al-Jadid** and, from the 1350s, **Gulistan**. Their weight was very stable and hardly changed until the 1370s. Most of the coins weigh 1.48–1.54g; the theoretical standard weight was probably 1.51–1.56g, that is, 1/3 mithqal, or two daniqs at 0.78g each [Fedorov-Davydov, 2003, p. 15]. Only Khwarezm continued to issue name-bearing dirhams by Janibek, Berdibek, Kulpa, Nawruz, Khizr. Khwarezm issued anonymous dirhams in the time of troubles on the 1360s–1370s.

Name-bearing dirhams by Suyurgatmysh (and Temur Gurgun) and Tokhtamysh Khan were issued in 781 AH (1379/80) [Fedorov-Davydov, 1965, p. 182–186].

The death of Berdibek in 1359 marked the beginning of internecine feud in the Ulus. The state split into the right bank of the Volga River, ruled by Karachibeg Mamai's puppet khans Abdallah (1361–1370) and Muhammad Bulak (1370–1380), and the left bank ruled by the 'Sarai' khans. By the 1360s, 'special numismatic provinces' had been formed, local coinage resumed, the nominally uniform monetary circulation had started to decay and hoarding to increase. The largest number of hoards dominated by coins issued in the capitals (Sarai al-Jadid and Gulistan) pertain to the 1360s.

Sarai al-Jadid issued dirhams bearing the names of Khans Berdibek (1357–1359), Kulpa (1359–1360), Nawruz (1360), Khizr (1360–1361), Temur Hoja (August 1361), Ordu Melik (1361), Kildibek (1361–1362), Abdallah (1361–1370), Khayr-Bulat (1364–1365), Aziz Sheikh (1365–1367), Tulunbek Khanum (1370–1372?), Urus (1374–1375) in 759–779 AH (1357/58–1377/78). In the late 1360s and 1370s, the weight of new Sarai coins was reduced [Muhamadiev, 1983, p. 100–101], which is probably attributable to tax irregularities and generally weakened state authorities.

Starting in the 1350s, **Gulistan**, a city that has not been located so far, though the question was raised back in the early 20th century, became outstanding through large-scale silver and, later, copper coinage. There are two most influential opinions on its locations. Either 'Gulistan lay within Bulgar' [Ibid., p. 21–23, 94, 98], or it should be associated with the Tsarevckoye archaeological site [Goncharov, 2005b, p. 99]. Coins issued in Gulistan, Gulistan al-Makhrusa, Gulistan al-Jadid, Gulistan al-Sarai in 752–768 AH (1351/52–1366/67) in the names of Khans Murid, Aziz Sheikh, and Bulat Hoja.

Measures were taken regularly to maintain a stable dirham weight during the time of troubles by changing copper coins—the old pul were apparently replaced by new, heavier ones. By maintaining the pul (both old and new) to daniq ratio (16 pul=1 daniq), the authorities were able to increase the silver rate of

dirham. The broad range of weight of copper coins even within one issue suggests that pulis circulated without their exact weight being taken into account; their rate was forced. The rate, established in non-central cities, only applied to a certain region, outside of which the copper coin depreciated. The central authorities established and maintained a forced rate of capital-minted pulis (Sarai, Sarai-al-Maqrus, Gulistan); so Sarai- and Gulistan-issued coins filled all local markets except for Khwarezm [Fedorov-Davydov, 2003, p. 36–38].

Crimea within the Mamai Horde began to issue coins on behalf of Muhammad Bulak after a long pause in 777 AH (1375). All further claimants upon the throne in the last quarter of the 14th century regularly issued coins [Lebedev, 2000, p. 17].

In the 1360s, **Azak** issued dirhams by Berdibek, Kulpa, Nawruz, Khizr, Ordu Melik, and Kildibek, copper coins by Khans Abdallah and Kildibek. A special numismatic province, largely dominated by Azak-issued coins, formed in the lower and middle reaches of the Don and Seversky Donets. The maximum weight of Azak coins in the 1360s was 1.3–1.35g; it increased to 1.4–1.42g in the 1370s during the rule of Khan Abdallah (Mamai's puppet khan) [Fedorov-Davydov, 2003, p. 16].

The monetary system of the Dniester River Region was largely dominated by local dirhams by Abdallah Shehr al-Jadid and Yangi Shahr of the 1360s and pulis by Aziz Sheikh [Yanina, 1977, p. 205]. Capital-issued coins (Sarai al-Jadid and Gulistan) were predominant there, as well as in the rest of the Ulus of Jochi, during the rule of Janibek until that moment.

In the 1370s, the steppe, apparently nomadic centre, **Horde**, issued silver coins at a mass scale. The Horde of the khans of the Mamai Horde Abdallah and Muhammad Bulak has not been located yet. A number of coins from Horde and hoards containing such coins suggest that Horde traveled in the lower reaches of the Dnieper and in the Azov Sea Region after it left Moldavia during the rule of Muhammad. Azak and Horde issued their coins according to local weight standards, different from the new Sarai and Gulistan ones, which meant the end of the dominance of the uniform capital-issued

silver coin of the Golden Horde, which had a stable weight due to a unitary weight standard. The maximum weight of Horde-issued coins in the 1370s was 1.45–1.5g [Fedorov-Davydov, 2003, p. 16].

Majar, one of the largest Northern Caucasian cities of the Golden Horde, issued silver coins by Tokhta (?) referred to by the title 'Padishah beyond Comparison were in 710 AH (1310/11) or 715 (1315/16). Majar al-Jadid issued silver coins by Muhammad in 774 AH (1372/73) and silver and copper coins stating no coinage place in the 1360s. The only criterion for identifying the coins as minted by Majar is their having been discovered in the region. Copper coins by Abdallah dated 767 AH (1365/66) state the coinage place as Majar [Rtveladze, 1971, p. 78–79, 83–84].

Back in the 13th century, when **Khwarezm**-issued coins acquired the name of Khan Tokhta, they ceased to bear the tamga of the House of Batu. Name-bearing dirhams by Öz Beg do not bear the tamga either. Khwarezmian dirham types remained unchanged even when one khan replaced another from 714 AH (1314/15) to 746 (1345/46), suggesting that Khwarezm had an autonomous monetary system. The local standard dirham weight was different from the silver coins of the Volga Region. The maximum weight was 1.85–1.9g (probably 5/12 mithqal, that is, 2.5 daniq, 0.78g each). The ration of the Khwarezmian dirham, which equaled 2.5 daniq, to the Sarai and Gulistan dirham was 2.5:2 [Fedorov-Davydov, 2003, p. 15]. In 762 AH (1360/61), Khwarezm manifested its autonomy from the Ulus of Jochi by issuing anonymous coins. The anonymous coins of the 1360–1370 were apparently minted by the Sufi Dynasty, which was independent enough to not place the name of the khan of the Golden Horde on its coins but too weak to issue them in its own name [Fedorov-Davydov, 1965, p. 185, 197]. S. Yanina disagrees with the conclusion. She maintains that the 'Kungrat Sufi Dynasty' never existed and that there is no reason to view the coinage of Khwarezm of the 760–770 AH as separate from that of the Golden Horde. She believes that the beginning of internecine feud did not affect Khwarezmian coinage. The city continued to coin dirhams

bearing the names of Berdibek (758–760 AH), Kulpa (760–761), Nawruz (761 AH), Khizr (762 AH), even copper name-bearing names by Berdibek (760 AH). The simplest explanation why anonymous silver coins were issued from 762 AH (1360/61) is Khwarezm's geographic remoteness from the centre of the Ulus of Jochi, which prevented it from keeping up-to-date with all court events and coups [Yanina, 1971, p. 60, 49–50, 47].

The beginning of active monetary circulation in **Saray-Jük** (on the bank of the Ural River, Kazakhstan) pertains to the 1320s. It witnessed a monetary inflow from cities in the Lower Volga Region and Khwarezm. We can assume that an active economic growth began in the Trans-Volga Region at that time, resulting in its catching up with Khwarezm. In 763 AH, Khizr's puls were reminted as those of Murid there [Goncharov, 2005a, p. 9–10].

Silver coins issued in **Sygnak** (in the territory of the Kok Horde) by Khans Mubarak Hoja in 728–729 AH (1327/28–1328/29), Urus in 770, 773–775, 777–778 AH (1368/69, 1371/72–1373/74, 1375/76, 1376/77), Tokhtamysh in 780, 781, 783 AH (1378/79, 1379/80, 1381/82), and copper anonymous coins dated 727, 731, 734, 768, 773 AH (1326/27, 1330/31, 1333/34, 1366/67, 1371/72) [Pachkalov, 2002, p. 87–88; Khromov, 2004a, p. 13].

The monetary and weight system was dominated by the dirham or the yarmaq, a silver coin minted on a mass-scale. The dirham equaled two daniqs, 0.78g each, a weight and count unit equal to 1/3 mithqal. Six dirhams formed the count unit known as the dinar (Turkic: al-tyn). The copper coin was known as the pul; 16 puls equaled one daniq (the count and weight unit), of which inscriptions '16 pul daniq' on many coins minted in Sarai in the 1320–1330 of 'pul Mukhsha—16 dang' are suggestive [Fedorov-Davydov, 2003, p. 33].

The classical system has been revised in the recent years. We will only cite two of the many opinions. 'In the 14th century, the Golden Horde silver coin was known as the deng. It is the ratio to them, actual coined denges, which the legends of a number of Jochid puls indicate. The perfect ratio was 16 puls per deng. This ratio between the basic silver and copper nom-

inals, just as the new coins themselves, was introduced in about 710 AH' [Goncharov, 2002, p. 157]. Here is another explanation: 'the basic silver nominal of the Jochid coin system, at least in the Lower Volga Region in the 13–first half of the 14th century, regardless of its actual weight, could have been called akçe, while the term dang, mentioned in Jochid pul legends, referred to a weight unit of 0.78g, equal to one dang or 1/6 mithqal weighing 4.68g' [Gumayunov, Evstratov, 2004, p. 82].

However, 13-century silver coins sometimes bear a nominal of 'dirham' [Singatullina, 2003, No. 12–18, 39, 51, 53, 60, 63, 222–225, 228, 233–234, 236], so to rename the silver coins seems untimely unless compelling evidence is provided.

'Open', or 'free' coinage of Jochid coins of silver, which private individuals brought to the mint, was practiced in the 14th century, when silver shortage was insignificant, if any. The state had a lot of silver due to the Russian tribute. However, hoarding was always possible, as was a disproportional value of silver in the monetary system as compared to that in the neighbouring countries, where silver was more valuable. The government did not take such unpopular measures as reducing the quality or quantity of the previous metal in the coin in order to raise the silver coin rate. It influenced the monetary circulation by manipulating copper coins, while silver circulation remained unchanged. Issuing new puls, which were heavier than old ones, enabled the government to raise not only their nominal but the dirham silver rate. However, copper value in puls was lower than their nominal value. Therefore, the pul had a forced rate and circulated without its exact weight being taken into account [Fedorov-Davydov, 2003; p. 35–36, 38].

14-century coins have been studied intensely recently because they have been discovered at a mass scale at Golden Horde archaeological sites. Numerous Bulgar-minted coins bearing the name of al-Nasir, those reminted by Mengü Khagan, undated copper coins with a 'lattice' [Fren, 1832, p. 36, No. 374], anonymous Bulgar-minted puls of 734 AH/1333–34 [Ibid., p. 7, No. 37], and rare 13-century coins with the 'late' mention of al-Nasir [Singatullina, 2003,

No. 65]—these make the whole output of the Bulgar mint over about 100 years. Unlike other places, such as Mukhsha, Azak, Shehr al-Jadid, Khwarezm, 14th century local Bulgar pulis make as little as 8.9% of all copper coins discovered, most of the pulis being minted in Sarai al-Jadid, Gulistan, and Sarai [Fedorov-Davydov, 1987, p. 179–181].

G. Fedorov-Davydov's conclusion that the silver rate was regulated by increasing the weight of copper coins has been confirmed by E. Goncharov, who weighed copper coins minted in Sarai al-Jadid. The first copper coins were issued during the rule of Janibek (the double-headed eagle type), a rate of '16 daniq' and sometimes the date '743 AH' stated on them. 32 pulis equaled one dirham. The chronologically successive 'flower' pulis are dated 751–753, 760, 761 AH and weigh about 1.7g. The type was issued during the rule of several khans (Janibek, Berdibek, Kulpa, and Nawruz). The average weight of a pul dated 762 AH (Khizr) is 2.7g; 763–767 AH (Kildibek, Khayr Bulat, Aziz Sheikh, anonymous), 1.8–2.25g; 768 AH (anonymous), 5g. Those issued during the rule of Temur Hoja (762 AH) and Ulja Temur (768 AH), the weight was about 2.5g. Only two dated issues of the 70s have been found so far—dated 773 AH (Tulunbeg Khanum), having a weight of about 2.8g, and anonymous pulis of 776 AH, weighing 1.7g. Their design is very different between each other and from the pulis of the 60s [Goncharov, 1998, p. 75–76].

In the 1370s, local coinage in the Lower Volga Region became less active until it was unable to meet the demand for silver coins. A long-brewing coinage crisis began; silver coin scarcity was obvious. The monetary circulation kept splitting into 'numismatic provinces'. Capital-minted coins ceased to dominate most of the state's European territory. Silver coins apparently got a share of forced rate to be approved by not only the central authorities but rather the local ones. It is probably attributable to introduction of weight standards different from those of the capital in province centres (Azak, Horde) [Fedorov-Davydov, 2003, p. 48].

The local authorities took various measures (mostly countermarking and clipping of

silver coins) to somehow raise the rate of the silver coin in circulation and prevent its hoarding. The countermarks included pictograms (like the lattice), khan's names ('Murid', 'Aziz Sheikh', 'Abdallah'), words ('khan', 'khakan', 'legal'), animals, fishes, and birds [Ibid., p. 49].

The practice of coin clipping was introduced in the Middle Volga Region back in the 1370s and lasted through the rest of the 14th century, gradually reducing the weight of the local dirham. This also applied to Khwarezm. Silver imitations of Jochid coins began to appear in the 1370s; it is still unknown why and where they were minted [Ibid., p. 51–52]. Such aspects of Jochid numismatics as imitations, silver clipping, dirham and pul countermarks, pul and dirham standard weights remain either under-studied or controversial. To address the issues, scholars need to extend the source base as well as to revise and reinterpret previous findings.

Third Period (from Tokhtamysh's Reform of 782 AH (1380/81))

All European cities in the Ulus of Jochi and those in Transcaucasia that minted dirhams bearing Tokhtamysh's names, namely Sarai, Sarai al-Jadid, Horde, Azak, Hajji Tarkhan, Saray-Jük, and Majar were to refer to the unitary weight standard of 1.42g (1/144 of a 204.7g bar). Khwarezm became an exception again. Even though coins by Tokhtamysh of the new weight, dated 781 AH (1379/80) have been found, the reform developed in the following year 782 AH (1380/81). As it was under Tokhta's rule in 710 AH, a very large number of coins was minted in 782 AH. However, the reform was completed in the Lower Volga Region only. A single standard was introduced in local mints, which facilitated the inflow of Azak and Horde coins to other areas, primarily the Lower Volga Region. Unlike the of 1310, Tokhtamysh's reform did not introduce capital-issued coins to replaced local ones but maintained large-scale local coinage, mostly in Azak and Horde. That is, it did not overcome the economic disunity of the country and the decentralization of its silver coinage. Unlike that of 710 AH, Tokhtamysh's reform of 782

Dirhams of Khan Tokhtamysh. Silver. Azak, Orda al-Muazzam, Horde al-Jadid, Horde, Crimea (according to G. Fedorov-Davydov)

AH did not cause complete withdrawal of old silver coins (hoards suggest that even in the Lower Volga Region about 10–30% of old-type coins remained in circulation after the reform [Ibid., p. 16–17].

In the Volga Region, Mordvin territories, partly in Ryazan, Verkhovsky Lands, along the Don, in Azak, Crimea, and the lower reaches of the Dnieper, old silver coins largely got out of circulation to be replaced by new ones by Tokhtamysh. Even though coins by Tokhtamysh made up over a half of the hoards discovered in the areas, about 53–100%, the reform had a limited scope [Ibid., p. 48].

While before the enthronement of Tokhtamysh it was traditional for province centres—**Azak**, later **Horde**—to refer to their own weight standards for coinage, he was able to unify coin weight for the cities. Dirhams dated 780, 782–783, 786–788 AH (1378/79, 1380/81, 1381/82, 1384/85–1386) and bearing the epithet 'God-protected', which dates back to the

time of Khan Öz Beg, were minted in Azak [Fomichev, 1997, p. 33].

In the first years of Tokhtamysh's rules, **Crimea** minted dirhams according to the unitary weight standard introduced within the framework of the reform (1.42g). However, the weight was reduced to 1.3 as soon as after 785 AH (1383/84), the maximum weight of a Crimean coin after 796 AH (1393/94) being only 1.13–1.16g. 1.13g equal 1/144 of a Russian libra of 163.7 [Fedorov-Davydov, 2003, p. 16; Ivanov, 1996, p. 10]. That is, Crimea, which at first followed the instructions of the central authorities, then introduced two material coin weight reductions. This happened during the rule of one and the same khan, Tokhtamysh.

No abrupt coin change followed the reform in the **Middle Volga Region**. The change was incomplete, if any. Tokhtamysh's reformed coins were very few in the **Bulgar Ulus**. It had ceased to mint any new coins by that time. Old ones, clipped to another weight standard (1.42g), circulated. Silver shortage, which began back in the 1370, caused coin clipping in the Bulgar territory and brought about an increased rate of silver in the coin form. That higher, apparently forced coin silver rate must have prevented an inflow of dirhams from southern cities to the area. This increased silver hoarding, which brought about increasing coin clipping in the Bulgar Ulus. The forced silver rate remained effective in the 15th century. At first, silver coins were mostly clipped to 1–1.1g. Clipped coins hardly ever acquired countermarks to confirm the legitimacy of clipping and the value of the coin, though at the forced (increased) rate. Clipped coins from the Middle Volga Region dating back to the time of Tokhtamysh are characterized by a very broad weight range with several peaks. They represent the centralized component of coin clipping, for which the authorities reduced the clipping standard step-by-step. The unclear vague distribution suggests random clipping by the population [Fedorov-Davydov, 2003, p. 52–53].

A. Muhamadiev found out the further clipping standards: 1.02–1.05; 0.93–0.95; 0.82–0.85; 0.73–0.75; 0.65–0.68; 0.55–57; 0.47–48, dating the beginning of the process at the be-

ginning of Abdallah Khan's rule. The scholar believes that the newly minted coins by Tokhtamysh issued in the 1380s were clipped to 0.78g, that is, 1 daniq, in the Middle Volga Region [Muhamadiev, 1983, p. 103 et seq.].

In other areas Tokhtamysh's new coin co-existed with the old one, and they circulated at a spontaneous market rate. The mint of **Hajji Tarkhan** is believed to have started its coinage in 776 AH (1374/75), marked by the first issue of copper coins bearing the name of Cherkesh Bek. Anonymous copper coins of 777 AH (1375/76) and 784 (1382/83)—Tokhtamysh's rule—have been discovered. 14th century silver coins are known to have been issued in 782, 786, 795 and 799 AH (1380/81, 1384/85, 1392/93, 1396/97) by Khans Muhammad Bulak and Tokhtamysh [Severova, 1997, p. 35–36].

Khwarezm, which minted coins according to its own weight standard of 1.89–1.9g throughout the 14th century, changed the standard weight for silver coins during the rule of Tokhtamysh but accepted a weight different from the European standard. The maximum weight of Khwarezm-minted silver coins of the period of Tokhtamysh is 1.5g. The standard was probably established as a double daniq, that is, the old pre-Tokhtamysh silver coin of the Volga Region. Khwarezm minted silver coins according to a weight standard of 1.16–1.17g, that is, 0.5 mithqal, in 1360–1380. Both silver and gold Khwarezmian coins were subjected to clipping both before the enthronement of Tokhtamysh and during his rule. This probably stabilized the gold to silver value ratio within the monetary system so that it was similar to the market value ratio for the metals [Fedorov-Davydov, 2003, p. 17].

Many recent works have provided data on previously unknown issuers, cities, coinage locations, or revised some names, such as 'Sheikhun' or 'Sheikhun Muazzan' [Pachkalov, 2001, p. 71–73]; 'Idil' in the place of the Vodyanskoye archaeological site [Evstratov, 2000, p. 74–76]; 'Ak-Sarai' in the place of the Tsarevskoe archaeological site [Goncharov, Pachkalov, 2002, p. 85–87]; 'Shongat' in the place of an ancient settlement near the village Bolshiye Atryasy, Republic of Tatarstan [Gumayunov, Evstratov, 2003, p. 79–81];

'Yangikend' in the lower reaches of the Syr Darya [Lebedev, 2003, p. 89–91], etc. The reports require a cautious attitude without either denying or accepting them without compelling evidence.

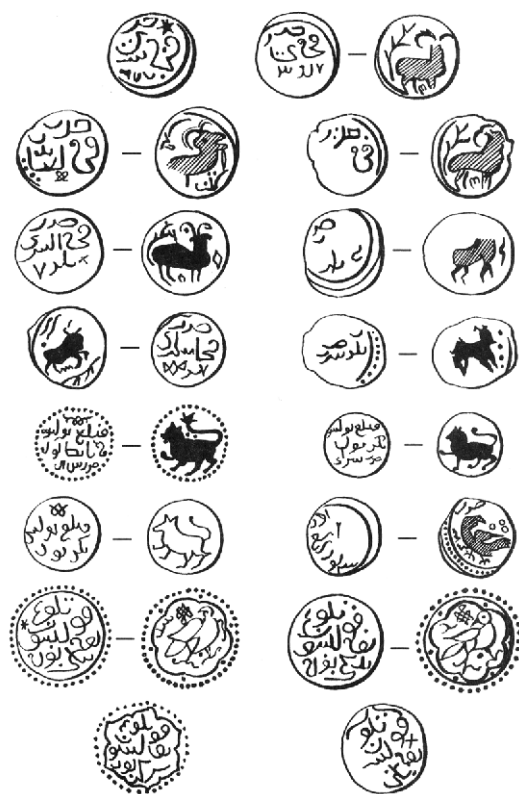

E. Goncharov has estimated that at least 13 mints were active in the Ulus of Jochi from 782 to 797 AH (1380/81–1394/95), while from 796 to 800 AH (1393/94–1397/98) the Ulus's coinage was reduced dramatically. Little data is available on coinage in 797–799 AH (1394/95–1396) [Goncharova, 2003, p. 94–95].

The decay of Golden Horde cities began already in the 1370s as the result of the Great Troubles, of which archaeological excavations at archaeological sites and coins discovered at them are suggestive. Many estates were ruined in the capitals of the Lower Volga Region; the city market suffered silver shortage because it was hoarding; coins by Tokhtamysh are rare at archaeological sites but common in hoards.

Tokhtamysh's reform had a limited territorial application. A more or less complete change of coins took place in the capitals of the Lower Volga Region only. Pre-Tokhtamysh dirhams remained in circulation at a large scale in some provinces. However, such old dirhams had been clipped and circulated at a new silver rate. While following the reform of 1310 capital-minted coins replaced local ones, this time capital centres ceased to dominate the coinage system in 1360, when province centres began to issue coins at a mass scale. Tokhtamysh's reform stabilized the situation. Timur's campaigns were a heavy blow to the Golden Horde, which many minting centres did not survive. Those included Sarai al-Jadid, Azak, Ukek, Majar, Hajji Tarkhan, etc.

Fourth Monetary Circulation Period (from Shadi Beg's Reform of 802 AH (1399/1400))

The reform by Khan Shadi Beg (1399–1407), appointee of Ulugh Karachibek Edigü, did not bring about even a temporary coinage unification and monetary circulation leveling. The weight of the dirham was reduced to 1.13g (1.5 daniq) on the model of Crimea dirham of 796 AH (1393/94) in Horde, Hajji

Anonymous pulis. Sarai. Mid-14th century
(according to G. Fedorov-Davydov)

Tarkhan, Sarai, Crimea, and Saray-Jük, while coins by Shadi Beg, later Bulat (1407–1411) and Jalal al-Din (1411–1412) replaced old dirhams by Tokhtamysh. Sarai minted few coins in the 15th century. New minting centres were established in Birdi-Bazar, Irda-Bazar, Jidi-Bik-Bazar ('Bazaar of Seven Beks'), Hel-Birdi-Bazar, Il-Uy-Mazzam ('Home of the Superior Realm'), and Ulug al-Jadid, which were probably nomadic centres. Coins minted in Orda-Bazar and Ulug al-Jadid come in both the Bulgar and the southern weight, suggesting that the minting centres were nomadic [Fedorov-Davydov, 2003, p. 18; Muhamadiev, 1983, p. 192].

Coinage was split geographically during the rule of Shadi Beg. The same 13 mints were active during the first 12 years of the 15th century. Saray-Jük and Majar ceased to mint coins. Bulgar and Rajan—the latter during the rule of Bulat—became new minting centres. Crimean coinage moved to Kaffa; Sarai, Horde, Hajji

Tarkhan, and Khwarezm issued coins on a smaller scale [Goncharov, 2003, p. 95].

The maximum weight of coins minted in southern cities of the Ulus of Jochi is 1.1–1.154g [Muhamadiev, 1983, p. 120; Yanina, 1954, p. 453]. However, they grew lighter in the 15th century. A. Muhamadiev assumed that the weight reduction had a reason, namely that the weight ratio of the southern and Bulgar coins was stable at 1.5:1 [Ibid., p. 128, 140]. In the 1430s, the southern coin weighed approximately 0.9–0.95g [Ibid., p. 125]. Monetary circulation died out in the Lower Volga Region in the second quarter of the 15th century—no hoards and coins pertaining to the period have been discovered.

Following Timur's occupation of Azak in 1395 and the Italian colony in the 15th century, the Azak mint resumed its activities. Silver coins by Shadi Beg dating back to this period have been discovered. However, the whole settlement was burned down during the last raid on Tana in 1418 [Fomichev, 1981, p. 241].

After Timur occupied Khwarezm in 1388 and had coins bearing its name issued, the Jochids came back for a while. Silver coins were minted in the name of Khans Shadi Beg and Bulat in the early 15th century. In 808–815 AH (1405/06–1412/13), Edigü ruled Khwarezm. Coins were issued in the name of the deceased Khan Bulat, as well as Timur Khan and Jalal al-Din, who were struggling to get power over the Ulus of Jochi, during his rule. The standard coin weight in Khwarezm in the early 15th century was about 1.1–1.5g, as it apparently was in the southern cities of the European part of the Golden Horde, that is, in accordance with the reform of 800 AH (1397/98), which applied to all cities of the state except for Bulgar [Fedorov-Davydov, 2003, p. 19].

Bulgar resumed minting in the early 15th century. The topography of 15-century coins bearing the name of Bulgar and Bulgar al-Jadid discovered suggests that the minting centre lay north of the Kama River; it might have been Kazan [Muhamadiev, 1983, p. 13, 20, 115]. The maximum Bulgar coin weight in the early 15th century, during the rule of Khans Shadi Beg and Bulat, was 0.75–0.8g. The

daniq (0.78g) was apparently the weight reference. The standard is also applicable to clipped coins of the previous epoch [Ibid., p. 104, 111, 120; Fedorov-Davydov, 2003, p. 17].

A. Muhamadiev inferred from an analysis of the Malye Atryasi Hoard that coins by Tokhtamysh were mostly clipped to a daniq (0.78g) [Muhamadiev, 1970, p. 62]. The standard weight of Bulgar-minted coins was constantly reduced in the first half of the 15th century. During the rule of Khan Dervish (1414–1419) they came to weigh 0.62–0.63g, and during that of Ghiyath al-Din (1422–1426?), '... the first sovereign ruler of Kazan, 0.585g' [Muhamadiev, 1983, p. 125–126]. The reduction in the Bulgar coin standard weight during the rule of Ghiyath al-Din and Ulugh Muhammad apparently came with a monetary reform, when old coins were withdrawn from circulation and replaced by new ones. Evidence of this can be found in hoards [Fedorov-Davydov, 2003, p. 18].

It is not only coin weight but coinage quality that decreased. 15-century coins are hard to identify; they are negligently or unskillfully produced in contrast to those of the 13th and 14th century. Some of them hardly bear any inscriptions because of stamp displacement; some have inversed inscriptions, which is a defect. Material—silver—quality decreased too, which is very obvious.

The weight of coins from southern cities of the Ulus of Jochi and Khwarezm also decreased over the 15th century. To quote A. Muhamadiev, '... while at the beginning, shortly after Shadi Beg's reform, Kazan coiners were to refer to the Sarai dirham in terms of weight, the stability of the Kazan weight standard by the end of the first quarter of the 15th century suggests that it was the Sarai weight standard that changed in accordance to that of Kazan. This is attributable to the declining monetary circulation of the Lower Volga Region in the mid-15th century. Coinage continued to decrease there. Nearly all coins minted in Lower Volga Region were exported to the Khanate of Kazan, where the monetary circulation was maintained. It is natural that coiners in cities of the Lower Volga Region had to refer to the weight standard of Kazan coins' [Muhamadiev,

1983, p. 128]. The Kazan Khanate had ceased to mint any coins. Russian ones came into circulation.

In the 15th century, the significance of the **Hajji Tarkhan** mint increased. It issued batches of silver coins dated from 805 AH (1402/03), by Shadi Beg, to 831 (1427/28), by Ulugh Muhammad. Those were replaced with silver coins by Astrakhan khans of the 15th century. The Hajji Tarkhan mint was the most active in the 15th century; however, there is no evidence that it issued any copper coins at that time [Severova, 1997, p. 35–36]. However, E. Goncharov reports Hajji Tarkhan to have minted copper coins in 808 AH (1405/06) and 809 (1406/07), emphasizing the fact that Golden Horde had ceased to mint coins by that time [Goncharov, 1997, p. 182–183].

By the mid-15th century, only **Crimea** and the Khanate of Kazan had been able to maintain their monetary circulation. Crimea continued to issue silver coins regularly. Moreover, silver minting began in the south-east of Crimea. A second mint opened there in the Genoese Kaffa at the very beginning of the 15th century to issue dirhams by Shadi Beg and Bulat. Kaffa-minted Jochid coins appeared in 802 AH (1399/1400), during the rule of Shadiibek. Later, from 1419 to 1475 (the date when the Genoese colony in Crimea ceased to exist), bilingual, that is, Genoese-Tatar coins were being issued. On the one side, they bore a Genoese portal image and a Latin inscription; an Arabic legend containing the name Sufi was on the other side. Those were replaced by bilingual coins also bearing the tamga of the Golden Horde, succeeded to by coins bearing the name of Crimean Khan Hacı Giray, whose Kaffa-minted coins already bore the Giray tamga [Fedorov-Davydov, 2003, p. 19; Lebedev, 2000, p. 17]. Thus, Jochid dirhams ceased to be issued in the 1430s, when the Crimean Khanate was founded. Coins by another mint, Kafa al-Jadid, bearing the name of Devlet Birdi (1421–1426/27) appeared after 825 AH (1421/22) [Khromov, 2002, p. 94].

Apart from silver and copper coins, stick-shaped silver bars, sums (soms) were in circulation in the Ulus of Jochi. 185–198g boat-shaped Jochid bars were shorter than 'Novgorod type'

Russian grivnas. Such bars were not in daily circulation and, being very valuable, were only used for large payments and saving by aristocrats and rich merchants.

The Ulus of Jochi did not mint any gold coins except for anonymous Khwarezmian dinars pertaining to the Great Trouble of 1360–1370. However, Indian and Egyptian gold coins entered the state's territory. Over 60 dinars by the Khalidid and Taglaqid Indian dynasties have been found in the territory of the Ulus of Jochi. The appearance of those coins during the rule of Öz Beg Khan is probably connected with Ibn Battuta's report concerning the Ulus's trade with India, in particular, the highly lucrative horse export to India. Such 11g gold dinars were used not for daily trade but for capital accumulation. M. Kramarovsky estimated a Jochid dirham of the time of Öz Beg to have cost 81.5 times less than an Indian gold dinar [Kramarovsky, 2005, p. 153].

Monetary circulation in the Ulus of Jochi had the same development stages as the state itself. It began in the 13th century in separate, poorly interconnected areas of local monetary relations with ancient trade and craft traditions and sedentary populations long engaged in commerce. In the first half of the 14th cen-

tury, during the rule of Khan Öz Beg, the entire state enjoyed the golden age of exchange. The increasing centralization of power caused non-central coinage to almost disappear, while capital-minted coins from Sarais and Gulistan filled all markets across the Ulus. The response of the monetary market to the relax of central rule in the 1360–1370s, when a series of coups took place, was rapid. Local coinage replaced capital-minted ones immediately. 'Numismatic provinces' appeared. In order to increase coin saturation of their markets, local authorities not only issued their dirhams and puls but resorted to countermarks and clipping old coins. Following Timur's campaign of 1395, when the Ulus's major cities were ruined, the international trade routes connecting the Western and the East shifted to the south, to another part of West and Middle Asia, while Samarkand became the centre of Timur's new empire. In the 15th century, coinage and monetary circulation was confined to the territory that it covered in the 13th century (the former Volga Bulgaria and Crimea, Hajji Tarkhan in the Lower Volga Region). Coinage was further limited to the Crimean Khanate (until the end of the 18th century). Russian coins were in circulation in the Khanate of Kazan.

CHAPTER 4

Political Power and System

§ 1. The Khan and the Aristocracy: Power and Administration Structure

Iskander Izmaylov, Damir Iskhakov

Though the Mongols easily defeated peoples across Central Asia and East Europe in a series of wars, it proved much harder to bring them into submission and maintain control over them. This is why many nomadic empires fell into oblivion as soon as their founders died. Chinggis Khan's advisor Yelu Chucai took into account the thousand-year rule of the Khitan emperors when he said, 'One can found an empire on horseback, but one cannot rule it in the saddle'. The Chinggisids followed the advice and created a complex far-reaching administrative system across the territory of their vast and multi-ethnic empire. It came to form the Ulus of Jochi as early as the 1240s. The administrative and territorial structure of the Golden Horde had become full-fledged enough to ensure efficient control over all regions of the empire in the first half of the 14th century.

Scholars, in particular domestic ones, have paid a lot of attention to the socio-political structure of the Golden Horde [Berezin, 1864; Yegorov, 1972; 1985; Fedorov-Davydov, 1973; Klyashtorny, Sultanov, 2000]. The range of opinions on the important and complicated issue is very broad. Their nature becomes clear if we outline the opposite concepts. On the one hand, the empire of Chinggis Khan and his descendants is viewed as a potestary political body with an underdeveloped class structure and no state institutions (see: [Skrynnikova, 1997, p. 12, 32 et seq.]). On the other hand, there is evidence that already Chinggis Khan's empire, not to mention the Ulus of Jochi, was a feudal state ('Mongol nomadic feudalism') with political and socio-economic institutions that were peculiar but more or less similar to those of other medieval states [Vladimircov, 1934; Fedorov-Davydov, 1973]. The two extreme

concepts apparently fail to provide insight into the actual socio-political structure of the Ulus of Jochi, which was a special combination of elements of the traditional nomadic community, headed by a ruling clan, and a well-developed Oriental, Islamic administrative system. At present, the complex structure can be described in very general terms only.

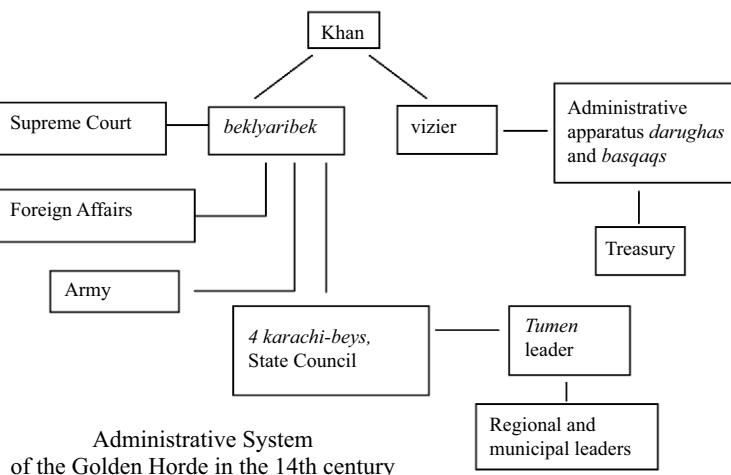

Only new studies by US historian Yu. Schamiloglu have enabled scholars to get a deeper understanding of it [Schamiloglu, 1984; 1986; 1992; 1993; 1998]. He believes that the socio-political structure of the Ulus of Jochi was based on the so-called 'system of four beks', or a union of four 'ruling tribes'. The leaders of such tribes, known as 'ulus emirs (beks)' (Russian: Horde princes, Arabic: amir al-ulus), one of them titled chief ulugh karachibek (*beklyaribek* ~ *beyliaribey* in Turkic, *prince of princes* according to Russian sources), along with the Chinggisid khan formed a ruling corporation, acting as a counter-balance to the sovereign ruler, the khan, within the collective ruling system. Cross-marriage through the female line was used to regulate the relations between the khan and the leaders of the 'ruling tribes' within the corporation. Besides, there was no clearly specified father to son power inheritance system in the Chinggisid House of the Golden Horde. Therefore, the leaders of the tribes acted as guarantors of the dynasty's rule and promotion for this or that Jochid Sultan by literally enthroning their candidate and subverting him when necessary. Describing the khan enthronization ceremony in the 'Golden Tataria' at the turn of the 15th century, J. Schiltberger noted, 'they seat the king (that is, the khan—I.I., D.I.)... on white felt... and lift him three times. Then they carry him around the tent, seat him

on the throne, and give him a gold sword, after which he must swear an oath according to their rules' [Schiltberger, 1984, p. 44]. The report suggests that it was karachibeks who carried out the essential governmental ceremony. This makes the system relying on a clan structure and, through it, on uluses and smaller land property, a major focus.

In fact, it is safe to say that the entire domestic politics of the Golden Horde was concentrated on two key elements of political power—the Chinggisid House and the clan and tribal organizations centred on the confederation of four 'ruling tribes'. The importance of the 'system of four beks' as a structural unit of state power in the Golden Horde is obvious from the scheme.

Unfortunately, a lack of sources has been preventing scholars from finding out whether each of the two parts (wings) of the Ulus of Jochi, the Ak Horde (right wing) and the Kok Horde (left wing) had a 'system of four beys', that is, 'ruling tribes', of its own, or the same confederation divided into halves ruled them. The second variant appears possible because 16th century historian Ötemish Hajji reported for the period of Khan Berdibek (1357–1359), '... Kiyat Mamai took the right wing and led the tribes to Crimea, (while) Tengiz Buga, son of Kiyat Jir Qutla, took the left wing to the Syr bank' [Ötemish Hajji, 1992, p. 108]. However, the information has to be further elaborated because it deals with a period when the state had started to dissolve. This is done below by reconstructing the clan composition of the Golden Horde. G. Fedorov-Davydov's assumption that there existed a secondary division into a right and left wing within the Ulus of Batu, that is, the right wing of the Ulus of Jochi, the Ak Horde, has to be further justified and tested, though there is some evidence of it [Fedorov-Davydov, 1973, p. 59–60].

The power of the 'golden clan' ('altyn urug')—Chinggis Khan's family—over the whole empire and its part, the ulus assigned to

this or that successor of Chinggis Khan, was the core of the political system in Chinggis Khan's empire and the Khanates founded by his descendants. The Chinggisid throne was available to Chinggis Khan's descendants exclusively. According to a tradition dating back to the time of Chinggis Khan, the Ulus of Jochi with all its land and population belonged to the Jochid clan, from which all khans who ruled the country in the 13–15th century descended.

The khans had superior power over the country. They were the sovereign rulers of its territory. It was khans who assigned uluses to other Chinggisids and their vassals and appointed them to positions, implemented domestic and international policies, in particular by adopting new laws, introducing taxes, issuing coins, and commanding troops. Describing the khan's power in the Mongol Empire, which is applicable, to a limited extent, to the Ulus of Jochi, in the mid-13th century, Giovanni da Pian del Carpine wrote, 'The emperor of these Tatars has an astonishing power over everyone.'

Nobody dares stay in a country unless the emperor so orders. He orders tribal leader where they should be; tribal leaders specify locations for thousand commanders, thousand commanders for hundred commanders, and hundred commanders for ten commanders. Moreover, they execute whatever he orders in any time or place, whether in terms of war, or death, or life, without reservations' [Travels, 1957, p. 45]. The khans' power was so enormous and their authority in the East so high during the empire's high noon that even such

Paitza. Gilded silver. Crimea. The Simferopol Hoard. 13–14th century. State Historical Museum

an independent thinker as historian Ibn Khaldun viewed the khans of the Golden Horde as outstanding among the rest of the Chinggisids and equal to great Mongol kaans. He titled them 'possessors of thrones'.

At the same time, it was not the unlimited power of an absolute monarch. Theoretically, the khan ruled with the consent of his 'altyn urug', expressing its collective will and implementing its policy. The kurultai was the only body that could nominate and elect a khan. Among essential provisions, apparently contained in Chinggis Khan's Yasa, Giovanni da Pian del Carpine mentioned the following: '... everyone who is overproud enough to become an emperor without being elected by princes must be killed without any regrets' [Ibid., p. 43]. That is to say, it was necessary but not enough to be a clan senior of Chinggisid descent to become a khan. The 'altyn urug' empowered the candidate by expressing its will through the kurultai. To quote historian T. Sultanov, 'In a manner of speaking, the ruling clan delegated one of its representatives to perform certain functions, also lodging him with certain pow-

ers' [Sultanov, 2006, p. 67]. It was the kurultai of Chinggisids and higher aristocrats who determined the successor, elected and enthroned him. It is quite natural that, strictly speaking, candidates were nominated and selected in advance at aristocrat meetings, while the kurultai elected and declared a khan unanimously, as previously agreed, took an oath to him, and carried out the enthronement ceremony (for more details, see: [Ibid., p. 69–72]).

The nomination and election procedures were specified in the Yasa and, apparently, common law regulations. Most importantly, all the rest 'altyn urug' representatives were to resign from power in public and empower the candidate previously agreed upon unanimously. However simple the procedure, it made one of the sultans more than just a head of state—it vested the charisma of the entire Chinggisid clan in him, thus turning him into an almost sacred figure. Several systems of succession to the throne were practiced in the Ulus Jochi over its history. They were all traditionally accepted as correct. The right one was to be chosen each time by taking into account the situation and the balance of power [Ibid., p. 91–92]. The single key principle was that a kurultai of 'altyn urug' representatives and clan aristocrats was to approve the candidate. This makes the inconsistent speculations by some domestic historians maintaining that Chinggisid states had no rigid succession system, which caused a permanent crisis of the khan's power—these are usually accompanied by statements that some autocratic khans caused absolutism to root in Rus' [Krivosheev, 1999, p. 232–293]—wrong. The political system of the Ulus of Jochi was stable enough to last for almost 200 years, while the power system had nothing in common with the classical eastern despotism.

The khan as the carrier of holder of superior secular power was traditionally viewed as the guarantor of stability, public order, and prosperity of his state. According to the medieval formula, the khan was expected to take care of his subjects and begs 'like a mother' takes care of her children, while they were to render obedience and respect to him 'as their father'. Besides, the ruler not only held the power but also maintained justice in the state,

which were believed to ensure social stability according to the medieval concept [Blok, 1998; Nelson, 1986].

The khan had a very broad scope of powers. Apart from the sacred functions of representing his state and maintaining the Chinggisid charisma, the khan had a whole host of rights and responsibilities. Most importantly, he was entitled to have the state's entire land and population at his disposal, administer justice, and maintain the country's integrity for the sake of the 'altyn urug'. This determined his functional rights to re-distribute uluses (khanates) within the clan, conduct diplomatic negotiations, wage war and make peace, hold trials and deliver judgments, issue and implement laws and orders.

The khan's right to allocate and re-distribute land was important evidence of his superior power over the state's land and population. William of Rubruck, who travelled in the Ulus of Jochi in the mid-13th century, wrote 'They (that is, the Mongol khans—*I.I.*, *D.I.*) divided amongst themselves Scythia, which stretches from the Danube to the sunrise; and every commander knows the limits of his pastures according to the number of people he commands. He also knows where to pasture his herds in winter, summer, spring and autumn' [Travels, 1957, p. 91].

Of course, the power of each khan depended on his capacity and opportunity to keep efficient and real administrative mechanisms in his own hands without entrusting them to his associates and his apparatus of administration and bureaucracy, but this touches upon the question of politics; 'the art of the possible'. At any rate, the Ulus of Jochi had its own forms of 'check and balance' systems in place to enable the various centres of power to maintain the stability of the society and the state.

One of these in the Ulus of Jochi, as in all empires following the ethno-political traditions of the Turkic khaganates, was the institution of co-ruling, where, along with the khan, a part (wing) of the state was ruled by the khan's vicegerent, who was inferior in status to the sovereign ruler alone [Trepavlov, 1991, p. 249–278]. These co-rulers were Batu and Orda. To quote Rashid al-Din, '... half of Jochid Khan's army

was commanded by him (Orda.—*I.I.*, *D.I.*), and the other half by Batu' [Rashid al-Din, 2002, II, p. 66].

However, the Kok Horde remained essentially independent. For instance, Rashid al-Din wrote, '... no one from the Horde dynasty who had taken his place ever visited the khans from the Batu dynasty..., (because they) are independent rulers of their ulus'. The historian notes, however, that it was customary for the Kok Horde 'to consider Batu's deputy their ruler and king, and they write their names over their yarliqs (decrees)' [Ibid.]. Thus, the rulers of the Kok Horde were in many respects inferior, as compared with the strongly centralised power of the Golden Horde, which was clearly on the rise. The sources give clear indications that the ruler of the Kok Horde Sasy Buka 'never deviated from the path of serving Toghrul Khan and Öz Beg Khan and never once refused to attend the kurultai' [Collection of Works Related to the History of the Golden Horde, 1941, p. 130]. His son Erzen became 'his successor' on 'the order of Öz Beg Khan', while the latter's son Chimtay, following a 'period of troubles', became the 'ruler of the same ulus' 'on the order of Janibek Khan' [Ibid.]. Historical tradition has preserved the idea that Orda's descendants had an inferior status during the rule of Khans Öz Beg and Berdibek [Ötemish Hajji, 1992, p. 105, 108–112]. In this connection, it is possible that the khans of the Kok Horde preserved the official status of co-rulers of the entire ulus, which they used as a pretext to participate in the disorders of the 1360–1370 [Trepavlov, 1993, p. 76–96].

However, the real power of the co-ruler was gradually ceded to the ulugh karachibek (beklyaribek). This did not happen overnight. For instance, according to the sources, Nogai was entitled 'chief' or 'superior army commander' (amir-i lashkar) of Khan Berke, 'the ruler of the Horde in the countries of the North', 'the Tatar ruler,' who had 'full power over kings from the House of Dushi Khan (Jochi Khan.—*I.I.*, *D.I.*), and, being 'listed amongst the khans', he was even mentioned alongside 'the head of the right wing' Emir Tayra and 'the head of the left wing' Emir Mawu in around 1270–1271 [Collection of Works Related to the History of the Gold-

en Horde, 1884, p. 101, 110, 155, 381, 509]. In other words, some Jochids, such as Nogai, used the mechanisms of power to seize real power and the right to become co-rulers of the khans of the Orda dynasty.

The administrative and territorial system of the Ulus of Jochi was similar to the internal structure of other the nomadic empires in Eurasia that were descended from the Hun Empire, in which all lands of the state were divided, as shown above, into two parts—the right and the left sides ('wings'). Moreover, these two wings were divided into two further wings, in accordance with the Turkic four-way division of the state. This kind of structure was reflected in the military organisation, that is, the military nobility assigned to each 'wing' was well aware of its place at the time of military operations, when the army was enlisted and fought. A curious report dating back to the epoch of Tokhtamysh (1395) suggests that the division into left and right wings was deep-rooted. When, during a battle against Timur, Khan Tokhtamysh was obliged to redeploy the left clan unit of the Bakhrens (Baryns), commanded by Yagly Biy, to the right wing, this was viewed as an extraordinary measure. The source tells us that Yagly Biy Bakhadur, who was the former 'leader of the Bakhren Ulus, a tribe which had belonged to the right side since the time of Oghuz Khan', was ordered to move over to 'the left wing.' As a result, at the kurultai of the Öz Beg sultans, 'the Bakhren Ulus was assigned a place(urun) on the left side', whereas 'the tribe used to (be)... on the right side, just as their relatives—the Kongrats, the Naimans, the Jalairs, the Uyshuns, and others—were' [Collection of Works Related to the History of the Golden Horde, 1941, p. 208; Mirzo Ulugbek, 1994, p. 233]. It is clear, however, that this military administrative system dated back to the time when the Ulus of Jochi was established and uluses were being portioned out following the conquest of the Eurasian steppes from the Danube to the Irtysh.

From the times of Batu, the right 'wing' (the Ak Horde) encompassed the uluses of Khan Batu himself, Berke, Khurumshi and others, while the left 'wing' (the Kok Horde) comprised those of Ordu Ejen, Tuqa-Timur, Shiban,

Udur, etc. For instance, in describing his travels across the 'country of the Comans', Giovanni da Pian del Carpine describes their land in terms of river systems, 'the Dnieper (Neper), near which Korenca set up camp on the Russian side, and on the other side... the Mauci, who is superior to Korenca, set up his camp. ... The Don, on the banks of which a prince by the name of Kartan, married to Batu's sister, has his camps'. The author describes how Batu 'moved from place to place' on the Volga, while 'the two thousands set up their camps on the River Yaik (Zhayyq), one on the one bank of the river, the other on the other bank' [Travels, 1957, p. 70]. A description of the Egyptian ambassadors' journey to Khan Berke's domain begins with their arrival on the banks of the river near Sudak, where they were met by a 'local ruler named Tayuk' in a 'town named Qirim'; after a day's travelling across the steppe, they 'found another leader, named Tukbuga', who 'commanded 10000 horsemen and ruled the entire land' [Collection of Works Related to the History of the Golden Horde, 1884, p. 63, 192].

Describing Batu's eastern territories, Giovanni da Pian del Carpine relates that 'Syban, brother of Batu' resided in the lands of 'the black Khitan people and the ocean', adjacent in the north to the dominions of the 'Saracens', previously led by Altisoldanus (that is, Ala al-Din Muhammad Khwarezm Shah), while 'Orda, Batu's elder brother,' lived in 'Horde, or his father's court' (that is, in the Ulus of Jochi) [Travels, 1957, p. 73]. Of Orda, Rashid al-Din writes that, along with '(this) army and four brothers—Udur, Tuqa-Timur, and Shinghum—it comprised the left wing...; they are still called princes of the left wing..., his yurt (and the yurt of these) brothers and their army are on the left side' [Rashid al-Din, 2002, II, p. 66]. On this division, the 16th century author Ötemish Hajji wrote the following: 'In compliance with the Khan's Yasa, (Chinggis Khan) gave Sain Khan (that is, Batu.—*II.I., D.I.*) the right wings with wilayahs on the River Idil, and gave Ijan (Orda Ejen.—*II.I., D.I.*) the left wing with wilayahs along the River Syr' [Ötemish Hajji, 1992, p. 93].

Reports by European ambassadors and other sources suggest that the initial stage of the

distribution of the dominions within the right and left wings was as follows.

The westernmost ulus of the Ak Horde in the interfluvium of the Danube and the Dniester as far as the Dniester-Dnieper basin divide evidently belonged to Nogai's father, and later Nogai himself. The lands of the Dnieper River Region belonged to Khurumshi/Kurmyshi (Kuremsa in the Russian chronicles), Orda's son, but in the 1260s the ulus was ceded to Kiyat Burundai. The land of Moutsa (Moucy according to Giovanni da Pian del Carpine), clearly Muji Yay, Chagatay's second son, lay on the left bank of the Don. It is quite obvious that, following the fall of Chagatay's clan in 1251, the ulus was handed over to a Jochid ruler. The ulus of Kartan, the husband of Batu's sister, was situated along the right bank of the Don. The ruler of the Steppe Crimea in the 1240–1250 is unknown but, during the rule of Khan Berke, this was an ulusbek from Tuk Buga's tumens (tens of thousands). At a further distance, in the steppes of the Volga-Don interfluvium, lay the dominions of Sartaq, Batu's son. The lands of Berke were situated in the steppes of the North Caucasus and the Western Caspian Sea Region, from where he was probably transferred by Batu to the Don River Region. The Volga Region was, in all probability, the Khan's ulus, that is, it was owned collectively by the 'altyn urug'. Every Jochid was likely to have property or income rights here. It is also possible that the lands of former Bulgaria had a special status and were controlled at first directly by the great Khan until it became part of the Khan's ulus in the latter half of the 13th century.

The Volga-Ural Watershed apparently served as a border between the right and left wings, the Ak Horde and the Kok Horde. The territory along the River Zhayyq (Yaik, Ural) belonged to a certain Jochid, whose exact name is unknown (probably Udur, Shingkum, or Singkum). The dominions of the Tuqa-Timurids were situated in the western Aral Region and on the Mangyshlak Peninsula. Northern Khwarezm, with its centre in Urgench, was a special area, probably owned collectively by all Jochids and, during the reign of Öz Beg Khan, was ceded to his uncle (his maternal aunt's son), the former ulugh karachibek Kiyat Qut-

luh Timur, who played a key role in Öz Beg's accession to the throne. The South Cis-Ural Region and western Siberian steppes belonged to Shibān, Jochi's son, and his descendants. It is clear that, for some time, the dominions of Shibān comprised the territories of the eastern Aral region and the lower reaches of the Syr Darya, including the cities of Jend, Sygnak, and Sayram, but became part of Orda Ejen's own ulus during his rule. Orda Ejen had originally owned the native lands of the Jochids in the upper reaches of the River Irtysh and near Lake Ala-Kul, where, the history of the Ulus of Jochi actually began.

There is still some debate amongst historiographers concerning which Jochids (such as Shibān) belonged to which wing, and whether the Ak Horde can be identified as the right wing and the Kok Horde as the left one. Literary works on this question are quite numerous and contradictory. To a large extent, this is because the sources are by no means always unequivocal. Many of the points of contention can be explained by the fact that some works pertain to a later period, and their authors tried to reconcile the information in the sources with which they were familiar with contemporary reality. Of key relevance in this respect is the mistake made by the Persian author of 'The Anonymous of Iskender', Muin al-Din Natanzi, who, misinterpreting the hierarchy of the ulus-es and the wings, identified Shibān's lands in the lower reaches of the Syr Darya as the dominions of the Ak Horde and, in attempting to clarify the clear indications in his sources that the Ak Horde was situated to the west of the Ulus of Jochi, confused the colours of the different wings and the genealogy of their rulers (thus, contrary to well-established genealogical tradition, the son of Nogai was made ruler of the Ak Horde, Sasy Buka, etc.). The contradiction of the sources and the confused situation can be explained by G. Fedorov-Davydov's well-founded hypothesis that the Turkic system of identifying the wings by colour was introduced in the mid-14th century as part of the general Turkification of the Ulus of Jochi and had not yet become a well-established tradition. While the Ak Horde was identified as the right wing and the Kok Horde as the left wing, each

of these wings was further divided into two—left and right—wings, in full accordance with the state's uniform military administrative system, which were later assigned their respective colours [Fedorov-Davydov, 1973, p. 141–144]. However, G. Fedorov-Davydov's conclusion that the ulus of Shiban and his descendants belonged to the state's right wing, the Ak Horde [Ibid., p. 144] appears to be not only dubious but inconsistent with his own findings. The source (which is, incidentally, the only source that identifies the ulus of Shiban as part of the Ak Horde) most probably refers to the Ak Horde of the left wing (the Kok Horde). At any rate, there is no evidence that Shiban's dominions belonged to the right wing, as this would oblige us to assume that the territory of his ulus penetrated deep into the lands of the Kok Horde as far as the River Irtysh, and to explain why Shiban's descendants were later referred to as sultans of the left wing.

The Ak Horde and the Kok Horde were, in turn, divided into uluses, which were governed by the descendants of the brothers Batu and Orda, who bore the title of 'oghlans' (or sultan, tsarevich). There were then the dominions of independent beys. By all accounts, the uluses were a complex military-administrative system of hierarchic possessions (ils). The ulus, the sovereign of which was obliged to deploy ten thousand armoured knights in military campaigns, were governed by begs, who deployed one thousand warriors each, and rulers, subjects of the begs, who in turn commanded a hundred warriors. All of these possessions could differ in their forms of ownership (tarkhans, soyurgal), but their place in the system of 'wings' and the military organisation was unchanged. As a result, the military-administrative system was closely connected to the territorial possessions and the tribal structure of the aristocracy.

The right to assign uluses was vested in the khan, who could grant plots of land to feudal lords who had distinguished themselves particularly highly. For instance, Batu withdrew the part of Berke's dominions 'lying towards the Iron Gate' and annexed it to his ulus, because the 'Saracen' merchants travelling through Berke's territories 'would bring him gifts', to quote William of Rubruck. Batu, who 'con-

sidered all this to be unprofitable,... ordered him to move from this place to Ethilia in the east, reluctant to have Saracen ambassadors travelling through his territory' [Travels, 1957, p. 117]. This example is an excellent illustration of the rights enjoyed by the khan. Following a series of military defeats by his commander Kurmyshi, Berke transferred his ulus in the Dnieper River Region to the rule of the baghatur Burundai. Khan Tokhta is also known to have 'made a gift' of the Crimea to Nogai, whose son Aktaji took up residence there [Collection of Works Related to the History of the Golden Horde, 1884, p. 111, Note 17]. Khan Tokhta went to war against Nogai to gain possession of his ulus. After defeating Nogai, Khan Tokhta sent his two sons, Tukulbuga and Ilbasar, to Nogai's dominions. The former ruled Isaccea on the Danube, on the territory 'adjacent to the Iron Gate', where 'Nogai's camps lay,' while the latter 'settled on the River Lika' [Ibid., p. 117]. The khan then appointed Abaji's brother Liji, son of Kurmyshi, as emir to replace Abaji [Ibid.].

The sources suggest that there was an active process of division the uluses in the Horde. While in the mid-13th century there were around twelve higher and influential beks [Travels, 1957, p. 44–45], after 50 years this number had increased to 50–60 (1264) or 70 (1317). This is confirmed, in particular, by Arab historian al-Nuwayri, who, describing the kurultai of the higher aristocrats who gathered in 1316 in the khan's camp to address the issue of marrying Khan Öz Beg's daughter off to the Egyptian sultan, wrote, 'emirs, heads of the ten thousands, a total of 70 emirs... were gathered' [Collection of Works Related to the History of the Golden Horde, 1884, p. 168].

Belonging to the ruling house and the 'altyn urug', the oghlans (or sultans) not only had the right to territorial possessions, but were also able to occupy military and public positions. The very system of the uluses had evolved since the 13th century from holding an office for a term to hereditary possession. Each ulus sovereign had to pay a certain amount in tax to his suzerain, and either bring his troops under the suzerain's banners or serve as a public official or diplomat. In the event that a vassal

failed to fulfil these obligations or satisfy the khan's requirements, the khan could deprive him of his ulus.

The exact frontiers of the khan's ulus in the 14th century are not quite clear, but al-Umari made the interesting observation that the khan was 'the sovereign ruler of Sarai, Khwarezm, the Crimea, and Desht-i Kipchak' [Ibid., p. 250], which can be interpreted as a reference to the personal domain of the rulers of the Golden Horde. Most probably, the khan's ulus was subdivided into two large uluses consisting of smaller feudal plots, which is confirmed, in particular, in the narrative 'Pimen's Trip to Constantinople,' where a description of a journey along the River Don mentions that the travellers 'passed Velikaya Luka and Tsar Sarykhoza's ulus... In the fourth week, they passed the ulus of Bek Bulat and, in the sixth week, that of Ak Buga' [Complete Collection of Russian Chronicles, 11, p. 96]. Another observation is made in the notes of Ibn Batutta, who, describing his trip with one of Khan Öz Beg's wives, noted that 'each local emir accompanied the khatun with his troops to the very border of his plot of land' [Collection of Works Related to the History of the Golden Horde, 1884, p. 303]. Ibn Batutta, describing the Golden Horde of the 1330s, mentions the Crimean Emir Tulugh Temir, the Azov Emir Muhammad Hoja al-Khwarezmi, 'the ruler of Khorasan' with its centre in Khwarezm, Emir Qutlugh Timur [Ibid., p. 282, 284, 311]. It is a known fact that Emir Mamai, who after the death of Berdibek 'administered all the affairs' of the state formally ruled by the young Khan Tokhtamysh (Berdibek's son), owned the Crimea (the Crimean Tumen) [Ibid., p. 390]. Egyptian sources often refer to the Crimea as a separate possession ruled by the emirs with its capital in Solkhat [Ibid., p. 413, 452]. An As-trakhan 'appanage' is also known to have been ruled by Emir Hajji Cherkes [Ibid., p. 391]. Ibn Arabshah reports that Edigü had around 20 sons, each of whom was an independent ruler with 'an appanage, an army and adherents of his own' [Ibid., p. 474]. It is entirely possible

Early 14th century

that most of the 50–70 noble emirs or ulusbeks, who would gather at the khan's court to address critical governmental issues, originated from the khan's domain. However, the grand ceremony in Sarai, which was witnessed by Ibn Battuta, was attended by 17 emirs 'leading 170 thousand men' [Ibid., p. 299], which most probably indicates that the emirs' possessions were located in the central domain, that is, that of the khan.

According to medieval sources, these lands were ruled on behalf of the khan by four ulus emirs, karachibeks or ulusbeks, 'as was the custom' (a similar system was practised in many nomadic Turkic states). The fact that the karachibeks had an elevated, important status is suggested, in particular, in Ibn Battuta's description of a reception by Khan Öz Beg: 'The chief emirs were sitting in armchairs to the right and left of the Khan... Standing by the entrance to the pavilion were his representative (naib), vizier, treasurer (hasib) and the keeper of the seal, whom they call al tamga... The four of them rose when I entered' (quoted by: [Schamiloglu, 1993, p. 49]). They had diverse functions. It was most probably the ulusbeks who made sure that each feudal lord adhered to the principles of his vassal relations in the lands entrusted to him, in particular by gathering his troops for periodical inspections. Moreover, every ulusbek owned a large lien as a source of his personal income in addition to that from his service to the state. The most famous ka-

rachibeks were Qutlugh Timur, who ruled Desht-i Kipchak during the reign of Khan Öz Beg and later Khwarezm, Mamai and Edigü, who actually ruled the state, the khans being formal title-bearers. According to the Egyptian sources, Qutlugh Timur, who was a beklyaribek, not only 'controlled the state administration and the arrangement of (its) affairs but was also responsible for 'tax collection' [Collection of Works Related to the History of the Golden Horde, 1884, p. 325, 516]. Although this seems to be somewhat exaggerated, some karachibeks did enjoy a very high level of authority, especially those who headed certain wings.

Reports by Ibn Battuta and some other sources suggest that these karachibeks constituted the supreme military and administrative power in the Golden Horde. The khan appointed an ulugh karachibek or beklyaribek (usually one of the ulus emirs) and a vizier to carry out the direct administration of the complex state apparatus and army, and, in so doing, implement the domestic and foreign policies of the khan, who, according to contemporary sources, 'only concerns himself with the essence of the matter without going into detail and is content with what is reported to him without delving into the particulars of income and expense items' [Ibid., p. 230]. Clearly, the two chief administrators controlled the large and complex apparatus of state officials of every rank.

The highest position in the Khan's court was held by the ulugh karachibek, or emir al-umara ('emir over all emirs'), or beklyaribek ('bek over all beks'), who was referred to as 'the Khan's vicegerent'. In the letters of an Egyptian sultan to the beklyaribek of Janibek Kutlubuga Inak, the latter is referred to as 'the ruler in the lands of Öz Beg, most noble emir, great, learned, just reinforcer, supporter, guarantor... of the greatness of Islam and the Muslims, head of the emirs of two worlds, protector of those who fight for our faith, chief of the troops, commander of the army... supporter of kings and sultans, sword of the ruler of the faithful' [Ibid., p. 348]. Judging by these pompous titles, the great emir commanded the Khan's entire army ('chief of troops, commander of the army', 'sword of the ruler of the faithful') during military campaigns, because khans,

who were formally commanders-in-chief, were rarely directly involved in any combat operations. For instance, Nogai fought for Khan Berke against the Hulaguids in Azerbaijan, while Qutlugh Timur commanded the army for Öz Beg. Of interest here is a letter to Nogai (Isu Nogai) from Egypt in which he is addressed by a number of exuberant epithets, some of which convey his status of a military chief: '... to a highly noble, most excellent, gentle-born fighter in the name of his God, radiant with the light of his heart, treasury of the Muslims and help of the faithful...' [Ibid., p. 101]. Another sphere of the beklyaribeks' activities was diplomacy. Although correspondence was formally in the name and on behalf of the Khan, Egyptian sources report that the ulugh karachibek conducted the principal negotiations, discussing agreement terms and instructing ambassadors [Ibid., p. 324]. The great emir also held judiciary power, especially on secular issues. According to Ibn Battuta, who visited beklyaribek Qutlugh Timur's chancellery during a court trial, this was attended by a qadi (judge), along with lawyers, and 'one of the senior emirs, accompanied by eight (more) senior emirs'. 'The qadi addresses religious issues, while the emirs resolve all other issues' [Ibid., p. 311–312]. Furthermore, the beklyaribek continued to rule one of the uluses of the Golden Horde.

The vizier had no less power, although his power was less visible. He was the khan's counsellor and head of the Divan, the central executive body. This explains why the letter from the Egyptian sultan to Vizier Husam al-Din Mahmud of the Divan addressed him with reverence as 'the Khan's Vizier' in the lands of Öz Beg, 'most noble emir, great... most powerful, who protects... the glory of Islam and the Muslims, the greatness of the emirs and viziers in the two worlds, the beauty of those most powerful, the only one amongst intimate friends, treasure of the state, counsellor of kings and sultans' [Ibid., p. 348–349]. He was responsible for the chancellery, which consisted of several chambers headed by secretaries [Berezin, 1850, p. 10; Usmanov, 1979, p. 211–226] and governed the financial and fiscal policies as well as domestic affairs. It employed a bureaucratic apparatus of local bodies to organise the

collection of tributes from subordinated peoples as well as the levying of taxes and duties. As a special prerogative, the vizier was entitled to appoint and remove all of the empire's numerous public officials responsible for finance and taxes of all categories, which in the Golden Horde were no fewer than eighteen [Usmanov, 1979, p. 216–217]. Inconspicuous as it was, the vizier's chancellery performed the critical function of ensuring the country's sustainability and stabilising its domestic life. Being in control of the treasury, the vizier enjoyed enormous power over the khan's court.

Moreover, there was a multi-branched system of civil officialdom in the Ulus of Jochi and a hierarchic military lien structure, binding the state from top to bottom. However, the state's true core, its backbone, was its clan aristocracy. A large proportion of the begs and their clans (*ilem*) had their camps in *Desht-i Kipchak*, while others became public officials, moved to the cities and are likely to have formed the basis of the urban official aristocracy. Under the influence of civilisation, many aristocrats started to change their lifestyles. Permanent settlements and even genuine estates with castles started to appear in winter camps. These were inhabited not only by the feudal lords and their court but also by craftsmen and merchants. All this helped the steppe aristocracy to accumulate enormous riches. According to al-Qalqashandi, large liens ensured an annual income as high as 100 and even 200 thousand Egyptian dinars [Collection of Works Related to the History of the Golden Horde, 1884, p. 244]. Large land possessions and regular income from trade and military undertakings enabled the nobles to keep large retinues of heavily armed professional warriors. Arab sources mention five emirs who had 30,000 fully armed horsemen [Ibid., p. 43].

The gathering of the aristocracy, the *kurultai*, played an important part in the social life of the Ulus of Jochi as a specific class-representative body. As a social institution, it originated amongst the nomadic peoples as early as the period of class formation and was a form of democracy. However, its functions were later appropriated by aristocrats, namely, heads of clans and chiefs of military retinues. At the

time of Chinggis Khan, it was primarily an assembly of the ruling house, the '*altyn urug*', and convened mainly for electing the khan. As the number of Chinggisids increased and their connections of kinship with other clans extended, the composition of the ruling clan became more diverse and the number of clan aristocrats entitled to participate in the *kurultai* through kinship rose. There is hardly any information on *kurultai* membership in the Ulus of Jochi. However, we can assume that it consisted of titled Jochid noblemen, the most noble and powerful clan heads, or *ulusbeks*, as the sources refer to them as 'heads of 10 thousand men' [Ibid., p. 168]. A regular *kurultai* was attended by the country's 50 [Ibid., p. 63, 193] or 70 [Ibid., p. 168] noblest emirs. They addressed the most important issues of succession to the throne (the enthronement or dethronement of the khan), concluding agreements (often connected with territorial concessions), the marriage of the descendants of Chinggis Khan, and even of making 'immoderate demands' contrary to the khan's policy [Ibid.]. For instance, after Khan *Öz Beg* died, 'the emirs of the state resolved that his son *Janibek* should rule the state until his elder brother *Tinibek* arrived' [Ibid., pp. 261, 263–264]. In essence, the *kurultai* served as a body expressing the collective interests of the clan aristocracy, relying on its own military might. It was a power that kept the absolutist ambitions of the khans and the separatism of the feudal lords in check, hastened to maintain traditional legal relations in society and, at the same time, served as a counterbalance to autocracy. The importance and the role of the *kurultai* were different during the different periods of the Ulus of Jochi: some khans were mighty enough to control the nobility; others had to make concessions to aristocrats. In a manner of speaking, this was a peculiar, medieval, steppe-type democracy. This institution, essential for an understanding of how the political system of the Golden Horde functioned, disproves the idea that this was a despotic Oriental state.

According to G. Fedorov-Davydov, the progress of feudalism in the latter half of the 14th century led to a reinforcement of the hereditary ownership of *tarkhans* in the western

part of the Horde [Fedorov-Davydov, 1973, p. 124–127]. Incidentally, this was also observed in the Kok Horde. For instance, after Emir Uruk Temur from the *Shirin* clan left Urus Khan, along with Tokhtamysh, for Timur, the khan granted (as a *suyurgal*) his thousand men to someone else'. When the emir was captured by the khan's son Timur Malik, he asked to have 'his il and people (*usul*) returned' to him, which request was denied, causing the disfavoured emir to flee a second time to Timur [Collection of Works Related to the History of the Golden Horde, 1941, p. 150]. This indicates that the emirs had stable dominions (*uluses*), which they viewed as their 'ils' or 'uluses', in the left wing of the Golden Horde, too. As the practice of granting these became more widespread, the major feudal lords, primarily the *ulusbeks*, not only grew in strength economically and militarily, they also developed a craving for the levers of central power, which inevitably led to differences. However much the nobility had in common, their interests clashed to a significant degree.

As the cities grew, so did the influence of Sarai's civil service elite, who monopolised control over the collection and redistribution of enormous riches. As a result, rivalry between clans for access to the levers of central power grew increasingly violent, while government became excessively centralized. This aggravated other internal conflicts, which fostered the development of destabilizing forces.

These trends were mere undercurrents in the mid-14th century, and contemporaries viewed the Jochid Empire as a world power. The Sultan of the Mamluk Egyptian Baybars reverently gave notice of his 'allegiance and subordination' to it in 1263. The Horde remained its formal sovereign until the end of the 14th century.

There is no doubt that other European and Asian rulers viewed Golden Horde khans as mighty, noble, sometimes awe-inspiring figures. It must have been unthinkable that this 'pillar of Chinggis Khan's house' was already riven with internal conflicts and ready to collapse, undermined by a number of factors.

§ 2. Administrative Apparatus

Mirkasym Usmanov

Russian Oriental scholars have long focused their research on issues related to the Jochid political order, in particular the administrative system. The first dedicated studies appeared in the mid-19th century. For instance, G. Sablukov wrote an essay in 1844, although it relied on a limited range of sources and literature (there is a second, revised and corrected, edition: [Sablukov, 1895]). Prior to that, V. Grigoryev had already explored certain aspects of the issue [1842].

However, I. Berezin's dedicated study provided a more complete account of the issue compared to others at the time. Before publishing his major work on the subject [Berezin, 1864], he presented a number of shorter pieces of research, some of which dealt with khans' *yarliqs* and 'Oriental chronicles' (for a list see: [Ibid., p. 391–392]). Evaluating I. Berezin's scholarly legacy, V. Bartold noted his works

to be predominantly philological [Bartold, 1926]. This would appear to be natural as certain meanings behind Oriental terms would be unintelligible without a linguistic analysis. Major contributors in this respect are V. Radlov, A. Samoylovich, S. Vakhidov, S. Malov, A. Kurat, Borovkov, and many others (for information on their works see: [Usmanov, 1975, p. 123–124, 129–130]; the contemporary study by A. Özyetgin is also noteworthy [Özyetgin, 1996]).

Such philological studies and their findings enabled 20th century historians to make better use of formal documents in their research. The most prominent titles of the period were written by historians A. Yakubovsky, A. Nasonov, V. Vernadsky, M. Safargaliev, and G. Fedorov-Davydov. G. Fedorov-Davydov's contribution deserves more than a passing mention. In his landmark monograph 'The

Social System of the Golden Horde' [1973], he meticulously compiled all data known and available to him—statements, assertions, and assumptions (including the opinions of, and experience gained by, foreign scholars)—concerning the socio-political terminology of states of Chinggisid origin, most importantly, the history of the Golden Horde. He was able to create a more or less holistic, though not very orderly, picture of the social structure of the Jochid state. Quite naturally, G. Fedorov-Davydov, who lacked a basic education in Oriental studies, especially Oriental philology, often had to rely on others in drawing certain conclusions. However, using a broad set of data and an integrated analytical approach enabled him to present a well-justified list of source factors relating to the administrative structure, that is, the state power of the Chinggisids in general and the Jochids in particular.

* * *

The Uluses and their rulers. The first elements of state administration in Central Asian nomadic communities apparently developed out of clan and tribal organizations. Over time, they evolved into the ulus system. To quote B. Vladimirtsov, 'the ancient Mongol term for any union of clans, generations, tribes, understood in terms of dependence on a tribal leader, khan, nayon, baatur, etc., was an ulus' [Vladimirtsov, 1934, p. 97]. This system of unification, which created a hereditary bond (*unagan bohol*) between clans and tribes was probably implemented by other nomadic groups in Central Asia, also. Its initial simplicity meant it could be made to fit any community. Proof of this lies in the fact that the system survived Chinggis Khan's reforms, though in a somewhat more complicated, or, rather, more widely legalized form. According to B. Vladimirtsov, 'the power of Chinggis Khan's clan over its ulus, that is, its people-state, was manifested in the following way: one of the kinsmen, the altan urug (urux), became the emperor, the khan (xan, xagan), who ruled the whole empire, after a council of all kinsmen had elected him (...); other members of the clan, mostly male descendants, were declared

Chinggis Khan on the throne. Miniature.
Iran. Early 14th century.

tsarevichs (...) entitled to hereditary use of an ulus appanage [Ibid., p. 99].

Ulus appanages were sometimes termed *inju* or *inchi* [Berezin, 1864, p. 426; Bartold, 1963, p. 548], meaning a 'share' inherited from one's father.

Tsarevich Jochi's appanage (the basis of the Ulus of Jochi) was allocated to him when Chinggis Khan was still alive. It was later divided into ulus appanages owned by Jochi's sons after it had expanded with newly conquered land. Jochi apparently had 14 sons who reached to maturity [Rashid al-Din, 1960, II, p. 66; Collection of Works Related to the History of the Golden Horde, 1941, p. 41], so it was supposed that the Ulus of Jochi was sub-divided into fourteen appanages [Safargaliev, 1960, p. 43].

Jochi had 17 sons, according to information related by Chinggisid informants in Khwarezm, which were recorded in the 16th century. Shiban's appanage was known as the Grey (Boz) Horde. Orda Ejen and Batu were uterine brothers [Ötemish Hajji, 1992, p. 92, 121]. The 'Collection of Chronicles' contains various different names for Orda and Batu's mother—Sartaq, Sartaf, or Sarkan, Ukhaa Fuj, Ukifujin, etc. However, she is stated to have been from the Kunigrat clan in both cases [Rashid al-Din, 1960, II, p. 66 and 71; Collection of Works Related to the History of the Golden Horde, 1941, p. 41 and 48]. The

person in question is probably the same, only the various informers knew her by different names (it is unlikely that Chinggis Khan established kinship with the same clan/tribe twice).

This summary shows that an ulus administration system that dated from antiquity existed in the Ulus of Jochi's state, both during its formation and later. Quite naturally, it changed as the new state developed to cover an enormous territory and acquired a multicultural population. Having been devised essentially for nomadic lifestyles, the system was adjusted to suit new conditions when non-nomadic, non-Mongol people outnumbered its nomadic population, especially Mongols [Grekov, Yakubovsky, 1950, p. 69, 100–101; Vernadsky, 2000, p. 140, 216]. However, the ulus system, as the basic form of administration, remained largely the same. The country was thus ruled by ulus leaders, *oghlands*, or *sultans*, who were in fact Jochid princes, led by a supreme ruler—the khan—also a Jochid, elected officially at the kurultai.

It is particularly worth noting that the ruler's high-ranking representatives were composed of both military and civil administrative leaders. This is attributable to the socio-political nature of the system, the original 'people state' that Chinggis Khan's reforms re-shaped into a mobile 'people army'.

The ruling khan's close family members, namely his *khatuns*, or wives, *oghlands* and *sultans* (both sons and daughters), formed, in their own way, an extension (sometimes temporary) of the high-ranking administrative officials. The fact that deceased khans' wives are known to have ruled the country as regents is proof that women were not excluded from the system. There are examples of this ranging from the death of Chinggis Khan and his sons, to Suyumbike's rule in Kazan following Safa Giray's death [Bartold, 1963, p. 553, 595; Nasonov, 1940, p. 31; Vernadsky, 2000, p. 210, 217, etc; Khudyakov, 1923, p. 109–113]. Moreover, queens and princesses were entitled to grant *yarliqs* [Records of Russian Law, 1955; Priselkov, 1916; Vásáry, 2002, p. 195; Usmanov, 1979, p. 53, No. 51], as well as conduct diplomatic negotiations with

foreign rulers (for instance, Taidula of the Golden Horde, Tsarina Nur Sultan of Kazan and the Crimea, and others, see: [Berezhkov, 1897; Khudyakov, 1923, p. 173]). Naturally, the rights and capabilities of such representatives of the fairer sex were determined by their personal qualities as well as their specific circumstances. However, they all had titles to distinguish them from the rest of society. For instance, the tsarina was termed *khatun*. This earlier term, meaning 'mistress' and 'tsarina' (the Khan's wife) in the Mongol state and the Golden Horde [Collection of Works Related to the History of the Golden Horde, 1941, p. 22, 42, 48, etc.; Grekov, Yakubvsky, 1950, p. 125–126], was replaced by *khanym*, *khanbike*, and even *bikem* in later Tatar Khanates [Velyaminov-Zernov, 1863, p. 190, 509, 512; Khudyakov, 1923, p. 181]. In some of the latter years of the Ulus of Jochi the term used was '*altyn khanym*' [Usmanov, 1972, p. 91–92].

Oghlands and sultans. The Turkic word '*oghlan*' (literally meaning 'child', 'son') initially referred to a Chinggisid prince in a meaning similar to the Russian '*tsarevich*' and the Persian '*shah-zade*'. Later, 'in the 15–16th centuries it meant service class noblemen and simply warriors' [Fedorov-Davydov, 1973, p. 46]. It was then replaced by the Arabic word '*sultan*', which initially meant 'ruler' as in '*as-sulan al-adil*' ('just ruler'), often found as legends on coins. In the 14–16th centuries it acquired the meaning of royalty, applicable to both sexes, and was sometimes used as a component of proper names, as '*bek*' was (compare examples: [Velyaminov-Zernov, 1863, p. 224, 305, 495, 503, 506–508, etc]), meaning the terms became devalued.

Karachis, viziers, emirs and mirzas. Below the common 'top' of the socio-political pyramid, namely the khan and his relatives, there was the administrative apparatus proper, that is, a multi-layered governmental body which also had a 'top', the *khan's council*. It consisted of high-ranking officials, mostly representing ruling classes and leading clans. Its most influential members were four councillors, known as the *four karachis* (for more details on them see: [Safargaliev, 1960, p. 68;

Fedorov-Davydov, 1973, p. 90–91]). The term 'karachi' as a special title [Velyaminov-Zernov, 1864, p. 411–417], as S. Bakhrushin noted, had a precise meaning: *higher councillor* [Miller, 1937, p. 487].

The following set forms of address used in the charter messages (bitiks) of the Crimean Khans provide a clear insight into the status and rank of karachis within the top administrative elite of Turkic-Tatar Khanates: *karachilardin wa biklardin wa mirzalardin* (for karachis, of beks, and of mirzas), *karachilarymyz, biylar wa mirzalar* (our karachis, biys, and mirzas), etc. (for examples see: [Materials, 1864, p. 22, 75, 87, 106, 377, etc.]). Data about apportioned yarliqs suggests that karachi had the second highest status in the administrative system after the khan. For instance, inscriptions (addressees) of granted yarliqs contain a list of the basic types of military and civil officials, from ulus rulers, oghlans, to low-level administrators obliged to carry out any orders contained in the ruler's decrees. None of the over sixty original documents analyzed mentions a karachi as an executor. The title is entirely absent [Usmanov, 1979, p. 205–228], although, as stated above, it is the first to be mentioned in letters to foreign rulers. This is probably attributable to the fact that granted yarliqs were issued to subjects 'with the consent' (at least theoretically, or, rather, traditionally) of their high-ranking councillors. Karachis therefore 'co-authored' the ruler's decrees.

Apportioned yarliqs also mention the titles *wazir*, *amir*, and *mirza*, without adding any definition or specification of the administered unit. Being a council member, the wazir occupied one of the highest ranks. His office was similar to that of the *beklyaribek*, as we will see below. He was probably elected (appointed) from among the four karachis. The title came to be widely used following the Islamisation of a country's feudal and governmental elite. The equivalent Turkic title it replaced is uncertain. I am inclined to attribute the frequent use of the title 'wazir' in Arab and Persian written sources to a desire to match one of the highest governmental beks of the Ulus of Jochi with its equivalent office in other

Muslim countries [Berezin, 1864, p. 433, 439, 440; Fedorov-Davydov, 1973, p. 91].

Oriental sources also often use the title amir (emir) to refer to beks as rulers. This was also a result of Islamisation. Its use was more popular with Muslim authors.

As for the term mirza (murza), it is a derivative of the Arabic-Persian term amir-zade, meaning 'children of emirs' [Berezin, 1864, p. 435]. This was not a title or an official rank but an indicator of a feudal aristocratic class, similar to boyars and noblemen. In other words, murza was not an office but a social class, to which various rulers initially belonged.

Bek (*beg, bey, bik, biy*), *bekliaribek*. The ancient term 'bek', which has been known to be have used since the time of the Turkic and Uighur Khaganates (possibly since the Hun epoch), initially meant a tribal/clan leader, a chief or 'head' in a general sense. Russian sources translated the term when used during the time of the Golden Horde as 'prince' ('knyaz'). This was also accepted by I. Berezin [Berezin, 1864, p. 434–435], while Ibn Battuta translated it as 'emir' [Collection of Works Related to the History of the Golden Horde, 1884, p. 246], which sometimes fails to accurately convey the specific meaning. At an early stage, the term bek meant apparently the same as the Mongol word nayon. This latter term was later completely superseded as a result of the intensified Turkification of the remaining Mongols and its administrative apparatus.

There are no clear records on when bek simply meant a tribal chief elected once for a specific campaign, when it became a hereditary title, or whether this was the case everywhere. It apparently not only had a number of variants characteristic of various vernaculars and dialects but bore different connotations depending on the region, ethnic community, epoch, or period. Its multi-purpose flexibility and its 'universality' (as it could be to be applied to any leader superior to others) are proof of this. For instance, it was used to denote a leader of ten men to a marshal of a tumen (ten thousand), even that of an ulus (for example, *onbegi*, meaning a ten warrior

bek, *yuzbegi*, meaning a hundred warrior bek, *minbegi*, meaning a thousand warrior bek, *tumanbegi*, meaning a ten thousand warrior bek, *darughabegi*, ulusbegi etc.). Thus, the name of the unit administered was added to the term in order to make it as specific as possible. This was the model adopted for the creation of other widely used binominal titles, such as heads of settlements, cities, and regions (for more information on beg types see: [Berezin, 1864, p. 450; Fedorov-Davydov, 1973, p. 46–47; Usmanov, 1979, p. 206–209]). Sources also mention such titles as *tugbegi* (famous bek), *kushbegi* (falconer), *koshunbegi* (koshun bek), etc. [Yudin, 1992, p. 37].

The term's semantic simplicity and flexibility is supported by the fact that it could easily be replaced by an equivalent term that had a specific meaning, and which was widely used in many languages, namely bash (head). For instance, *onbashi* meaning head of ten men, *tumanbashi* meaning ten thousand head, *shahrbashi* meaning city head, etc.

Even though the term 'bek' was simple and commonly used, the position it denoted in the Ulus of Jochi and the later Tatar states was strictly official. That is, beks were either appointed by superior authorities or elected by legitimate gatherings, councils, in 'bottom-up' governance. In other words, bekship was not hereditary at the time in question. This was clearly stated by Karachi Kadir Alibek, who was an expert in Turkic-Tatar legal norms. For instance, describing the relations between Timur Qutlugh and the famous beg Edigü, he reported that 'one was the khan, and the other a biy'; 'Shaikh Mamai Mirza ruled the ulus but did not become a bek himself' [Usmanov, 1972, p. 83, 92–93].

The word 'bek' as a component of proper names, which apparently was first used by aristocrats as an anthroponym, later lost its terminological meaning.

Of all the titles for public officials, which varied depending on their function, or, rather, on the unit they administered, of special significance is the term *beklyaribek* (beklyaribegi), which Arab contemporaries translated as 'emir al-umara' (emir over emirs, chief emir), that is, 'prince of princes' [Collection

of Works Related to the History of the Golden Horde, 1884, p. 227, 249, 401, 412]. This title therefore referred to the chief ruling bek, who was appointed from among the four karachis as the head of the government. Scholars believe the beklyaribek to have been in control of military and administrative affairs, while the wazir was responsible for civil, financial, tax, and economic affairs [Safargaliev, 1960, p. 68–69, 71; Fedorov-Davydov, 1973, p. 90–91].

The key governmental apparatus was the khan's council, which, later, after the Islamisation of the country, became known as the khan's divan. It was also the supreme chancellery. At its head was an administrator, the *divanbegi*, meaning *divan head* (divan amir) [Collection of Works Related to the History of the Golden Horde, 1941, p. 193, 201, etc.]. According to M. Safargaliev, the divan controlled the country [Safargaliev, 1960, p. 71]. Naturally, ulus (appanage) rulers also had divans of their own.

Basqaqs. The basqaq was a high-ranking administrative official in the early period of the Ulus of Jochi. This term referred to a kind of administrative viceregent responsible for census arrangement, tax collection and military conscription, to which the populations of conquered kingdoms responded with riots and rebellions. Using Russian sources, A. Nasonov has studied basqaqs in detail. He discovered that there were both regular basqaqs and those superior to them (such as the 'great basqaq of Vladimir' [Nasonov, 1940, p. 20, 23, 145–149]. They also controlled and 'supervised their vassals' activities closely'. 'Vassals' in this context refers to Russian princes [Safargaliev, 1960, p. 38]. There were no basqaqs 'in the territory directly belonging to the Golden Horde'; they were only present in southern principalities of Rus'. Even they cease to be mentioned by the final quarter of the 13–early 14th century [Nasonov, 1940, p. 12, 20, 109, 149]. Therefore, it is reasonable to specify that 'basqaqs and darughas were also empire- and non ulus-level administrators' [Fedorov-Davydov, 1973, p. 30]. According to an Armenian source, in 1254–1255 Möngke Kaan and Batu sent dedicated officials to

'take a census... in Armenia, Georgia, and the Aguan land' (quoted by: [Berezin, 1864, p. 465]; for information on similar events see: [Nasonov, 1940, p. 31, 55]).

Apart from census arrangements and tax collection, *basqaqs* were responsible for ensuring the regular conscription of soldiers from conquered peoples to serve in the empire's army [Ibid., p. 14–15, 17, 54–55]. Large contingents (10% of the males, or 5% of the total population) of Russian, Alan, and Kipchak 'slave warriors' served in the khan's troops and fought in battles both in the West and in the Far East [Chao Chu Cheng, 2002, p. 189; Vernadsky, 2000, p. 135, 156–157, 179, 188, 222–223, 226]. Tens of thousands of these warriors participated in the Mongol conquest of South-East Asia. A Russian colony appears to have been formed near Beijing in the 1330s [Vernadsky, 2000, p. 129].

Darugha. As G. Fedorov-Davydov clarified above, the title denoted an empire-level official, the same as 'basqaq'. In fact, the title took on this meaning at an early stage, which Russian sources indicate by mentioning a 'darughatsi' as one of the organizers of census, tax collection, and military conscription [Nasonov, 1940, p. 14–15; Vernadsky, 2000, p. 225–226]. This fully correlates with the function of *darughachis* in Central Asia [Bartold, 1963, p. 468–469]. As can be seen from the form of the word in Russian sources (*daruga+tsi*, that is, *daruga+chi*), it underwent 'turkification'. It can therefore be supposed that the term of Mongol origin was equivalent to the Turkic word 'basqaq', as they both are derived from a verb stem meaning 'to press' [Berezin, 1864, p. 453; Fedorov-Davydov, 1973, p. 30]. The stem of the term, 'doroga', was later used in the Ulus of Jochi to refer to an administrative and territorial unit, meaning 'area', 'land', 'appanage', and 'city'. When used with the word 'bek', the names of such localities referred to the ruler of the territorial and administrative unit in question. Numerous examples from *tarkhan* and *suurgical* *yarliqs* provide evidence of this. The first parts of their inscriptions (addressees) contain the names of the highest titles and those next to them, such as wing (flank) *oghlans*, *ulus beks*, *tumen beks*,

thousand/hundred/ten *beks*, *darugha beks*, in particular, *darugha beks* of settlements and cities [Usmanov, 1979, p. 206–208]. The latter examples indicate the term 'daruga' had a double meaning, referring both to the rank of a military and civil administrator and to an administrative unit, such as the *darugas* in the Khanate of Kazan (for more details and comparison see: [Ibid., p. 210, 218]).

In the second half of the *yarliq* inscriptions, religious 'princes' that is, clergymen, are mentioned. They did not appear in early *yarliqs*. Later documents written in Arabic mention the following titles: *mufti* (law expert), *kaziy*, (qadijudge), *sayyid* (seyd, descendant of the Prophet), *muhtasib* (guardian of Sharia), *shaikh mashaikh* (spiritual elder), *mudarris* (Theology teacher), *imam* (spiritual leader), *muezzin*, etc. [Berezin, 1864, p. 448–449; Usmanov, 1979, p. 211–213]. The fact that they appeared in the more recent *yarliqs*, in contrast to the 'metropolitan' ones, is attributable to the Islamisation of the ruling elite of the Golden Horde. (The honorific titles 'sharif' (noble) and 'ata' (father) being bestowed upon the *sayyid* and the political influence of the qadi judge during the time of Öz Beg has been reported by Ibn Battuta [Collection of Works Related to the History of the Golden Horde, 1884, p. 296, 301]).

At the same time, religious officials were not direct administrators (executors of the khan's will), but public authorities who took into account the legitimacy and integrity of *yarliq* orders. They could act as testifiers or text interpreters in disputes. Therefore, representatives of the Muslim clergy participated to some extent in the legal administration of society from the mid-14th century.

There is evidence that Sharia judges (*qadis*) were the most active and efficient of the clergy. They were preceded by the *yarguchis*, who were guided in their rulings by the *Yasa* and the common law [Berezin, 1864, p. 450–451]. Archaic as it was, the nomads' system of justice stood its ground for a long time against Sharia law [Barbaro and Contarini, 1971, p. 145]. *Yarguchis* administered justice in the times of Öz Beg [Collection of Works Related to the History of the Golden Horde, 1884,

p. 311–312]. Overall, the rise of Islam in the Ulus of Jochi was relative. Vestiges of the old customs and beliefs lived on with the nomadic part of the population for a long time [Barbaro and Contarini, 1971, p. 146, 159, 223].

These roles made up the core body of high-ranking administrators and administrative officials in the Ulus of Jochi and the Tatar states into which it dissolved.

Bottom-rank executive officials. Such officials were not entitled to address every issue administratively; they were obligated to execute the monarch's orders and instructions and maintain the existing order in terms of specific legal issues. A list of such positions and related ones can be found in yarliqs, namely in the third part of the addressee [Usmanov, 1979, p. 213–221]. I. Berezin, and later V. Radlov, A. Samoylovich et al., explored their meanings and suggested explanatory translations for them. The most influential of the ranks, especially at the early stage, was the *bitikchi*, or scribe (secretary), who actively participated in the 1257–1258 census in Rus' as 'counters' [Nasonov, 1940, p. 13–14]. This rank is mentioned in yarliqs issued to Russian metropolitans [Usmanov, 1979, p. 218, Table XVIII].

The term *biticki* originated in the Uighur bureaucratic tradition, within which its polysemantic equivalent *bakhshi*, meaning a scribe and secretary, was initially more active (for more details see: [Bartold, 1968, p. 501, 508]). In yarliqs issued in the Golden Horde in the 14–16th century, the term *bakhshi* was gradually replaced by the Arabic words *qatib* and *hafiz*. More recent yarliqs often use the composite term *divan bitikchi*. This was the position of the chief inspector and record manager of the governmental chancellery [Usmanov, 1979, pp. 220–221, 267–268]. The term *bitikchi* had a broad range of meanings in the Ulus of Jochi, from a high official at the khan's court who participated in the censuses and tax collection during the early stages, to a specialized chancellor officer in control of subsequent official document execution.

Influential executive officials were titled *bukaul*, *karaul*, *yisaul*, *tutkaul*, *chiri*,

etc. Scholars have not come to unanimous agreements on their meaning. For instance, I. Berezin chose not to translate 'bukaul', while A. Yakubovsky interpreted it as 'army controller' [Grekov, Yakubovsky, 1950, p. 127], and G. Vernadsky suggested the translation as 'intendant' [Vernadsky, 2000, p. 218], etc. The terms also appear as parts of double titles in yarliqs: *bukaul-tutkaul*, *bukaul-chiri*, *yisaul-bukaul*, *karaul-tutkaul*. This probably indicates that they referred to the representatives of a 'military police service' in general, while their meanings were similar.

Double terms included *tamgachi* (customs officer) and *tartnakchi* (weighter), *kimachi* (boatman) and *kopurchi* (bridge manager), *yamchi* (postmaster) and *susunchi* (horse fodder collector), *kushchy* (falconer) and *barschy* (panther hunter). Separate ranks included *suyubashi* (head of the army), *aktachy* (stable manager), *anbarchy* (granary manager), *baurchy* (cup-bearer), etc. The *kharafat agalary* (qartlar) as 'craftsman seniors', *jaza-i'amil* as 'punishment' executors and '*amali mutasarrif*', action possessors, that is, generally authorized persons, etc. enjoyed specific powers and rights [Usmanov, 1979, p. 213–215]. Some of them, as representatives of fiscal services, were in charge of the economic and financial order, while others were closer to the core and thus could exert influence on the course of events.

To sum up, the administrative system of the Jochid state stemmed from the rich Eurasian tradition. The apparatus was simple yet complex, multi-layered and elaborate. Its traditional, time-tested basic administrative institutions, which were the essential component parts to the ulus bek system, in turn ensured simplicity. The complex structure resulted from the need to adjust the originally nomadic administrative system to meet the needs of the multi-order state that contained both nomadic communities and large sedentary agricultural regions. The evidence here generally suggests the Ulus of Jochi was a class-representative feudal monarchy with an ulus bek administrative system.

§ 3. Clan Structure*

Damir Iskhakov

The politically dominant population of the Ulus of Jochi, which was divided into clans and tribes, remains under-studied. Even those historians who admit the importance of the subject tend to limit their research to preliminary conclusions or descriptions of long clan lists extracted from late Middle Asian historical works (see: [Fedorov-Davydov, 1973; Sultanov, 1982; Schamiloglu, 1998, Klyashtorny, Sultanov, 2000]). To single out the ruling clans is also a challenge. Some sources suggest that those of the Great Horde that succeeded to the Ulus of Jochi were the Kiyat, Saljigut, Kongrat, and Manghit clans. However, the political nucleus of the Crimean, Kazan, and Kasimov Khanates were the *Shirin*, *Baryn*, *Arghyn*, and *Kipchak* clans [Schamiloglu, 1998, p. 90, 129; Inalchik, 1979–1980; Manz, 1987; Iskhakov, 1998]. Other clans are also reported to have ruled various uluses of the Golden Horde and its successors in the 15–16th century. However, more recent lists are not applicable to the situation in the Ulus of Jochi (see: [Istoriya Kaaxstana, 2001, p. 235]) because it may cause a misinterpretation of the ethno-political situation in the Golden Horde as it actually stood in the 13–14th century. This is chiefly because it was largely different from that of the mid-14th century, when the Ak Horde witnessed the large-scale infiltration of clan aristocrats from the Kok Horde with their troops, and also probably the partial migration of its clans.

The clan system is hard to study because of source-related difficulties. It is sometimes unclear what certain terms refer to in authentic medieval works (*urug*, *kabile*, etc.). The vague terminology of sources in turn often influence the work of historians (for instance, see usage of the terms 'clan' and 'tribe' as synonyms in source experts [Sultanov, 1982]). Since there is an ethnographic tradition behind the terms, the authors apply the term clan to a more general

union than that of blood relatives or a tribe as a potestary political union.

The Turkic-Mongol community and the clan and tribal structure of Chinggis Khan's empire. The conquest of Northern Eurasia and the establishment of Chinggis Khan's empire put an end to old family and tribal structures, and what remained of them formed a new system. On the one hand, the dissolution of the old tribal structure resulted from the Mongol's violent coercion. On the other hand, there were also intrinsic reasons. In order to explore the tribal and clan structure of the Ulus of Jochi, we have to find out what families and tribes existed in the previous epoch. The basic social (and, undoubtedly, economic) unit was the *ail* (ayil), a nomadic household that usually consisted of at least two families, including their dependents and all the individuals associated with them within the subordination and kinship system. The *ayil* was the smallest, self-sustainable independent unit in Central Asian nomadic society because it contained the workforce necessary to ensure an efficient and highly productive nomadic way of life (see: [Weinstein, 1991]).

Larger units above the *ayil* also sometimes existed for collective pasture usage and protection against enemies. However, the most common type of union in 12th century Mongolia is considered to have been the '*buluk irgen*' ('small detachment'), a mixed group probably consisting of several *ayils*, or perhaps one very large nomadic *ayil* not controlled from the outside [Munkuev, 1977, p. 385 et seq.]. It is evident that such independent groups actually made up the units on which the founders of steppe empires built their state hierarchy.

Family segmentation systems, such as the *obokh* (obog) or the *khamag*, were critical because there was no generally clear social organization above the *ail* level. Unlike the *urug*, which consisted of the lateral descendants of a real, famous person, the *khamag* (or *obokh*) consisted of the lateral descendants of a more distant (in fact, as distant as possible) ancestor (referred to as *ebuten* or *obokhtan*). However, the

* The paragraph is written with the participation of I. Izmaylov.

most important feature of that descendant system was rather its mobility and flexibility than its scale. Unlike the *urug*, where membership could only be changed through death or birth, the *obokh* could be subjected to radical changes, as the founding ancestors of the *obokh* tended to be legendary, and new lines of descent could be invented easily to ensure the adjustment of new groups willing to establish a direct connection to the clan [Lindner, 1982, p. 689–711]. Therefore, associations like Qabul Khagan's Kamag Mongol and the Tatar union were often bound through fictitious descent systems, in which genealogical lines dating back to a distant mythical ancestor were invented as a reason for existing kinship and subordination. Most of them had a uniform ownership sign, or *tamga*, a special *uran* (battle-cry), patron animals, or *ongons*, and treated a specific part of mutton (like the right side or the shoulder) as the most important and honourable. Some *ail* groups were controlled by certain families of family units with groups known as the *ulus* (*votchina* [patrimony], state).

It should be noted that each nomadic *ail* or group of *ails* was entitled to have camps within a specific area. The land belonged not to the individual livestock breeders, but to the entire *obokh* with which they were connected through descent and kinship. The *obokh* also provided the legal framework and opportunities to repel external threats. Key unions of this kind in the 12th century Mongol steppes included the Naiman, Kereit, Tatar, and Mongol tribes. In most cases, the association was rather unstable. However, some were able to establish dynasties of their own, which ensured their leadership at wartime and during other crises. Chinggis Khan belonged to the lateral branch of one of these dynasties, which probably helped him ascend to power. But as essential as they were in terms of territorial order, group unity and protection, the *obokh* and *khamag* could never become the efficient, permanent potestary and political units that could regulate interactions among the various combinations of *ails*, or unite all the tribal groups across the Central Asian steppe area. Primitive anarchy reigned at this time, where small social units fought over resources and power.

However, internal and external pressure caused major transformations in the nomadic

society of Central Asia in the late 12–early 13th century. Many small Mongol social units (the *ayil*, the *bolok irgen*), which had been quite independent, developed into larger, more compact and clearly-outlined groups with political leaders of their own; they were tribal groups that competed against each other with a sense of identity, and against the outside world. The Tatar unification structure is representative. According to Rashid al-Din, the Tatars had a *khamag* near Lake Bur Nor, which included the following six tribes: Tutukuljut, Alchi, Chagan, Kuin, Terat, and Barkui [Rashid al-Din, 1952, I, 1, p. 103]. He also reported that 'other Turkic families, who belonged to different categories and had different names, became known as Tatars' [Ibid., p. 102]. He wrote earlier that these included the Durban, Saljiut, and Katakina tribes. If we also take into account other important tribal groups, such as the Naimans, the Keraites, and the Merkits, it appears that Turkic-Mongol unions were not genealogically and linguistically related. In fact, they were merely ethno-political associations where the memory of kinship was in large part legendary.

Our sources present various accounts of this tribalisation. The process appears especially vivid if we trace the semantics of the important term '*kuren*' (Mongol: *gure'en*). Its oldest meaning is a type of camp where yurts and carts with livestock were fenced in the centre, where it was easy to watch them. To quote Rashid al-Din, 'in ancient times, when a tribe camped in an area, it formed a ring where the senior was in the middle of the circle, like a central point. This was called a *kuren*' [Ibid., p. 86]. Later, at the end of the 12th century, the term acquired a secondary meaning, namely a temporarily fortified camp, as well as a social and political unit: 'at present, when the enemy's army is near, they [the Mongols] also form such a camp to prevent enemies and strangers from getting inside [Ibid, p. 86–87]. Thus, the term *kuren* evolved to mean not just a circle of yurts and carts surrounding the tribal leader but, primarily, a new social, military, and political unit, mostly equivalent to the 'thousand', a full-fledged tribal union in the Mongol Empire. The entire Mongol society had divided into such *kurens* by the early 13th century.

As the khan of a new tribal confederation and the prototype of the Mongol Empire (the *Yeke Mongol Ulus*), Chinggis Khan made no attempts at changing the basic social order of the new community. He simply accepted and extended the existing tribal structure. In 1206 after formally rising to power, he approved the tribal order for his empire by recognising nine new or existing tribal groups as 'thousands', meaning military, administrative and ethno-political units capable of providing approximately one thousand combat-fit warriors during wartime (his *yarliq* 'The Secret History of the Mongols' includes the names of 92 of them). He appointed the associated heads of the units from his group of trusted allies (see: [Ibid., p. 86, 266–278]). About 13 out of the 92 (or 98 according to Rashid al-Din) 'thousands' were formed from the tribal union that composed Temujin's original confederation in 1201. That is, they became the 'core' khan clan for the Mongol Empire and served as both the khan's personal guard and the new state's central administration [Kychanov, 1993, p. 148–156].

As the Mongol Empire carried on its expansion, new 'thousands' were formed and their rulers appointed. In fact, the establishment of 'thousands' and the appointment of their owners was part of the Mongol's general expansion. Thus, the former clan system was included in the military and administrative system of Chinggis Khan's state, though not in its authentic, family-based form, but as sub-divisions of what used to be tribes and families. For instance, the same clans were included in several different thousands, while some were dissolved among many thousands without any mention of them at all. For instance, the Keraites were divided among the clans of Chinggis Khan's associates. However, some clans, like the *Kiyat* and *Ongut*, were apparently included in special thousands without any further division, and their power hierarchy was preserved. Thus, the structure was a complex conglomerate of ethnic groups and tribes consisting of subordinated tribes and families that acquired a new nobility structure, within which their status was determined by their relatedness to Chinggis Khan's '*altyn urug*'. That is to say, the new order modified the tribal structure, but did not abolish it.

That tribal structure largely impeded the increasing centralisation of power by the khan, who ruled through his *kuren* (or court) and *nökers*, as it established the power of all representatives of the '*altyn urug*' over the various nomadic territories and population groups (the '*unagan bogol*' institution) (for more details see: [Munkuev, 1977, p. 386–390]) who used them collectively (as an *obokh*), and not individually. Power and whatever it yielded was used collectively by families. The tradition became a major challenge for the young Mongol Empire because it continuously caused internal conflicts which were never settled, even in Chinggisid states.

However, the real location of *ulus* and tribal union territories within the new empire and their transfer to new authorities loyal to the new great khan was not the only manifestation of the new regime. As Chinggis Khan's state expanded, it had to keep its new territories on a short leash. The Mongols maintained their power over newly conquered and annexed territories with the help of internal troops known as the *tanma*, commanded by special authorised representatives of the central government, or *tanmachis*. Their equivalent in the Ulus of Jochi was apparently the *darugachis* or *basqaqs*. It is important to mention that the troops were formed from different families and tribes. Such detachments often became the core and command staff of new local units, and thus obtained power and land ownership.

Meanwhile, *uluses* and troops from various clans were allocated to Chinggis Khan's sons to become the core of the prospective vast domains, and also used their detachments to introduce the new military and administrative organisation system over the new territory that relied on clans of Central Asian origin. The sources available are too sparse to trace this process in detail. It is clear, however, that entire tribes were not moved together to new territorial units. An army representing several clans came to new *uluses*, and the structure evolved into new family and tribal units, forming military and administrative units from the remaining nomadic population. Such families in the Ulus of Jochi were the Kimak and Kipchak, As, and other inhabitants of the steppe, especially its eastern areas.

Clan structure development in the Ulus of Jochi. It is beyond a reasonable doubt that clan structures existed in the Golden Horde. For instance, Khan Berke's letter received in Egypt in 1262–1263 contained a list of converts to Islam 'with a detailed specification of their tribes and families' [Collection of Works Related to the History of the Golden Horde, 1884, p. 98]. When one of Nogai's sons killed another around 1299, not only 'relatives', but 'tribes' found out about it [Ibid., p. 116]. Speaking of the 'Desht-Berke area' as 'an exclusively Tatar area', Ibn Arabshah wrote that it was 'rife with Turkic tribes' [Ibid., p. 459]. According to him, when Khan Tokhtamysh gathered an army 'of the right and left sides', it came 'by tribes and families'. When Edigü sent messengers to 'his relatives and neighbours' who belonged 'to his adherents and friends', this referred to the 'left side tribes' and the 'left side leaders and tribal chiefs'. Thus, Edigü was able to appeal to 'numerous tribes' and the 'hearts of tribes and families' when talking to Timur [Ibid., p. 464–470]. Following Khan Tokhtamysh's defeat by Timur and his death, 'tribal warriors' (uimag~aimag) were first gathered by Chinteg Oghlan after which Timur Qutluğ controlled 'all the tribes (ils)' [Collection of Works Related to the History of the Golden Horde, 1941, p. 132–133]. Frequent mentions of emirs and beks as rulers of ten-thousand and thousand uluses actually refer to tribes, as it was actually clan units that stood behind them. The greatest challenge is to find out which clans the chiefs belonged to using the sources.

Some scholars have turned to the epoch of Khan Batu in order to study the original clan structures of the Ulus of Jochi. According to 'Altan Deftir', Jochi Khan initially owned four thousand *Sijivut* (Saljigut) and *Kingit* clans, and two *Khushin* (Uishin) sub-divisions [Rashid al-Din, 1952, I, 2, pp. 274–275]. They have discovered what roles such tribes as *Kongrat*, *Uishin*, *Oirat*, and *Alchi-Tatar* in the west of the Chinggisid realm and *Kongrat*, *Sajirat*, *Argghyn*, *Kereit*, *Uighur*, *Naiman*, *Kipchak*, and *Merkit* in the east played [Schamiloglu, 1998, pp. 90–92]. If we study the network of marital relations of the Jochids and their emir, the list would also include the *Suldus* and *Tulas* (Tuklan) clans in the right wing, and the *Ogunan*,

Yisut, *Bargut*, and *Imen* in the left wing of the Ulus of Jochi [Collection of Works Related to the History of the Golden Horde, 1941, pp. 41–63]. Later sources ('Bakhr al-asrar') suggest that Batu's army included *Argun*, *Oghuz*, *Naiman*, *Buirak*, *Oirat*, *Karluk*, *Kushchi*, *Usun* (Uisun), *Ming*, *Kongrat*, *Kereit*, and *Barlas* detachments [Klyashtorny, Sultanov, 2000, p. 207]. The reliability of this compilation is dubious [Akhedov, 1985, p. 145], as is the fact that all the clans stayed in the Ulus of Jochi and did not return to Mongolia.

The clan system as it was at the early stage of the development of the Ulus of Jochi has not been formulated for the latter half of the 13th century. However, much more information is available for the first half of the 14th century, or the time of Khan Öz Beg (1312–1342) and his direct heirs, Janibek (1343–1357) and Berdibek (1357–1359), as well as some of their successors.

Emir Tovlu~Toglu (Tulu) Biy from the Kangly tribe, who was believed to be a person 'with numerous and powerful kinsmen', is known to have been Khan Berdibek's atalyk [Ötemish Hajji, 1992, p. 108]. The Russian chronicles characterise him as a 'tma prince (that is, a tumen head, temnik—*D.I.*) and a powerful person' [Safargaliev, 1960, p. 111]. Tovlu Biy was known to be in Khan Öz Beg's court back in 1339–1340 [Gorsky, 2000, p. 65]. According to 'Anonymous of Iskender', Khan Janibek believed the prince to be 'one of the pillars of his state' [Collection of Works Related to the History of the Golden Horde, 1941, p. 129]; he also participated in Berdibek's ascension to the throne in 1357 [Grigoriev, 2004, p. 87] and later controlled Azov city customs for some time [Grigoriev and Grigoriev, 2002, pp. 152–153, 228], or was even the ruler (darugha beg) of the Azov tumen. He was killed together with Khan Berdibek in 1359 [Safargaliev, 1960, p. 111]. This attests to how influential the Kangly clan was among the tribes of the Golden Horde.

The Kiyatclan also played a major role, and it is beyond doubt that it existed in the Golden Horde as a military and administrative unit. Rashid al-Din reported that during the rule of Khan Tokhta (1291–1312): '...the Kiyat tribe is now ruled by Khan Toqtai and is said to con-

stitute one *tumen*' [Rashid al-Din, 2002, I, 2, p. 270; see also p. 46]. However, the *tumen* has yet to be precisely localised.

We can obtain some information by analysing the indirect data. Ulusbek Mamai, 'one of the chief Mongol emirs', who was married to Khan Berdibek's daughter, played a major role in the history of the Ulus of Jochi in the 1360s–1380s [Safargaliev, 1960, p. 114]. He was influential in the western part of the Ak Horde because, to quote Ibn Khaldun, 'the city of Qrim belonged to his domain' [Collection of Works Related to the History of the Golden Horde, 1884, p. 389]. According to Ötemish Hajji, his father's name was Alash (possible forms: Alysh~Alish) [Kafali, 1976, s. 39], and he belonged to the Kiyat clan [Ötemish Hajji, 1992, p. 108]. Even though no connection has been established between Mamai and other historical figures, it is safe to say that the Kiyat clan itself played an important role as early as during the time of Khan Öz Beg. In particular, the 'chief emir' and 'ulus head' of Khan Öz Beg Isa Bek (Isa Gurgun) can be identified as Isatay Kiyat [Ibid., p. 67, 102–103, 104–105, 109; Collection of Works Related to the History of the Golden Horde, 1884, p. 295]. The data provided by al-Muhibbi and al-Qalqashandi suggests that the Kiyat clan had its domain in the Crimea before it was transferred to the Shirin clan.

The Kiyats might have come to the Crimea back during the rule of Batu Khan, as later reports provide the relevant information. For instance, speaking of Shiban and the 'families and tribes' and 'wilayahs' that Khan Batu assigned to him, Ötemish Hajji reported Batu to have 'added... to the thirty thousand people that he had assigned [to Shiban Khan] another ten thousand Kiyat [and] Yuraldai people', 'and sent [him] as an appointee to the wilayahs of Crimea and Kaffa'. Abdulgaffar-Qirimi confirms the information by reporting Batu to have sent Shiban along with his atalyk Bor Altay Tarakly from the Kiyat clan to the Crimea [Schamiloglu, 1998, p. 94].

A report pertaining to the time of Khan Khyzr (1360–1361) provides information on another Golden Horde tribe. Namely, a list of the associates of the khan born in the Kok Horde includes 'a beg of the Naiman tribe

named Qutlugh Buga [Ötemish Hajji 1992, p. 112]. Was he the Qutlugh Buga of the *yarliqs* by Janibek, dated 1347, and Berdibek, dated 1358, to Venice citizens (Cotloboga), and the one mentioned in the 1357 *yarliq* to Metropolitan Alexius? [Fedorov-Davydov, 1973, p. 146; Grigoriev and Grigoriev, 2002, p. 115, 163; Grigoriev, 2004, p. 113]. Al-Muhibbi apparently referred to the same person as Qutlubuga (Qutlubuga Inak), whom he defined as 'Khan Janibek's vicegerent', and 'one of [the] four who rule the land of Öz Beg according to the custom' in a 1351 report [Collection of Works Related to the History of the Golden Horde, 1884, p. 348]. It is entirely possible that Qutlugh Buga was Khan Janibek's *karachibek* in 1351–1357 [Grigoriev, 2004, p. 113] and ruled the Crimea in 1358–1359 [Grigoriev and Grigoriev, 2002, p. 209]. Qutlugh Buga might have also been related to another outstanding Golden Horde emir, Mogul Buga (see: [Ibid., p. 208]). There is also other indirect evidence of this. According to 'Anonymous of Iskender', Khan Murid's (1362–1363) 'chief emir in the Ulus of Öz Beg' was Ilyas, son of Mogul Buga [Collection of Works Related to the History of the Golden Horde, 1941, p. 130]. Some Russian chronicles contain the following report dated 1365/1366. '...in winter, Vesneilyas, son of Koultubuga, was in Tver on his way back from Lithuania' [Complete Collection of Russian Chronicles, 15, p. 79]. This probably refers to Qutlugh Buga's son Ilyas, who left Lithuania somewhere between the spring and winter. In this case, the confusing identity of Emir Ilyas's father indicates that Mogul Buga and Qutlugh Buga were close relatives, probably brothers.

The data indicates that the Naiman clan was included in the Ulus of Jochi. Even though Ötemish Hajji localised the Naiman tribe far in the east, in the 'yurt of Taibuga' in the Irtysh Basin [Kafali, 1976, s. 44], the clan might have also lived in the Ak Horde, as Abu-l Ghazi mentioned Batu Khan to have assigned the 'people' of four tribes, including the Naimans, to Shiban [Abu al-Ghazi, 1906, p. 160]. However, representatives of the clan played a major role in the politics of the Ak Horde as early as in the latter half of the 14th century. In any event, in the Crimea the Arghyn Ulus went under the double

name 'Arghyn—Naiman' in the 18th century [Lashkov, 1895, p. 82].

There is evidence that the Saljigut (Sijud) clan was part of the Golden Horde in the 13–14th century. Rashid al-Din reported Khan Tokhta's chief emir to have been Cherkes 'of the clan' Mungede (Munghur), a nayon from the Sijiut tribe transferred to Jochi [Rashid al-Din, 2002, I, 1, p. 183; II, 2, p. 274]. Ötemish Hajji also wrote that during the rule of Khan Bazarchi (?) (apx. 1362) 'there was... Sijud Ali Bek, a chief emir,' whom Taidula ordered to kill, while his son Hasan 'fled and came to Kongrat Nagadai's son Ak-Husain, who was the khakim of the wilayah of Khwarezm' [Ötemish Hajji, 1992, p. 113; Kafali, 1976, s. 44]. A mention of the Saljigut is also contained in another report by Ötemish Hajji, dated 1312, when Tokhta sent Kiyat Isatai (Isa Bek) and Sijut Alatai along with 40 thousand warriors for the khan-to-be Öz Beg [Ötemish Hajji, 1992, p. 103]. The Saljigut clan obviously enjoyed a privileged status within the power structure of the Ulus of Jochi in the late 13–early 14th century.

Mentions of the Kungrat clan in the Ulus of Jochi appeared not later than at the end of the 13th century. It was common for 'altyn urug' sultans to marry Kungrat women during the time of Jochi. For instance, Rashid al-Din reported Khan Tokhta to have been married to the daughter of Kungrat Saljidai Gurgan, who married his son off to Nogai's daughter [Collection of Works Related to the History of the Golden Horde, 1941, p. 70]. The Kungrat clan (or a sub-division of it) most likely belonged to the right wing (the Ak Horde). In addition, the fact that the above report mentions 'the khakim of the wilayah of Khwarezm' Ak Husain, Kungrat Nagadai's son, confirms the high status of the clan within the political hierarchy of the Ulus of Jochi in the first half of the 14th century. In fact, Emir Nagadai (Nangudai) was also mentioned by Ibn Battuta because his daughter was Khan Öz Beg's second senior wife, while he apparently belonged to the khan's court [Collection of Works Related to the History of the Golden Horde, 1884, p. 294]. Moreover, he is mentioned as Nagadain in Khan Janibek's yarliq of 1342 as a representative of the high aristocracy of the Golden Horde [Grigoriev

and Grigoriev, 2002, p. 48]. Nagadai must have been ulusbek of Khwarezm, which was a position he apparently occupied after his predecessor Qutlugh Timur died in 1335–1336 (for more information on him see: [Collection of Works Related to the History of the Golden Horde, 1941, p. 129, 140 et seq.]). Along with other 'old princes', he was killed around 1361–1362 [Grigoriev, 2004, p. 145].

The surviving data on the Kungrat lineage suggests that Emir Nangudai descended from the famous nayon (or prince) Nukai (Nogai), whose son Akhadai Bakhadur is believed to have ruled in the 'countries of Bulgar, Cherkes, and Kazan' [Bregel, 1982, p. 367]. Emir Nangudai was his son. According to the dynasty's chronicle, he ruled the Circassians at first, then moved to the Lower Volga Region as Öz Beg Khan's 'emir al-umara', and finally arrived in Khwarezm [Ibid., p. 370–371]. Even if some of the information in the chronicle is the stuff of legends, the general narrative conforms to the historical data and confirms the Kungrat clan to have become a Golden Horde clan not later than at the end of the 13th century.

A somewhat different clan system is described in various sources for the time of Khan Tokhtamysh (1380–1395), when more representative data on the tribal composition of the Ulus of Jochi became available. For instance, Yazdi mentioned the following 'emirs and nayons' of the Ulus of Jochi when describing the first battle between Tokhtamysh's army and that of Timur (1391) in 'Zafar-nama': *Ali, Suleiman-Suleiman-Sufi Kongurat, Navruz Kongurat, Aktau, Uruschuk, Kiyat, Isa Bek* (Manghit Edigü's elder brother [Collection of Works Related to the History of the Golden Horde, 1941, p. 148]), *Hasab Bek Sarai, Kuke Buga, Yargly Biy Bakhrin and Kungur Biy*. The description of the second battle (1395) mentions the already-mentioned Aktau, Savud-Sufi (Tokhtamysh's son-in-law) and Udurka (right wing), as well as the above-mentioned Isa Bek and Yakhshy Hoja, Urug Temur's son (left wing) [Ötemish Hajji, 1992, p. 116] as representatives of Tokhtamysh's army. When describing the defeat of the right wing of the Golden Horde army in 1395, the author reports emir Bek Hoja to have been killed. Emirs Ka-

zanchi (Kazan) Bakhadur and Urug Timur are known to have left Urus Khan for Tokhtamysh [Collection of Works Related to the History of the Golden Horde, 1941, pp. 118–121, 131–132, 146–148]. Among those emirs whose tribal affiliation is not mentioned in sources, Ali Bek was a Kongurat, and Ak Buga a Bakhrin; they were both titled Tokhtamysh's chief emirs [Ibid., p. 151].

Yazdi also mentioned Urug Timur [Ibid.], who was apparently a Shirin [Ötemish Hajji, 1992, p. 114], among them. Kara Hoja was believed to be an 'old nöker' of Tokhtamysh [Collection of Works Related to the History of the Golden Horde, 1941, p. 189]. He can be identified as the 'Arghyn bey' mentioned in the epic 'Edigü' [Edigü, 1988, p. 142, 206]. Thus, the following clans were subordinated to Khan Tokhtamysh: *Kongurat*, *Bakhrin* (Baryn), *Manghit*, *Kiyat*, *Sarai*, *Shirin* and *Arghyn*.

Some scholars believe that Hasan Bek of the Sarai clan, who was reported to have fought within Tokhtamysh's army in 1391 and was also mentioned in other documents (1380, 1384, 1393), was Ramadan (Ramazan) Zayn al-Din, who ruled Crimea (Solkhata) in 1349–1358 [Grigoriev and Grigoriev, 2002, pp. 172–174; Collection of Works Related to the History of the Golden Horde, 1884, p. 452], who was probably in the Crimea already in the first half of the 14th century. In addition, the Sarai tribe is known to have been included in what is known as the 'nomadic Öz Beg' group [Sultanov, 1977, p. 166, 170]. However, it is still possible that the ethnonyms Sarai and Kiyat were synonyms, as the latter clan was the leading administrative clan in the state that had its centre in the city of Sarai (hence the other name for the clan, Sarai) during the rule of Khans Tokhta and Öz Beg.

The Shirin clan also played a major role in the clan structure of the Ulus of Jochi. According to Ötemish Hajji, the Shirin tribe, which descended from the 'As tribe with the "scoop" (chumech) tamga', was represented by the nökers of Tui Hoja, Tokhtamysh's father. Then Urek Timur, son of Shirin bek Dangy Bey, served Khan Tokhtamysh. In 1379–1380, as his ulug bek he married Mamai's widow, Khan Janibek's daughter [Kafali, 1976, s. 42]. Shirin

Crimean murzas provided similar information in the 19th century: '...Dangy Bey commanded the army during the rule of Tokhtamysh, while his son Ruktemir (Urek-Timur.—*D.I.*) was appointed chief bek in charge of all begs and peoples subordinated to the khan... (he sat) on the divan... to the khan's right' [Lashkov, 1889, p. 99]. It is clear that the Shirin clan replaced the Kiyat in the Crimean tumen during the rule of Tokhtamysh. Ötemish Hajji also mentioned the changes: 'most of the els left by Janibek Khan was controlled by Mamai. Tokhtamysh Khan killed Mamai and took his els and nökers. Then he came to the wilayah of Sarai' [Ötemish Hajji, 1992, p. 118]. The term 'els' here refers to clans. Abdulgaffar Qirimi also reported that 'Shirin Bey Urak Timur bine Dangy Bey was Tokhtamysh's chief bey (until 1398), along with his son, Teginya b. Urak Temur, was the father of the Crimean Shirins' [Schamiloglu, 1998, p. 127]. According to Ötemish Hajji, Ureg Temur's son Yakhshy Hajji was the atalyk of Tokhtamysh's son Kepeg Khan, while his second son Tekene Beg 'served' another son of Tokhtamysh, Qadir Birdi Khan. Ötemish Hajji specified that he was the khan's 'right side bek', while Khaidar Bek of the Kungrat clan was the 'left side bek' [Kafali, 1976, s. 43]. The authors who continued al-Dhahabi's chronicle made the following note to the report on Edigü (1419/1420): '... he (Edigü.—*D.I.*) was merely the second emir, as there was another emir named Tekina (Tekinya). The chief emirs there were the right and left wing emirs. Tekina was the right wing emir, while Idiki was the left wing emir' [Collection of Works Related to the History of the Golden Horde, 1884, p. 553].

Additional information on the subject can be found in the Russian chronicles. For instance, ulug karachibek Edigü's army, which invaded North-Eastern Rus' and besieged Moscow in 1408, is reported to have included 'Prince Teginya, Shikh's son' [Priselkov, 1950, p. 468]. That is, he was most likely the son of Yakshi-Yakshi Hajji. The second mention of him in the Russian chronicles is dated 1432, when 'Sherin Teginya,' after becoming the 'Great Prince of the Horde' (apparently karachibek) at Khan Ulug Muhammad's court, favoured the Prince Yuri of Moscow for the throne, Great

Prince Vasily's uncle. He spent that fall at the khan's court and went 'to the Crimea for the winter' to return 'from the Crimea to the Horde' in the spring [Complete Collection of Russian Chronicles, 25, p. 249]. The source also mentions him to have had a 'tsar's chamberlain' and a 'Tatar named Usein' (that is, Husain).

Characteristically, other Tatar clans were also involved in the events. Khaidar Bek of the Kungrat clan, mentioned above according to Ötemish Hajji, is also mentioned in a report dated 1432 among the 'great princes of the Horde' under the name Aydar [Complete Collection of Russian Chronicles, 27, p. 103; 11–12, p. 15]. Vasily Vasilyevich turned to him and his brother Min Bulat for a confirmation of his right as the great prince. That is, members of the Shirin and Kungrat clans played a key role in the khan's court during that period, scheming and implementing policies for their khan.

The fact that the Shirin clan descended from the 'As tribe' does not necessarily mean that it was the offspring of the Caucasian Alans (As people). In fact, a number of 14th century Arab sources (Abu-l Fida, Ibn Battuta, al-Umari) distinguished between the Alans and the Ases, mentioning the latter to have been Turkic Muslims living in steppe regions and Sarai [Alemande, 2003, p. 328, 341, 359]. The data provided by al-Masudi (10th century) and al-Biruni (11th century) suggests that the term refers to the descendants of the ancient Turkic *Az/As* people, who lived near Khwarezm in the 10th century, professed Islam, were known as al-Arsiyah and subsequently moved westward. Their language was a mixture of Khwarezmian and Pecheneg during Biruni's time [Ibid., pp. 348–349, 333]. Since the Shirin clan moved from the Khwarezmian area together with Tokhtamysh, its legendary relatedness to the 'As tribe' can be interpreted to convey the clan's descent from the Turkic-Iranian *As/Az* tribe.

It is entirely possible that other clans that were treated as Khan Tokhtamysh's *els* (Arghyn, Baryn, Kipchak) moved westward together with the Shirin clan. In any event, Sarai Bek of the Baryn clan was the atalyk of Khan Tokhtamysh's son Jalal ad-Din, also serving his other son, Qadir Birdi [Kafali, 1976, s. 43]. Therefore, these groups should be included in

the list of tribes within the Golden Horde (most likely it was initially its left wing, the Kok Horde). The Kipchak group is mentioned in the Kungrat dynasty chronicle, reporting the Nagadai (Nangudai) to have '... fled from the Circassians together with Kipchak Esen Buga, his father's friend, and come to Öz Beg Khan in the lower reaches of the Volga' [Bregel, 1982, p. 369]. This mention of the Kipchak group dates back to the first decade of the 14th century.

Clans in the power structure. Clans of the Golden Horde were not kinship-oriented. These principles were violated back when the Mongol State was established with Chinggis Khan at its head. The clan, as well as the military and administrative system of the Ulus of Jochi, was the same. For instance, 'Chinggis-name' by Ötemish Hajji contains a number of narratives that prove this fact. For instance, regarding Batu Khan's (Sain Khan's) campaign against Ijan Khan's (Orda's) *nökers*, who are reported to have killed their ruler, it is mentioned that when 'their great people fled', '[Sain Khan] moved all the families and tribes to his lands, annexed them to his *il*, and assigned each *aimag* to a *bek* as a *koshun*'. It is also mentioned that during the period of Khan Öz Beg the 'el of the Ming tribe' was assigned to Emir Alatai of the Saljigut clan [Ötemish Hajji, 1992, p. 94, 105]. Thus, U. Schamiloglu was right to state that a constant mixing of the population in the Golden Horde 'complicated kinship relations so much that they became vague, and the actual tribal relatedness only formal.' In his opinion, however, the 'fictitious kinship. .. contributed to the establishment of social connections within the society' [Schamiloglu, 1998, p. 94].

At the same time, marital relations within the clan aristocracy were common. Many noble families wanted to establish a connection to the 'altyn urug'. The Emirs' relatedness to the Chinggisids through the female line was an efficient social tool that they used to reinforce their influence in the court and obtain higher promotions. The khans viewed it as a reliable way of ensuring the loyalty of powerful clans and their support for political issues. Batu's mother is known to have been Ukhaa Ujin of the Kungrat clan, while Barakchin Khatun of the Alchi-Tatar clan was his wife. Rashid al-

Din emphasised the role and importance of such marital connections between khans and clans in one of the chapters of his work [Rashid al-Din, 1952, I, 1, pp. 77–197]. The following fact is representative of the essential role that marital connections played. When Khan Timur's troops commanded by Emirs Tekinya (Tekinyya) of the Shirin clan and Ghazan besieged Khwarezm in 1410 and Tokhtamysh's son Jalal ad-Din was declared khan, Emir Ghazan, who was married to his sister, did not hesitate to take the side of the new khan, while Tekinya, who was married to Khan Timur's daughter, remained loyal to him [Collection of Works Related to the History of the Golden Horde, 1941, p. 194]. Each khan had a kinship network connecting them to the chiefs of the ruling tribes (for instance, see Ibn Battuta's report on Khan Öz Beg's relatives: [Collection of Works Related to the History of the Golden Horde, 1884, p. 290–293]).

Taken together, the facts indicate that a number of mechanisms for intra and inter-clan interactions existed apart from the operational kinship institutions. In the Golden Horde, the institutions of atalyks and imeldashes played an important role. Though seemingly archaic, these social institutions were essential to the social structure of Turkic-Tatar states. In fact, they were the link connecting the Chinggisid khans to the clan aristocracy. Both parties benefited from such kinship because they brought Tatar aristocrats closer to the throne, while ensuring loyal support for the khans. Atalyks were not just teachers, but the principal advisors for khans-to-be. They often exerted formative influence on their pupils' policies without occupying any high positions themselves, not to mention the fact that it was largely the atalyk's personal qualities and authority that determined his pupil's chances to be elected khan. Similarly, the choice of imildashes established a connection of mutual duties between the sultan along with the khan-to-be and their 'foster brother' clans. Like marriage, the selection of imldashes and an atalyk was an important event and an essential tool used to reinforce the khan's power. It is no wonder that many atalyks were prominent people who pushed their sultans to the peak of power. They often descended from such leading clans as the *Kiyat*,

Kungrat, *Manghit*, and *Shirin*. For instance, it is clear that Emir Edigü was Qutlugh Timur's atalyk, though the sources do not mention him. 'Tawarikh-i Guzida-iy nusrat-name' explains how the mechanism worked in relation to Muhammad Sheybani Khan, who was to become the ruler of the State of Nomadic Uzbeks. After their father died when they were 'young children', they 'lived in the house of Uighur Bay Shaikh Ateke because Bay Shaikh was their father's ateke (that is, atalyk.—*D.I.*)' [Materials on the History of Kazakh Khanates, 1969, p. 19]. Some sources mention the important role that the atalyk played in the Khanate's military political affairs. For instance, Abdulgaffar Qirimi reported Batu to have sent Shiban, accompanied by his atalyk Bor Altai Tarakly, to the Crimea [Schamiloglu, 1998, p. 94] (see also: [Ötemish Hajji, 1992, p. 95]). Or, when Nogai had a conflict with Khan Tokhta, he required the khan to render him Emir Saljidai of the Kungrat clan, who was the father of Tokhta's wife. The Khan refused to do so and said, 'He is like my father and teacher (this probably means atalyk.—*D.I.*), and he is an old emir' [Collection of Works Related to the History of the Golden Horde, 1941, p. 423].

Another institution used to incorporate clans into the 'altyn urug' was the office of *imeldyashes/imildyashes* (foster brothers, sworn brothers) [Vasary, 1983]. It enabled clans to establish family connections to the families of sultans by sending their youngest sons there. As several sons were sent to sultan families, this formed a stable network of intra-clan relations that ensured greater sustainability.

The institutions formed a network of social and inter-clan collections. For instance, Emir Saljidai of the Kungrat clan, who was married to Khan Tokhta's daughter, married his son off to Nogai's daughter [Collection of Works Related to the History of the Golden Horde, 1941, p. 70]. This eventually caused the Chinggisid dynasty to become 'a ruling family, a meta-tribe or a supra-tribal community that used regular marriage between khans and tribal leaders daughters' to ensure the supply [of women] from all tribes. As a result, the 'overlapping of the dynasty and tribes' was possible. For instance, as a paternal Chinggisid, Nogai had a

maternal tribal affiliation that ensured his 'outstanding position within the tribal organisation' [Schamiloglu, 1998, p. 95].

A number of clans existed in the Ulus of Jochi apart from the key ruling ones. The findings of the study on the clan composition of the Golden Horde have been summed up in a table of 37 clan names. The list of Golden Horde clans is obviously incomplete, as there were 50 to 70 *tumen* heads in the former half of the 14th century, which has already been mentioned, most of whom should be interpreted as tribal leaders. However, the sources available are too sparse to identify the tribal affiliation of all the *tumen* heads in the nearest future.

Speaking of the clan structure of the ulus of Jochi, it should be noted that the scant sources prevent us from reconstructing the exact clan system, especially for the period before the mid-14th century. It is clear that a tribal organisation existed, but its structure is unknown. It is safe to say, however, that representatives of the *Siljivut* (*Saljigut*), *Kingit* and *Khushin* clans, as well as the *Alchi-Tatars*, *Kiyats*, and *Kungrats* played an essential role in the politics of the Ulus of Jochi. At least, they were the most often-mentioned ones, which in a way is representative of their significance in the Khanate's clan structure, primarily ensured by relatedness to the Jochid family. At the very least, Ulug Karachibek and Sultan Nogai are known to have been closely related to the Kiyat clan, suggesting that it was a ruling clan at that time. It is entirely possible that the other clans were not numerous enough to become leaders at that point.

The 'Great Troubles' of the 1360s–1370s dealt a heavy blow to the entire social system of the Ulus of Jochi, and also affected the clan system. The ruling clans probably suffered considerable losses and began to slip out of the political arena to be replaced by clans from the Kok Horde. The situation then changed greatly by the 1380s. Apart from the long-ruling Kungrat, Kiyat, and Sarai clans, such clans as the Manghit, Shirin, and Baryn began to claim leading status. The Shirin clan became well-established in the Crimea, influential Shirin karachibeks appeared in the early 15th century, and members of the clan also held important public offices. Later, in the 15th century, the

clans among the four ruling clans of the Khanates of Kazan, the Crimea, and Kasimov were the *Shirin*, *Baryn*, *Arghyn*, and *Kipchak*. Other clans, such as the Kungrats, were pushed aside and only managed to remain leaders in the Kok Horde and Shibanid Khanates.

The issue of what structure and hierarchy the units had is challenging, and it remains unclear how consolidated they were. Sub-divisions sharing a name and the distant memories of kinship might have existed within the wings. However, it seems reasonable to assume that the ruling and most powerful clans have a tribal territory like the Kiyat land in the western part of the Ak Horde and the Crimea, or in Sarai and in the Lower Volga Region, where members of their court drew resources for their military and political struggle for influence in the Jochid Empire. It is a well-known fact that later, in the latter half of the 14–15th century, the Kungrats had their tribal family territories on the Mangyshlak, and the Manghits in the Trans-Volga Region. It is possible that the khans checked the expansion of certain clans and tried to scatter them across the ulus of Jochi to ensure the greater consolidation of the empire through the mid-14th century, when the domains of certain clans, as well as their influence, began to grow uncontrollably amidst internecine feuds.

To assess the role that certain clans played in the Golden Horde, one should take into account the demographic weight of the state's clan-forming population, and how essential this clan was for the army. According to our estimate, which is based on data on the military resources of the Ulus of Jochi, the size of the population divided into clans could have been anywhere from 600 to 800 thousand during the rule of Batu Khan, 900 to 1,200 thousands during that of Berke Khan, 1.5 to 2 million during that of Khan Tokhta, and 2 to 2.8 million in the time of Öz Beg and Janibek Khans. Thus, the percentage of nomadic population was high in the state. And although most of its common class were Kipchak descendants, the elite was primarily of Tatar-Mongol origin. The previous system of Kipchak tribal and family elite was fully replaced in the Golden Horde [Fedorov-Davydov, 1973, p. 41–42] by Turkic-Tatar clans.

Clan name	Recorded as part of the Golden Horde (centuries)			Ethnic (linguistic?) origin
	13th	14th	15th	
1. Arghyn	–	–	+	Mongol
2. Alchi(n)-Tatar	+	+	+	Turkic (Turkic-Mongol)
3. Bahryn (Baryn)	–	+	+	Mongol

36. Uighur	+	+	+	Turkic
37. Shirin	–	+	+	Turkic (Turkic-Iranian?)

The list of the main Golden Horde clans in the 13th–early 15th centuries (compiled by D. Iskhakov)

CHAPTER 5

The Population of the Ulus of Jochi and the Development of the Medieval Tatar Ethnos

§ 1. Early Stages of the Ethnic History of the Ulus of Jochi and Its Distinctive Features

Mirkasym Usmanov

The time when certain uluses of the Mongol superpower started to become independent as it dissolved into four empires does not start in 1224 when Chinggis Khan assigned autonomous appanages to his sons, or in the 1240s (see a characteristic examples from official textbooks: [Buganov, 1964, p. 700]). These uluses did not become truly independent until shortly after the struggle between Kublai and Arig Buga for the title of great khan in the 1260s, which the latter lost, followed by the transfer of the capital from Karakorum to Beijing, and the beginning of coin minting in the name of the ulus khans, as well as the recognition of their independence by both part of the Chinggisid clan and by other states. To prove this, the third and four-generation Chinggisids from the western uluses (of Chagatai and Jochi) entered into an agreement 'in the meadows of Talas and Kendjek' in the spring of 667/1269, when a kurultai was gathered following a seven-day feast to re-establish their frontiers and promise to maintain peaceful relations [Collection of Works Related to the History of the Golden Horde, 1941, p. 77; Rashid al-Din, 1957, III, p. 72]. Only after this political process did Sarai khans begin to produce coins bearing state titles in their own name (for the materials see: [Fedorov-Davydov, 2003; Singatullina, 2003]).

Another fact that should be taken into account is that ulus rulers' aspirations for the independence of the khagan did not prevent them from finding it reasonable to maintain a dynastic unity. Evidence of this is the fact that ulus khans had special appanages (khubis) within the khagan's domain [Chao Chu

Cheng, 2002, p. 190]. In addition, Jochid—controlled states, including Rus', provided military contingents to China on an almost regular basis [Vernadsky, 2000, p. 156–158, 179, 222–224, 250; Chao Chu Cheng, 2002, p. 189]. The great khan did have property interests, such as the right to a share of the tax income from the western areas of the former superpower (for more details see: [Vernadsky, 2000, p. 138–139]). Even though ulus khans were actually independent, Beijing in this case continued to view them, at least the Jochid ones, as mere 'northwestern princes', that is, vassal vicegerents [Chao Chu Cheng, 2002, p. 190]. Almost as if putting on a poker face—in spite of Khan Berke's support of Arig Buga against Kublai—khagans continued to approve each new Sarai khan by issuing them a ruling yarliq.

Thus, despite the frequent and sometimes also long political conflicts between them that at times developed into military actions and even serious wars, the newly independent uluses formed a confederation starting in the late 1260s. This is especially evident from the Jochids' relations with the Khanbaliq (Beijing) rulers.

Things lasted this way until the mid-14th century when the 'Great Troubles' began, and ended up continuing as this game of 'leap-frog' for the throne in the latter half of the 14th century. At that time, the Golden Horde was a country generally recognised to be, linguistically and culturally, in large part Turkic. This raises the question whether there is a connection between the super-empire's political history and the ethnic history of its areas

within the ethno-political environment of the Mongol State? When applied to the Ulus of Jochi, this can be reduced to the following question: In what way did the politically dominant but sparsely numbered Mongols dominate the Turks, who were in fact the majority? This suggests that a very intense assimilation of Mongols in the Turkic environment took place in the Ulus of Jochi, but it also raises the question of when it began and when it was completed.

All studies dealing more or less with the history of Ulus of Jochi emphasise how multi-ethnic the state was while identifying the majority of its population as Turkic-speaking [Grekov, Yakubovsky, 1950, pp. 65–66; Fedorov-Davydov, 1966; 1973; 1976; Spuler, 1965, S. 282–283; DeWeese, 1994]. An analysis of written documents, primarily *yarliqs* issued by rulers of Ulus of Jochi, confirms the leading role that the Turkic language played in the area's administration [Berezin, 1851; Radlov, 1889; Malov, 1953, p. 187–195; Borovkov, 1966, p. 13–24; Nadjip, 1970, p. 87–92; 1979, p. 31–150; Sultanov, 1973, p. 53–61; Usmanov, 1979, p. 94–111, 218–244; Kononov, 1982, p. 249, 318; Özyetgin, 1996; etc.].

A large part of the Mongol armies led by Guyuk and Möngke returned to Central Asia following the western campaign of 1236–1243. Those Mongols who stayed in Europe were thus subject to assimilation in the Turkic-speaking environment of Desht-i Qipchaq, a fact noted by contemporaries. It should also be taken into account that the Mongols were known as Tatars in the Turkic and Muslim environment, as well as in China. The Turkic term for the Mongols became common not only in Middle Asia and in the near East, but in Rus' and West Europe, even though the Mongols did not call themselves Tatars (see: [Klyashtorny, 1993, p. 140–141]). There is a famous report by al-Umari that 'they (the Mongols) became mixed up with and thought of as them (the Kipchaks), but the land overcame their origin and race, and they all became like the Kipchaks...' [Collection of Works Related to the History of the Golden Horde, 1884, p. 235].

The above report by al-Umari dates back to the mid-14th century and is representative of the point of view of Muslim diplomats interested in the origin and the actual state of affairs of certain ruling dynasties or individual rulers. Relying on al-Umari for this information, we must admit that the assimilation of the Mongols in the Kipchak environment had been completed by the middle of the 14th century. It then follows that Mongol Turkification actually began much earlier.

Is there any linguistic evidence to confirm the Arab author's report? According to famous linguists specialising in Turkology, the period from the 13th to the 14th century was the third stage of Turkic borrowing in Russian. N. Baskakov believed that the period was 'characterised by a large-scale introduction of Turkic and, less frequently, Mongolian words into Russian' [Baskakov, 1974, p. 6]. Relying on current findings, it is safe to say that Mongolian speakers were not numerically dominant in the land of Khan Batu's descendants in the former half of the 14th century. That is to say, the Mongols were an ethnic minority in Ulus of Jochi who had no significant influence on the linguistic environment, even though they were monumental in determining the state's administrative and political affairs.

As the ethnically diverse Tatar-Mongols conquered the vast Eurasian territory from the Altai Mountains to the Danube (1218–1239), the percentage of the largely mixed Turkic component, which was united by a new powerful suzerain, increased significantly in Jochi and Batu's army. The 'Tatar' conquerors that poured into East Europe were not exclusively Mongol in an ethnic sense. Mongol troops were a conglomerate numerically dominated by Turks, but organised and managed by the Mongol elite and the khan's guard. The above ratio of Turkic and Mongolian borrowings in Russian can be explained by this fact, and it also determined the rapid Turkification of the Mongols of Ulus of Jochi reported by al-Umari. 'Given the Turks' numerical superiority, it was natural for the Mongols to gradually become turkicised' [Vernadsky, 2000, p. 216].

This gives rise to the reasonable question of why the Turks, who were defeated in mil-

Khan's departure. Miniature. Iran. Early 14th century.

itary terms, were the victors in terms of ethnicity and culture in Ulus Jochi. To answer this question we can appeal to the evidence of what influence the Uighur culture had on the Mongols before the empire was established [Brief History, 1991, p. 233–245]. According to V. Bartold, the similar lifestyles, customs, and traditional outlooks of the people favoured a considerable influence [Bartold, 1968, p. 264]. V. Vernadsky believed that 'the Turks were recognised to be legitimate members of the religious background of the majority of both groups' after the Mongols conquered them [Vernadsky, 2000, p. 140, 216]. The sources suggest, in a characteristic way, the absence of hostility between the Mongols and Tatars or vice versa. For all intents and purposes they felt like they were equals.

Another fact that should be taken into account is that the Mongol State included separate Turkic tribes even before the foreign conquest began (about 1206–1207) [Kara, 1972, p. 17], while in 1209 the Uighurs entered it 'of their own accord' to be followed by the Kyrgyz, Uriankhai, and other peoples [Kutlukov, 1970, pp. 46–61; Trepavlov, 1993, pp. 51–53]. According to B. Spuler, Turks made up more than half of the Mongol troops already during the time of Chinggis Khan [Spuler, 1965, S. 281].

However, these were not the only deciding influences on the ethnic processes in Ulus of Jochi. As has already been mentioned, the increase of the Turkic-Tatar percentage in the Mongol armies engaged in westward operations picked up the pace after they entered Desht-i Qipchaq. This part of Eurasia is known to have been inhabited by Turkic-speaking tribes who did not resist entering the 'army people' (term by L. Gumilyov) [Gumilyov, 1970, p. 172–175].

For instance, witness Thomas the Archdeacon wrote on the army that Batu Khan brought to Hungary that 'They have a great number of warriors from different peoples who they conquered through war, primarily the Cumans, whom they force to fight' [Thomas the Archdeacon, 1997, XXXVII].

In what ways did Turks usually contribute to Jochi and Batu's military operations? To answer this question we need to study the domination and subordination system as a steppe-specific variant or equivalent of vassalage adjusted to nomadic communities. In nomadic communities, common livestock breeders depended on the tribal aristocracy indirectly through livestock ownership. It was livestock owners who actually owned and used the land [Vladimircov, 1934; Tolstov, 1934]. Land was believed to be owned collectively by the whole family or tribe regardless of the wealth of individuals [Markov, 1976, pp. 278–313].

This unique mechanism ensured the relatively easy and fast inclusion of Turks in Jochi and Batu's troops. It also determined the more or less rapid assimilation of the Mongols in the west. The uniqueness of the domination and subordination system in general, that is, the nomadic 'type of vassalage', caused nomadic empires in Europe to rise and fall quickly.

Thus, there were more meaningful social prerequisites and conditions apart from the assumed 'wildness' of the 'barbarian' Mongols behind the Turkic-Mongol ethnic integration of the 13–14th century. The everyday life, living standards, and social development of the Mongols and Turks of Desht-i Qipchaq were all at around the same level at that time. The Tutar-Mongols used the preceding communities' administrative experience for organisational transformations, i.e. Chinggis Khan's reforms, to become superior to the scattered steppe tribes and other groups in both military and organisational terms.

The findings of many years worth of archaeological research confirm that the ethnic process in question was quite rapid. 'The Mongol population that came to the steppe of Desht-i Qipchaq was relatively insignificant', while the key 'steppe territories preserved their nomadic population, which only replaced the tribal aristocracy with new rulers, namely steppe Golden Horde khans and their emirs [Fedorov-Davydov, 1966, p. 247]. It is thus quite natural that Mongol Turkification in Ulus of Jochi did not take long. There is also some additional evidence to this fact. S. Zakirov, who believed the Jochids were Mongol-speaking, referred to al-Mufaddal's report below, which in turn referred to Ibn Abd az-Zahir, while describing Khan Berke's (1257–1266) reception of Egyptian ambassadors [Zakirov, 1966, p. 48]. According to the ambassadors, the chief qadi translated the sultan's letter that they brought from Arabic into Turkic, and the vizier read it out to Berke. The khan and all people present were extremely satisfied with its content [Collection of Works Related to the History of the Golden Horde, 1884, p. 194]. As it was proven quite usable for Khan Berke and his people, the Turkic language must have become even more understandable, probably even native, for later Jochids. For instance, V. Bartold referred to a description of the khan's court custom by Ibn Battuta, who enjoyed Khan Öz Beg's favour (1312–1342): 'we only heard Turkish (that is, Turkic.—*M.U.*) words there. The Turkic language was 'used for Is-

Khan's court dressed in white celebrating the New Year. Miniature. Iran. About 1330. Topkapi Museum, Istanbul

lamic divine services' as well [Bartold, 1968, pp. 139–140]. The formal records issued by Sarai rulers for local purposes are adequately representative of the trend [Usmanov, 1979, pp. 94–111; 1979a, pp. 238–240].

Mongolian gradually slipped into disuse in Ulus of Jochi. Yet the Jochids most likely remained bilingual for some time before it did [Bartold, 1963, pp. 452–455]. Sarai rulers wrote letters in Mongolian to the great khans in Karakorum and Khanbaliq (Beijing), as well as the early Hulaguids, who had been using their ancestors' language longer than the Jochids had [Usmanov, 1979, pp. 100–101]. Families who were settled in the steppe might have preserved Mongolian for a longer time. There is documentary evidence that some part of the population of Ulus of Jochi spoke two languages on an everyday basis [Poppe, 1941, pp. 81–134].

The Mongol ethnos and its language faded into non-existence in a similar manner in other fragments of the former super-empire, surviving only in a small part of their native land. This same thing probably also happened to many imperial peoples of the past.

§ 2. Arab and Persian Sources on the Dynastic and Political Names of the Ulus of Jochi and the 'Tatar' Ethnonym

Alsu Arslanova, Ilyas Mustakimov

The only Arabic works mentioning the **political names** of the Jochid state are those by the secretaries of Mamluk rulers Taqi al-Din al-Muhibbi (late 14th century) and Abu-l-Abbas al-Qalqashandi (late 14–early 15th century).

Even though the terms are rare in sources, they were used in the official correspondence of Mamluk rulers with Golden Horde khans and noblemen, in whose titles they were included (the reports of al-Muhibbi and al-Qalqashandi, who were well aware of the diplomatic correspondence rules, indicate this very clearly). According to al-Muhibbi, a nobleman from the Golden Horde, 'Sheikh Hasan the Great, an ulus head,' had the following title (among others): 'the Satisfier of the needs of the Kaan's Kingdom' [Collection of Works Related to the History of the Golden Horde, 1884, pp. 347–348]. Another high-ranking official was titled 'Vizier of the **Kaan's Kingdom**' [Ibid., p. 349] (emphasis added hereinafter.—A.A., I.M.). Al-Qalqashandi reported that Ulus of Jochi was also referred to as the '**Kaan's Kingdom**' in a letter by Egyptian ruler al-Malik al-Nasir Faraj to a khan of the Golden Horde [Ibid., p. 410].

It is curious that later (late 14–early 15th century) letters by Mamluk sultans refer to Ulus of Jochi as 'the State (Kingdom) of the Kaan', though the title **kaan** was only initially applicable to great khans, who were rulers of the Mongol Empire. However, all Mongol dynasties in the former Chinggisid uluses, except for the Jochid State, had been either subverted or had decayed by the end of the 14th century. Thus, the only real claimants upon the title Kaan were the Golden Horde's khans.

Persian authors hardly ever applied the term 'Tatars' to the Mongols and Mongol (Chinggisid) states of the 13–18th century. Therefore, it is more reasonable to study the political and dynastic-political names of the Jochid State.

The way in which Persian sources used the names of the components of Ulus of Jochi to

represent its administrative and territorial division is of special interest. First and foremost, this applied to the terms 'the Ulus of Batu', 'the Ulus of Orda', 'the Ulus of Berke', 'the Ulus of Öz Beg', etc.

Similar names of Ulus of Jochi can be found in Arab sources. For instance, certain Arab authors began to apply dynastic-geographical terms ('Berke's land', 'Berke's steppes') to the Ulus of Jochi when Khan Berke came to power (1257–1267). Later, Arabic dynastic-geographical terms were derived from the names of the more recent khans of the Golden Horde—Tokhta (1291–1312) and Öz Beg (1312–1342).

Characteristically, some Arab sources use the term 'bait Barka' ('the House of Berke') primarily to refer to the ruling Jochid dynasty (for instance, see: [Ibid., p. 116 (Baybars), 359 (Ibn al-Furat), 518 (al-Ayni)]). The occurrence of the name 'the State of Berke's House' suggests the same interpretation: 'It is the one (Berke) from whom the state originated; it is called the House of Berke (bait Barka), which means that it is the State of Berke's House (mamlaka bait Barka), just as people say about the Iranian Kingdom, this is the Kingdom of Hulaku's House (mamlaka bait Hulaku)' [Ibid., p. 405 (al-Qalqashandi)].

This may be a peculiar way of translating such terms as 'the *Ulus of Berke*', or 'the Ulus of Öz Beg', which were used in Persian sources. The fact that the name of the state was commonly derived from the currently (or formerly) ruling clans of Ulus of Jochi is not incidental. In fact, it is attributable to the ulus system introduced by Chinggis Khan. According to its principles, the state (Yeke ulus, meaning 'the Great State', 'the Great Ulus') was viewed as the Chinggisid clan's capital [Vladimircov, 1934, pp. 98–99]. After creating his state (Mongyol ulus), Chinggis Khan followed the steppe tradition of assigning ulus appanages to his sons and immediate relatives. This principle is reflected in the Arabic sources because the authors iden-

tified the ruling dynasty (which they called 'the House of Berke') as the state of the Golden Horde as such. Other names of the Jochid state derived from the names of its most powerful khans (Berke, Tokhta, Öz Beg), where after their reigns Ulus of Jochi actually became an independent state, appeared later.

The earliest and most common dynastic-political names of Ulus of Jochi in the Persian sources are 'the Ulus of Jochi [Khan]', 'the Kingdom of Jochi Khan', 'the Ulus of Batu', and 'the Ulus of Orda'. One of the first Persian authors to use these names was the official historiographer of the Hulaguid court Fadlullah Rashid al-Din. In his work 'Jami al-tawarikh' ('Collection of Chronicles'), while describing the history of the Mongol conquest in Middle Asia and East Europe, he referred to the land that Chinggis Khan assigned to his eldest son Jochi as 'the Ulus of Jochi' [Collection of Works Related to the History of the Golden Horde, 1941, p. 29, 50–51, 65, etc.].

Later, other terms for the Ulus of Jochi appeared that were derived from the names of the later khans Berke and Öz Beg, such as 'the Ulus of Berke', 'Desht-i Berke', 'the Ulus of Öz Beg', 'the State of Öz Beg', etc. These were all similar to the Arabic names. Reports by Arab and Persian authors suggest that similar terms for the Golden Horde state were also used in Ulus of Jochi.

Ethnically speaking, the population of Ulus of Jochi was a conglomerate of different peoples. Among the Jochid-controlled peoples, sources mention the Volga Bulgars, the Russians, the Burtas people, the Bashkirs, the Circassians, and others. However, the most common terms used to denote the Jochid state and its population in Arab sources were 'the Tatars' and 'the Kipchaks'.

For instance, Arab contemporaries mostly knew Ulus of Jochi as 'the Tatar land' [Collection of Works Related to the History of the Golden Horde, 1884, p. 118, 123, 327], or 'the Tatar land in the North' [Ibid., p. 516], while its rulers were referred to as 'Tatar kings' throughout the existence of the Golden Horde [Ibid., p. 55, 119–120, etc.].

It was no less traditional for Arab and Persian sources to use the ethnonym 'Kipchak' in

Jochid rulers' titles, and to refer to the territory of the Ulus of Jochi. For instance, the most common ethno-geographical and ethno-political terms for the Ulus of Jochi in Arab, and especially in Persian, sources contain the ethnonym 'Kipchak' ('Desht-i Qipchaq', 'the country of the Kipchak steppes', 'the Kipchak Kingdom', etc.) [Mustakimov, 2001, pp. 263–279; Arslanova, 1997/1998, p. 30–41].

Some sources use both the term 'Tatar' and 'Kipchak'. For instance, Ibn al-Furat wrote in his *tawarikh* that 'In the (Hijrah) year 665, Mengü Temür... took the throne of the **Kipchak Kingdom**. He came to rule the Tatars (that is, 'he obtained the **Tatar Kingdom**.'—A.A., I.M.), the Northern Countries, the Kipchak, the Iron Gate, and the adjacent land [Collection of Works Related to the History of the Golden Horde, 1884, p. 358].

A number of factors led both western and eastern (including Arab and, partly, Persian) authors to extend the meaning of the term 'Tatars' to the entire Mongol army, which included both Mongols proper and members of tribes and peoples (largely Turkic-speaking) whom they had subordinated starting in the 13th century (for more details, see: [Izmajlov, 1993, pp. 17–32]). More recent Arab authors who lived after the Mongol Empire had been dissolved and independent Chinggisid states had been established, applied the terms 'Tatar countries' and '**Tatar kings**' to not only Ulus of Jochi and its rulers, but other Chinggisid-ruled states ('...duties and other income from Sudak were divided among four Tatar kings; one of them was Toqtaï' [Collection of Works Related to the History of the Golden Horde, 1884, p. 195 (al-Mufaddal); p. 73 (Ibn Wasil)], in particular, to the rival of Ulus of Jochi, the Hulaguid State in Iran. The Hulaguids were also referred to as 'Tatar kings' [Ibid., p. 73 (Ibn Wasil), p. 121 (Baysbars)]. In his *tawarikh*, Ibn al-Furat also refers to Hulagu as the 'Tatar king' [Ibid., p. 359]. This is why al-Ayni must have mentioned a 'Tatar land in the North', emphasising the geographical placement of Ulus Jochi [Ibid., p. 516]. Thus, by the end of the 13th century Arab authors had come to use the term 'Tatars' rather as an ethno-social than a purely ethnic one, which primarily determined the ruling aristocracy of the states. Thus, the

term 'Tatar countries' in Arab sources was extended to the entire region and country (or countries) ruled by Chinggisid khans ('Tatar kings').

The term 'Tatars' and, traditionally, 'Mongols' was later applied to the social elite of the Chinggisid states (for instance, see Ibn Battuta's usage: [Ibid., p. 295]). For example, al-Dhahabi called Khan Berke (1256/1257–1266) a 'Mongol (al-Maguli), King of Kipchak and the steppes of Sudak' [Ibid., p. 204]. Al-Asadi also applied the term 'Mongol' to Khan Tokhta of the Golden Horde (1291–1312/1313) [Ibid., p. 275, 446].

The Jochid state and its successors preserved the ethnonym 'Mongol'. For instance, late 14th century author al-Muhibbi mentions the following title of the khan of Ulus of Jochi, among others: 'Sultan of the Mongols, Kipchaks and Turks' [Ibid., p. 343]. Crimean Khan Muhammad Giray used this title as late as in 1520 for one of his yarliqs [Usmanov, 1979, pp. 193–194], a fact most likely attributable to tradition.

It should be noted that it was very uncommon for Arab sources to apply the ethnonym 'Tatars' to the population of Ulus of Jochi in the 13–14th century. However, Arab historian Ibn Arabshah, who visited Ulus of Jochi in the early 15th century, and his contemporary al-Maqrizi, more or less clearly indicate that the term 'Tatars' applies to the population of Ulus of Jochi. To quote Ibn Arabshah, 'The area is exclusively **Tatar**... and overfilled... with Turkic tribes' [Collection of Works Related to the History of the Golden Horde, 1884, p. 459]. Maqrizi wrote that 'He (Yedigei) is the one who prohibited the **Tatars** to sell their children, which caused their inflow into Syria and Egypt to decrease' [Ibid., p. 474].

Terms containing the component 'Kipchak', which was common in the geographical names or titles of khans of the Golden Horde, were more wide-spread for Ulus of Jochi [Ibid., pp. 334–343]. The ethnotoponym 'Desht-i Qipchaq' ('Kipchak Steppe') was especially popular with Persian and Arab authors.

'Desht-i Qipchaq' is one of the oldest ethno-geographical terms for the territory of Ulus of Jochi. Desht-i Qipchaq was a central element of the Mongol-ruled state that covered the

steppes of East Europe up to the Danube, and most of Western Siberia and Kazakhstan.

Now, we must pay special attention to the ethnotoponym 'Desht-i Qipchaq'. Placenames, just like ethnonyms, can develop according to different patterns. Some are very stable, while the meaning of others changes over time. This sometimes makes their interpretation a challenge and causes historiographic variations on the issue. In our opinion, this is exactly the case with the ethnotoponym 'Desht-i Qipchaq'. Its usage became disputed in the 19th century, when medieval Oriental sources were first subject to serious research in historical terms, bringing about a more profound understanding of the issues related to the history of peoples in our country.

By the mid-19th century, domestic historians had been using the ethnotoponym 'Desht-i Qipchaq' in three basic ways.

The first group, which was strictly adherent to certain Oriental sources dating back to the Mongol conquest and their terminology as such, failed to take into account its possible semantic instability. They used the terms 'Ulusof Jochi', 'the Golden Horde', and 'Desht-i Qipchaq' ('the Kipchak Horde', 'the Kipchak Kingdom') to mean the same state with its centre in the Lower Volga Region founded by Khan Jochi. For instance, even the titles by G. Sablukov are representative of the trend: 'A Study on the Location of Sarai, the Capital of the Kipchak Horde' (1843), 'Coins of the Golden Horde' (1896), 'Essays on the Internal State of the Kipchak Kingdom' (1844), etc.

Some scholars limited the meaning of 'Desht-i Qipchaq' to the east of Ulus of Jochi, which we believe to be wrong. For instance, N. Aristov indicated clearly that the term 'Desht-i Qipchaq' referred to the eastern half of Ulus of Jochi, while 'the steppes of the Western Half from the Ural to the Danube were used as camping grounds by the surviving Polovtsians and the preceding Turkic tribes, which merged with part of the Kipchaks to be known collectively as the Nogais' [Aristov, 1896, p. 314].

However, a number of authors were able to trace the ways in which Persian sources used the term. Scholars thus found the meaning of

'Desht-i Qipchaq' to have been considerably generalised among them; they only differentiated between the 'narrow' and 'broad' meaning of 'Desht-i Qipchaq'. For instance, N. Veselovsky noted that 'Ulus of Jochi' included, firstly, Desht-i Qipchaq (in the broad meaning of the term), and secondly, the Crimea, part of Transcaucasia, Khwarezm, and Rus'. However, this ulus, which spanned across vast steppes and sedentary countries, soon split into two hordes, 'golden' and 'blue', and the disunity between them continued to increase [Veselovsky, 1877, pp. 75–90]. A. Kharuzin believed that 'the name (in the broad sense) also applied to the Crimea, all of our southern steppes, those on the opposite bank of the Ural River... and part of Turkestan [Kharuzin, 1895, pp. 76–81]. According to the scholars, the new state preserved the name 'Desht-i Qipchaq'. V. Bartold also shared this point of view.

It is thus obvious that Russian historiographers never agreed on an unambiguous interpretation of the term 'Desht-i Qipchaq', which had its effect on Soviet historiographic literature as well.

Many outstanding works relying on Persian narrative historical sources appeared in the 20th century. In particular, the volume by V. Tiesenhausen [*Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy*, 1941] was a true milestone. However, we cannot name a single work that contains a dedicated analysis of the ethnotoponym 'Desht-i Qipchaq'. Most authors limit themselves to a passing footnote on it without any bibliographic references, as if it were a widely accepted term. However, a review of the literature soon reveals a disunity among historiographers concerning its usage. The patterns described regarding the pre-Soviet period still apply here. For instance, N. Egorov [Egorov, 1984, p. 90], A. Muhamadiev [1983], and others use the term 'Desht-i Qipchaq', as well as 'the Golden Horde' to refer to Ulus of Jochi, though it included such areas separate from Desht-i Qipchaq as the Crimea, Khwarezm, Volga Bulgaria, and others. To quote N. Egorov, 'in the first half of the 12th century, Mongol-Tatar troops conquered one of the first state unions in the Middle Volga Region, Volga-Kama Bulgaria, turning it into

the Bulgar Ulus of Desht-i Qipchaq...' [Egorov, 1984, p. 90].

Even earlier, A. Chuloshnikov made the assumption that even though Oriental sources suggest that 'the Desht-i Qipchaq State' and 'the Golden Horde' were synonyms from the 14th century, these did not always mean the same. Initially, the term applied to the steppes between the Don, the Kama, and the Ural only. It later extended to cover the entire Southern Russian plain, including the Crimea, the steppe across the Ural River, and part of Turkestan [Chuloshnikov, 1924, pp. 71–72]. A. Kononov [Kononov, 1958, p. 87], and R. Kuzeev [Kuzeev, 1974, p. 87] expressed opinions similar to this as well. They interpreted the term 'Desht-i Qipchaq' as a broad steppe belt from the upper reaches of the Syr Darya to nearly as far as the Danube. They likewise emphasise that the term was applied to various areas of the vast territory depending on the period.

In the monograph by B. Grekov and A. Yakubovsky 'The Golden Horde and Its Fall', the first chapter, authored by A. Yakubovsky, is titled 'Desht-i Qipchaq (the Polovtsian Steppe) in the 11–13th Century before the Coming of the Mongols'. The author rightfully believes that the term 'state' as used by the Mongols is not applicable to the Polovtsians and Polovtsian unions. He then wrote that 'Numerous Mongol campaigns created a large state covering the vast Desht-i Qipchaq and a number of adjacent regions, to which Oriental sources referred to as Ulus of Jochi or the Blue Horde. Russian chronicles call the state the Golden Horde. However, it is still unclear why and when the name appeared'. [Grekov, Yakubovsky, 1950, p. 59]. A. Yakubovsky viewed Desht-i Qipchaq as the core part of Ulus of Jochi containing the nomadic khan's camp. 'Cultural farming areas (the Crimea, the North Caucasus, Khwarezm, Bulgar) lay adjacent to Desht-i Qipchaq... The name Desht-i Qipchaq has not only been preserved, but spread across the world from China to Andalusia' [Pishchulina, 1977, pp. 59–65].

G. Fedorov-Davydov made a particularly significant contribution by demonstrating the Polovtsian Steppe to have been the core area of the Golden Horde. To quote the author: 'It is no coincidence that a number of Arab and

Persian sources identified the Golden Horde as *Desht-i Qipchaq*, that is, the Polovtsian Steppe. Mongol khans ruled the steppe, while the local aristocracy was excluded from administration' [Fedorov-Davydov, 1973, p. 28]. However, at the same time he also emphasises the fact that applying terms to Ulus of Jochi required special attention. While editing A. Muhamadiev's book, he noted that the term *Desht-i Qipchaq* should be used with great care. A. Muhamadiev refers to the state known in literature as the Golden Horde as *Kipchak*, according to the name of the predominant steppe population. According to G. Fedorov-Davydov, 'the name *Kipchak* is understandable because the steppe known as *Desht-i Qipchaq* was the state's core area... Ancient writers sometimes called the Jochid Ulus *Desht-i Qipchaq*, or simply *Kipchak*. However, the term *Kipchak*, just as any other name, is applicable to the Jochid state only to a limited extent, as some of its areas (Khwarezm, Volga Bulgaria) were not included in *Desht-i Qipchaq* [Muhamadiev, 1983, p. 8].

A brief overview of the usage of the term *Desht-i Qipchaq* in historical literature suggests the following trends: on the one hand, by relying on certain medieval sources, historians could not help but develop a narrower idea of what the term referred to, as it was interpreted as either a part of Ulus of Jochi or as the whole country throughout its period of existence. On the other hand, another meaning of it had already absolutised. That is, the term was assigned to the territory dominated by the *Kipchak* tribal group.

Thus, the term became established when *Kipchak* migration southward (forcing out the Oghuz people) and eastward (to the Volga Region and the so-called southern Russian steppes to replace the *Pechenegs*) peaked. As the *Kipchaks* rose to dominate the political life of East Europe and Middle Asia, '*Desht-i Qipchaq*' referred to the steppes from the *Irtys* to the Danube.

It is beyond doubt that the semantics of the term '*Desht-i Qipchaq*' would be incomplete without a holistic analysis of the information contained in written sources. This approach is required to ensure it is correctly interpreted. Information on the *Kipchaks* and their land is

contained in the Russian chronicles, works by European travelers, and the notes of Oriental authors. However, the term was most popular in 13–18th century Persian sources.

An analysis of how the sources use the term in question yields the following findings. In 13–15th century Persian sources, the placename *Desht-i Qipchaq* (or its other versions, such as *Kipchak*, *Desht*, *Kipchak Land*, *Kipchak Country*, *Country of the Kipchaks*, *Country of Desht*, *Kipchak Tsardom*) occurs quite often. Upon closer examination, the early Persian chronicles of Mongol invasions used the term '*Desht-i Qipchaq*' as the core ethno-geographic area of Jochid Ulus, along with other regions of the medieval state. For instance, Wassaf wrote, '... Jochi was Chinggis Khan's eldest son, who owned *Saqsin*, *Kipchak*, *Khwarezm*, *Bulgar*, the *Crimea*, and *Ukek*, up to *Rus*' [*Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy*', 1941, p. 86]. The term has a similar meaning in '*Tabaqat-i Nasiri*' by Juzjani, '*Tarikh-i jahangusha*' by Juwayni, '*Seljuknama*' by Ibn Bibi, '*Jami al-tawarikh*' by Rashid al-Din, and '*Tarikh-i guzide*' by Hamdallah al-Qazwini.

However, the meaning started to expand starting in '*Tarikh-i Sheikh-Uways*' by Abu Bakr al-Qutbi al-Ahari. At that point its meaning combined two aspects, namely a part of the state and the state as a whole. For instance, 'when princes were ruling *Desht-i Qipchaq* together, *Tokhtai* arrived there, defeated everyone, and took the throne of *Berke* and *Batu* [Ibid., p. 100]. 'The Genealogy of Turks' contains the following information: 'Reliable history books read that, following the conquest of *Khwarezm*, on the order of Chinggis Khan, *Khwarezm* and *Desht-i Qipchaq*, from the *Kayalik* borders to the most remote areas of *Saqsin*, *Khazar*, *Bulgar*, the *Alans*, the *Bashkirs*, the *Uruses*, and the *Circassians*, as far as the Tatar horse's hoof reaches, became the domain of Jochi Khan, and he held the throne as the khan and ruler of the countries... All *Desht-i Qipchaq* sultans are descendants of Jochi, Chinggis Khan's son; there are 39 of them in total... [Ibid., p. 204]. Thus, some Persian sources began to use the usual geographic term '*Desht-i Qipchaq*' with the connotation that it was the name of a state.

This then became a well-established historiographic tradition and played a certain role in the historiographic studies that relied on the information provided in those sources. These included 'Zafar-nama' by Nizam al-Din Shami, 'Anonymous of Iskender' by Muin al-Din Natanzi, the continuation of the 'Collection of Chronicles' by Rashid al-Din, 'Zafar-nama' by Sharaf al-Din Ali Yezdi, 'Matlai ul Saadeyn' by Abd al-Razzak Samarkandi, 'Nusah-i jahanara' by Gaffari, and 'Tarikh-i Haydari' by Hayder Razi. To quote Sharaf al-Din Ali Yazdi, '...As the victor, Toktamyskh Khan took the throne of Desht-i Qipchaq, where he replaced his ancestors, and sent Urus Hoja to inform Timur of the victory [Ibid., p. 150].

In the 15th century, the political and ethnic situation in the region changed dramatically. The Kipchaks were a major component of the ethnogenesis of a number of Turkic-speaking peoples. However, the term connected with their ethnonym continued to occur in historical and geographic works by Middle Asian authors for a long time (through the 18th century). Yet they always refer exclusively to the Eastern Desht-i Qipchaq, which included the steppes east of the Volga Region that are now known as Kazakh. At the same time, in the western part of the dissolved Ulus Jochi the terms 'Desht-i Qipchaq' and 'Kipchaks' were gradually replaced by 'Tataria' and 'Tatars'. Therefore, the terms 'Desht-i Qipchaq' (or 'Desht', 'Kipchak', 'Eastern Desht-i Qipchaq') in the sources are connected with the history of the Kazan and Öz Beg peoples who developed in the region. Such sources as 'Tawarikh-i guzida-yi nusrat-name', 'Sheybaniname' by Kamal al-Din Binai, 'Tarikh-i Abu-l-Khair-khani', 'Tarikh-i Rashidi' by Mirza Muhammad Haydar Duglat, 'Sharaf-name-yi Shahi' by Hafiz-i Tanysh, 'Bahr al-asrar fi manaqib al-ahyar' by Mahmud Ibn Vali, and 'Tarih-i Qipchaqi' by Hojamkum Beg Balkha, etc. provide considerable information on the topic.

It appears not incidental that Persian and Arab sources viewed Ulus of Jochi and Desht-i Qipchaq as the same. 'Desht-i Qipchaq' referred to the nomadic community of the Kipchaks, which Arabic-Persian authors believed to dominate the population and inhabit most of the country's territory. Therefore, the term is essen-

tially correct but, like any name applied to Ulus of Jochi, also historically determined.

Unlike some Persian sources that viewed 'Desht-i Qipchaq' as both part of the Jochid state and the entirety of it [Collection of Works Related to the History of the Golden Horde, 1884, p. 43], the Arabic sources, which apparently borrowed the term from the Persians, tended to narrow the meaning to the core part of Ulus of Jochi ('In the Hijra year 712, Khan Toqta, the king of Desht-i Qipchaq and all adjacent states and those that it includes, died (*Dasht al-Kybjak wa ma ma'a-hu*) [Ibid., p. 174 (al-Birzali)]; 'Desht-i Qipchaq and what is with it' (*Dasht-al-Kybjak wa ma ma'a-hu*) [Ibid., p. 241, p. 244 (al-Omari)]; '...Tatar kings in Khwarezm and Desht-i Qipchaq in the North' (*muluk at-tatar fi Hawarazm wa Dasht al-Kyffak*) [Ibid., p. 377 (Ibn Khaldun), p. 406, 416 (al-Qalqashandi), p. 553 (al-Dhahabi), p. 279, 303 (Ibn Battuta)]). Most likely, the authors primarily referred to the ulus of Batu, Jochi's second son, as the core political and territorial unit of Ulus of Jochi before the beginning of the 15th century when speaking of 'Desht-i Qipchaq'.

The Term 'Kipchak' in Arab sources includes ethno-geographical and ethno-political names referring exclusively to Ulus of Jochi, in contrast to those containing the 'Tatar' component, which sources applied to all Chinggisid states.

To sum things up, the use of terms for Ulus of Jochi containing the ethnic component 'Kipchak' in Arab-Persian historical geographical literature was apparently determined by the Oriental tradition of naming the population of the Eurasian steppe area.

For a long time, the term 'Desht-i Qipchaq' referring to the territory of the Golden Horde was also common in Turkic sources written in the Volga Region and Crimea. The dastan 'Edigü', which was composed on the former territory of the Golden Horde, refers to the country as 'the glorious Kipchak land' (*danlı kıpçak cire*) [Edigü, 1988, p. 11]. The usage frequency of the term 'Desht-i Qipchaq' in yarliqs and letters by Crimean letters from the first half of the 16th century indicates that it was always present in their titles [Materials, 1864, p. 2, 13, 26, etc.; Tunmann, 1991, p. 23; Usmanov, 1979, pp. 193–194]. By applying it to the addresant of their charters

along with 'Great King of the Great Horde', the Crimean khans manifested their claims to the Golden Horde's heritage. M. Usmanov believed the reason why Crimean rulers began to use the titles was Khan Mengli Giray's victory over the primary successor of the Golden Horde, the Great Horde, in 1502, when the latter ceased to exist as a state [Usmanov, 1979, p. 193].

From a historical perspective, it would be interesting to identify the exact borders of the territory where medieval Islamic sources placed 'Desht-i Qipchaq'. However, quoting A. Yakubovsky's poignantly truthful remark, 'exact borders are out of question when contemporaries had no idea of them either' [Grekov, Yakubovsky, 1950, p. 18].

Chinggisid khans, a group of Mongol and local nomadic aristocrats who were named 'Tatars' in Arabic sources following the conquests, were the ones who really ruled Ulus of Jochi. However, it was common for Asian and European authors of the early 18th century to widely use the term 'Tatars' to refer collectively to the Mongol-Turk invaders. This is the meaning in which some Arab authors, like Ibn al-Athir, Rukn al-Din Baybars, al-Nuwayri, al-Umari, and others used it.

Another meaning of the term became predominant later. Arab authors started to apply the word 'Tatars' to Chinggisid rulers and non-indigenous Mongol aristocrats in the newly established uluses of the Mongol Empire who enjoyed complete power, which determined the appear-

ance of this meaning of the term 'Tatar' in Arabic sources. The term was also sometimes applied to nomads in Chinggisid states as such in that period (for instance, by Ibn Battuta) [Collection of Works Related to the History of the Golden Horde, 1884, p. 253]. As they were apt to do, Arab authors ceased to refer to Iran as a 'Tatar state' after the fall of the Mongol Hulaguid dynasty (1336), while still viewing Ulus of Jochi and its khans as 'Tatar'. Following the dissolution of Ulus of Jochi, the title 'Tatar king' (that is, 'Chinggisid kings', 'Mongol kings') was assigned to the khans of the new states in its territory.

It is beyond doubt that the term 'Tatars' was widely spread in Ulus of Jochi itself. In particular, the rulers of post-Golden Horde states are known to have used it a lot.

Crimean khans even included the phrase 'great monarch and great khan of the innumerable Tatars' (*sansız küp tatarññ... olug padişahı wä olug xanı*) into their title [Materials, 1864, p. 2, 13, 26, etc.]. Sources in Turkic languages and in Russian dating from the 15–17th century primarily used the term for its social aspect to denote a military service class, mostly nomadic life (for more information on this issue see: [Izmaylov, 1993, pp. 17–32]). For example, the intitution of some Crimean rulers contains the term *çirü* (army) as a synonym for Tatars [Materials, 1864, p. 228, 238, 245, etc.]. The initial ethnonym 'Tatars' initially acquired a social meaning back when the Jochid state existed, which is represented in the 13–16th century Arab sources.

§ 3. The Formation of the Medieval Tatar Ethnos*

Iskander Izmaylov

The Mongol Conquest: The Tatars in Asia and Europe. The Mongol invasion that swept through Asia and Europe in the first half of the 13th century very nearly put an end to the old way of life in the civilised world. But as ambitious as they were, the campaigns of Chinggis Khan and his descendants apparently did not

cause any new nomadic tribes to move to East Europe or to the Near East on a mass scale. Yet it was the campaigns themselves that enabled the Chinggisid to establish their empire and determined the frequent use of the 'Tatar' ethnonym.

When the ethno-political structure of the Golden Horde state was formed, the old principles of tribal order were gradually eradicated. The large-scale conquests by Mongol khans,

* The paragraph is written with the participation of D. Iskhakov.

the ruination of well-established customs, and the establishment of new empires within a very short period of time were a real shock to contemporaries. To quote Arab chronicler Ibn al-Nasir, who witnessed the events, 'the chronicles contain nothing similar or suitable' [Collection of Works Related to the History of the Golden Horde, 1884, p. 2]. They were also eager to find out what the mysterious newcomers were like. The first thing they learned was their name, 'Tatars', which learned European and Oriental authors tried to clarify using mythical and apocalyptic images inspired by John's 'Revelations' and further refined by Methodius of Olympus in 'Revelation'. Therefore, Christian authors viewed them as descendants of the legendary Gog and Magog (Christian) peoples, or the Yajuj and Majuj (Oriental), who were believed to have been forced to the end of the world by Alexander the Great. Europeans still tended to interpret their name as 'those who come from Tartarus', meaning hell, which the works by many famous historians of the 13th century (Methodius of Olympus, Roger Bacon, and others) etched into the public mind of many European peoples [Matuzova, 1979, p. 137, 148, 153, 157, 207; Drobinskij, 1948, pp. 125–127].

However, by the end of the 13th century, when Europeans had become more familiar with the life and history of the 'Tatars' thanks mostly to the travels of Christian missionaries to the courts of Mongol khans, scholars started to suggest more realistic versions of their origin. The first European monks who explored the vast Eurasian steppes to ally with Prester John's Kingdom or 'Great Hungary' against the Tatars, were surprised to discover that the Tatars were not the conquerors but the conquered, often a conglomerate of subjugated tribes and peoples. The following extract from a letter by Hungarian Franciscan monk Julian is characteristic. 'They do not hesitate to kill princes and noblemen who are likely to resist in any way in every country that they conquer. They give arms to combat-fit warriors and country people and force them to fight ahead of them. Those country people who cannot fight have to cultivate land... and go by the name of Tatars ever after' [Anninsky, 1940, p. 67]. Another traveler, Giovanni da Pian del Carpine, who

accompanied the Pope's embassy to the great khan's court in Karakorum, even titled his treatise 'History of the Mongols Whom We Call the Tatars.' However, he used the term 'Tatar' as denoting the group of conquerors that had become commonplace in Europe, while mentioning the 'Tatar country' to include many tribes [Travels, 1957, p. 57]. William of Rubruck, who probably relied on what Mongols from Karakorum had told him, wrote that they 'are reluctant to call themselves Christian, and willing to raise their name, that is, Moal, above any name; they will not call themselves Tatars either, because the Tatars were a different people' [Ibid., pp. 114–115]. What he had found out about the Tatars was that they were a tribe living near the Mongols that favoured Chinggis Khan's promotion, as he 'always sent them ahead..., so their name spread because everyone would shout, "Tatars are coming." However, almost all of them have been killed in the recent frequent wars. This is why the Moals want to eradicate that name and raise theirs' [Ibid., p. 116]. This report became quite popular in Europe. As evidence of this fact, a number of historico-geographical works, including by R. Bacon, cited this almost exactly [Matuzova, 1979, pp. 189–234]. Later, at the end of the 13–beginning of the 14th century, a number of merchants and Catholic clergymen visited Mongolia and China, and described their impressions, including reports by Marco Polo, John of Montecorvino, Odoric, and G. Marignoli [After Marco Polo, 1968; Book of Marco Polo, 1990]. The most accurate and meticulously detailed of them, Marco Polo's memories, were widely referred to by politicians, merchants, and cartographers until the 16th century [Gol'man, 1988, pp. 24–28]. However, he often applied the term 'Tatars' to all citizens of the Chinggisid empire, provided that this is not the correction of scribes or later interpolations. Yet it is clear, in any event, that even those Europeans, who were well aware of what life was like in the Mongol Empire, called its citizens 'Tatars' rather than 'Mongols', as apparently was the custom.

Armenian historians who also had extensive knowledge of Transcaucasian conquerors, distinguished between the 'Tatars' and the 'Mughal Tatars', the latter being defined as a tribe

Belt accessory set. Ukek. 13th century.
(according to L. Nedashkovsky)

'of Khazars, Huns, Gatians, Ankitans, and many other barbarian tribes, also sometimes termed 'the people of archers' [Gandzaketsi, 1976, pp. 152–182; Galstyan, 1977, p. 166].

As utterly conservative in their content, Byzantine historiographers associated the new conquerors' name with those of Asian tribes known since antiquity, though the similarity was vague and apparently merely phonetic. For instance, a contemporary of the Mongol conquest named Georgius Pachymeres (1242–1310) always called Mongols 'Tokhars': 'The Tokhars, colloquially termed Atars, flow across Persia like a rapid torrent' [Lebedev, 1944, p. 92]. Thus, he was guided by the principle of identity when he traced the Tatars' origin back to the ancient Tokhars, whose actual ethnic roots and relation to the Mongols he certainly had no clear evidence about [Uspensky, 1992, pp. 194–202].

Arab and Persian authors often called them 'Mongols' (Rashid al-Din, Juwayni) and 'Tatars' (especially Ibn al-Athir and al-Nasawi), be-

tween which they often distinguished. Hulaguid court historian Rashid al-Din, who was well aware of the situation in Central Asia before the era of Chinggis Khan, wrote that 'They (the Tatars) were the patrons and rulers of most of the (Mongol) tribes and areas most of the time in ancient times, outstandingly powerful and venerable. Because of (their) extreme greatness and out of enormous respect for them, other Turkic clans were known under their name despite all the differences in their ranks and names. They were all referred to as Tatars. This is why all Turkic tribes have been known as Tatars in Khitai, Hind, and Sind, Chin and Machin, in the Kirgiz, Kellar, and Bashkir country, in Desht-i Qipchaq, in areas north of it, those inhabited by Arac tribes, and in Syria, Egypt, and Morocco (the Maghreb) [Rashid al-Din, 1952, I, 1, pp. 102–103]. However, the Tatars became less influential in the early 13th century, while Mongol clans who supported Chinggis Khan came to dominate the steppe [Ibid., p. 102; II, p. 63 et seq.].

Russian chronicles and other written records, unlike sources in other languages, refer to the Mongol khans' troops nearly exclusively as 'Tatars'. 'Strangers came... godless people of Moab, known as Tatars. Nobody knows who they are or where they come from, and what language they speak, and to what tribe they belong, and what their faith is. They go under the name Tatars; others call them Taurmens, Pechenegs [Complete Collection of Russian Chronicles, 1, p. 463]. It would be reasonable to assume that the chronicle wanted to associate the new conquerors' name with the traditional terms for Turkic steppe peoples. But in fact, this is not rational knowledge on an existing ethnos, but rather an irrational image of it inspired by the apocalyptic literature the author of the Novgorod Chronicle introduced, emphasising that '...others, such as Bishop Methodius, say that they come from the desert of Eritrea, which is between the east and the north. According to Methodius, they will appear after the end of the world, and conquer the entire land from the east to the Euphrates and from the Tigris to the Pontic Sea, except Ethiopia' [Complete Collection of Russian Chronicles, 3,

p. 61]. That is, it is not the actual ethnic affiliation and tribal composition of the conquerors, but their position in his mental map and the Biblical genealogy of peoples that was important for the Russian chronicler.

Synchronous Chinese sources mention both the Tatars and the Mongols. 'Meng Da Bei Lu' ('Complete Description of the Mongol-Tatars') indicates that the Chinese termed the conquerors 'Tatars' or 'Tatar-Mongols', which included not only Mongol but also Turkic-speaking and even Manchu-Tungus tribes [Meng Da Bei Lu, 1975, pp. 92–94]. It is beyond any doubt that in this case Chinese historiographers traditionally extended the common term 'da-da' ('Tatars') to the Mongols (*meng gu ren*) as a pejorative name with the connotation of 'wild', 'brutal' [Dalai, 1983, p. 63]. It is also characteristic that the term 'Tatar' here was definitely supra-ethnic and referred not to the ethnic Tatars, but to all non-Chinese conquerors. At the same time, the official Yuan term for the Mongol dynasty was 'the ruling dynasty' (*go chao*), while the Mongols were referred to as 'the people of the ruling dynasty' (*go chao ren*), meaning the elite descendant from Mongol clans.

An analysis of the written sources indicates that the ruling nobility of the Great Mongol State (the Yeke Mongol Ulus) preferred to refer to itself as 'Mongol' [Meng Da Bei Lu, 1975, pp. 92–94; Munkuev, 1977, pp. 378–385; Mikhaylov, 1993, pp. 179–198]. According to Rashid al-Din, a number of tribes 'like the Jalairs, the tatars, the Oirats, the Onguts, the Keraites, and Tanguts, and others, each of whom had a name of its own and a nickname—they all take pride in calling themselves Mongols, though they would not accept the name in ancient times [Chinggisids, 1952, I, 1, p. 102]. The name 'Tatars' apparently referred to the remnants of conquered peoples gathered together to form special troops. It is possible that most of the multi-tribe detachments were transferred to Ulus of Jochi, as there were as few as 4 Mongols proper, while the rest came 'from Russian, Circassian, Kipchak, Majar, and other troops that joined them' [Ibid., p. 275]. As Ulus Jochi expanded, its military and administrative system grew like a snowball to include new contingents from Central Asia, as well as

local Turks who had already been included in the new army and clan system. Undoubtedly, the Mongols had close contacts with the Turks, who were a part of their state and participated in the Chinggisids' conquest when the empire's initial core was first being formed. The Turks probably enjoyed the greatest influence in Ulus of Jochi, where part of the Tatar, Kungrat, Naiman, Uighur, Kangli and Ongut tribes constituted a large part of the Golden Horde [Bregel, 1982; Kadyrbayev, 1993].

At the same time, many scholars have noted that the search for archaeological 'traces' of the Mongol-Tatars in East European steppes, which began back in the early 20th century [Spitsin, 1927] and continued into its latter half, [Zyablin, 1955, pp. 83–96; Fedorov-Davydov, 1966, pp. 150–160] resulted in the conclusion that such evidence is extremely scant [Yaminov, 1997, pp. 66–69; Kostyukov, 1997, pp. 11–12] and that the 'Mongol ethnic component—the Mongol cultural and historical layer—can hardly be observed in nomadic complexes on the basic territory of the Golden Horde. As an exception, some women's burials contain *bocca* headgear. Ethnic attribution for men's burials is challenging even where the costume and weapons are traditionally 'Mongol' [Kramarovskiy, 1989, p. 259].

This might be shocking to advocates of the so-called archaeological ethnogenetics, who tend to view the ethnic process as a mechanical interaction, or a diffusion or combining of elements of archaeological cultures (that is, some 'ethnic' or 'ethnically diagnosing' traits) because the result is counter-intuitive. The formation of the medieval Tatar ethnos in the Golden Horde is in direct contradiction to the analysis of the findings of archaeological evidence. Archaeologists and historians suggest two different ways in which the problem can be solved. Some believe that because the archaeological situation in the steppes of East Europe and Central Asia was largely unchanged, the area remained home to Kipchak tribes 'in disguise'—so the Mongols and Kipchaks in the Golden Horde were known as 'Tatars', though they mostly preserved their previous ethnonyms [Gumilyov, 1993, p. 47; Khalikov, 1985, p. 16; Pletneva, 1990, pp. 185–188], while some his-

guistic stages. The issue of ethnicity in Desht-i Kipchak should not be reduced to the mechanical ratio of Tatars, Mongols or Kipchaks, and their cultures and languages. It consists of the nature of the ethno-social and ethno-cultural processes taking place in Ulus Jochi in the latter half of the 13th century, a climax of which was the establishment of a new ethno-political order and adequate identity structure.

Even though Tatars and Mongols were apparently few in number in the East European steppes, the establishment of Ulus of Jochi and the development of its social structure completely changed the ethno-political situation in the region. The society and its clan composition became notably different, while the economic order was preserved [Izmaylov, 1993, pp. 22–24]. The previous Kipchak tribal organization that relied on kinship and the power of clan leaders was replaced with a military administrative system based on personal loyalty to the new rulers [Golden, 1992a, pp. 291–293].

Meanwhile, a number of historians believe the Kipchaks to have assimilated the Mongols rapidly, an assertion they often evidence with quotes from the mid-14th century Arab historian al-Umari: 'The land overcame their (Tatar) origin and race, and they all became like the Kipchaks, as if they descended from the same clan, because the Mongols (and Tatars) came to live in the land of the Kipchaks, married them, and stayed in their land' [Collection of Works Related to the History of the Golden Horde, 1884, p. 235]. According to many historians and archaeologists, this text sample explains why 13–14th century archaeological materials are so similar to earlier pre-Mongol materials. Speaking in ethnic terms, this proved the Kipchak ethos, which only assumed the conquerors' ethnonym, was preserved [Pletneva, 1990,

torians believe that the population of Ulus of Jochi did not use the ethnonym 'Tatars', which they view as a European exoethnonym [Alishev, 2000, pp. 52–59]. But the ethnic disguise theory, which is appealing and easy to understand, still fails to answer the main question: How and why did the Mongols and the Kipchaks replace their ethnonym with that of the Tatars? Another approach to this issue relies on the same idea that ancient Kipchak culture remained unchanged in the pre-Mongol and Golden Horde time, suggesting that the Tatars were Turkic-speaking and constituted a large part of the Kipchaks, who had moved to the Northern Black Sea, Don River Region, and Trans-Volga Region, from Central Asian. The Tatar conquerors were so closely related to the Kipchaks in terms of culture and language that they assimilated without a trace [Fakhrutdinov, 1992, 55–57 b.; 1993, pp. 9–11; 1993a, pp. 6–14]. In both cases, scholars tend to apply quasi-ethnological methods to ethnological problems, replacing the analysis of medieval ethnic processes with research on the correlation between the archaeological and ethnic features for different time periods and the lin-

pp. 186–187; Yaminov, 1992, pp. 226–227]. Another sample from a work by Mamluk Sultan al-Melik al-Nasir's secretary is viewed as the *ultima ratio* in the system of evidence. However, the text suggests that the author explained why slaves brought from Öz Beg's land to Egypt remain as good as they had been before, but does not describe the Mongol's assimilation with the Kipchaks. The medieval author attributed this to 'nature', which caused the Tatars to assume the beautiful physical and moral qualities previously characteristic of Kipchaks. Al-Umari obviously was guided not only by geographical determinism but by political intentions, as this passage not only constitutes an elegant ending to a long praise of the virtuous Kipchaks as saviours of the Muslim world, but presents another argument of why Kipchak Egyptian rulers and the conquerors of Desht-i Qipchaq maintained friendly relations [Kostyukov, 1999, pp. 165–166; 2004, pp. 227–230].

The actual situation in Desht-i Qipchaq was in fact far from the idyll portrayed by the Egyptian historian and today's archaeologists. The Mongol conquest not only destroyed states and peoples, but also forced them into the military and administrative system established in Ulus of Jochi. As nomadic, in particular Kipchak, tribes were included in the Mongol ulus and clan structure as dependents, the old clan elite was exterminated or forced out of the land. Mass tribe migration followed, and old clan relations decayed [Fedorov-Davydov, 1973, pp. 35–43; Pletneva, 1990, pp. 182–184]. In fact, old clan and tribal structures, tribal cults and traditions had already been abolished during the Mongol conquest and the territorial military administration and accommodation principle was introduced. New uluses and clans were now established to include fragments of Kipchak-Kimak tribes. Archaeological records discovered in Northern Eurasia provide a clear insight into these events. The Kipchak tradition of erecting stone sculptures started to decline in the 14th century, and the number and diversity of burial complexes decreased dramatically. New types of ceremony, as well as those combining old the old styles, appeared as well [Fedorov-Davydov, 1966, pp. 166–193; Kramarovskiy, 1989, pp. 255–273; Kostyukov, 1997].

It was probably then that the old clan and tribal Kipchak ethnonyms ('Burcheviches', 'Toksobiches', 'Yetebich'es, 'Kolobiches', etc.) fell into disuse in the central part of the Eurasian steppes, which turned into the urans of medieval Tatar tribes [Däftäre, 2000, pp. 18–21b], and place-names [Iskhakov, 2002a, pp. 60–67], while new Mongolian names appeared ('Manghit', 'Jalair', 'Baryn', 'Naiman', 'Arghyn', 'Shirin', 'Kiyat', etc.) [Sultanov, 1982, pp. 7–51; Kostyukov, 1998, p. 219]. At the same time, a very small part of the Kipchak and Oghuz-Pecheneg clans were able, apparently in the east of Ulus of Jochi, to enter the new ethno-political system, though in a now-changed form, like Usun—Yushun, Uighur—Yugur. However, rare exceptions prove the general rule: the old Kipchak clan and tribe system now ceased to exist. Even though the term 'Desht-i Qipchaq' still applied to East European and Volga Steppes, as Persian sources suggest, it gradually lost its ethnic definition in the 13–14th century and acquired the meaning of a territory within the Jochid state [Arslanova, 1990, pp. 13–14].

Scholars have often attempted to challenge the idea that the Kipchaks assimilated with the Tatar-Mongol clan and tribal system. The key argument against it as formulated by V. Kostyukov is that the Kipchaks could not have become Kungrats upon entering the Kungrat clan, while the name of the Kipchak clan directly indicates that the former tribal name was preserved—which were 'probably the lucky inhabitants of the small part of the steppe that the Mongols kindly left to its previous masters' [Kostyukov, 2004, p. 239]. The same author believes that Mongol ethnonyms would have been completely dominant if they had been imposed by force, and Mongol tribes would have become the largest ones, which he thinks did not happen. So why did the Jochids register the Kipchaks as Mongols or allow them to do this? He is confident that it is unlikely that 'Turkic clans and tribes replaced their names with those of Tatar and Mongol clans or tribes, and adjusted their genealogy, causing their ancestors to slide into oblivion'. [Ibid., p. 240].

As these doubts are quite serious, the challenging arguments deserve more than just a passing mention. Firstly, there is evidence that

Mongol ethnonyms were hardly used in Ulus of Jochi. It should be noted, however, that we have to compare the early 18th century ethnonyms in Mongolia and those of the nomadic Turks of the Aral Sea Region in the 15–17th century [see: Sultanov, 1982]. Unfortunately, there is no other data. However, it is entirely possible that the ethnonymy of Ulus of Jochi was adequate to that of 13th century Mongolia. As for the ethnonym 'Kipchak' and whether it refers to the 'lucky inhabitants' of the steppe fringe, the very existence of such a fringe is dubious. In addition, the term 'Kipchak' was not a self-designation of any clan or tribal groups in the Eurasian steppes, but rather an exoethnonym. Therefore, it most probably originated with a Turkic thousand, for instance, in the Irtysh River Region, which was included in the military and administrative system of Ulus of Jochi. No tribe of this name is known to have existed in the 12th century.

Secondly, why would the Jochids qualify Eurasian Turks as belonging to Tatar-Mongol clans? The obvious answer seems also to be the most accurate. They severely lacked the military force to conquer the west, so they had to refill their army with members of subordinated peoples. In fact, the medieval military system was inextricably connected with the administrative system, and that of the Chinggisid states was one and the same with the clan system because troops were divided into wings, tumens, thousands, and hundreds even during times of peace. It was not entire Kipchak tribes, but groups of the tribute-paying population, regardless of their clan and tribal affiliation, that the system operated. Before new thousands and Turkic-Mongol clans included the survivors, the old Kipchak tribal structure in the steppe was ruined, and the Turks exterminated, scattered, and depopularised. Why did this occur? It could be said that it was for the sole purpose of ensuring loyalty and complete subjugation, as the initial conquerors were very few in number. In addition, the Jochids could not think of another approach to newly conquered territory unless it was a sedentary agricultural country. By dividing the newly conquered land into wings and uluses, khans assigned

their subjects' land plots to representatives of the 'altyn urug', who in turn divided them into thousands, which they then granted to related clans for further sub-division into hundreds, etc. Expanding their domain and establishing new thousands steppe by steppe in this manner, the Jochids and Tatar-Mongol clans supported them 'processing' the steppe population into loyal subjects and brothers-in-arms. On the battlefield, they shouted the urans of their new commanders, who remained their suzerains.

Thirdly, what caused the Kipchaks to forget their ancestors? Strangely, there is no pre-Mongol clan or tribe name among hundreds of such names pertaining to 15–17th century Turks in the Aral Sea Region. This might be viewed as an unfair turn of events in history, but facts are stubborn even when we do not like them.

In addition, the Kipchaks failed to preserve their tribal system and ethnonymy even when their identity remained basically unchanged in India, Egypt, Hungary, and China. Furthermore, in Egypt the name Toksoba had to be specified as 'of the Tatar people' as early as the early 14th century. This proves that the Kipchaks did not perceive themselves as such while their identity was maintained by the tribal nobility. But it turned to dust as soon as the aristocracy was eliminated. However, there can be no population without authorities and a nobility, a type of special identity. In Ulus of Jochi, these functions were performed by clan solidarity and a Tatar ethno-social and ethno-political identity. At the very least, this conception of events in Ulus of Jochi is consistent with all the facts. A description of how this identity formed and became manifested as actual self-perception is provided below [Izmaylov, 2002, pp. 244–262].

Regardless of any other facts, a large part of the population, especially the aristocracy, wanted to be integrated into the new social system considering the decay of the tribal system and clan relations, as well as aberrations in identity. In the Desht-i Qipchaq steppe, where the Kipchak tribal structure collapsed and the steppe population, held together by the Mongol ethno-political system and the ethno-social structure of Turkic-Mongol clans, was undergoing re-consolidation, Tatar became the gen-

eral ethnonym. To prove this, Rashid al-Din wrote, 'the Tatars are so powerful that... (now) in the country of the Kirghiz, the Kelars and the Bashkirs, in Desht-i Qipchaq, and north of it, in territories inhabited by Arab tribes, Syria, Egypt, and Morocco, all Turkic tribes are called Tatars' [Rashid al-Din, 1952, I, 1, p. 103]. A layer of new elements in Central Asia that originated with Khitan-Jurchen art, which was mostly connected with new imperial state administration traditions (metal paizas, Jochid coins, etc.) and the Chinggisiid chivalry (belt decorations, weapons, munitions, ornamented horse harnesses, etc.), represents this process in ethno-cultural terms [Kramarovskiy, 1989, pp. 260–264; Крамаровский, 1999, pp. 38–46].

It is also possible that some subordinated peoples that assumed the 'Tatar' name and the ruling Mongol dynasty were somewhat mutually hostile. Khans might have supported these sentiments at the early stage of the development of Ulus of Jochi to justify their separatism. Indeed, this might be the reason why in the 14th century the term 'Tatars' was wide-spread only in Ulus of Jochi, while other parts of the empire began to use new ethnonyms, such as the 'Chagataids' (Middle Asia, Khorasan) and 'Moghols' (Eastern Turkestan, India) [Clavijo, 1990, p. 72, 143–146; Bartold, 1964, pp. 35–36, 49].

To sum things up, in essence it was not the Kipchaks who assimilated the Mongols, but the new Tatar or Turkic-Mongol clan system that was able to include the Kipchak, Bulgar, Magyar and other peoples, and impose a new ethno-political identity on them—along with a new ethno-social one on their elite.

Ulus of Jochi: a Tatar or Mongol State?

Some recent studies and popular scientific works, as well as textbooks in Domestic History for primary schools [Grigoriev, 1987; Grigoriev and Grigoriev, 2002; Egorov, 2003; Russian History, 1999] define not only the Mongol Empire, but the Golden Horde (Ulus of Jochi) that stemmed from it, as 'the Mongol State'. On the one hand, this should be interpreted as the Moscow historians' response to the public Tatar aspiration to cast off the

A Warrior's Burial. Southern Urals.
Early 14th century (according to V. Ivanov)

label of those who established the cruel 'Mongol-Tatar Yoke' in Russia, an aspect that Soviet textbooks traditionally emphasised [Iskhakov, 2003; 2004b]. On the other hand, some historians, in particular academicians, have been trying to revivify the idea that modern Tatars are by no means descendants of the Golden Horde, thus excising that stage of their ethnic life on the pretext of eradicating the negative stereotype in Russia. To prove this, the high school textbook 'History of Russia from Ancient Times until the Late 16th Century' by the Institute of Russian History of the Russian Academy of Sciences, tends to term the Golden Horde simply the 'Horde', and its politically dominant population, the 'Horde people', which is sometimes replaced by 'Tatars' [History of Russia, 2000, p. 253]. This all represents a return to the ideas that appeared in the 1940s, as the imperial ideology in its Soviet form reigned in the USSR [Izmaylov, Gibadullina, 1996, pp. 96–114; Iskhakov, 1997, pp. 194–205]. This is why the ethnic labeling of the Golden Horde name, an issue that is closely connected with the es-

Burial from a burial mound of the Tlyavgulovo Burial Site. Southern Urals. Late 13–early 14th century (according to V. Ivanov)

establishment of a medieval Tatar community within the state, is a separate point.

The theory that Golden Horde sources had other terms for the country other than 'the Great State' (*Ulug/Olug Ulus*), as it is called in Khan Tokhtamysh's letter to Jagiello (1393) [Berezin, 1850, p. 66; Grigoriev, 1987, pp. 40–41], such as 'the Mongol State', is primarily associated with Russian historian A. Grigoriev. Thus, we must analyse the expert's evidence in order to shed light on the problem.

To start with, no information is available on any ethnic names for Ulus of Jochi used in the 13th century. The sole genuine letters issued by Khan Mengü Temür to Metropolitan Cyril in 1267, which have only made it to our times in a Russian translation, can not be considered representative [Ancient Russian Vivliofike, 1891, p. 196; Records of Russian Law, 1955, III, pp. 467–468]. However, A. Grigoriev assumed in an early work that the word 'lyudskim' (the Russian for 'those of the people') in the yarliq, which he believed to mean 'to

the baskaks and princes', actually meant 'ulus' as 'people' or 'country', yielding the Russian adjective 'ulusnyj' (that of an ulus) [Grigoriev, 1987, p. 42]. His further speculation went as follows: medieval Russian authors did not know the ethnonym 'Mongol', so they always replaced it with 'Tatar', meaning that the Mongol Empire was formally called the Great Mongol State (*Yeke Mongol Ulus*, Turkic: Ulug Monkul Ulus in the former half of the 13th century). It was not just an ulus, but the Mongol Ulus, that is, the Mongol state and what Mengü Temür's yarliq referred to [Ibid., pp. 39–40, 42]. However, he abandoned this idea in his later works, stating that the Russian editor interpreted the term as 'worldly, secular', meaning 'civilian darugha princes', so the entire phrase thus meant 'cities and settlements of darugha princes' [Grigoriev, 1990, p. 76; 2004, pp. 24–25]. Thus, there is no evidence that authentic sources applied the term 'ulus' to Ulus of Jochi in the 13th century, not to mention an ethnic definition. This is attributable to the condition of the sources.

The situation changed in the 14th century. Apart from the term 'Ulug Ulus', which appeared, as has been mentioned above, at the end of the century in Khan Tokhtamysh's letter written in Turkic using the Uighur alphabet, the ethnic label of the state-organized 'people' of the Golden Horde is represented in two groups of yarliqs by Golden Horde rulers, namely those issued to Russian metropolitans and to Venetian citizens (translations into Latin and the Venetian dialect of Italian have survived) [Ancient Russian Vivliofike, 1891; Grigoriev and Grigoriev, 2002; Grigoriev, 2004]. In both cases it is challenging to interpret the translated terms, including those suggestive of the ethnic label attached to the 'state people'. For instance, the 1357 charter by Khan Berdibek, almost identical to that of Taidula (1351), as well as a somewhat more recent yarliq by Khan Muhammad Bulak (1379), contains the phrase 'to the Tatar ulus and army princes', which also includes other administrative positions in the Golden Horde [Grigoriev, 2004]. The charters that have reached us in Russian were initially written in Turkic using the Uighur alphabet

[Ibid., p. 210, 214]. The phrase 'Tatar ulus and army princes' is curious because its equivalents in Khan Janibek's Venetian *yarliq* (1374) and that of Khan Berdibek (1358) are 'Allo puouolo di Mogoli' [Grigoriev and Grigoriev, 2002, p. 89], and 'del pouolo deli Mogoli' [Ibid., p. 131], respectively, which are literally translated as an address, as is the phrase 'to the Tatar ulus and army princes', a state-organized 'people', in this case, 'to (the entire) Mongol (Moghul) people', structured into various levels of power [Ibid., p. 89]. Therefore, A. Grigoriev was correct in inferring that the element 'to the people of the Mongols' is equivalent to [to the Tatar ulus (people)] [Ibid.]. However, the author's further conclusion that the phrase 'to the people of the Mongols' should be interpreted as 'the formal name of the Golden Horde, which appeared in the genitive case in the original texts of *yarliqs* by Golden Horde and Crimean khans, 'of the Mongol State' [Ibid., p. 90], invokes objections.

Firstly, the *yarliqs* only contain the phrase 'Great ulus' (Ulug Ulus) [Usmanov, 1979, p. 63], and to identify it as an equivalent of 'the Mongol State' was merely a highly disputed finding of A. Grigoriev's quite dubious reconstruction. Secondly, both the Golden Horde *yarliqs* surviving in Russian and in Latin and Italian are translations using terminology not of the authors of the Turkic (sometimes polylingual) original, which was in some cases also translated into a mediator language like Persian [see: Grigoriev and Grigoriev, 2002, p. 89, 92], but of other ethnic and linguistic environments. This brings the problem to light of taking into account the latter's view on the categories translated, in particular those dealing with ethnic nominations. A. Grigoriev faced this issue when analysing the *yarliq* by Muhammad Bulak (1379), which was originally written in Turkic. To quote him, '...we cannot restore the country's name in its form used for the documents executed in Mongolian (which are, in fact, also reconstructions.—I.I.); the name of Ulus of Jochi in it was different (that is, not 'the Mongol Ulus'.—I.I.). The editor of the compilation of Russian translations apparently unified the beginning of the *yarliq's* address form,... adjusting it to the text of Ber-

dibek's *yarliq*' [Grigoriev, 1987, pp. 42–43]. As we can see, the scholar had to limit himself in his assumptions when speculating on the actual name of the state or state-organized people represented in the 1379 *yarliq*. To make the situation even more complicated, we are dealing with the editions of the so-called collection of khans' *yarliqs* to Russian metropolitans, one of which is dated from the first half of the 15th century and a more recent one, dated in the 1540s, which was subjected to editorial changes [Zimin, 1962, pp. 29–40]. To prove this, the phrase 'Tatar ulus (people)' in the 1351 *yarliq* by Taidula and the 1379 one by Khan Muhammad Bulak are replaced by 'Golden Horde (and) ulus (people)' [see: Ancient Russian Vivliofike, 1891, p. 193, 195; Grigoriev, 1842, p. 118, 122]. Even though the phrases are synonyms, this cannot but raise the question of which form is the original. But it is not easy to answer this question because the editors of the former half of the 15th century and that of the latter half of the 16th century might have had different ideas of the above category. How can we find out the meaning of the corresponding places in the Turkic (probably Mongol) original? This was apparently the reason why the editor of the collection of *yarliqs* issued by Tatar khans to Moscow metropolitans A. Zimin preferred to interpret the phrase 'Tatar ulus (people)' in the Golden Horde documents as a translation of the term 'Great Ulus' [Records of Russian Law, 1955, III, p. 473], and not the 'Mongol State', as suggested by A. Grigoriev.

On the other hand, the phrase 'the (entire) people of the Mongols' (*allo puouolo di Mogoli; del pouolo deli Mogoli*) in Venetian sources is not so simple to interpret because we cannot neglect the possible influence of the translators' own ideas. The fact that 'the people of the Mongols' are even mentioned in the sources is in itself unusual. For instance, the Venetian Marco Polo, who spent a long time living among the Mongols in the 13th century, almost always applied the ethnonym 'Tatars' to both the population of the Mongol Root yurt and Ulus of Jochi [Carpine et al., 1997, pp. 194, 197, 232]. Other 13th century European authors (Giovanni da Pian del Carpine, William of Rubruck, etc.) also tended to use the term although not always in a

consistent manner [Ibid., pp. 30, 43–44, 92, 114, 117, 129, etc.; Christian World, 2002, pp. 99–100, 142–144; Yurchenko, 2002b, pp. 108–109, 113, etc.]. A document of Golden Horde origin suggests that the Venetians had ambiguous terminology for the population of the Golden Horde in the 14th century as well. In particular, the Italian translation of Janibek Khan's *yarliq* (1347) contains the following beginning phrase in Latin: 'In nomine Domini et Maomethi, profete Tartarorum' [Grigoriev and Grigoriev, 2002, p. 87]. While the first part of the phrase, as A. Grigoriev and V. Grigoriev rightfully noted, is a theological form of the translated Quranic formulas [Ibid., p. 87], the ending should be translated as 'in the name of God and Mahomet (Muhammad) the Tatar Prophet'.

That is, the translators of the Golden Horde *yarliq* actually understood the Turkic population of the Golden Horde, including its politically dominant clan-structured stratum, as 'Tatar' in the 14th century. Thus, the 'people of the Mongols' and 'the people of the Tatars' (represented by 'Tatar ulus (people) and army princes' etc.) is the same. By the way, the *yarliq* issued by Öz Beg Khan to the Venetians in 1332 is titled *Pactum Venetorum cum Husbecho imperatore Tartarorum* [Grigoriev and Grigoriev, 1990, p. 81]. It is possible that the publishers of the document referred to old archive inventories for the title, as the *yarliq* is kept among the proceedings of the Venetian Assemblies in the *Commemoriali* series. Anyway, the term *Tartarorum* means the same here as it does in the 1347 *yarliq* of Janibek.

Analysing the content of Khan Öz Beg's 1332 *yarliq* to the Venetians, A. Grigoriev and V. Grigoriev arrived at the conclusion that the phrase 'populi Venetorum' in it denoted 'the Venetian people' as an ethnic community [Ibid., p. 91]. If they were right, the term 'pouolo deli Mogoli' ('the people of the Mongols') denotes a similar community in the Golden Horde. It can also be labeled as 'the people of the Tatars' as has already been shown above.

This is why the 'Great Ulus' (Ulug Ulus), if only it can be interpreted as denoting the 'Mongol State', could just as well be translated as the 'Tatar State'.

The Tatars as an Ethno-Political and Ethno-Social Community

When the Jochid empire was flourishing, its cities were developing and an exuberant syncretical culture were forming, while a generally understandable urban koiné and literary language appeared (the 'Volga Turki'), the military feudal aristocracy was being subjected to an intense mixing, and the medieval Golden Horde-Tatar ethno-political community began to emerge. Although the consequences are well-known, the question of how the ethno-political transformation actually worked remains under-studied. However, contemporary ethnological studies and an analysis of the specific medieval mindset suggest that ideological reasons, such as the introduction of a new Jochid ethno-political identity, played a key role in these processes.

One of the historical phenomena arising where religious, political, and ethnic processes overlapped in the Golden Horde period is, beyond any doubt, the development of the Chinggisism ideology as a political cult of Chinggis Khan and his descendants, primarily his son Jochi. Its formation and development is not only representative of how unique this epoch was but demonstrates trends in the development of the ethno-political identity of the population of Ulus of Jochi. It is in fact the formation of a mythologem system with the cult of Chinggis Khan at its core that marked the profound processes and mechanisms of the emergence and development of Tatar ethno-social identification.

It is quite difficult to trace authentic changes in these matters and how they acquired new elements because only more recent interpretations and fragments of the state historiographic tradition of Ulus of Jochi have become available to us. Some scholars are even inclined to deny that any Golden Horde historiography actually existed. They believe that 'Chinggis-name' and other similar works were not part of the historical tradition of Ulus of Jochi but a 'steppe oral historiography' [Yudin, 1992, p. 25]. However, the tradition was not oral because it also existed in literary works by

court historians, who naturally referred to oral narratives without limiting themselves to them. For instance, Ötemish Hajji wrote in 'Chinggis-name' (16th century) of 'chronicles that... (he) has seen...' [Ötemish Hajji, 1992, p. 90], thus indicating that there existed a written historical tradition. It was not specifically steppe either as it existed in cities, in particular, in the Golden Horde khans' court. The ratio of oral historical narratives to historical traditions is also a complicated issue. The surviving texts are quite homogeneous, suggesting an influence of the historical tradition of Ulus of Jochi on post-Golden Horde legends.

It is impossible to provide accurate information on who contributed to and when the independent history of the Golden Horde was founded. Its purpose was clearly to ensure greater legitimisation against other Chinggisid branches and create convincing arguments of the founder's unique qualities and natural greatness. In the 15–16th centuries, and probably even earlier, in the 14th century, the tradition that had become full-fledged by that time acquired a clear political and social meaning.

According to the historical tradition of the Golden Horde, Chinggis Khan is no saint or heavenly patron of the dynasty and state but rather a founding father of the state and its law ('Chinggis Khan's Yassa'), an 'eternal ruler', who only delegates his rights temporarily to other khans. It was within the ideological paradigm that the fundamental concept of an independent Ulus of Jochi and Tatar ethno-political unity formed, and parameters for the dynastic legitimacy, succession to power, and clan and social hierarchy were established. It was not before this united state dissolved that certain khanates and territories (the Kazan, Crimean, Öz Beg (Shibanid) Khanates, the Great and Nogai Hordes) developed new power symbols and legitimisation schemes adjusted to the local power structures, and a more intense influence of Islam and its introduction to these processes (glorifying certain branches of Jochi's offspring—the Toqa-Timurids and Shibaniids—and even non-Jochids, like Edigu's descendants, believing local saints to be patrons of various dynasties, etc.).

As Islam became ingrained in the society's mentality in the 14th century, traditional power mythologems were re-codified into the new concept system of islamised religious and political symbols within archaic ideas of the ruler's charisma in Ulus of Jochi. By adjusting the cult of Chinggis Khan and his son Jochi to Islamic values, the ruling dynasty of the Golden Horde became included in the Islamic system for sacralising and legitimising political power. The nature of this process in the historical tradition, which quite naturally took the form of 'intuitive political action', can be termed the 'Turkic-Mongol tradition within the Islamic paradigm'.

The most important elements of the tradition originated in the formal Mongol history of Chinggis Khan's clan, 'Altan Debter' ('Golden Notebook') [Rashid al-Din, 1952, 1, 2, p. 266]. Its characteristic narrative elements included a chronicle-type genealogy (both mythological—Chinggis Khan's descent from Alan Goa—and historical—Khabul Khagan and his descendants), brief biographies connected with genealogical narratives, 'small' plot forms (encomiastic, didactic, and other narratives), and a relatively unpronounced chronological narrative (often in the form of event recording). However, the historical part is largely focused on Chinggis Khan's life and deeds [Neklyudov, 1984, pp. 223–241; Shastina, 1977, pp. 462–483].

All Turkic genealogies are to some extent representative of the Mongol tradition. Indeed, its most complete description is presented in the Tatar historical collection of works dating back to the 17th century, 'Daftar-i Chinggis-name' [Ötemish Hajji, 1992; Ivanics, Usmanov, 2002], which contains nearly all elements of the narrative contained in the 'Collection of Chronicles' by Rashid al-Din, and those probably originating with it, including the mention of the founding mother Alan Goa (as *Alangu*). It is beyond doubt that part of the chronicle was borrowed directly and combined with other Tatar sources [Iskhakov, 2006, pp. 151–156; Izmaylov, 2006d, pp. 99–128]. It is unclear, however, whether this results from a more recent compilation or it is a surviving element of early Golden Horde historiography. At the same time, the source lacks one essential detail—the biography of Khan Jochi and

his descendants (except for Janibek, to which a dastan that was later remade is dedicated).

In Ulus of Jochi, this tradition developed more when the independent state was being formed. The predestined appearance of 'Chinggis Khan's altyn urug' and the transfer of power over part of the state (Ulus of Jochi) to his son Jochi, including 'Khwarezm and Desht-i Qipchaq from the Kayalyk borders to the most remote areas of Saqsin, Khazar, Bulgar, the Alans, the Bashkirs, the Uruses, and the Circassians, and as far as the Tatar horse's hoof reached, became its key element [Collection of Works Related to the History of the Golden Horde, 1941, p. 204]. Ötemish Hajji described this as follows, 'Jochi Khan was the eldest of his (Chinggis Khan's.—*I.I.*) sons. He gave (him) a large army and sent him to the wilayah of Desht-i Qipchaq, saying, "May this be pasture land for your horses." He (also) gave (him) the wilayah of Khwarezm' [Ötemish Hajji, 1992, p. 91]. Abu al-Ghazi provided a very similar description: 'Jochi, along with the nökers belonging to him, went to Desht-i Qipchaq. The Kipchak people gathered, and a battle took place. Jochi Khan defeated and killed (all) the Kipchak that he caught... The Kipchaks, who lived between the Itil and the Tin, scattered in all four directions... Having captured some Kipchak youth, Jochi Khan settled himself in the Kipchak yurt. He moved his family and all the ils that his father had given to him there from the Mongol country. People moved to the Kipchak yurt from every Öz Beg urug.' Jochi plays two parts here: the one who inherited Chinggis Khan's charisma, and the one who conquered the territory of Ulus of Jochi and established his country there. 'He had the throne as the khan and ruler of the countries' [Kononov, 1958, p. 44].

Emphasising Jochi Khan's investiture to rule Chinggis Khan's ulus is representative of the concept of noble origin, stressing dynastic relations that suggest charismatic qualities were believed to be inheritable, along with the sanctification of Jochi's and his descendants' power through the cult of the 'Rocker of the Universe'. Gradual saturation with Islamic elements (especially in the 15–16th centuries)

through short excursions (information about the acceptance of Islam by the khans Berke and Öz Beg, biographies of saints, etc.) and tracing khans' and karachibeks' (Edigü) origin back to the saint prophets was a developmental trend of the tradition. This tradition was gradually built in to an Islamic picture of the world and its historiography. Its closeness to folk and epic systems and clear localisation of each clan (microcosm) within the Jochid empire (macrocosm) favoured the dissemination of this tradition and its penetration into the public mind of the Turkic population [DeWeese, 1994, pp. 321–408]. The 'indigenisation' of the state's history emphasising its local tradition and origin was another trend manifested by including clan and tribe histories, local saints' biographies, and those of popular legendary and narrative heroes into state historiography.

Ulus of Jochi united a considerable number of Turkic-Mongol clans, among which a certain hierarchy, enshrined in historical tradition, was established. Their status depended on their relation to Chinggis Khan's clan. The establishment of the clan hierarchy, headed by the Juchids, in Ulus of Jochi was interpreted as not just founding a state but as a social creation to bring the macrocosm to order. The enshrinement of this historical tradition in written form and later in oral (folk) form made it generally recognised and legitimate. This historical tradition worked out a basic set of mythologema and became an ideological justification for the formation of a new ethno-political 'Tatar' self-consciousness. It eventually became most wide-spread among military service class aristocrats (highly Islamised) who were largely vassals to Jochids as members of their clan and ulus system and also often nomadic.

The establishment of a Jochid (Tatar) historical tradition had a major influence on the new mental universum and determined the solidification of Turkic peoples, as well as the formation of the Tatar ethno-political identity. After becoming independent of the Mongol Empire, Ulus of Jochi gained every opportunity to develop and build a state historical tradition of its own. After Islam became its formal religion, it could rely on the broad opportunities offered

by the Islamic historiographic and philosophical tradition as a source of new motives and symbols. Unlike those of a number of Turkic states with a vague social structure and underdeveloped state traditions, the Golden Horde's state ideology (a 'political theology') meant a boom in the Turkic-Tatar sense of identity. The paradigm was authoritative enough to dissolve less well-adjusted and weaker mythologems dating back to the previous epochs, or devour them, which determined the further development of the Turkic historical and political identities of the late medieval states and peoples of Eurasia for centuries. The medieval Tatar historical tradition was powerful enough to become part of other local traditions in various Tatar states in 15–18th centuries, after Ulus of Jochi dissolved.

Thus, the active formation of a military feudal aristocratic stratum and the establishment of material and spiritual symbols of imperial unity as well as a state ideology using both traditional (Turkic and Mongol) mythologems and Islamic ideas and symbols gave rise to a new ethno-political community in Ulus of Jochi that had an identity of its own. As the ethno-political structure of the society became more complex, the meaning of the term 'Tatars' changed, acquiring new semantic shades. In the 14–15th century, it became well-established as a polysemantic term denoting several basic categories of referents [Izmaylov, 1993, pp. 17–32].

1. *Ulus of Jochi (Golden Horde) as the Tatar state.* This is the meaning conveyed by Arab authors ('the state of the Tatars', 'the kingdom of the northern Tatars'), the Russian chronicles, European travellers [Complete Collection of Russian Chronicles, 1, p. 40; Egorov, 1985, pp. 152–153; Clavijo, 1990, pp. 72, 143–146], and the folk epic 'Edigü' [Edigü, 1990, pp. 121, 124–125]. The stable use of the country's name in various—including authentic—sources suggests that it conveys one of the country's names and refers to it and its people according to the Tatar ruling ethno-social elite. It should be emphasised that the data provided by a number of travellers [Barbaro and Contarini, 1971, pp. 140–157] suggests that they applied the term 'Tatars' to both nomadic and sedentary populations, either urban or rural.

2. *The Tatars as a military feudal aristocratic stratum.* Apart from said reports by Rashid al-Din and West European travelers and merchants, evidence for the semantic aspect of the term can be found in Arab sources reporting that a lot of Kipchak emirs, who are termed Tatars, arrived in Egypt during the rule of Baybars (1269–1277). In this same vein, an Arab philologist explained the name of the noble 'Toksuba' Kipchak clan as 'a tribe of Kipchak Tatars' (that is, 'a noble clan from Desht-i Qipchaq'), which was apparently typical [Nadjip, 1989, p. 86]. Historian Ibn Khaldun gave a similar definition: 'the Toksoba Tatar tribe' [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy', 1884, pp. 541–542]. It should be noted that as early as in the late 13th century, the name of one of the most famous Kipchak clans, even in an environment likely to use old ethnonyms a lot, had to be explained, suggesting that the new Tatar self-identification had replaced the old one, and this emphasised the clan's belonging to the nobility, which was more important then. These processes also took place in the sedentary areas of Ulus of Jochi, in particular Rus' and Volga Bulgaria. For instance, many native Russian princely and boyar clans began to include mythical Tatar murzas and princes in their genealogies. Of more importance, however, is the evidence contained in the dastan 'Edigü', which directly represents the ethno-political identity of part of the population of the Volga and Cis-Ural Regions in the 15–16th centuries, where the protagonist often boasts of his belonging to the 'glorious Tatar (Tat) clan' [Edigü, 1990, pp. 70, 108, 128, 135].

The early stage in the development of the military service class is described in sources dating back to the 13th century, when tribes subjugated by the Mongols became their vassals [Fedorov-Davydov, 1973, pp. 35–43]. For instance, the late dynastic history of the Khongirad describes their history and mentions them to have been 'accompanied' by a large group of 'other Turks' (probably Kipchaks) [Bregel, 1982]. However, a stratification took place in the existing tribes as the ulus system developed; the imperial military service aristocracy was established. Most likely, members were eager to use the socially prestigious name of

Tatar, evidence of which can be found, in particular, in Rashid al-Din's work. It is beyond doubt that it was the environment that gave rise to the special, supra-ethnic class knighthood culture, including similar types of weapons, horse harnesses, heraldry, and lifestyles and genealogy [Däftäre, 2000], one of the elements of which was their legendary descent from the Tatars [Kononov, 1958, p. 40; Edigü, 1990, p. 5]. Naturally, certain elements of the culture require dedicated research. It is clear, however, that the culture, as well as the self-designation 'Tatar', had a supra-ethnic nature that cannot be reduced to the ethnic and linguistic unity of its carriers in the 14–15th centuries and later on. This is all the more true because the khan's ruling elite of the Ulus remained Mongol and partially Mongolian-speaking until the mid-14th century [Collection of Works Related to the History of the Golden Horde, 1884, pp. 261, 396; Grigoriev, 1981].

The data suggests that the ethno-social Tatar identity was primarily based on their belonging to the military feudal class, Muslim civilisation, and typically nomadic lifestyle. This self-designation, which helped the Golden Horde's elite maintain its unity, did not disappear when the state dissolved but survived as a social term. It was then used to denote the military and service class nobility in the Volga Region until as late as the 17th century and occurs in Russian sources as 'serving Tatars'. An analysis of this reveals that it was not an ethnos but 'the feudal stratum of non-Russian (mostly Muslim Tatar) feudals', who viewed themselves as opposed to the duty-paying strata ('yasak Chuvashes' and 'yasak Tatars'), that contemporaries referred to [Ermolaev, 1982, pp. 63–67; Iskhakov, 1988, pp. 140–146; 1998, pp. 61–102].

3. *The Tatars as a nomadic, primarily Turkic-speaking people.* This usage of the term 'Tatar' is similar to the previous one, though it is more an exoethnonym than a word used for self-designation. The famous invective by Muhammedyar (mid-16th century), a well-educated Muslim poet, against the Tatars addresses not the ethnos but the nomadic livestock breeders, whose lifestyle the refined urban dweller found disgusting [Izmaylov, 1997b; Iskhakov,

1998, pp. 107–108]. In addition, the epic 'Edigü' contains several mentions of 'the Tatar people' as the population of the Golden Horde steppes [Edigü, 1990, pp. 124–125, 231]. In fact, nearly all European sources of the 15–17th centuries termed the nomads of the Black Sea and Volga Steppes Tatars, though it would be hard to distinguish between this meaning and the term denoting the entire population of Ulus of Jochi [Barbaro and Contarini, 1971, pp. 140–157; Herberstein, 1988, pp. 165–167].

It should be noted that to name a country and its people by the ruling elite or clan was common for medieval communities in Middle and Central Asia. The term 'Chagatai' denoting a state, the Ulus of Chagatai, and its nomadic nobility is representative of the custom [Clavijo, 1990, pp. 93–94, 106; Bartold, 1964, pp. 35–36, 49; Stroeve, 1958, p. 216; Kutlukov, 1977, p. 101]. The Kazakhs, Uzbeks, and Moghuls were known under military *druzhina* terms [Fedorov-Davydov, 1973, pp. 174–175]. The names picked up use among the public not as a strange, imposed ethnonym, an 'ethnic disguise', or a name coined by the people's neighbours, but as one determined by the functions of the community's social structure, cultural development, and the formation of an ethno-political and ethno-social identity. This is why the processes depended on the increasingly complex ethno-political organisation of Ulus of Jochi in the 14–15th century.

As the Golden Horde dissolved in the late 14–15th century, its ethno-social body split into subcategories, with each ulus acquiring an ethnos of its own. While the macroethnonym and ethnosocionym 'Tatars' remained socially prestigious, the national names of new people derived from those of the khan ('Uzbeks', 'Shibanids', and probably 'Nogay') or an area or capital ('Crimeans', 'Kazan people') appeared. Part of them completed their ethno-social development as full-fledged peoples, while others dissolved and assimilated with other ethnos. However, originating from Ulus of Jochi, most of them preserved such clan structures as *Shirin*, *Kungrat*, *Baryn*, *Kipchak*, *Arghyn*, and *Manghit*, as well as the general term 'Tatars' to denote their military nobility.

**'Muslims' as the Main part
of the Turkic Tribute-Paying
Population of Ulus of Jochi**

Unfortunately, the ethnic self-consciousness of most of the urban and rural population of the Golden Horde and the khanate that appeared on its territory in the 15th century remains under-studied. However, even the scant and fragmented sources available suggest it was fai-based. Most likely, the Besermens, who often appear in the Russian chronicles (especially in the 14–15th centuries), were the sedentary population of Ulus of Jochi. It comes as no surprise that the chronicles do not identify them as Tatars ('robbed... Tatars, and Besermens, and Ormens' [Complete Collection of Russian Chronicles, 24, p. 124; Priselkov, 1950, p. 382], 'killed the Besermens' [Complete Collection of Russian Chronicles, 25, p. 192; 18, p. 117], 'killed the Tatars and Besermens' [Complete Collection of Russian Chronicles, 18, p. 170], 'killed the Besermens and Tatars and conquered the whole Tatar land' [Priselkov, 1950, p. 453; Complete Collection of Russian Chronicles, 25, p. 226]). Austrian diplomat S. Herberstein, who visited Moscow in the early 16th century and collected extensive information on the Tatars, provides similar data. He reported that 'the Tatars are divided into hordes' and 'are all Mahometans; they do not like to be called Turks, which they find to be disrespectful. They are glad to be called 'Besermens', a name the Turks often apply to themselves' [Herberstein, 1988, p. 167]. M. Tikhomirov was the first to take this fact into account. He assumed the 'Besermens' and the 'Tatars' to have been two different ethnic groups, the former descending from the pre-Mongol Bulgars and gradually 'tatarised' by invaders from the Golden Horde [Tikhomirov, 1973, pp. 84–90]. The author mentioned the word Besermyans in Russian sources to have had two apparent meanings, a Muslim, non-Christian people in general, and the people of

An official and a warrior. Painted on silk.
Yuan Empire (1271–1368)

the Volga-Kama Bulgars. This was the main drawback of his work. In his comments on the data on the 1375 campaign of the ushkuiniks, who sold Russian captives to 'Besermens' in Bulgar and went further down the Volga where they plundered Sarai, 'robbing Christian guests and killing Besermens' [Priselkov, 1950, p. 400; Complete Collection of Russian Chronicles, 24, p. 132], he had to remark that the Russian chronicles used the term 'Besermens' to refer to two different communities, namely the Volga Bulgars in the first case, and Muslim Tatars in the second.

We believe this approach to be superficial because the author in reality imposed his ideas of the history of the people on the source, thus complicating the ethno-political situation in the Volga Region in the 14–16th century. It seems more reasonable to rely on chroniclers and their knowledge of the ethnic situation in the Horde when explaining why the two terms are used. An analysis of the reports suggests that it was common for chronicles to write 'Tatars' or 'Tatars and Besermens' when speaking of combat, while the term 'Besermens' was used almost in every case when it referred to civilians. Thus, they did distinguish before the two words, which confirms that the difference was not ethnic but ethno-social. 'Tatars' referred to the military service, while 'Muslims' applied

to the rest of the population. The existence of the 'Besermyan' ethnos in the Upper Kama River Region, partially Muslim and apparently subjected to Muslim influence at some stage, suggests how critically important religious affiliation was in the Middle Ages in the determination of ethnicity [Tikhomirov, 1973, p. 89; Iskhakov, 1980, pp. 23–37; Rodionov, 1984, pp. 140–152].

* * *

In summation, several stages can be singled out in the history of the term 'Tatars'. In the pre-Mongol period (12th century), it was primarily used in the Central Asian steppes by various ethnoses affected by the then-current policy, or in contact with the powerful Tatar tribal union. When Chinggis Khan defeated the Tatars and made them part of the Mongol State, their ethnonym extended to other Mongol-conquered peoples, while remaining prestigious. The ruling clans were eliminated in the Eastern European steppes following the Mongol conquest. State fron-

tiers were broken, and tribes and peoples mixed together. A new ulus system was imposed on the territory. As the social structure developed and became increasingly intricate, the ethnonym 'Tatars' was actively introduced into social use, especially among the clan aristocracy. It was within Ulus Jochi that the Tatars formed a medieval ethno-political and ethno-social community. Later, in the 14–15th century, the term became synonymous with Ulus of Jochi, meaning the ruling elite of the military service class and the clan-organized nomadic population as such, opposing its carriers as the nomads, Muslims, and vassals of the Jochids to the rest of peoples. Most of the country's population apparently used the religious self-designation 'Muslims'. Therefore, the formation of the medieval ethnos was intense in Ulus of Jochi. It had been largely completed by the time the state dissolved. Otherwise, the formation of Tatar ethno-political communities within late Golden Horde states in the 15–16th century would have been somewhat unnatural.

§ 4. The Anthropological Characteristics of the Ulus of Jochi's Population

Leonid Yablonsky

The ethnic history of a number of contemporary peoples of Eastern Europe, Middle Asia, and Kazakhstan is inextricably connected with the medieval Golden Horde state. Cities built on the order of Golden Horde khans boomed in the 14th century, which was important for the state's political and economic life.

Archaeologists have been studying the records for a century. Apart from residential, amenity, and production sites, urban cemeteries have also been excavated. About 1 burials have been exhumed in total.

Scholars have noted Muslim city necropoleis to contain material that suggests the population's social, ethnic, and anthropological structure despite a complete absence of any material items found in burials [Gellakh, 1956; Polyakov, 1973; Khalikova, 1976; Yablonsky, 1978; 1980].

The range of issues arising during a detailed study of Golden Horde Muslim city necropoleis is extremely wide. This is natural because the Golden Horde state, which was in control of vast territories, artificially united a conglomerate of tribes and ethnic groups that were sometimes experiencing different stages of historical development. The population of the Golden Horde did not belong to any uniform anthropological type. In particular, some scholars suggest that ethnic Tatar burials can be singled out at city burial sites in the Golden Horde.

Scholars failed to find any archaeological evidence of Central Asian burial ceremonies in the Volga Region for a long time. This motivated L. Zyablin's assumption that ethnic Tatars and Mongols were actually few in the Golden Horde's population [Zyablin, 1955]. The author

refers to convincing archaeological data and historical evidence to prove this. Information that the conquerors constituted a small percentage can also be found in works by V. Bartold [1928] and A. Yakubovsky [1932].

G. Fedorov-Davydov carried out a detailed analysis of Golden Horde nomadic burial ceremonies. He was able to trace a number of features that might be attributed to the Tatar-Mongols in Muslim burials dating to the Mongol conquest period [Fedorov-Davydov, 1966]. These include side niches in burial pits, special bocca headgear, anthropomorphic bronze figures found in some burials, and a northward burial orientation. However, the scholar also mentions that these traits fail to form a statistically complete burial complex, so they thus remain separate findings.

When describing the appearance of Mongol conquerors, medieval European travellers emphasised features that they did not have themselves, such as highly flattened faces and other indicators of the great Mongoloid race (for the term, see [Yablonsky, 2003, pp. 162–163]). For instance, Giovanni da Pian del Carpine wrote, 'The (Mongols'.—*L.Ya.*) faces look different from those of any other peoples. They are broader than those of others between the eyes and between the cheeks, with the cheeks protruding prominently from the cheekbones; they have flat, small noses, small eyes and eyelashes raised to the eyebrows... Nearly everyone has a tiny beard. However, some have small hairs on their upper lip and chin, which they never cut' [Travels, 1957, p. 26]. A description of the Mongols as it appears in medieval Armenian sources, Armenians being pronouncedly Caucasian, is quoted below. 'They had broad shoulders, muscular arms, large heads, smooth and disheveled hair, narrow eyes, broad foreheads, flat noses, and thin beards [Galstyan, 1960].

Domestic paleoanthropologists have long been finding pronouncedly Mongoloid skulls, and categorise them in craniological series [Debets, 1932; 1936; 1948; Trofimova, 1936; 1949; 1956; Zalkind, 1972]. There is well-known evidence, however, that the Mongoloid anthropological type was present in the Volga Region as early as in the pre-Golden Horde period. This suggests that it is not only the Mon-

gol invasion that made the Mongoloid element present in the Golden Horde's population. It might also have more ancient roots.

It can be challenging to single out Mongol burials, primarily because it is methodologically difficult to attribute them to anything as the burial pits, although generally Islamic, are ethnically heterogeneous.

In a characteristic manner, the urban Islamic burial ceremony in the Golden Horde produced a wide variety of gravestones and burial chambers. In fact, the range is so broad that a typological diagram for the burial ceremony can only be composed using statistical methods [Yablonsky, 1975].

Scholars have attributed the high variability of burial ceremonies to a number of influences, either separate or taken together. The key ones were apparently the deceased's social status and ethnic origin and how islamised the social order which he or she belonged to was. Quite naturally, the differences between rich brick burial vaults and simple soil graves without any ceiling are attributable to the social stratification of the urban community. Vault burials constitute only 7.4% of Muslim urban necropoleis, while simple graves without ceilings make up 56% of those studied. The percentages are representative, to some extent, of the rich to poor ratio.

Two burial ceremony types are attributable to the social elite. These include 1) burials in brick vaults and 2) burials in niche type graves, as Juzjani reported Khan Batu to have been buried in a niche type grave [Collection of Works Related to the History of the Golden Horde, 1884]. Burials in niche type graves have been found in Muslim necropoleis of the Vodyanskoe (Beljamen), Selitrennoe (Sarai-al-Maqrus), and Khan-Tyube archaeological sites.

According to G. Fedorov-Davydov, the number of niche type burials increased dramatically in the steppe during the Mongol conquest [Fedorov-Davydov, 1966]. Niche graves make up a percentage of the total as small as 11.3% in urban necropoleis (of the total number of burials studied), which confirms that ethnic Tatars and Mongols were not common in cities. It is also recognised that both burial ceremony types are of no absolute significance in terms

of identifying their burials. Wealthy citizens could belong, for example, to the Muslim clergy, most of whom the written sources report to have come from Khwarezm [Collection of Works Related to the History of the Golden Horde, 1884]. Niche type burials were widespread in Mongolia as early as in the pre-Mongol period as they were traditional for the local population.

This articulates the challenge of establishing a connection between burial ceremony types and the set of craniological features of the people buried in a certain way to fit them into the historical picture. To make this even more complicated, the accumulated craniological evidence suggests Ulus of Jochi had a motley anthropological composition, which apparently indicates ethnic diversity as well [Debets, 1932; 1936; 1948; Trofimova, 1936; 1949; 1956; Zalkind, 1972; Alekseev, 1967a; 1974; Postnikova (Rud), 1970; 1970a; 1973; Yablonsky, 1978; 1979; 1980].

Most of the large Golden Horde urban Muslim necropoleis could not have emerged before the late 14th century. The burial ceremony remained pronouncedly syncretical at that time. The differences smoothed out gradually following the total Islamisation of the population. At the same time, the anthropological miscegenation of the multi-ethnic and heterogeneous urban population also took place. This is why it is hardly possible to attribute any of the burial ceremony types to an ethnos, and an ethnos to a dominant anthropological type.

Scholars have found that the connection between the burial ceremony and the craniometric traits can only take the form of trends in statistical probability. One method of calculating the non-parametric value of influence in a one-factor dispersion complex has been adopted as an approach to attributing burial types to craniometric traits [Plokhinsky, 1970]. Ranged (qualitative) craniometric features are associated with burial ceremony types. The criterion χ^2 is used to identify the significance of influence for each trait and ceremony type. The matching was done with materials from two well-studied archaeological sites, the necropoleis of Vodyanskoe and Selitrennoe. The archaeological

site of Selitrennoe is remnants of the historical town of Sarai, while archaeologists identify Vodyanskoe as the Beljamen reported in written sources [Egorov, Poluboyarinova, 1974].

The craniological series from the Vodyanskoe necropolis consists of 32 male and 32 female crania. A brief overview of this series has been published [Yablonsky, 1978; 1979; 1980].

The feature used to match was the protrusion angle of the nose and the foreface horizontal profile index as the half-sum of the nasomalar and zigomaxillary angles (these angles demonstrate the flatness of the top and middle section of the facial skeleton).

Calculations have revealed the following trend: people buried in niche graves at the Vodyanskoe archaeological site demonstrate a statistically significant difference from the rest by having a small nose protrusion angle and a high horizontal profile index, that is, the set of traits typical of the great Mongoloid race.

Another statistical method was used to test the data, namely to calculate the qualitative correlation factors. In this case, niche type burials showed a positive, statistically significant correlation with a small nose angle, large zigomaxillary angle, average nasomalar angle, and shovel-shaped incisors (an odontologic Mongol trait). The findings of the previous analysis were confirmed.

Thus, the necropolis of the Vodyanskoe archaeological site tends to feature a correlation between the niche grave trait and the set of craniological data that is characteristic of the Mongoloid race. The 'burial vault' trait has no correlation with any craniological traits at the Vodyanskoye archaeological site (Fig. 1)*. It was apparently not ethnicity but the social role that determined the development of the ceremony type at the necropolis of the Vodyanskoe archaeological site [Yablonsky, 1980].

A study on the materials of the Selitrennoe necropolis yielded different results. The craniological series included 103 male and 86 female crania, and these measurements have

* All the reconstructions are made by the method of M. Gerasimov.

been published [Yablonsky, 1979]. The approach to connecting craniometric traits and burial ceremonies was similar to that applied to the materials of the Vodyanskoe necropolis.

The larger sample yielded a broader comparison range. Apart from nose protrusion angle (Martin No.75(1)) and the horizontal profile index, two brain case types were matched with ceremony types. Module 1 is the geometric mean of the total of three brain case diameters. This is somewhat representative of the brain case size. Module 2 is the quotient of cranium height diameter (Martin No.17) and the geometric mean of cranium length (Martin No.1) and breadth (Martin No.8) when Martin No.17 is divided by Martin No.8. This method is efficient for differentiating crania by relative brain case height.

Individuals buried in vaults in the Selitrennoe necropolis were found to have a significantly different nose bone protrusion angle, which is relatively small when compared to others (Fig. 2).

No statistically significant differences have been found between individuals buried according to different ceremonies in terms of horizontal profile face flatness.

Taken together, these facts suggest that individuals buried in vaults had an outstandingly small nose bone protrusion angle, a relatively large brain case, and a lower cranium, that is, typical great Mongoloid features. Their Module 1 size qualifies them as contemporary Uzbeks and Kirghiz, and their Module 2 is rather Kirghiz and Mongol. Individuals from richer burials clearly tend to have a more Mongoloid appearance.

It is also important to mention that individuals from niche type burials in the Selitrennoe necropolis have a highly Caucasoid appearance (Fig. 3) and are not as Mongoloid as in Beljamen. It was probably the influence of Islam that shaped the niche grave tradition in Old Sarai. These graves sometimes had lahd niches according to the Islamic canon. The deceased has to face the Qibla, or Mecca, which means a southward orientation at the archaeological site of Selitrennoe. In order to emphasise the direction, Muslims often interred the dead body in a position between supine and on

their right side, turning them deliberately onto their right side. A study aimed at identifying well-established burial ceremony types in the Selitrennoe necropolis revealed that only the niche burial ceremony completely adhered to Islamic requirements [Yablonsky, 1980a].

Thus, we find it reasonable to assume that the core of the urban social stratum that produced the niche graves in the necropolis of Sarai came from Middle Asian areas, primarily Khwarezm (they were generally Caucasoid anthropologically). It was in Khwarezm where Islam became wide-spread and well-established long before Mongol conquerors arrived. Written sources suggest that Khwarezmian imams made the greatest contribution to the Muslimisation of the initially multi-ethnic population of the Golden Horde [Collection of Works Related to the History of the Golden Horde, 1884]. Khwarezmians (Caucasians) almost certainly constituted a large part of the Golden Horde's urban population [Grekov, Yakubovsky, 1950]. And it seems as though it is primarily them with whom the well-established, stable Islamic burial ceremony should be associated.

The findings from the materials found in two necropoleis, Sarai and Beljamen, are therefore not identical. The social and ethnic processes in the urban population of Ulus of Jochi seem to have differed depending on whether they took place in the capital.

Dedicated studies have revealed the anthropological composition of the two cities' population to have been inhomogeneous [Yablonsky, 1979; 1980]. Most Golden Horde citizens were mixed type (Caucasoid-Mongoloid) in the early 15th century, and the Caucasoid component was pronouncedly dominant (Fig. 4). There is evidence that the anthropological mixing took the form of the assimilation of Mongol conquerors both in the capital and out of it. The urban anthropological and ethno-cultural assimilation acquired a rapid pace and gradually put an end to the social and ethnic isolation of the occupants.

However, the process was different in the capital when compared to Beljamen, which is fairly well represented in the materials of the Sarai necropolis.

Fig. 4. A man from the necropolis of the Selitrennoe archaeological site. By L. Yablonsky

Firstly, the burial ceremony is more uniform in the Sarai necropolis. Well-established burial ceremony types for both the upper and middle class (vault and niche grave burials) had already formed there by the end of the 14th century. Urban Islamisation was apparently more rapid in the capital. Not only pressure from the central authorities but also Sarai's geographical proximity to the Middle Asian centres of Muslim civilisation contributed to it.

Secondly, vault burials in the Selitrennoe necropolis are clearly associated with the Mongoloid population element, which is less explicit in Beljamen. The original tradition of burying people with Mongoloid appearances in rich vaults, mausoleums, honourable cemetery lots, and in the mosque had been reduced to mere vestigial elements [Yablonsky, 1980a]. It appears as though the conquerors remained socially and economically isolated for a longer time in the capital, but they were probably more numerous and socially influential there.

Thirdly, niche grave burials are very numerous in the necropolis of Sarai, while being only occasional in Beljamen.

In Beljamen, people in niche burials were different from others because they featured the set of Mongoloid traits. In Sarai, niche type graves mainly contain brachicranial (round-headed) Caucasoids. Here the burial ceremony was based not on the ethnic traditions of a certain group of the urban population as was the case in Beljamen. This emphasises what different ethnic groups had in common in terms of religion and social relations.

The paleoanthropological analysis thus suggests that the Mongol invasion changed not only the political order and social structure of the conquered peoples but, to a certain extent, their anthropological features as well. The changes were especially dramatic in sedentary groups residing in cities built by the Golden Horde khan, though there were few proper Mongols among them [Fedorov-Davydov, 1966]. This indicates that the role of non-indigenous peoples in the formation of the physical appearance of the population of the Golden Horde varied greatly depending on the area. The findings of comparing the data for the ne-

cropoleis of Vodyanskoe and Selitrennoe confirm this assumption.

The irregularity of archaeological research at Golden Horde archaeological sites has dramatically influenced the qualitative and quantitative features of the craniological series. However, analysing and comparing craniological evidence from the sites provide more insight into the anthropological composition of the urban population of the Golden Horde, which helps scholars estimate the Mongol contribution to the physical appearance of the Golden Horde population in certain areas of the large state.

The following Golden Horde series were used for comparison: Bulgar (the Rectangle, Middle Volga Region) [Postnikova (Rud), 1970a]; Ukek (Lower Volga Region) [Debets, 1932; Trofimova, 1936]; the Vodyanskoe archaeological site (Beljamen, Lower Volga Region) [Yablonsky, 1978; 1979; 1980]; the Tsarevskoe archaeological site (Sarai al-Jadid, Lower Volga Region) [Zalkind, 1972]; Selitrennoe (Sarai-al-Maqrus, Lower Volga Region) [Yablonsky, 1979]; nomads in the Lower Volga Region (Kalmyk Steppe, right bank) [Debets, 1948]; Polovtsians/Kipchaks (Lower Volga Region); the Khan-Tyube archaeological site (Lower Volga Region); Mizdakhkan (Southern Aral Sea Region, Khwarezm) [Khodzhayov, 1969; Yagodin, Khodzhayov, 1970]; Saray-Jük (Northern Kazakhstan) [Ginzburg, Zalkind, 1955; Ginzburg, Trofimova, 1972]; Majar (North Caucasus) [Alekseev, 1967; 1974]; Upper Julat (North Caucasus) [Alekseev, 1964].

All the craniological series are brachicranial (round-headed) and characterised by facial skeleton flatness near the nose bridge (the nasomalar angle). The crania from steppe mounds in the Lower Volga Region, Saray-Jük, and Polovtsian, are flatter at this level. They have a nasomalar angle of over 145°. The zigomaxillar angle (middle face flatness) varies. The nomadic, Polovtsian crania, and those found in Khan-Tyube have outstandingly flat faces.

Cranial vault height does not vary greatly; the crania have high and broad faces. Those found in Bulgar are the exception. The Mizdakhkan crania have broader faces when compared to others. The deceased population of the

Lower Volga Steppes, Tsarevo archaeological site, and Saray-Jük had relatively broad faces.

Thus, all the crania have similar brain case shapes and sizes. However, they have different face skeleton flatness. The series from Saray-Jük and the Vodyanskoe archaeological site have the smallest absolute values of nose bone protrusion angle, while the Polovtsian found in Mizdakhkan have the largest.

In general, the population of the Lower Volga cities—Saraïs, Ukek, and Beljamen—seems to have had much in common anthropologically. All nomads from the Lower Volga Region were rather Mongoloid, while the population of Bulgar was predominantly Caucasoid.

The comparison materials suggest that the urban population was anthropologically heterogeneous across Ulus of Jochi. Although it was similar, it was not identical, and local combinations of craniological traits have indeed been revealed.

The series found in Khan-Tyube is morphologically very similar to the urban crania from the Lower Volga Region. However, this comes as no surprise because the settlement lay close to the urban centres of the Lower Volga and maintained close cultural, economic, and apparently other types of connections with it.

The Mizdakhkan Khwarezmian crania and those found in the Rectangle cemetery in Bulgar are similar to the crania located in the Lower Volga Region. A number of features suggest that the population of medieval Khwarezm and the Caucasoid brachicranial component of the Lower Volga population belong to the same racial type, namely the Middle Asian interfluvial race (Northern variant). In addition, it should be taken into account that a large number of migrants from Khwarezmian lands might be present in the urban population of the medieval Volga Region. This also applies to the Volga Bulgars, who were actively engaged in the life of Golden Horde cities.

Studies using other methods of inter-group craniological analysis [Efimova, 1983, p. 18] have revealed some series from Volga Bulgaria (the Bolshye Tarkhany, Kaybely, Semyonovka 2, Izmeri, and Rectangle burial sites) to be similar to the population of the Salto-

vo-Mayaki culture and Khazaria, as well as the more recent urban population of the Golden Horde.

The cranium series from Saray-Jük and the Polovtsian series are equidistant from the one discovered in the Lower Volga Region. This confirms the assumption that the population of Saray-Jük was predominantly Polovtsian [Ginzburg, Trofimova, 1972]. At the same time, we find it surprising that the Polovtsian series is so distant from the one found in the Lower Volga Region as there is every archaeological, historical, and linguistic evidence possible that the Polovtsians made up a large percentage of the Golden Horde's urban population. The mixing may have been more intense in the cities of the Lower Volga Region than it was on the outskirts of the Golden Horde. This might have caused the urban Kipchak population to drop from the equation by the end of the 14th century. There is also clear archaeological evidence of urban ethnic mixing. It also must be taken into account that only a small sample from one burial site is representative of the Polovtsians for our purpose. The group is anthropologically unique because it combines a flat horizontal profile with a relatively large nose protrusion level. This combination occurred in the Volga Ural Region long before the Golden Horde was established, and there is evidence that the Kipchak tribes were also ethnically heterogeneous [Akhinzhanov, 1976]. The only way to solve the problem of their anthropological composition is to continue to accumulate craniological material.

The differences between the urban series from the Lower Volga Region and the one pertaining to the steppe nomads are quite apparent. We have at our disposal a large sample of medieval nomads. These crania were found in burial sites located in the Kalmyk steppes. It has already been mentioned that the steppe series is pronouncedly Mongoloid, which makes it separate and distant from the urban Lower Volga series as a whole. Groups that came to the Volga River along with the Mongol troops must have constituted a large percentage of the nomads inhabiting Desht-i Qipchaq. While

A man from the Tsarevskoe archaeological site.
By L. Yablonsky

new citizens of Golden Horde cities were mostly craftsmen coming from highly sedentary regions, the steppe was inhabited by traditionally nomadic ethnic groups with nomadic economies. This has to be the reason behind the pattern described by G. Debets: while the urban population of the Golden Horde was predominantly Caucasoid, that of the steppe was characterised by a high Mongoloid percentage [Debets, 1948, p. 272]. V. Alekseev mentioned the steppe population of Ulus of Jochi to have had a brain case shape and facial skeleton size similar to those of Siberian Mongoloids (Fig. 5) [Alekseev, 1967].

Residents of Northern Caucasian cities Marjar and Upper Julat, have a distinct appearance. This can be attributable to a complete or nearly complete absence of any Mongoloid component in the Caucasian crania. The Mongoloid element appears to have made a contribution to the anthropological appearance of the population of the Northern Caucasian cities of the Golden Horde that was below the absolute minimum.

* * *

The establishment of urban centres in the medieval Volga Region is connected with the history of the establishment and development of the Golden Horde state itself. The intense ethnic processes occurring within the Golden Horde, which was expanding into vast territories, was the origin of many contemporary ethnic groups in the Volga Region and Middle Asia.

The physical appearance of the population of Ulus of Jochi resulted from a mixture of two races, Mongoloid and Caucasoid. The Mongoloid component is evident to this or that extent in the appearance of residents of all Golden Horde cities. However, urban dwellers tended to be largely Caucasoid (Fig. 6). The Mongoloid percentage, which has been noted to be present in the so-called Southern Russian Steppes even before the Golden Horde was established [Debets, 1948; Trofimova, 1949; Alekseev, 1971], increased during the Golden Horde period. This is most likely attributable to the migration of part of the Central Asian population. However, genetic studies on the

Fig. 7. The ratio between the Caucasoid (1) and Mongoloid (2) components of the mitochondrial gene pool of the population of the Volga-Ural Region [Limborskaya et al., 2002]

modern population of the Volga Ural Region have revealed (Fig. 7) that contemporary Tatars are even less Mongoloid than Russians in Bashkiria [Limborskaya et al., 2002].

There is both archaeological and paleo-anthropological evidence that the invasion of eastern tribes primarily affected the physical appearance of the population of the Lower Volga Region, which was indeed the administrative and political centre of Ulus of Jochi. The total series from Lower Volga necropolises is different from the series discovered in Khwarezm, the Caucasus, and Bulgar (Fig. 8) as being more Mongoloid. As has already been demonstrated for the medieval Volga Region [Trofimova, 1949] and Kazakhstan [Ismagulov, 1970], the Mongol invasion cannot be viewed as a mass migration to the European steppes from the west.

The connection between an individual's ethnic and social status was at first extremely tight in Golden Horde society. It is a common fact that at the early stage of its existence the country's elite was predominantly, and almost exclusively, Mongol and Tatar, while the local nomadic aristocracy was dismantled. However, the mass migration of nomadic tribes causing cities to grow and the khans' policy of the general Islamisation of the population brought about a gradual fusion between the Central

Asian nomadic aristocracy and the urban elite [Fedorov-Davydov, 1973].

This is why in the beginning there was a correlation between a high social status and a Mongoloid appearance; it is precisely the crania found in the 'aristocratic' areas of the Vodyanskoe necropolis that had Mongoloid features. However, by the end of the 14th century, the nomadic aristocracy had become engaged not only in trade and economics but also in intense inter-ethnic processes in the Lower Volga Region.

The Mongol and Tatar's unusual inheritance custom played a major role in changing the anthropological appearance of the Golden Horde's urban aristocracy. To quote Giovanni da Pian del Carpine, 'There is no difference between a son by one's concubine and by one's wife. But it is the father's choice on what he gives to each of them. If he belongs to a princely clan, his concubine's son is as much a prince as a son by his legal wife' [Travels, 1957, p. 30].

It is no wonder that very Caucasoid people were buried in rich burial vaults in the Vodyanskoe necropolis. The son of a Mongol man and, for instance, a Polovtsian woman, was apparently still entitled to a high social status; he could identify himself as Tatar while still having a Caucasoid appearance. It is no less possible that impoverished Mongoloid-look-

Fig. 8. A face reconstructed from a man's skull from the necropolis of Bulgar. By L. Yablonsky

ing people were also present in the urban population.

These complicated processes apparently caused the social and ethnic factors to drop from the equation by the time the Islamic burial ceremony became well-established in urban areas. Features reminiscent of the original cus-

tom and traditions can be traced only as more or less statistically significant traditions.

There is paleoanthropological evidence that nomadic clans preserved their anthropological appearance for a longer time in the Volga Steppe. However, even there, the constant cultural and genetic diffusion of heterogeneous populations eventually shaped the ethnic community that later becomes collectively known as the Tatars. The process was more intense in the large urban centres of Ulus of Jochi than it was in the steppe.

New historical developments began following the dissolution of Ulus of Jochi. However, we can still find traces of traditions and rites dating back to the Golden Horde in the ethnographic materials pertaining to Modern Times. For instance, the Kazan Tatars have been reported to have preserved the custom of viewing lawful and extramarital children as having equal status in the early 20th century. They also continued to bury their dead in niches on their right side, facing Mecca [Zhamensky, 1910]. This and other data suggest that it was in the Golden Horde epoch when the process that put an end to the old ethnic borders among pre-Mongol groups in the Volga Region began. This ultimately resulted in pre-Mongol unions being transformed into a cohesive Tatar community.

§ 5. The Medieval Uighurs and Their Contribution to the Culture of the Ulus of Jochi

Aleksandr Kadyrbayev

The medieval Uighurs played a major part not only in the Great Mongol Empire founded by Chinggis Khan and in Mongol-ruled states such as the Yuan Empire in China and that of Hulaguid Ilkhans in Iran in the Near East following its dissolution but in Ulus of Jochi as well.

By the early 13th century, when the Mongols were first introduced to medieval Uighur culture, it had already existed for over 450 years. But what is surprising in terms of a steppe civilization is that it actually continued to develop after the Uighur State collapsed. Uighur culture

was booming in East Turkestan, the Beshbalyk oases, Kocho, Hami, and the north-western parts of China: Dunhuang, Suzhou, Shazhou and Lanzhou. It was greatly influenced by Sogdian, Tokhar, Chinese, Indian, and Tibetan Buddhism, and sometimes combined it with Manichaeism—the religion of the Iranian world named after its prophet, Mani—and Syrian Nestorian Christianity. The first Uighur Muslims had also already appeared on the historical scene [Kara, 1981, pp. 51–52]. It was the medieval Turkic-speaking Uighurs who taught the Mongols to write, more specifically, Tatatung

(Tatātun-a according to Chinese sources), the Head of Chancellery in the Naiman Ulus, who thus bestowed upon the Mongols the key to the centuries-old and well-developed Uighur culture [Yüan shih, 1958, Yuan 124, p. 27398 (1446)]. This fact is confirmed by Persian and Western European chronicles. To quote Juwayni, 'Since the Tatars (Mongols.—*A.K.*) had no script, Chinggis Khan ordered that the Tatars (Mongols.—*A.K.*) should learn literacy from the Uighurs... and enshrine their laws in manuscripts. Everything written in the Uighur script is known as the Great Book of Yasa... Knowledge of the Uighur language and script is recognised as great learnedness and talent' [The Tarikh-i Jahan-gusha by Juvaini, 1912, p. 40]. In turn, William of Rubruck reported the Mongols to have borrowed the Uighur script, while the 'Uighurs are their principal scribes... And Mangu Khan (Möngke Khan) sends you (King of France.—*A.K.*) a charter in the language of the Moals (Mongols.—*A.K.*) but written in the Uighur script.' [Puteshestviya, 1993, p. 129]. On Chinggis Khan's order, Tatātun created the Mongol script, which is still used to this day, based on the medieval Uighur alphabet. He was also the first to teach the sons of the Ruler of the Universe to read and write. Later, members of Chinggis Khan's 'Golden Clan' had mostly Uighur—Buddhist and Nestorian Christian—teachers. Among the Uighurs who taught Mongol princes descending from Chinggis Khan, Chinese sources mention Tatātun's son Sulokhai [Yüan Shi, juan 124], Kara Inakh Buirug, the teacher of Chinggis Khan's son, Arin Temur, that of Chinggis Khan's brother Otchigin, Nestorian Christian Sibān (Shiban), who taught Khashi, grandson of Chinggis Khan and son of Ögedei Khan [Ibid., juan 134, p. 27493 (1541)], and Tolocha, the teacher of Kublai, who was to become the Great Khan of Mongolia and found a Mongol dynasty in China. Uighur doctors and healers, such as Urunch Hai and his son Jirlakhan, served the Mongols as well. Medieval Uighurs also played a major role in the administrative system that the Mongols established in the countries they had conquered. From the time of the founder of the Mongol Empire Chinggis

Khan to the rule of his successors Ögedei Khan and Güyük Khan, Zhen Hai, whose biography is mentioned in 'Yüan shih', remained an influential figure in the state. His highest position was head of the Mongol government in 1231–1241 and 1246–1248 [Shaomin, 1936, juan 192; Yüan shih, juan 135, p. 27510 (1558)]. Chinese sources on the Mongol epoch mention a total of 300 Uighur high officials serving the Mongols. In 'Yüan shih' alone, 34 of the total 227 darughachis mentioned were Uighur. Rulers of the Uighur Turpan Principality, who were awarded the title of Idikut because Idikut Barchuk Art Tegin joined Chinggis Khan at the head of 10,000 Uighur warriors on his own accord in 1211 and participated in his western campaign, which was particularly helpful in the land becoming part of Jochid Ulus, enjoyed a high status at the court of great Mongol khans [Yüan shih, juan 124, p. 27399 (1447)]. The reason for this is clearly visible in Great Mongol Khan Kublai's declaration addressing the Korean ruler, 'You gave up later, so your rank is lower than that of the wangs (members of Chinggis Khan's clan.—*A.K.*). During the rule of our Taizu (Chinggis Khan.—*A.K.*) the idikut rank was the highest among those who surrendered, and the order was that he is to rank the first among wangs. Arslan Khan (a Karluk ruler.—*A.K.*) was the next to give up, so he ranks lower than them (the idikut.—*A.K.*). You should know this.' [Yüan shih, juan 1, p. 26031(79)]. Chinggis Khan adopted Barchuk Art Tegin as his 'fifth son' and thus granted ulus status to the Uighur Turpan Principality, the ulus being the administrative unit into which Chinggis Khan divided the Mongol Empire when allocating its parts among his sons.

Jochi Khan was on the friendliest of terms with Nestorian Christian Uighur Kurkuz (Kuerkussu in Chinese sources). As a young man, Kurkuz served his ruler, the head of the Uighur Turpan Principality in East Turkestan. The Uighurs enjoyed the high trust of the Mongol khans for a number of reasons and were actively engaged in their conquests and the state building of their global empire. Back at the idikut's court, Kurkuz was able to learn the Uighur script within a very short period of

time. Mongol rulers encouraged knowledge of Uighur as its alphabet was used for Mongolian by promoting those who knew it. This is how Kurkuz was introduced to Jochi Khan as one of his *bitikchi* secretaries. However, before this occurred, Kurkuz had tried his luck in the camp of Jochi's son Batu Khan following the dramatic Mongol westward expansion. At first, Kurkuz had grazed the cattle of a Mongol *noyon*. He had eventually become known as a trusted individual and rose to the level of his associate. Kurkuz had met Jochi Khan while hunting in his lord's retinue. Jochi Khan had received a *yarliq* from his father Chinggis Khan, and Kurkuz read it out to him because nobody in the retinue knew the Uighur script. He had been able to impress Jochi Khan, which enabled his promotion within the Mongols. Jochi Khan ordered that Kurkuz be offered the position of an official (*qatib*) at his chancellery. Being a talented, eloquent speaker and expert in the Uighur script, he was trusted enough to teach Mongol noble children, in particular members of the ruling Chinggisid dynasty, to read and write. His highest position in Ulus of Jochi was as an advisor for a *darughachi*, a Jochid vicegerent in Khwarezm, in the city of Urgench. In the 1220s–1230s, Kurkuz was appointed *darughachi*, or Mongol administrator, first in two Persian provinces, Khorasan and Mazanderan, then across Persia and Mongol-controlled territories in the Near East. According to Rashid al-Din, 'having been entrusted (with Khorasan), Kurkuz brought along *bitikchis* and officials and brought the affairs in Khorasan and Mazanderan into proper order. He took a capitulation, established fixed taxes, and founded workshops. Kurkuz was ordered to manage all the areas across the Amu Darya'. Later in the text, Jochi Khan's younger brother, the Great Mongol Khan Ögedei, successor to the throne of their father Chinggis Khan, 'entrusted (the areas) from Khorasan to the borders of Rum and Diyarbekr to Emir Kurkuz.' One of Kurkuz's sons was a Mongol *darughachi* of Iraq and Azerbaijan tasked with 'controlling the land and establishing fixed taxes' [Rashid al-Din, 1960, 2, pp. 46–48].

Batu Khan, who succeeded to his father's position as the head of Jochid Ulus, appreci-

ated experts in the Uighur scripts, like Muslim Hojja Najmuddin, who was probably of Iranian origin and whom the Great Khan of the then-united Mongol Empire Möngke (in Turkic, Mengu) appointed *ulug bitikchi* in Jochid Ulus. William of Rubruck described their role at the court in 1253. He presented a curious and detailed description of Buddhist and Christian Uighurs, reporting Buddhists to 'pray to the north, clapping their hands and spreading their bodies on the ground while kneeling, their forehead resting on their hands', while 'Nestorians never hold their hands together to pray but stretch them out in front of their chest.' William of Rubruck also described the ceremonies where Möngke Khan and his wives attended Nestorian divine services, which leaves no doubt that the Uighurs played a major part in meeting the Mongol ruler and his associates' spiritual and educational needs [Puteshestviya, 1993, p. 129]. Nestorian Christian Uighur Sauma, who arrived in Rome as a Mongol ambassador, said to the Catholic cardinals, 'You should know this, Fathers, that many of our fathers (Uighurs.—*A.K.*) went to the Mongol, Turkic, and Chinese land to preach' [Istoriya Mar Yabalaxi, 1958, p. 36]. William of Rubruck remarked that Uighurs were on hostile terms with Muslims in the Mongol Empire, which predetermined the tragic future of the Uighurs of Jochid Ulus: 'Saracens (Muslims.—*A.K.*) are so eager to avoid them (Uighurs.—*A.K.*) that they will not even talk about them. This is why Saracens whom I asked about Yughur (Uighur.—*A.K.*) rituals became indignant' [Puteshestviya, 1993, p. 127].

William's report on the Uighurs at Batu's court is as follows. 'Then we spent a month travelling with Batu before we could get a guide. At last, I got a Yughur (Uighur.—*A.K.*), who expected nothing from me and ordered for a charter that he was to bring me directly to the Turkish sultan, hoping to get gifts from him and profit more from the route, though I had said that I wanted to go to Armenia [Ibid., p. 164]. As an adolescent, Batu Khan had a dedicated Uighur script teacher, Bekbuka, a native Naiman highly influenced by medieval Uighur culture.

The number of Buddhist and Nestorian Christian Uighurs at Golden Horde chancelleries was significant in the late 13–early 14th century when Ulus of Jochi became independent following the dissolution of the global Mongol Empire in 1259–1260. The events before and during 1312–1313 when the young Öz Beg Khan took the throne of the Golden Horde and, as an enthusiastic and newly converted Muslim encouraged by his Muslim associates who preached and talked scandal, proclaimed Islam the ruling religion and hurried to 'kill several emirs and noblemen, a large number of Uighurs, that is, lams and magicians, and proclaimed that now Islam was to be professed' [Collection of Works Related to the History of the Golden Horde, 1941, p. 174]. Öz Beg Khan informed Egyptian Mamluk al-Nasir of this in a personal letter [Usmanov, 1990, p. 70].

The medieval Uighurs made a cultural contribution to the history of the Golden Horde. As evidence of this, Mongol-Uighur birch bark manuscripts have been discovered in ancient Golden Horde towns in the Volga Region. According to Arabic sources, the first khans of the Golden Horde tended to write their letters to Mamluk State sultans in Egypt and Syria in Turkic using the Uighur script. The Uighur script remained in use at the court of Golden Horde khans even after Islam was proclaimed the state religion of Ulus of Jochi. For instance, Khans of the Golden Horde Toktamys and Temür Qutluğ used the Uighur script for yarliqs and charters executed on the banks of the Don and the Dnieper in the late 14th century. The original of Khan Toktamys's letter to King Jagiełło of Poland was also written in Uighur script. Yarliqs by other Golden Horde khans, Mengü Timur (1267), Berdibek (1357), and Byulek (1379), as well as Taidula's charters dated 1347, 1351, and 1354, an inscription on the gold paiza symbolising state power, which served as an identification for higher officials, dating back to 1362–1369, the time of Abdullah Khan, have all survived to this day. They include the names of Khans Tokhta, Öz Beg, and Keldibek. All of these yarliqs and paizas were written in Mongolian using the Uighur script, except for Byuleg's yarliq, which was

Uighur Ruler. Fresco.
Eastern Turkestan. 9th century.

written in Turkic. Golden Horde coins also bore inscriptions in the Uighur script [Sultanov, 1978, pp. 234–235].

The medieval Uighur language and script were also important in their written form not only for the medieval Uighurs and Mongols as the leading ethnos in all Mongol empires in the 13–14th centuries but the Kipchaks as the key Turkic steppe population of the Golden Horde, on whom the khans relied greatly and who began to assimilate the few Mongols of Ulus of Jochi as early as in the early 14th century. To quote William of Rubruck, 'Uighurs are the source and root of the Turkish and Coman (Kipchak.—A.K.) vernacular...' [Travels, 1993, p. 115].

In summation, the cultural, linguistic, and written contact between the medieval Uighurs and other peoples in the Golden Horde, primarily between the Mongols and the Kipchaks, were important. Just like other Turkic peoples, the Uighurs lived in the Golden Horde until at least 1313, though they had no major source to repopulate their community from because the dissolution of the Mongol

state separated them from their country of origin, Eastern Turkestan, which became an arena of internecine wars for other Mongol states, namely the Yuan Empire with its centre in Khanbaliq (today's Beijing) and the Ulus of Chagatai in Middle Asia. The cultural importance of the medieval Uighurs for Ulus of Jochi was also determined by the fact that in

the Golden Horde, as well as in other states that stemmed from the ruined Mongol Empire of Chinggis Khan and his first descendants, the Uighur script was traditionally associated with the khan, which was the sphere where it continued to remain in use according to old traditions and regardless of the new situation until the fall of the Golden Horde.

§ 6. Population of alien confessions in the Jochid Ulus

The Russian Population of Cities in the Ulus of Jochi

Marina Poluboyarinova

Written sources describe the Mongol practice of capturing a large portion of the people in newly conquered countries. Reports on Russian prisoners in particular are especially numerous due to their inclusion in the Russian chronicles. They seemed to disappear in this new vast state, Ulus of Jochi, assimilating with the conquerors and other subjugated peoples. However, there is also some written and archaeological evidence of what happened to them.

Written sources of information on Russians in Golden Horde cities are very diverse. They include Russian chronicles and the lives of saints, spiritual and treaty charters, notes by Catholic missionaries, *yarliqs* issued by Golden Horde khans to Russian Metropolitans, and works by Arab and Persian authors.

For instance, Ibn Battuta, an Arab traveller who visited the Golden Horde in 1333–1334, reported various peoples, including Russians, to live in the city of Sarai (the Selitrennoe archaeological site). 'Each people lives separately in their own plot; they have their bazaars there' [Collection of Works Related to the History of the Golden Horde, 1884, p. 306].

Most of the Russian residents of Ulus of Jochi were captives. They were a free labour force that the conquerors used to build cities, manage skilled labour, and for war and commerce. According to Catholic monk Giovanni da Pian del Carpine, upon conquering a city, the Tatars left those young men and women whom they wanted to use as slaves for their craft skills

and killed the rest [Travels, 1957, pp. 54–55]. Skillful craftsmen made especially valuable slaves. 'In the land of the Saracens and others, to whom they are superior, they take the best craftsmen and use them to do whatever work they do' [Ibid., p. 58]. Some skillful captive craftsmen could also benefit from good promotions. Giovanni da Pian del Carpine mentioned Russian jeweller Kuzma, Great Khan Güyük's favourite, who made the khan's throne and seal in Karakorum [Ibid., p. 78]. Another Russian, married to the French Paquette, was a builder. However, they all apparently remained slaves, as did the French craftsman Boucher captured in Hungary, whom another Catholic missionary, William of Rubruck, believed to be a slave of Mengu Khan's mother [Ibid., p. 166].

It was not only prisoners of war but also the individuals unable to pay their tributes or debts who became slaves. A 1262 entry in a Russian chronicle reports the abuse of tax farmers in Russian cities [Complete Collection of Russian Chronicles, 1, p. 476]. According to Giovanni da Pian del Carpine, when single men and women, each of the three sons of each family, and the poor had been captured, the khan's official imposed a fur tribute on the rest. Those who could not deliver the tribute were sold into slavery for Tatars [Travels, 1957, p. 55]. To quote William of Rubruck, 'When Russians cannot give more gold or silver, Tatars capture them and their little ones... to watch their animals' [Ibid., p. 108]. Arab author al-Umari reported Russians and Tatars to have sold their children as slaves during famine and drought [Collection of Works Related to the History of the Golden Horde, 1884, p. 241]. Russian

Stone icon of hierarchs (?). Bulgar.
13th century (According to T. Nikolayeva)

captives were sometimes sold as slaves by their compatriots, for instance, during internecine feuds or when Novgorod Ushkuiniks raided Russian and Bulgar cities [Complete Collection of Russian Chronicles, 15, 1965, p. 114].

Rashid al-Din reported Tokhta Khan's army to have included Russians, Circassians, Kipchaks, and others [Rashid al-Din, 1952, 1, 2, p. 275]. The anonymous author of the 'Continued Collection of Chronicles' described Toktamys's army against Timur as follows: '...a large army consisting of Russians, Circassians, Bulgars, Kipchaks, and Alans...collected together' [Collection of Works Related to the History of the Golden Horde, 1941, p. 156]. Speaking of Öz Beg Khan and his capital Sarai, al-Umari wrote that 'Sultans in this state have Circassian, Russian, and Yas slaves' [Collection of Works Related to the History of the Golden Horde, 1884, p. 231]. This probably refers to contract fighters, who might have been employed in a different period. The practice was pure coercion at first: 'So the Tatars demand them to join their troops against any person that they tell them to go against' [Travels, 1957, p. 55]. According to the Russian chronicles pertaining to the period, the conquerors 'capture people and order them to fight with

them' [Complete Collection of Russian Chronicles, 5, p. 190].

The Mongols sold excess slaves, in particular Russians, which was very profitable. There was a large slave market in Bulgar [Complete Collection of Russian Chronicles, 15, 1965, p. 114] and probably all large cities in the Volga Region, as well as in the Crimea and North Caucasus.

The Russian chronicles tend to report Russian princes' stays in the Golden Horde as important historical events. Russian princes were forced to visit the Horde from the first years after the yoke was imposed on them until almost the middle of the 15th century. Batu and his successors summoned princes to show their obedience and receive a yarliq permitting them to remain princes.

When visiting the khan's camp, Russian princes had to perform a number of pagan rites like walking between fires, worshiping bushes, fire, the sun, or idols. They were to kneel to the khan and drink 'black' kumis, which Russians believed to be a sin. To neglect the duties could spell death, as it happened to Prince Mikhail of Chernigov in 1246. 'They also send for land rulers, ordering them to come to see them immediately. They are treated without proper respect when they come... For some of them, they find a pretext to kill them;...they let others come back to attract more and use a special drink or poison to kill some', Giovanni da Pian del Carpine described the conqueror's policy for the princes and rulers of subordinate territories.

If a prince was killed in the Horde, his boyars and slaves often died with him, as was the case with Mikhail of Tver. He was executed in Öz Beg Khan's camp in the foothills of the North Caucasus because he lost his struggle for the title of great prince against the prince of Moscow. In order to ensure princely loyalty, khans often kept not only the princes themselves but also their sons hostages for years on end. Princes probably visited the two capitals, accompanying the khans from camp to camp. A prince's seal found in the archaeological site of Selitrennoe suggests that Russian Prince Constantine visited Sarai. A stone seal

Bronze icon
depicting saints
Kirik and Iulitta.
Ukek District
(according
to L. Nedashkovsky)

bearing Prince Mikhail's name has also been found in Ukek.

The ambassadors of princes, or kilicheis, visited the Horde to bring gifts to the khan, or sometimes for diplomatic purposes, for instance, to receive a yarliq.

Golden Horde khans encouraged foreign trade in their state to a great extent because it was extremely profitable to them. With control over the Great Volga and Don Route, the most important trade roads in East Europe, the Golden Horde restored its international and domestic commercial contacts. Several written sources mention Russian merchants in the Horde. William of Rubruck reported Khans Batu and Sartaq to receive great income from the Crimean saline basins, where merchants from across Rus' went to for salt. Oriental 13–14th century authors also reported Russian merchants to have visited cities along the Volga River. To quote Ibn Abd az-Zahir, 'The Itil River... Russian vessels navigate it'. Al-Umari wrote, 'Large vessels navigate the Itil to the Russians and the Slavs' [Collection of Works Related to the History of the Golden Horde, 1884, pp. 63, 241]. Persian author Hamdallah al-Qazwini described ships arriving from Rus' at Mazanderan along the Volga and Caspian Sea in 1340.

Russian chronicles contain several reports on Russian merchants in the Horde, dated 1319, 1356, 1378, and 1382. The narrative on the ruination of Moscow by Toktamyskh mentions the khan to have sent his people to Bulgar to defeat and rob Christian and Russian merchants, seize their goods, and bring them to him to deal with [Complete Collection of Russian Chronicles, 15, 1965, p. 143]. Giosafat Barbaro wrote the following in the 15th century: 'Every year people from Moscow board ships bound for Astrakhan for salt' [Barbaro and Contarini, 1971, pp. 148, 157].

The Orthodox Christian Eparchy in Sarai

Marina Poluboyarinova

Contemporaries emphasised how religiously tolerant the Mongol-Tatar conquerors were. As they were pagans at the early stage of the Golden Horde's existence, its rulers patronised both Orthodox clergymen, and Catholics, and Muslims. Maybe the Mongols wanted to make sure that the gods of strangers liked them. It could have also been political circumspection as well. 'Tatars used their military power to subjugate various Christian tribes but permit them to maintain their law and faith,' Franciscan monk from Hungary, Johanca, wrote in the early 14th century [Anninsky, 1940, p. 91]. The chronicle entries on a Russian census for taxation purposes dated 1257 and 1275 specifies that '...Priests, and deacons, and monks shall not be counted.' [Complete Collection of Russian Chronicles, 15, p. 32]. In accordance with Chinggis Khan's Yasa, yarliqs issued by khans to metropolitans relieved the clergy of any duties and taxes: "Those basqaqs, scribes, customs officers, and land tax collectors who see and hear this charter shall not collect any tribute or anything from priests and monks. Shall they collect anything, they must ask forgiveness and die according to the Great Yasa' (from Mengu Timur's yarliq dated 1267 [Priselkov, 1916, p. 34]). The clergy was also relieved of military service. These privileges enabled Russian clergymen to enter the Mongol environment from the first years of the yoke. Quite naturally, they hoped to persuade

pagan conquerors to accept Orthodox Christianity. This was all the more necessary because the Catholic Church was already exerting similar pressure on the East. The Pope wanted the Mongol-Tatars to support him against the Seljuk Turks, Emperor Friedrich II of Germany, and the Nicene Empire. He sent missionary monks to the conquerors to persuade the khans to convert to Catholicism. Some wrote the most curious reports on their travels as far as Karakorum, with descriptions of Mongol customs. However, this was not their main intention. The Roman Church wanted the Russians instead to convert to Catholicism. The Pope's letters to Russian princes, especially Daniel of Galicia, are indicative of this fact. The rumour about the Nestorian Christian sect in Asia kindled the enthusiasm of Orthodox and Catholic Churches.

The Orthodox Christian Church was able to reinforce its connection to the khan's government. An Orthodox bishopric was established in 1261 during the rule of Khan Berke, who had converted to Islam. The first Bishop of Sarai and Pereyaslavl was Mitrofan. He controlled the territory upstream the Volga Region and the Don from Sarai. The bishop's title was 'Bishop of Sarai and the Don Region' in the mid-15th century.

There are several reasons why an Orthodox Christian bishopric was established in the Golden Horde. For one, its Russian population had increased. It now consisted not only of slaves but of princes with their retinues, merchants, and embassies, which sometimes spent years there. The Church wanted to keep all the Russians within their own walls. In addition, the spiritual authorities of Rus' hoped to use the Sarai Bishopric to influence the khans' policy for Russian principalities. The khans would benefit from this by reinforcing their contacts with Byzantium with the help of the Sarai bishops. The second Bishop of Sarai, Theognostus, was the only Russian bishop to attend the 1276 Constantinople Patriarchal Council to execute certain diplomatic orders for the khan and the Russian metropolitan. He also raised questions related to divine service under nomadic conditions. In 1279, Theognostus '...was sent to

the patriarch by the metropolitan and to Tsar Palaiologos of Greece by Tsar Mengu-Timur' [Complete Collection of Russian Chronicles, 7, p. 174]. Thus, both khans and Russian metropolitans used the bishops of Sarai to establish contact with the clerical and secular authorities of Byzantium.

Owing to the fact that it was well-established in the Horde, the Russian church was able to resist the Catholic influence. However, a Catholic bishopric was established in the Golden Horde in 1315. Franciscan Stefan became the first bishop, and 12 Franciscan monasteries had been established by the beginning of the 14th century. In 1336 monk Elemosina wrote to the Pope that in the Golden Horde '...the true church has been imposed, and Minorite friars have established their refuges in ten places: five in cities and five in battle camps and Tatar grazing camps... Among the Tatars who graze their herds, the five refuges have the form of felt yurts and move from place to place when the Tatars change their camp' [Golubovich, 1909, p. 135].

The Orthodox clergy probably had to face these same unusual conditions. To prove this fact, Theognostus asked the Patriarchal Council of Constantinople the following questions: Is it permitted to carry consecrated meals from place to place and use them for divine service? What is the baptism procedure for Nestorian and Jacobite converts? What baptism ritual is recommended for Tatars? 'If a Tatar comes and I have no large vessel, where do I immerse him?' [Records of the Ancient Russian Canon Law, 1908, pp. 129, 136, 138].

Another Bishop of Sarai, Ismail, implemented the khan's policy by accommodating Russian princes at a congress in Vladimir in 1296 where the khan's ambassadors judged them. Quoting a 1330 chronicle entry, 'Azbeq Tsar showed mercy to the Bishop of Sarai, granted him everything according to his request, and did no wrong to him' [Complete Collection of Russian Chronicles, 10, p. 203]. In 1354 Patriarch Philotheus of Byzantium mentioned the role that the Bishop of Sarai played in the relations between Rus' and Byzantium; both refer to Bishop Athanasios.

The bishop was expected to spend a lot of time in the khan's summer camps in the Volga and Don River Regions. He probably had a permanent residence in either one or both capitals. The chronicle always reports a new bishop to have been appointed 'to Sarai' and not 'to the Horde'. Sarai Berke (the Tsarevskoe archaeological site) lay closer to the Russian Land and probably had a larger Russian population. A. Tereshchenko discovered a lot of personal Orthodox icons and crosses while excavating the Tsarevskoe archaeological site in the mid-19th century [Poluboyarinoва, 1978, pp. 58–71].

The bishops of Sarai had been transferred to Krutitsy Estate, Moscow, by 1480. This determined their title, Bishops of Krutitsy.

Apart from the Russian clergymen who resided in cities, others who visited the Golden Horde for various purposes are also mentioned. Every new metropolitan was to see the khan to obtain a *yarliq* confirming the church's rights, the ceremony of which was to be performed over and over again each time the khan was replaced. In 1357 Metropolitan Alexius arrived to the Horde on Janibek's invitation to heal his blind mother Taidula. Alexius was able to cure her, and she gave him a ceremonial vestment (*sakkos*) and a ring. Metropolitan Pimen visited the Horde in 1385 on his way to Constantinople after 'traveling downstream the Volga to the Sarai onboard a ship' [Complete Collection of Russian Chronicles, 15, p. 150] accompanied by other clergymen.

Priests were able to persuade some figures in the Golden Horde to convert to Christianity. Noble Tatar women who were engaged to Russian princes, such as Mengü Timur's daughter and the daughter of Öz Beg, as well as Tatars moving to Rus' to work for Russian princes, were baptised. The burial at the burial site Mayachny Bugor 1, Astrakhan oblast, studied by E. Pigarev, is of special interest. A buried teenager was discovered in a grave lined with sun-dried bricks and featuring a brick foundation and remnants of a wooden coffin on the grave floor. The body had an alloy cross with lily-shaped points, which suggests Orthodox Christianity. The burial dates back to the later 13–early 14th

Stone icon of Saint Nikola, Ukek.
12–14th centuries (according to T. Nikolayeva)

century, and the burial ceremony combines Islamic and Christian traditions [Pigarev, 1994, pp. 77–80].

Most likely, Orthodox Christian churches or chapels gradually started to appear in all cities of the Golden Horde with some Russian population. Giovanni da Pian del Carpine reported Güyük Khan to have permitted Orthodox priests to perform divine service 'according to the Greek custom' in a chapel in front of his tent [Travels, 1957, p. 80]. The Chronicles report churches to have existed in the city Bezdezh (presumably the Vodyanskoe archaeological site), where the body of Prince Mikhail of Tver, murdered in the Horde, was brought. The body could only be placed in the church yard, as it was in the Northern Caucasian city of Majar. That is, there were Russian churches both in Bezdezh and in Majar. No remnants of Orthodox Christian churches have been found in Golden Horde cities to date. However, church equipment like *corona lucis* fragments and incense burners have been found. When excavating the Sarai Berke in the mid-19th century, A. Tereshchenko found stone slabs with crosses incised on them, probably pertaining to church buildings.

Details of *coronae lucis*. Ukek.
14th century (according
to M. Poluboyarinova)

The fact that numerous crosses and icons have been unearthed in Golden Horde settlements suggests that most Russian citizens adhered to their religion.

Only archaeology can provide convincing evidence that Russians were present in Golden Horde cities. Now a brief description of Russian-related objects will be provided by site downstream the Volga River.

The Selitrennoe archaeological site (Sarai) has yielded a small number of Russian-related discoveries, mostly pertaining to Orthodox Christianity. A round copper icon depicting John the Precursor as part of the Deesis tier, probably inserted in a church altar cross, has been found. A miniature glass icon of the Mother of God holding the Infant on her right hand is also of interest. Such icons were produced in Venice or Constantinople in the 13th century. However, they occur in the territory of Rus' more commonly than they do in Western Europe. The icon probably belonged to a Russian person. It is entirely possible, however, that it was brought by Catholic missionaries. A fragment of a bronze encolpion cross made in a 12–13th century Kiev workshop has also been located here. The site has yielded several fragments of glass bracelets, Russian in terms of glass composition, and two slate spindle whorls, a commodity that was not traded after the Mongol invasion, but which a Russian woman might have kept.

Poachers recently reported to have found a prince's lead seal at the Selitrennoe archaeological site. The general appearance of the seal suggests that it dates back to the 14th century. It bears an incision stating its belonging to Prince Constantine on the one side and a standing saint figure holding a cross in front of his chest, as well as an inscription reading 'Saint Constantine', on the other.

The Tsarevskoe archaeological site (Sarai al-Jadid) has yielded more Russian objects, mostly excavated by A. Tereshchenko. A whole encolpion cross with a central relief of the Crucifixion and Mother of God images, with engraved crosses and signs on the top and side ends, is worth mentioning. Such encolpions were made in Rus' in the early 13th century. There are also two front panels of two encolpions dating back to the late 12–early 13th century, a copper body cross with spherical beads on its ends (11–13th century), and a stone cross dating back to the 12–14th century. The church ware includes a bronze chain and a corona lucis fragment. Part of a church chandelier and an incense burner lid, that is, church ornaments, have also been mentioned.

Further excavations at the Tsarevskoe archaeological site yielded nothing but rare Russian ceramic fragments and a folding cross head piece [Matyukhina, 2000, pp. 216–217, Fig. 39:2].

The Vodyanskoe archaeological site (Bel-jamen). Russian ceramics were found here in 1963 during the first examination of the site by an expedition to the Volga Region. Excavation revealed that Russians and, most likely, Bulgars were the first constructors and inhabitants of the relatively large city. Russians lived in the central and south-eastern part of the surviving area. Russian dishware made up 45% of the total ceramics in the bottom layers. Two

semi-dugouts with Russian ceramics and a copper cross have been discovered at this site. A cemetery, most likely a Christian one, has also been studied here.

The excavation and surface discoveries include several body crosses of various shapes dating back to the 12–14th century, a bronze Crucifixion icon, an encolpion fragment (re-cast), and a six-blade corona lucis holder. A miniature light blue cast glass icon depicting St. Nicholas and bearing a Russian inscription is a rare Russian antiquity and dates back to the 13–14th century.

A double-faced stone casting form used to cast two round dangles, one bearing the so-called Maltese cross and the other a six-foil rosette, was found at the same site. Both ornaments are typical of Russian dangles. A tamga of two arrows is chiseled on the side edge of the form; such signs occur on individual Golden Horde ceramics. The tamga could have belonged to a jewellery shop owner from the Golden Horde, or it probably belonged to a non-Russian craftsman.

The front panel of a copper encolpion with a Crucifixion image in the centre, saints on the side ends, and a cross on the top one was found at the Vodyanskoe archaeological site recently. It is a two-dimensional combination of engraving and drawing. The cross has flaring ends. It probably dates back to the latter half of the 12–early 13th century. Pig bones have also been found at the Vodyanskoe archaeological site, suggesting that Christians, probably Russians, were present here.

The Uvek archaeological site (city of Ukek) and the nearby territory. Old excavations yielded a quadrifoil folding cross with images of the Crucifixion and Mother of God and Child on the throne (14th century), a round-top icon of Saint George and the Dragon, and a fragment of an encolpion cross bearing a Crucifixion image. The two latter objects are production rejects. L. Nedashkovsky published a fragment of an icon with defects, and a prefabricated chain for a chandelier or a cross from Uvek [Nedashkovsky, 2000, Fig. 30, 18, 25, p. 109]. These findings suggest that crosses and icons were produced in Uvek for Orthodox Christian citizens.

A 12th century bronze cross, a rectangular icon of St. George (not earlier than the 14th century), and half of a quadrifoil folding cross cast in the same form as the above one were found at the same site. Noteworthy stone articles include a jewellery Saviour icon (14th century), a St. Nicholas jewellery icon (14th century), a pink slate jewellery Myrrhbearers icon, a jewelry icon depicting the Saviour, Mother of God, and a saint, and a Byzantine-produced decorative icon of an archangel. Old publications mention an oval seal with an animal image that bears the name of its owner, Prince Mikhail. L. Nedashkovsky published a copper ring with a solar sign (swastika) on it, a bronze kolt, a fragment of a kolt casting form, two glass rings with a circular cross-section, which are usually classified as Russian-made articles, a corona lucis chandelier, and an incense burner. M. Kramarovsky published a bone seal, found at the Uvek archaeological site, bearing a reverse inscription in Russian, 'Semyon's seal' [Kramarovsky, 1999, pp. 39–40, Fig. 2]. Such bone seals occur among Russian antiquities and date back to the latter half of the 13–14th century. Two similar seals have been found in Bulgar, while Russian ceramics have also been found in Uvek.

Berezovka settlement researched in the 1950s by A. Alikhova was located on the Usa river near Samara Bend, where there was a portage. It was a small settlement from the latter half of the 13–14th centuries. Besides, the Tatars, Russians and Bulgars also lived there. Russian ceramics made up 52.9% of the total. Two Kievian cross engolpia from the early 13th century, a stone cross worn next to the skin from the 12–14th centuries, and a bone cross with crosses at the ends from the 12th century were found here.

An above-ground house was excavated in Berezovka. Russian ceramics, a bone cross, and an earthen house belonging to Russians were found there. Pig bones were found at the site. The settlement is dated to the latter half of the 13–14th centuries, and evidence of Russian presence can be seen at all levels.

Russian ceramics can also be found in other settlements of this period along the Usa river: near Pechera Vyselki village and Rublennoe

Russian ceramics. Ukek. 13–14th centuries
(according to L. Nedashkovsky)

lake. Russian ceramics and engolpia were found in a dugout researched by A. Alikhova in a Golden Horde town called Mokhsa (modern Narovchat).

An engolpion from the early 13th century was found in the settlement at Gubino village, on the right bank of the Volga river, and a zmeevik from the 13th century with an image of St. Theodore Stratelates was found near Balakovo village.

The most findings related to the Russian population from all Golden Horde cities are in Bulgar. This can be explained by its close proximity to the borders of Rus' and the strong ties between Bulgar ulus and the Russian State since the pre-Mongol period. Orthodox relics and ancient Russian ceramics are most commonly found here [Poluboyarinoва, 1993]. Crosses and icons have been found in Bolgar Archaeological Site since the 19th century, for example, a stone icon with an image of St. Nicholas and the seven sleepers of Ephesus dated back to the 13th century, a bronze

church ripidion of the 12–13th centuries, a copper icon with the image of the Virgin, and a fragment of a cross.

Twelve Bulgar stone cross pendants (12–14th centuries), metal cross pendants (11) of different types including five with wedge-shaped ends (12–early 15th centuries) and other ones are known from among Russian relics of that time. Eight cross engolpia have been found, both unbroken and fragmented ones. A bronze one decorated with a relief, coloured enamel depicting St. Nicholas by Zaraisky is the most noteworthy. It is a full-length image of the saint with uplifted hands. There are columnar Russian inscriptions containing his name on both sides. The engolpion was found at the 'Greek chamber'. This is a Christian cathedral not far from the Armenian settlement behind its walls.

An unbroken engolpion cross from the 14–15th centuries was recently found on the bank of the Volga by the settlement. It has a stepped centre and four-way ends [Faskhutdinov, 1999, pp. 94–95]. Fragments of two engolpion crosses from the 12–13th centuries and 14–15th centuries, tops of two more crosses, and a one-sided cross cast from the imprint of an engolpion from the 12–13th centuries are also in the collection. A stone icon pendant with a partly preserved image of two saints was recently found at the settlement. The inscription 'Eupathy' was near one of them.

As far as church adornments are concerned, a six-blade carrier of the chain holding a corona lucis, some parts of a corona lucis, and an incensory from the 15th century were found in Bulgar.

The Russian finds in Bulgar are not only religious items. There were also two bone seals similar to the Russian seal from Uvek and findings on the Russian territory dated to the middle of the 13–early 15 centuries. Bracelets made of Russian glass, various types of glass beads, jewellery in the form of metallic three-bead temple rings and signet rings with solar symbols (gammadions) on the shield could be trading items. Several Russian coins from the late 14th –middle of the 15th century are evidence that they traded with Rus'.

The Russian ceramics found in various quantities in almost all excavations are one of the most massive finds. They are triple-fired pots made of gray clay or white bowls with an addition of coarse sand in the puddle clay. Besides these, there are similarly shaped pots made of a different type of puddle clay that are better fired and less ornamented. Apparently, these vessels were influenced by local Bulgarian pottery.

The Russian ceramics were found in the Bolgar Archaeological Site in several Early Golden Horde dwellings (middle of the 13th century–early 14th century), where a stone cross and slate spindle whorls were also found. A small number were also found in its cultural layer. Its fragments made up from tenths of a percent to 4.3% of the layer in the late Golden Horde period. Dwellings and middens were studied. Russian ceramics made up about 50% there, for example, in Zarechny district, or about 40% in the town centre.

The topography of the findings of this earthenware crockery allows us to outline the areas where Russians dwelled in Bulgar. It turned out that it is impossible to distinguish areas in the town, within the limits of the ramparts, where only Russians lived. Dwellings with a high percentage of Russian ceramics and other Russian items can be found across the whole town, except for the districts where adobe buildings belonging to the Golden Horde nobility were concentrated. Both Muslims and Russians were scattered throughout Zarechny district, which had been settled since the middle of the 13th century. Many people dwelling in houses with Russian ceramics were craftsmen: jewelers, metallurgists, and bone carvers.

Of the late Golden Horde layers, 13 dwellings can be classified as Russian ones with various confidence levels. Four of them are ground-based, the rest are dugouts and half-dugouts. In three cases the ground-based houses have cellars, one of them have a clay oven on wooden forehearth casing. Four dugouts were 1.4–1.7 metres deep and measured 16,521.5 square metres. The walls were panelled with logs, planks and fences. The hearth was in the centre or in the corner. There were pillars supporting the roof. There were five half-dugouts: four of them were fit to live in, and the last one

was used as a utility room. They are 0.65–1.2 metres deep and measure 16–24 square metres. One of them has an oven in the centre, and the other ones have hearths. The walls are panelled with planks and fencing. There are pillars along the central axis and the edge of the foundation pit. The details of construction of the dugouts are similar to those found on Russian territory, including North-Eastern Rus'.

Recastings of the sides of an engolpion depicting St. Prince Boris (the original dates back to the 12–13th centuries) and a fragment of a cross with a stepped centre similar to the one described above (14–15th centuries) were found in Aga-Bazaar, a trade port of Bulgar. Moreover, three stone icons were found there: one with two saints, one with St. Stephan (with an inscription on the back), and one with a saint warrior (fragment, inscription is faded).

The lower end of a cross engolpion depicting two saints (14–15th centuries) was found at the **Bilyar Archaeological Site**. These finds could originate from the Bilyar Settlement 3.

The finds of the Golden Horde records mentioned above show that orthodox church items and ceramics are the most reliable sign of the presence of a Russian population there. Separate Russian items as well as pig bones, which could only be left by Christians in the town, are indicative as well. Personal things have been found. Cross pendants, engolpia, and icon pendants are typical of Russian lands, where they were initially produced. Most of these items are recurring. The image becomes even more unclear in subsequent castings; rough edges can be often seen on them. The production of crosses and icons in this way in the provinces explains the fact that Russian relics items dating back to earlier times are found by archaeologists in layers of the 14–early 15th centuries when artisan centres where the originals had been produced had ceased to exist or produced other types. One can also see later finds, which might have been brought from Russian towns in the 14th century to sell to countrymen living in the Golden Horde. These were also copied. Stone casting molds to produce icons and crosses, for example, in Uvek, are evidence of local production of Christian relics.

Without a doubt, details of coronas lucis, incensories, and holders and chains of lamps are Russian church utensils.

Ceramics were the most traditional part of family life in all periods. Russian earthenware crockery differed dramatically from Golden Horde ceramics in colour, quality, and shape. Russian potters could make it using their own approaches for preparing puddled clay, moulding containers, and firing. Russian pots with puddled clay closer to Bulgar ones and with better firing can be found in Bulgar. These containers could have been made by Bulgar potters in small workshops specially for Russian inhabitants or by Russian masters borrowing the technique from the Bulgars. It is noteworthy that the same type of ceramics was found in Uvek [Nedashkovsky, 2000, p. 111].

Besides these mass materials, unique finds such as seals and pens of princes and other people also point to the presence of Russians.

Different metal and glass jewellery of a Russian type could have belonged to Russians or be merchandise. Copper signet rings with solar symbols (gammadions) on the shield and traces of light enamel sometimes depicting a hand can be found in Golden Horde layers especially frequently. These signet rings were produced in Novgorod workshops until the late 14th century. Probably some finds from the Volga Region were cast in the provinces in imitation of goods bought from Novgorod merchants.

Especially many finds connected with Russians were found on the territory of Bulgar ulus of the Golden Horde. This can be explained not only by the close proximity of Rus' and Volga-Kama region but also the pre-Mongol relations between the two countries, including trade relations.

Jews in the Golden Horde

Igor Volkov, Aleksandr Kadyrbaev

It is known that there was a Jewish presence in Eastern Europe long before the Mongol conquest, but it was mainly concentrated in the Black Sea Region and Middle Asia. It was due to the fact that Jewish communities had an important role in international trade.

According to written (mainly epigraphic) sources, Jewish communities were known in Phanagoria and Bospor from at least the 3rd century CE [Danshin, 1993; Solomonik, 1997], but the majority of available sites allow us to give a double interpretation. In particular, most headstones, of which there are around 60 in Taman [Solomonik, 1997, p. 18], have no dates in the inscriptions or reliable stratigraphic dating [Danshin, 1993, p. 71]. There are few written sources from later periods. The postscript of Pentateuch from Karasubazaar synagogue dated back to 905 mentions Matarkha, Karakuban, and Tokht [Ibid.], but this source may be a later forgery. Jewish travellers of the 11–12th centuries noted the presence of Jews in Crimea. Possibly the 'Khazars' who prospered in Tmutarakan under Russian princes were adherents of Judaism. However, not all those who professed Judaism at that time were ethnic Jews. For example, Jewish traveller rabbi Petachiah from Regensburg met Jewish sectarians and Karaites among Kipchaks in the Dniester region in the 12th century. Some researchers connect them to the emergence of Turkic Karaims in Crimea.

There are many names referring to Jews (mountain Jews, Tats) in the toponymy of north-eastern Caucasus. Their communities date back to the epoch of the late Sasanids—rulers of Iran—right before the Arabic invasion in the middle of the 1st millennium CE, particularly in Derbent, and became stronger under the Khazar Khaganate. Judaism became wide spread in the Caucasus due to the Byzantine empire's policy of forced christianization of its Jewish community when many Jews took refuge in the Khazar Khaganate fleeing from 'Rum (Constantinople.—*I.V., A.K.*) to the land of the Khazars' [Alikberov, 2003, pp. 454–460]. It is known that the ruler and nobility of the Turkic Khazar Khaganate, which included the territories that later became the possessions of the Golden Horde (Lower Volga Region, North Caucasus, Southern Rus'), turned to Judaism back in the late 8–9th centuries, in which Jewish merchants played a part.

There is evidence of a Jewish community in Rus' from the 10th century, since the reign of the great prince Vladimir Sviatoslavich, who

brought Christianity to Rus'. There was a rich trade quarter in Kiev [Short Jewish Encyclopedia, 1982, p. 253]. Relations between the Jewish community and Orthodox population varied. The wealth of the community that engaged in usury and money-lending were a constant source of envy. The religion of a community that did not believe in Jesus Christ and opposed Christianity also caused discontentment among the people who had already converted to Christianity by that time. In 1239 when Mongol troops stormed and occupied Kiev, the Jews suffered just as all other citizens and fled west to Poland and Hungary. However, there were still Jewish communities left in the Ancient Rus' Kingdom of Galicia–Volhynia that did not suffer much from the Mongolian conquest, possibly because the tactics of the conquerors had changed by that time.

Jewish communities settled widely in the main towns and trade points along the most used caravan routes leading from China to Europe to a certain extent because of the Mongol conquests and the formation of the Mongol Empire. After Mongol conquests, significant changes occurred related to the large groups of people's resettling from the East to the West and from the West to the East. Apparently, Jewish (Hebrew) communities became involved in these migrations. In any case, an ambassador of the Roman Pope named Giovanni da Pian del Carpine went on a lengthy journey through the steppes of Eastern Europe and Central Asia to Karakorum (the capital of the Mongol Empire) in 1242 names the Jewish among people subordinate to the Mongols [Travels, 1993, p. 51].

This is not surprising, because the multi-ethnic cities of Ulus Jochi and the people and the ruling Golden Horde elite consisting of Chinggis Khan's offspring, who complied with the requirements of Yassa concerning tolerance towards representatives of different confessions, were non-judgmental towards the Jews, unlike the majority of European Christian countries, where the Jewish were considered exploiters, malicious sorcerers, black magicians, and poisoners. In the Golden Horde there was a privileged regime for the priesthood of all religions, including Orthodox Christianity and Judaism, which was even preserved after Islam had been

adopted by Öz Beg Khan as an official religion. The priesthood was free from paying tribute, and its church possessions were protected by the Golden Horde authorities, which is a little uncommon for a Muslim empire because 'the unfaithful', that is, 'non-Muslims' were obliged to pay a tax called 'dzhizya' for the right to practice their religion in Islamic states. But Ulus Jochi was an exception to the rule.

The presence of Jewish communities in various Golden Horde towns was noted by the first European travellers. For example, in 1253 William of Rubruck reported about the town of Samaron, located between Derbent and Shamakhi in the Caucasus, lands which were disputed by the khans of Ulus of Jochi and Mongol rulers of Iran and the Middle East—Ikhans of Hulaguids—where 'many Jews lived...' [Ibid., p. 166].

The Jewish communities notably consolidated in the districts where they traditionally lived in the Northern Black Sea Region and Western Ciscaucasia, of which there is evidence. After the stable centralised power of the Golden Horde khans had been established, the Jews started to be regularly mentioned in notarial acts concerning the Azov Sea Region, and there was a Jewish quarter in Azak itself called Giudecca in the Venetian manner. The source of migration is clear—that is, Crimea and the Black Sea Region in general. The most significant Jewish colony was located in Sevastopol (Sukhumi) [Karpov, 1990, pp. 298–299]. 'The charter of 1449' registered a significant number of Jews on the territory of Kaffa [Solomonik, 1997, p. 10].

From the 13th century the number of Karaims in Crimea began to increase. They lived there with Rabbinic Jews. For example, I. Schiltberger visited Crimea in the early 14th century and wrote that 'four towns situated on the seashore depend on Kaffa. There are two types of Jews, there and two synagogues in the town and four thousand houses in the outskirts' [Schiltberger, 1984, p. 45]. At that time Karaim communities were known not only in Kaffa but also in Solkhat, Qırq Yer (Chufut-Kale), and Mangup. The Karaims were mainly handicraftsmen and small traders in Crimea like the Orthodox Jews.

The exotic religion could spread even among Italian colonists. It is noteworthy that it was not always reflected in the names of its adherents as it was in antiquity [Danshin, 1993, pp. 68–69]. For example, most of the Jews mentioned in Italian sources have Muslim or Christian names: Yusuf, Ismail, Johannes son of Andrey [Karpov, 1990, pp. 298–299, app. 172–174].

The possessor of Matrega and then inhabitant of Copa, Zacharias de Ghisolfi, is even more illustrative. It is absolutely impossible to recognise him as an adherent (or at least follower) of this religion on the basis of his name. It is known that he was Vincenzo's son and nephew of Simeone de Ghisolfi from the marriage of Vincenzo and Bike-khanum, Adygean prince Berozokh's daughter [Lavrov, 1957, pp. 17–18]. However Russian sources mentioning his correspondence with Ivan III call him a 'Taman prince' [Sbornik Imperatorskogo russkogo istoricheskogo obshchestva, 1884, pp. 73, 77] and 'Cherkas' [Ibid., p. 114] and a 'Frank' [Sbornik Imperatorskogo russkogo istoricheskogo obshchestva, 1895, p. 309] and a 'Jew' or 'Zhidovin' [Sbornik Imperatorskogo russkogo istoricheskogo obshchestva, 1884, pp. 41, 71–72].

Vivid evidence of how wide spread the Jews were at the lower reaches of the Kuban is from the late 15th century when Giorgio Interiano lived here. His essay, which was first published in Venice in 1502, provides a rather detailed ethnographic description of the Adyghes living in the Kuban and mentions: 'They don't have any script and don't use either their own or a foreign alphabet. Their priests serve in their own way using Greek words and inscriptions without understanding their meaning. When they happen to write someone, although it happens rather seldom, they mainly have to use Hebrew and Hebrew script, but they tell news to each other in oral form, via messengers [Adyghes, Balkars and Karachays, 1974, p. 48]. Later the evidence of Jews in sea towns of Taman and Temryuk became regular.

There is little archaeological evidence of the presence of Jews in the western part of the Jochid Ulus. One is a fragment of an amphora that is most likely from the middle of the 13th century from the outskirts of Anapa [Volkov,

2002, pp. 42–45]. There is a Jewish inscription with the name 'Itskhak' on the fragment.

The evidence of the presence of Jews to the east is fragmentary. For example, while describing Majara, Ibn Battuta noted: '... I saw a Jew who greeted me and spoke Arabic. I asked him where he came from, and he said that he was from Andalucian (Andalussian) Lands, that he came from there by land, not by sea, and that he was going through Constantinople the Great, Roman lands, and the Land of the Circassians' [Collection of materials referring to the history of the Golden Horde, 1884, p. 288]. This traveller also reported about a Jewish quarter in Sarai. The geographic essay by al-Umari stated that there were only 100 houses of Jews and 100 houses of Christians in Khwarezm, and they were not allowed to have more [Ibid.] Most likely, 'Christians' means Syrian Nestorians in this context. This information was reproduced almost literally in 'Geography' by al-Qalqashandi [Grigoryev, Frolova, 2002, pp. 282–283]. Although the reasons for these limitations are not quite clear, it is evident that they were connected with the adoption of Islam as an official religion under Khan Öz Beg. At the same time, it is obvious that these communities had a lot of privileges in the possessions of the Jochids, particularly, they could practice and spread Judaism without limits and engage in economic activities that were traditional for them.

The role of Jews in the Horde policy in Rus' was rather significant. It was connected with the fact that the khans of the Golden Horde started recruiting Jews along with Muslims serving Mongol khans and charging them with the function of darughachi, meaning they were in charge of collecting taxes from the people in ancient Russian towns, which intensified the hatred toward the Muslim and Jewish communities. This affected all the Muslims and Jews during anti-Horde uprisings. In the latter half of the 13th century, when the Mongols established their power in Rus', Kievian princes invited Jews to settle in Kiev with their permission [Solzhenitsyn, 2001, pp. 4–5]. In the 15th century, right before the collapse of the Golden Horde, Russian chronicles mention the Jewish

tax collectors in Kiev that have significant possessions. At that time, in 1470 (or 1471), Moscow Orthodox hierarch Joseph Volotsky reported in 'Book on Heretics' that a Jew called Skharia came to the suite of prince Mikhail Olelkovich from the Grand Duchy of Lithuania to the lands which were subordinate to the Horde.

The Jew was well versed in black magic, sorcery, and astrology. Orthodox priests accused Skharia of preaching Judaism, which was adopted by several Orthodox priests under the influence of his speeches.

Thus, the Jews played a role in the history of the Golden Horde. Probably it was a reflection of the tradition originating from the Khaganate to a certain extent. Although Jews were not seen in the inner circle of the khans ruling the Jochid Ulus, their representatives became intermediates between the inhabitants of the Horde and Orthodox populations of the Eastern Slavs that they were obliged to collect taxes from. However, the Jews were not only darughachi, tax collectors, usurers, and merchants in the Golden Horde; they were also doctors, astrologers, and priests able to convert adherents of other confessions to their religion, and they left a mark on the symbiotic culture of the Golden Horde.

After the Jochid Ulus had collapsed, the Jewish population moved to quieter districts—towns and places of southern boundary regions of the Polish-Lithuanian state as well as Crimea.

Armenians

Igor Volkov

It is well known that Armenians made up a significant part of city dwellers in Crimea. Numerous literary works cover this issue [Jacobson, 1956; Mikayelyan, 1965; 1974; Korkhmayan, 1978; Dombrovsky, Sidorenko, 1978, pp. 55–78]. Although the emergence of the first

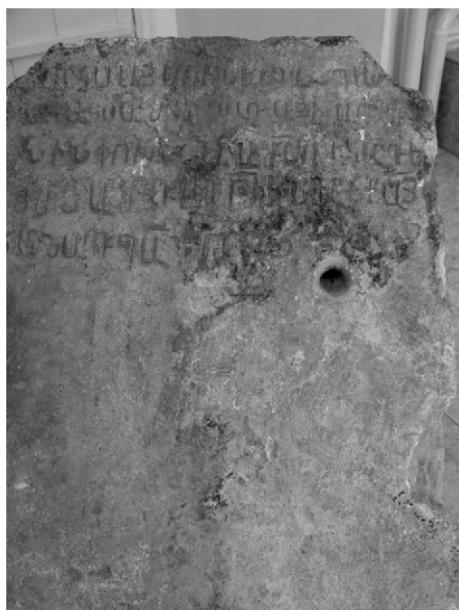

Armenian headstone. Crimea. 14th century. Hermitage Museum

resettlers was in the pre-Mongol period, it is evident that the mass movement of the Armenians to Crimea from Transcaucasia began in the 13–14th centuries in connection with the occupation of these regions by the Hulaguids [Jacobson, 1956, p. 60].

There was an Armenian colony in Bulgar, at the northern boundary of the Golden Horde. 'The Greek chamber,' which has the ruins of an Armenian church and adjoining territories with a burial ground with prevailing 'Armenoid type' of the buried, was archaeologically researched [Smirnov, 19578, pp. 343–344]. A series of Armenian headstones was found in Volga Bulgaria. Some of bore Arabic inscriptions [Ibid., p. 331]. The founding of this colony may date to the 10th century, just as Novgorod the Great and Kiev. Meanwhile, real finds date to the 13th century.

The public architecture of the Golden Horde continues the traditions of Seljuk style almost across the whole state [Smirnov, 1958, pp. 330–331; Zilivinskaya, 1991, pp. 12–22]. The architectural decor of the Golden Horde is also similar to Seljuk-style sites. It is noteworthy that the Armenians played an important role in the formation of the Seljuk style [Marr, 1934, pp. 36–37; Orbeli, 1978, pp. 4–5]. For example, Tagavur ibn Stephan built a Seljuk madrasah in Malatia, architect Baluyet worked in Iconia [Ibid.] Kaloyan (Galoyan), Geluk ibn Abdallah, and others can be also added to this list [Khachatryan, 1987, p. 43]. It is plausible that there were many more Armenians among the architects mentioned in the inscriptions of Asia

Armenian headstone. Bolgar.
Mid-14th century. Bolgar State Historical
and Architectural Reserve

Minor, because Muslim names were easily understood in their environment [Grenard, 1901, p. 551]. This phenomenon was wide-spread in Crimea in a similar form—there Turkic names started appearing in Armenian epigraphics [Jacobson, 1956, p. 58].

It is known that there was an Armenian quarter in Azak. Three memorable entries of Armenian manuscripts in Azov report about the existence of at least one Armenian church in Azov constructed in the honour of Grigory the Illuminator [Fomichev, 1992, p. 49; Memorable entries, 1950, pp. 329–330]. It is known that Ter Sargis was the senior priest there under Khan Öz Beg. He was a son of priest Ter Manuel who apparently served here as well. There was a scribe Terter Yerevantsi working at the church of Grigory the Illuminator, and he left one of the entries. Moreover it is known that Armenian merchants suffered during the conflict of 1342 between the Venetians and Tatars. After their bilateral relations had been restored, the khan established a special tax on Venetian goods to recover losses [Sbornik veneciansko-genuë`zskix gramot, 1860, p. 183]. The Armenian church and congregation in Azov are mentioned in the description of the

conflict that took place in 1355–1356 between Metropolitan of Alania Simeon and priests of Tana [Drevnie akty', 1867]. It is reasonable to assume that there was Armenian architecture in Golden Horde Azak.

Not only architectural decorative elements but also carved stone articles in towns of the Golden Horde reflect features of the Seljuk style that spread across Crimea and Transcaucasia. Probably this is due to the carvers who came from Transcaucasia and Anatolia, which included Armenians. Similar ornamental patterns were used to decorate numerous headstones from Majar and Azak. Golden Horde articles carved from a mix of gypsum and clay also have identical analogs in Armenia, in Dvina [Fedorov-Davydov, 1976].

Researchers have studied the similarity of Golden Horde ceramics and Transcaucasian and Siberian samples several times [Jacobson, 1950, pp. 112–114; Fedorov-Davydov, 1976, pp. 126–128]. A potter with the Armenian name of Sarkis worked in Sarai al-Jadid. Most likely he had resettled from Armenia [Kramarovskiy, 1978]. Finds with the brand of this master potter come from Tsarevskoe, Selitrennoe, and Vodyanskoe archaeological sites, and identical items without the brand are well established as far as Azak. Consequently, there were master potters from Transcaucasia and neighbouring regions there as well.

A striking example of resettlement is the movement of the Armenian community recorded in a memorable entry of one of Matenadaran's chronicles [Mikayelyan, 1974, pp. 13–14; 1965, pp. 17–27]. In the 1290s a significant number of them migrated from the territories subordinate to the Hulaguids to the Golden Horde, to the Volga. They founded a new colony at a new place near Ak-Sarai. In 1299 this community moved again, this time to Azak, and in the 1330s they moved to South-East Crimea where the colonies of this population had got a foothold much earlier, in the 1280s [Sidorenko, 1988, p. 116]. As it was mentioned above, some of the Armenians continued living in Azov after that. Scribe Terter Yerevantsi left Yerevan for Azov shortly before 1341. He went there by sea through Kaffa [Memorable entries,

1950, pp. 329–330]. Some of the resettlers also stayed in Sarai (that is where the gospel was written that was brought to Azov in 1319) [Ibid.]. Unfortunately, the actual ratio of the local population to migrants in the 14th century cannot be determined based on these examples.

There is clearer evidence for the 15th century when, for example, Armenians made up around 65% of the population while the Greeks, Karaims, and Tatars made up only 15%, and the Genoese, around 4% [Abramyan, 1973, p. 25; Mal'owist, 1939, p. 40]. The town of Azak was not a temporary refuge of the Armenians. Their large community existed there at least up to the 1395 pogrom by Timur.

The epigraphics of Stary Krym provide for interesting observations. The most significant collection of headstone inscriptions comes from this site. Some of them indicate the origin of the dead. In total there are 18 cases of this kind, only 10 of them are from Crimea, in the other 8 cases the people were migrants from Asia Minor, Iraq, and Middle Asia [Akchokrakly, 1927; 1929]. Certainly, even if the nisba is indicated, the origin of the dead could still be in question; there were cases when this extra part was added to the name because of frequent trips made to an oversea town [Goytein, 1981, p. 42]. But it appears these mistakes were corrected with Crimean nisbas of migrants who settled successfully. For example, Husein, son of Aivaz the Crimean, was mentioned on one of the headstones of Stary Krym [Akchokrakly, 1929]. The emigrants of the second generation got a local nisba [Akchokrakly, 1927].

After the Jochid Ulus had collapsed, and most Volga towns had been destroyed, the Armenian population moved to quieter regions like Crimea and the Kazan Khanate where they had an Armenian sloboda as well as to towns and areas in the south and sou-eastern part of the Grand Duchy of Lithuania. A rather significant Armenian community formed there over the course of time. They preserved some elements of the urban culture of the Jochid Ulus. For example, the members of this community corresponded and composed documents in the Tatar language (Volga Turks), but they wrote using Armenian graphics [Abdullin, 1974, pp. 166–185; Garkavets, 1981, pp. 76–80].

This cultural-linguistic phenomenon could have started only in towns of the Jochid Ulus, and it is an important sign of the Golden Horde's civilisation.

A Kipchak-type language dominated in towns of the Jochid Ulus, but there were many migrants there, and the wide-spread occurrence of this language was mainly explained by the multi-ethnicity of the resettlers. In this environment Tatar became the urban lingua franca.

Catholic communities

Mark Kramarovsky

Kaffa became the centre of the Latin presence in Golden Horde Crimea starting in the 1260s. Apparently, the Latin community built a church of Virgin Mary in the 13th century. It was destroyed in 1308 [Balard, 1978, I, p. 206]. Two cathedrals dedicated to Virgin Mary, two cathedrals of St. Domenic, a cathedral and chapel of St. George, and churches of St. Laurenty, St. Anna, St. Nicholas, St. Catherine, St. Daniel, St. Anthony, St. Cross, St. Jericho, St. Angel, St. Lazar, St. Simon, St. Kiriak, St. Christ were mentioned in registers of Massaria Kaffa of 1381 and 1386. Churches of St. Michael, St. Francisco, and Johannes were situated in communes. The charter of Kaffa of 1449 lists 18 cathedrals, adding cathedrals of St. Agnes (received this status in 1318), St. Mary Magdalene, St. Clara, and St. Mary Coronato to the ones mentioned above [Ibid., p. 213; Charter, 1863, pp. 704–706]. The people's assembly was the highest legislative authority in the city (Kaffa received city (civitas) status from Pope Johannes XXII in 1322). The assembly was in charge of construction, water supply, and budgetary matters in the commune. It consisted of a large council (24 members) and small council (6 members). They were elected for one year from amongst Latins and representatives of the non-Latin community in a ratio of 5:1. Two treasurers were in charge of the public treasury, they were obliged to keep cash receipts and payments books. In the latter half of the 14th century clavigerii (custodians of the treasury) were replaced by *massarias*, who were members of the large council. The small council controlled the activities of

Sudak fortress

functionaries, who were supervised by *sindiks*. The consul was the head of the executive power. He was appointed in Genoa for a year or two. Judicial authority in the colony also belonged to him. The cavalry and the captain of the communes kept the order in the town. The captain relied on hired guards, including the cavalry headed by the captain of the *Orguziis*. In the 1420s they started to mint their own bi-language coins in Kaffa. When Constantinople fell (1453), control over Kaffa and Crimean colonies of the Genoese passed to the Bank of St. George. Subsequently, the cross of St. George, the official symbol of Latin trading posts, made way for the image of St. George.

The Latins appeared in Solkhat in the last quarter of the 13th century. The acts of Genoese notary Lamberto di Sambuceto working in Kaffa for three years (since July 1288) give an idea of his Solkhat clients [Balard, 1973, pp. 138, 151]. Wax trader Barnabo di Mogniardino, owner of a tailor workshop Francesco and his wife Julianna, smith Paolo da Piacenza married to a Russian woman called Francescina, etc., were among them. Probably by the 1290s there was already a Genoese quarter as inhabitants of Genoese Solkhat were mentioned in several documents. A consulate subordinate to Kaffa defended Genoese interests. According to the *Ordo de Kaffa* of 1316, the consul of

Solkhat was assigned by Kaffa as an exception to the rule, he was not chosen in the provinces, probably because the community was small in number. As contradictions between Solkhat and Kaffa intensified, life became less safe for the Latins in the city, so during the period of open war of 1385–1386, which was called *Belum de Sorcati*, the Genoese quarter probably did not exist. Anyway there are apparently no Latins among secret informers of Kaffa 'resident' Pietro from Valencia acting on behalf of the consulate. It is hard to determine the location of the Latin quarter on a map of the medieval town. Judging by paintings by Jacques Baltasar de Traversa (page from the collection of the Cayot Gallery in Paris), the skyline of Eski Qirim Crimea featured a Genoese tower in the early 1780s. It was crowned with a viewing platform with merlons on consoles, which was typical for the 14th century. It is natural to believe that the tower, which did not survive to our days, once belonged to the complex of the Genoese town church, which was the centre of the Latin quarter. It is suggested that it was situated not far from the road leading to Kaffa between the buildings of the Islamic and Jewish communities. The city church (Oderico, historian of the 18th century called it 'Castello Kirma') was captured by the Crimean Tatars in 1430, and after Carlo Lomellino was defeated

Aspers of Ulug-Muhammad and Hacı Giray

in 1437, it ceased to exist. Oderico provides evidence of a fragment of an inset flagstone with a Genoese cross on it and the emblem of the consul depicting a heraldic lion. A Greek inscription made apparently no later than 1464 says that this flagstone was taken from 'Kirma Castle.' The list of indisputable material evidence of the life of the Latins in Solkhat is rather short. Probably a bronze seal of a metalworker and smith (judging by the hammer and anvil depicted) should be classed with the Latin group of finds [Kramarovsky, 2005, p. 123, cat. No. 710]. Two other finds are a glass key-chain made from smalt (?) with an image of an Eurasian eagle-owl on it. The bird is sitting on a three-part flower and spreading its wings. The find from Solkhat originates from one of supplementary constructions of a glass-making workshop. We do not have sufficient information to state that the workshop belonged to a Latin glass-maker, but we cannot exclude this possibility either. The other find is a fragment of a glass container handle painted with enamel (not published). Let us remind you of the find of the Italian glass cup with enamel and heraldic shields at the outskirts of Solkhat at Bokataş II settlement [Ibid., p. 124]. It goes without saying that there were also Latins in other towns of the Golden Horde, including Sarai, where a Catholic episcopacy was operating; in 1364 Trebizond Minorite Cosma was a bishop. The Latin component is not very convincing in the ceramic complex of towns and settlements of the Golden Horde. An amphora fragment with an imprint of a European (maybe Venetian) seal with an image of lion on it and a round Latin inscription 'Lagoon of St. Mary...' was found at Selitrennoe archaeological site [Volkov, 1992]. A small group of Italian din-

nerware (two milk jugs) of the mezza maiolica type was found in Azak [Belinsky, Maslovsky, 1998, pp. 28–32. Fig. 7; Kramarovsky, 2005, p. 124. cat. Nos. 613, 619]. Fragments of chandelier containers from Valencia were found in Belgorod-Dnestrovsky, Azak, and Crimea [Kravchenko, 1986, pp. 99–103; Koval, 1998; Teslenko, 2004]. Latin silver articles, including imported sets of belts, containers, and catholic crosses for signet rings produced here, are presented more significantly in the treasures of Crimea and burial sites of the North Caucasus [Kramarovsky, 2001, pp. 120–124. 140–156, 157–161]. A golden signet ring with an emblem of the famous Genoese Spinola family stands out in this group of finds on the Mangup Plateau [Ibid., pp. 162–168, Fig. 84].

The Orthodox community is one of the most significant among Christian communities of the Golden Horde towns. The Greeks, Russians, Turks, and representatives of other ethnoses who adopted Orthodox Christianity became an integral part of the population of the Golden Horde. Greek communities prevailed in Crimea. Byzantine Kherson remained a powerful centre of Orthodox religion. The town of Gothia was active until the late 13th century. A basilica from the early Middle Ages and a chapel attached to it in the 13th century, a cathedral of Donors with frescoes that were possibly created by a Constantinople artist, and the remarkable Cathedral of Three Horsemen in the rock (the middle of the 13th century) were known before the destruction of Eski Kermen in the late 13th century [Jacobson, 1964, p. 101]. St. George was portrayed as triumphant dragon-slayer who set captives free in the paintings of this cathedral [Stepanenko, 2003, pp. 452–457].

The active life of Christian communities was confirmed by excavations at archaeological sites in Bakla, Tepe-Kermen, Alushta, whose territory increased to 3 ha in the 13–14th centuries [Myts, 1991, p. 152]. The repairs done in the 14th century in the church of John the Baptist in Kerch-Vosporo are noteworthy in this context. Neither a Russian layer nor Russian ceramics were found in these towns by archaeologists. The Orthodox community of Solkhat is most indicative from the standpoint of its close proximity to Islamic quarters. As we remember, Evlia Çelebi marked five town quarters for the Greeks and Armenians. There were hardly more than two Greek quarters in the 14th century. One can judge the location of the Greek community on the town map by the cathedral in the north-west sector of the archaeological site next to the Armenian quarters. This is a basilica-type cathedral without pillars and with one nave. It looks rectangular, measuring 4.55 x 6.74 m; its walls are 0.87 m thick. The semicircular apse goes along almost the whole width of the building. It consists of the main space and vestibule. The vestibule measures 4.1 x 5.1 m, its walls are 0.6 m thick. The southern wall of the cathedral has two arcosoliums and ossuary niches. Both arcosoliums are constructively similar, but the eastern one is larger. Both of them have pointed endings outside [Kramarovsky, 2005, p. 124]. The ossuaries were used as family tombs. One side

of a cast bronze engolpion of Kievan type was found in one of them. The Basilica was located on the site of a cemetery, and probably it was used as a chapel. Its foundation and lower masonry cover burials predating the church that have no inventory. The archaeological evidence allows us to date the cathedral back to the middle of the 14th century—beginning of the 15th centuries. A row of burials revealed on the side of the apse contained several skeletons (about 3–4), which means there was not enough space to develop a necropolis during the period when the Islamic community dominated the town. It appears important that a large settlement near the south-east boundary of Bokataş II was settled by Orthodox, judging by the funeral ritual, and most likely by Christianised Turks. A trade suburb with a developed pottery district and necropolis was situated there [Kramarovsky, Gukin, 2004]. In 2004 a man's burial from the 14th century with one side of a Syrian-type engolpion from the 12–beginning of the 13th centuries with a Greek inscription was found here [Kramarovskiy 2005, p. 75, draughtsmanship]. A bread stamp with an image of an equal-ended cross made from fired clay was found in the cultural layer of the settlement along with 14th-century coins, including those from Byzantium, Trebizond, Bulgaria, and Epirus-Lepanto. There are grounds to conclude that there was a Christian church in this settlement.

CHAPTER 6

Military Science in the Ulus of Jochi

§ 1. Armament

Mikhail Gorelik, Iskander Izmaylov

Weapon system: traditions and innovations. The Jochid Ulus emerged as a result of military campaigns and conquests, and it also collapsed in battle. The whole history of the medieval empire in the latter half of the 13th century—beginning of the 15th centuries was a history of wars, internecine feuds, and battles. It is not surprising that this epoch was a time when an original weaponry system, military art, and mastering military technological innovations were begun and developed.

It started strictly on the basis of Turkic-Mongol weaponry traditions brought from the east, mainly from Central Asia. But the environment of Eastern Europe with its developed artisans and trade relations, especially with the Islamic Central Asia, invariably affected the development of the weaponry of the Golden Horde as well. The conquerors faced powerful and advanced military and weapon-making traditions in Eastern Europe. It is typical that many features of weaponry and military science of the different peoples and states of Eastern Europe turned out to be comparatively similar, despite the ethno-confessional differences and isolation of states. They united and resisted the central Asian tradition brought and implemented by conquerors.

Indeed, whatever military tradition of Eastern Europe we examine, we see almost the same type of defensive armament everywhere, and the offensive weaponry is very similar. Certainly this refers to, first of all, the equipment of the main military force of that time, which was the cavalry *druzhina* of the chieftans of these lands—the Khwarezmshahs or Dagestan rulers, Russian princes, Bulgar emirs, Kypchak khans or the beks of Chorni Kolbuki, Alanian *ardars*, or Circassian *pshis*.

In the late 12–beginning of the 13th centuries we see how chain armour dominated in defensive armament with the addition of lamellar short armor, sphere-conical helmets with chain barmica, board tear-shaped, circular, or triangular shields. The types and the shapes of battle-axes and clubs, spears and bows became more and more similar. The preference of a sabre or sword was not so much a ethno-cultural distinction (although it is certain that sabres were preferred in the south-east, especially in the steppe, while swords were preferred in the north-west of the region) but more of a local one. Often ornamental-stylistic traditions changed as world military-political circumstances changed.

In the period of conquest and formation of the military-administrative and clan system of the Jochid Ulus, a new set of weaponry began to emerge. This happened because, as the troops of Batu were replaced by conquered peoples, they encountered local military traditions. It is noteworthy that when local military contingents were incorporated into the military system of the Jochid Ulus, they clearly prevailed. It is not without reason that Rashid al-Din directly indicates the Turkic-Tatar (mainly Kipchak)—not the Mongol—forces dominated in the Jochid army. It is also characteristic that Russians and Circassians were mentioned among the troops of Batu. Excavations of the last decades revealed a very rich image of military equipment of the principalities of Rus' and Northern Caucasian societies. The weaponry uncovered in excavations in trade centres of Bulgar Ulus was also very diverse. It is not a coincidence that we observe that Bulgar cities and handicrafts revived shortly after Batu-khan's conquest, and then

they grew rapidly. It is typical that a syncretic combination of Central Asian elements and local traditions can be traced back in types, forms, and appearance of articles. Apparently, this happened at the same time migrants settled in Bulgar cities, including Russian and especially Armenian artisans among whom gunsmiths are known. But most artisans were brought from Muslim areas of the left side of the Jochid Ulus, especially from the badly damaged Khwarezm.

If the ethnocultural masses described above participated in cultural exchange in the field of weapon making, relying on their own traditions and adopting (willingly, or as necessary, or by force) the Tatar imperial tradition, then the Mongols were its safekeepers and advocates, as well as the Turkic-Tatars taken to Europe by them who were bearers of the new military culture. It was they who made up the nomadic population of the Horde steppes and the basis of the military force of the Golden Horde. Unlike city-dwelling Muslims, they remained pagans for a relatively long time (at least some of them in the latter half of the 13–beginning of the 14th centuries) and were the basis of the military service class—that is, professional soldiers. They lived for war; obviously, the duration of their lives was shorter than that of city-dwellers because they died in battle or from wounds.

As a result we observe the formation of syncretic Golden Horde weaponry (its description is below; see [Gorelik, 1983; 2002]).

Ranged weapons. Archery was one of the most important combat techniques of all the Chinggisid states, which was mentioned by foreigners rather frequently. For example, Marco Polo, who spent almost all his younger years in China at the court of the great Kublai Khan, particularly noted that they 'mostly used bows and arrows because they are great archers' [Kniga Marko Polo, 1990, p. 181].

The bow used as a ranged weapon and the main weapon of the Horde cavalry was mainly the central-eastern Asian, 'Mongolian' version. It differed from other types because of its special bone strips—medial frontal and middle side. Compound bows reinforced with these strips were quite powerful and reliable

Arrowheads. Jochid Ulus.
13–15th centuries (according to M. Gorelik)

due to the stiff girder connection in the centre and flexibility of the shoulders, which were made with flexible horns and various types of wood. Judging by archaeological findings, this type of bow was first created in the steppes of Central Asia and it appeared in Europe in the early 13th century. But it was most widespread in the Jochid Ulus in the 13–15th centuries. At the same time, they started using a compound Middle Eastern bow there that gradually replaced the Mongolian one. It was usually made from several types of wood and soft horn, was easier to produce, and was somewhat inferior to other types of bows in its combat qualities.

In the 13–14th centuries Central Asian arrowheads were widely used that were two-horned, sesame-leaved ones that were rather large, which is typical for the Mongols. Apparently Kirgiz three-blade perforated and Jurchen chisel-like arrowheads were used not as often. By the late 14th century the arrowheads were much smaller, and even earlier on the outskirts of the steppe. Gradually by

Quivers and stone plates. Jochid Ulus. 13–14th centuries (according to M. Gorelik)

the middle of the 14th century the number of types of arrowheads noticeably decreased, and around 20 types of triangular shapes of the same length became the most popular.

In the majority of cases Golden Horde quivers of the 13–14th centuries were long narrow cases that fit the entire arrow. Arrows were put in with the arrow-head up. The quiver was in the Central Asian style, it widened at the mouth, was covered often with a round fan-like top and had a hanging system made mostly from bone plates. The exterior of the quiver was covered with bone plates, richly decorated with engravings, with paint, and plant and zoomorphic designs. Bone could be replaced with gilded silver in luxurious articles and design of bone facing could be openwork, delicate, or with golden foil [Malinovskaya, 1974].

In the late 14–beginning of the 15th centuries this type of quiver was replaced with quivers that were rectangular flat cases that held the arrows fletching-side up. These quivers were half as long as the arrow shafts. A similar quiver shape typical in the 10–12th centuries for Khitans, Jurchens, Tatars, and Chinese cavalry was also brought to Europe by Mongol troops and apparently was widely developed there as in other Eurasian countries conquered by the Mongols. Later this type of quiver became predominant in Northern Eurasia.

The leather case was usually decorated with carved bone as well as metal plates. The Saadak set (a leather case and quiver) was attached

to the sword-belt, which was usually fastened with a hook. Although a blade belt was usually the dress uniform, there are also dress examples of shooting and saadak belts. For example, there is such a saadak belt in the Simferopol Treasure.

It is completely covered

with golden oval plaques, the pendant badges, and end plates (one of them has a hook) are made from carved and engraved gold framing heart-shaped insets, and the receiver is cast from gold in the form of a sculptured rosette.

Close combat weapons. As in the past bladed weapons, especially sabres, played a special role in close combat weapons. In the period of conquests, Batu's troops used swords (a weapon with a straight, two-edged sword and a handle that is coaxial to the sword), broadswords (a weapon with a straight blade, one-, one and a half-, or two-edged, with a deflected handle), and sabres (a weapon with a curved one- or one and a half-edged sword usually with a deflected handle). But the sabre became the most wide-spread in the armament of the Jochid Ulus, gradually replacing swords and broadswords almost everywhere. According to Central Asian tradition, the blade of the horde's sabre usually had a 20–30 cm long shank on the top and a rhombic section in this part. By the 14th century they had started forging the end of the blade in the form of faceted bayonet in the Kuban River Region steppes of the Jochid Ulus. Such a sword was called Circassian and was wide spread up to Central Asia. A traditional Central Asian feature of Golden Horde swords was that the chape is crossed by a special collar with a tongue covering the blade top by 10–15 cm. This collar protected the index finger of the warrior as it covered the lower tine of the cross-guard as well as the opening of the scabbard. Fullers, sometimes

double ones, cut along both sides of the sword along the edge were typical for Golden Horde swords; in addition, they were staggered relative to the fullers on the other side. That made the sword more durable and lighter. A modern analysis of the steel of Golden Horde swords testifies to their high quality. They were made from Damascus steel and even from cast steel. Over the course of time the Golden Horde sabre blades became more curved. In the latter half of the 14th century they acquired a well expressed yelman—the lower third or quarter of the sword became wider.

In the overwhelming majority of cases, sabres of the Golden Horde era had cross-shaped narrow rhombic cross-guards with ends that stretched down. The asymmetry is a typical early Mongol sign of the Horde cross-guards—the lower tine is longer than the upper one. Later in the 14th century the ends of cross-shaped handguards become flatter or were crowned with decorative balls. This type of cross-guard replaced all the various pre-Mongol handguards and defined the style that has continued almost to modern times due to the simplicity and universality of the hand protection and the wider variety of fencing manoeuvres that are possible.

A sabre as a bladed weapon was a weapon of professional soldiers—the serving nobility. Describing the weaponry of the Mongols, Giovanni da Pian del Carpine wrote that 'the rich have swords that are sharp at the end, cut only with one side, and slightly curved' [Journeys, 1957, p. 50]. This tradition of using sabres remained in the Jochid Ulus where 'Damascus sabres' were also mentioned in Russian sources as well as depicted in miniatures. Moreover sabres were much more prevalent than other bladed weapons. The sabres served as not just a weapon but also as a symbol of nobility and wealth of the owner, indicating he belonged to the Tatar nobility. It is not without reason that a valuable belt granted by the khan on which the sabre was hung was an symbol of particular esteem. The sabre usually had a special 'magic' name like a combat horse (for example, the shining sabre of Tokhtamysh called 'Alzhasman' that chopped off heads from the Tatar dastan 'Edigu').

Bows and a quivers. Jochid Ulus and Iran.
13–15th centuries (according to M. Gorelik)

Parts of a scabbard that usually looked like clips with adjustable rings for fastening to the belt, according to the Central Asian tradition, were also preserved. This type of fastening to the belt, which became fashionable in Eastern Europe in the early 13th century, came from Central Asian to a large extent. Later this type of scabbard fastening became typical for Tatar warriors and countries influenced by their military fashion.

Combat knives with 20–30 cm long blades brought by the Mongols were very typical equipment for a Golden Horde warrior. Straight daggers—weapons with two-edged blades—were used less frequently. The latter have been extremely popular in the North Caucasus up to modern days. Apparently, curved short sabres (maximum 60 cm long) that were attached to the hilt with pins were an additional or probably child's weapon. Some have been found that were remade from a part of a real sabre.

The lance—an offensive pole weapon—was used by the Golden Horde as one of the

Sabres. Jochid Ulus and Iran.
13–15th centuries (according to M. Gorelik)

replaced by other forms of lengthened lances over the whole Tatar-Mongol oecumene—from the Danube to the Pacific Ocean and the Persian Gulf. They were extended leaf-shaped or lengthened triangular, rhombic in the cross-section, or flattened with an axial rib. These tips were more universal and caused more extensive wounds, whereas a faceted pike was specially intended for piercing through armor. However, different types of tips of spears continued to coexist until the early 15th century.

As far as strike weapons are concerned, maces and bludgeons were wide spread, according to illustrative [Gorelik, 1979, pp. 30–63; Gorelik, 2002, pp. 66–67] and written [Kniga Marko Polo, 1990, p. 81] sources.

Maces came in various forms in the 13th century and first half of the 14th century. They were made with spherical tips and had driving edges and barbs sticking out in the form of various polyhedrons.

most important second blow weapons. Russian sources often mention the combat uses of lances by the Tatars who 'hacked some with swords and lifted others with lances' or 'hit hard with lances.' These recollections along with images, mainly Persian miniatures, suggest that lances were used by mounted warriors who used ram attack and acted as a concentrated group. There were fairly diverse types of lances. For example, they used the tetrahedral lances preferred by Central Asian warriors. Sometimes they made notches at the edges, and a small hook was welded to the base of the head according to an oriental tradition brought to Europe by the Mongols. Traditional narrow-bladed pikes were used along with similar tips in the Middle Volga Region [Izmaylov, Nedashkovsky, 1993, pp. 73–74, Fig. I, 1,2]. Wide lances with laurel-leaved leather and a notch on the blade—rogatinas—were found here as well. Since the latter half of the 14th century narrow-bladed and faceted types of tips gradually started to be

Spearheads. Jochid Ulus.
13–15th centuries (according to M. Gorelik)

These versions started to converge in the 14th century as they were superseded by pommels featuring seven to eight concentrically projecting flat facets known as shestopyors or pernaches. Most often these bludgeons were made from bronze and iron, but in the 14–15th centuries a great many pommels were made from steel plate [Galkin, 1963; Izmaylov, Nedashkovsky, 1993, p. 74, Fig. 1, 4]. Bronze clubs from Bulgar with pyramidal barbs projecting on three sides and a beak-shaped projection on the fourth side are typically found. This type of club continues pre-Mongol traditions, but the 'beak' makes them more similar in use to war hammers—klevtsy. They were used for puncturing armour on account of their weight and pointed shape. Many examples of steppe clubs have extended hilts—this is also traditional for Central and Eastern Asia.

Bronze biconical octahedral bludgeons and spheric iron ones with immobile metal hasp are particularly worthy of note [Izmaylov, Nedashkovsky, 1993, pp. 74–75, Fig. 1, 5]. The variety of materials typically used

Bulavas and bludgeons. Jochid Ulus and Iran.

Kuyak and armour plates. Jochid Ulus.
13–14th centuries (according to M. Gorelik)

to make the ends of bludgeons in the pre-Mongol period (horn, bronze, and iron) was gradually replaced by iron. Obviously, the appearance of square steel bludgeons with cut off corners and a mobile metal flail fastened to a combat weight belongs to the 15th century.

As far as axes are concerned, their combat role on the steppes of the Jochid Ulus noticeably reduced. Both archaic Central Asian puffin axes with narrow blades and special hammer-like picks and Jurchen-style wide-bladed axes that could also be thrown gradually fell out of use. The military use of the axe did not lessen in the foothills and plains of the North Caucasus, nor in the sedentary regions of the Volga-Kama Region. In the Volga Region there was a noticeable increase of the use of the battle axe in a prestigious, parade role as a symbol of power. Richly decorated patterned puffin axes were produced here for the first time. Gradually they came to the forefront of the applied arts in

Combined armour reconstructed with the help of Iranian miniatures. 13–15th centuries (according to M. Gorelik)

the Tatar Volga Region. In general, universal military axes with tapered wedge-shaped and elongated blades continued to be of great importance. They were almost the same in shape as non-military ones but were half the weight. The use of such puffin axes has been recorded in written sources as part of the equipment used by mobile Tatar warriors.

Defensive armour. Defensive armour was actively developed in the Golden Horde. The developments mainly related to metal armour. In the 13–14th centuries armour was assembled from bulky rectangular plates (sometimes with oval or scalloped sides) with openings along the sides. They differed in the size of their component parts, which could be either lamellar (made from relatively small plates) or laminar (made from large plates). In terms of the methods of fastening armour plating, laminar armour plates were connected using leather straps. With lamellar armour, the plates were fastened onto a cloth or leather base layer using rivets and straps.

Kuyaki (brigandines) were assembled from large plates and fastened onto a leather or cloth base layer. All of these types of armour consisted of breast- and backplates connected by side-pieces that reached the hips. They attached to the side and shoulders. Changes made to these means of defence during the Golden Horde were mainly improvements to mobility, impenetrability, and reliability. Special pauldrons and long faulds to protect the thighs featuring wide cuts at the front and rear to facilitate a comfortable horse-riding position as well as armour plating to protect the throat and face are characteristic features of armour at this time.

At the same time, written sources often mention leather armour. For example, Marco Polo described the equipment of Tatar warriors in the following way: 'they have a coat of mail on their back made of boiled solid buffalo leather or that of some other animal' [Book of Marco Polo, 1990, p. 81]. It is likely that leather armour was constructed in the same way as metal armour and consisted of the same plates, only they were made from multilayered leather.

The full body armour that had been brought to Eastern Europe made a great impression on the Europeans. A typical account is given by the author of the Galician–Volhynian Chronicle, which describes the Europeans' surprise at meeting Daniel of Galitsia's army, who were fully equipped in the 'Tatar manner,' on the battlefield: 'the Germans were surprised by the Tatar weaponry... the people were furious, and one could see his majesty among the regiments and the gleaming weaponry' [Complete Collection of Russian chronicles, 2, p. 814].

At first, lamellar armour was used, but from the latter half of the 13th century the local chain mail tradition had an increasing influence on the conquerers. In the 14th century we see the two types of armour being used simultaneously: chain mail as under armour covered by lamellar armour. This matches the pre-Mongolian East European tradition, only lamellar armour in the Golden Horde had a Mongolian structure and fit. Nevertheless, chain mail gradually superseded both lamellar and laminar armours. It ceased to

be used following a brilliant innovation by Golden Horde weapons makers in the late 14th century: they invented a way of linking iron plating with iron rings instead of straps. Very quickly chain mail-plate armour became prevalent all over the Middle East and Eastern Europe. Its functional properties—strength, flexibility, relative lightness—were unrivalled. There is a reason why all the names given to this sort of armour go back to the Iranian word 'bekhter' meaning 'best.' Its only disadvantage was that it was very labour-intensive to produce and was owned therefore by noble warriors.

Due to its simple method of production and highly protective properties, Mongol armour became very widespread. Its textile base layer had iron plates attached to it from the reverse side. Usually these were brigandines—kuyaks—as well as prototypes of European brigandines, which were made from large steel plates.

Use of folding wrought iron vambraces brought by the Mongols as well as plated-mail cuisses also spread. Folding wrought iron greaves were also connected by mail. It should be noted that the 14th century Horde inventions contributed to the creation of the full plate-mail armour that spread through the Middle East in the 15–17th centuries, having influenced the development of armour in Rus', the Polish-Lithuanian Commonwealth, and Hungary.

With regard to helmets, it might be said that the traditions brought to Eastern Europe by the Mongols took over completely. Among archaeological finds, helmets with Mongol characteristics—visors, spikes, with rings on the crown for attaching ribbons—are regularly encountered. However, the helmets became more technically refined. They began to be welded from a hat band and a three-, two-, or even single-piece crown. Decoration of the rim of the hat band, or connecting sideplates, often engraved, is a typical Horde characteristic. Finally, single-forged helmets also appeared. By the middle of the 13th century the horde itself was developing systems for protecting a warrior's face. First, there was

Pauldrons and poleyns reconstructed with the help of Iranian miniatures. 13–15th centuries (according to M. Gorelik)

the half-mask system described above, also known as the 'eyebrows-nose' system. Second, there was a visor in the form of a mask. All known depictions of Golden Horde visors of the same type show a face with almond-like eyes encircled by bulbous eyelids, eyebrows pointing in opposite directions, a slightly open, smiling mouth, a huge hooked nose, and usually a long pointed moustache. Sometimes there was also a beard, and onto the trailing edge of the hinged part of the mask bronze ears were cast. This type of visor became so popular in the Islamic East that it was reproduced in north-western Iran, eastern Anatolia, in the Caucasus in the 15–16th centuries.

The warriors of the Golden Horde adopted the Mongol rod shield completely. After Italian colonies sprang up in the Black Sea and Azov Regions of the Jochid Ulus in the 13th century, the Kuban River Region adopted the Western European system of attaching iron to a shield base made of organic material. In the same way, round shield bosses were fastened to a base by overlaid iron crosses whose ends would be bent to fit the boss. Holes would be then be made in them, and in the openings rivets and rings would be inserted to which the ties and straps of the handle would attach.

Helmets. Jochid Ulus. 13–15th centuries
(according to M. Gorelik)

Horse armour. Iranian miniatures
and reconstruction.
13–15th centuries (according to Gorelik)

The edges of shield bosses, according to the traditions of Golden Horde craftsmen, are also decorated with inlaid toothed patterns. The shield bosses were supplemented with radial decorations made from iron rods flattened out in places where they were attached to the base. This not only made the Mongol rod shield more solid but leather board shields as well. It should be noted that over time Mongol rod shields became prevalent all over the East from Tibet to Turkey and from China to Egypt. In addition, the radial decoration that first appeared in the Golden Horde was further developed in the Caucasus and Tibet.

Significant changes occurred in the 13th century regarding horse equipment and armour. The saddle became lighter, and the bridle became more complicated due to the inclusion of Central Asian iron parts. Chain mail (on a thick, soft lining) came to be used as horse armour. Once it was developed, plate-mail armour became the best protection for a

Tatar knight's companion in combat. Armour made of leather plates and strips, especially quilted armour made from soft materials, was used even more frequently. Here is a typical description of this type of armour from the Galician–Volhynian Chronicle: 'The Germans were surprised to see Tatars in visors with faces on them and horses with leather armour' [Complete Collection of Russian Chronicles, 2, p. 814]. This soft armour, covered with patterned textiles, framed by tassels and edging, decorated with metal plates, could have adorned a horse of a man of high nobility. Horse armour always included a mask called a 'nalobnik.' They were made of forged iron or hard leather. The leather would be painted and the iron engraved with patterns. The iron masks could also be covered with patterned leather. Mascots, hackles, plumage, and metal appendages to the bridle and harness completed the horse's decoration.

As we have seen, weaponry in the Jochid Ulus developed in the 14–15th centuries, and

a whole range of original inventions were created. These innovations were of importance around the world, gaining popularity in large areas of Asia and Europe among very different peoples—from Russians and Poles to Chinese and Arabs. Handicrafts and military traditions were intertwined with the traditions brought by Mongols.

However, after the invasion of Aksak Timur in 1395, a decrease in armour production in the Lower Volga Region and probably also in the Northern Caucasus must be noted. On the other hand, in the Middle Volga Region, Crimea, and the Caucasian Mountains there was a great increase in activity, which was further enhanced by an influx of master armourers fleeing the carnage.

Shields. Jochid Ulus. 13–15th centuries
(according to M. Gorelik)

§ 2. Military architecture

Ayrat Gubaydullin, Iskander Izmaylov

Questions about how cities looked and functioned during the Golden Horde period are closely related to the state's approach to town planning. The reasons, times, and places that they were built varied across the vast territory of the Golden Horde state. One town planning method was typical in central regions of the Jochid Ulus, for example, the towns of Sarai, Sarai al-Jadid, Beljamen, Majar, etc. These towns were built in one go, in a short period. At the same time the majority of the cities in Khwarezm, Bulgaria, and the Crimea continued to develop, many of them having been founded in the pre-Mongol period.

In keeping with this, their building traditions and military architecture were different. The majority of the towns that were rebuilt in the Jochid Ulus initially had no defensive features, whereas those in other traditional centres had already existed and been evolving since long before the Mongol period.

The differences were mainly dictated by the towns' geographical and geopolitical positions. In general, new towns were built in the centre of the Golden Horde and therefore did not fear outside threats. In various ways

'outlying' settlements were threatened by outside enemies, even if only hypothetically. Threats could come either from other states or surrounding peoples. With their fortified embankments and ditches, walls and towers, the fortresses in the 'border lands' could guard internal (and external) trade routes, agricultural areas, and other internal administrative, spiritual, and craft centres. Thus, they prevented anyone from entering the state and at the same time had to defend themselves, if necessary. The various political and economic processes that took place here in the Jochid Ulus period were inseparably linked to the same processes in neighbouring territories. There are many opportunities to discuss their interrelations and mutual influence with regard to the development of military defences at that time.

There is one important problem that clearly must be discussed with regard to this. It has become a historiographical fact but is no more convincing as a result. It relates to an opinion that is often to be found in historical texts, according to which in the Jochid Ulus there was allegedly a 'prohibition' on constructing fortifications in conquered countries, includ-

ing Bulgaria. There are quite a few instances of this misconception. The most persuasive advocate of this point of view and, clearly, the first person to formulate this hypothesis clearly was G. Fedorov-Davydov [1994, pp. 42–44]. A. Khalikov [1978, p. 92; 1989, p. 128] was among the Kazan archaeologists who were on his side and keen to 'prove' this hypothesis based on Bulgar material.

It should be noted that this statement is presented as fact in most academic literature without any supporting evidence. Only in the work of G. Fedorov-Davydov [1994, pp. 42–44] are the ideas fleshed out and justified. Essentially there are two pieces of evidence. The first is a reference to information provided by Marco Polo who wrote (in Ramusio's version): 'There are so many traitors and unfaithful people who are ready to rebel in all areas of Catay and Manga [Manza] and in the rest of his (the great khan's—*A. G., I.I.*) domain that it is necessary to keep troops everywhere where there are big cities and many people... and the cities are not allowed to have walls and gates so they cannot prevent troops invading' [Book of Marco Polo, 1990, p. 260]. The second indisputable fact is that Golden Horde cities in the Lower Volga Region and part of the Southern Aral Region did not have any fortifications up to the latter half of the 14th century.

However, both of these pieces of evidence are false. For example, there is a contradiction in Marco Polo's story. Having mentioned the 'ban,' he constantly refers to various towns, fortresses, and castles with 'high walls and towers' while travelling through the Chinese provinces [Ibid., pp. 56, 60, 65, 67, 117]. City walls and especially border fortresses in China during the Yuan dynasty are well known in historical literature as well (see, for example: [U Han, 1980; Bokshchanin, Nepomnin, 2002]). In other words, if there was such a prohibition, it was in place for a very short time. In addition, it would need to be proved that such a prohibition was universally applied throughout the empire from the Amur River Region to the Dniester River Region.

Concerning this question, it is possible that two political tendencies that had differ-

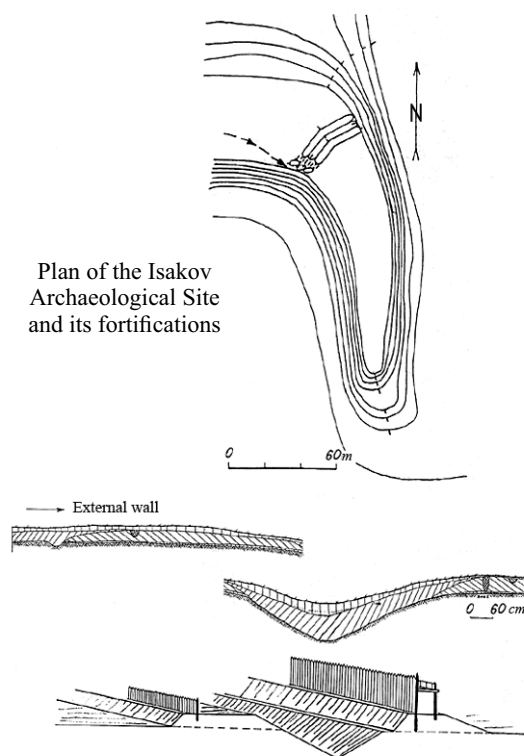

ent aims and occurred at different times have become mixed up. The practice of destroying town fortifications was in general actually quite customary in the medieval world. However, this usually occurred right after conquest. Once the new rulers' power was established, a gradual liberalisation of policy took place, and the vassal territories erected walls around their towns and built castles because of independence but not always separatism. The reason was more likely to have been an increase in internal strife and internecine feuds. Rus' was a typical example of this phenomenon. According to the archaeologists' data, many towns were destroyed there, and Giovanni da Pian del Caprine wrote an eyewitness account saying that 'the Mongols destroyed towns and fortresses' 'in the lands of Ruthenia' [Travels, 1957, p. 45]. Later, during the 1259–1260 campaign in Poland, the Tatars forced Prince Daniil Romanovich to demolish the fortifications of the main cities of Galicia and Volhynia [Complete Collection of Russian Chronicles, 2, pp. 848–855]. This is evidence of a prohibition of a sort, but at the same time in the southern Russian lands, in Kievshina, new fortified cities continued to exist or were rebuilt (for more details see: [Belyayeva, 1982, p. 27]). Later, as far as it is possible to judge from sources, the building of new fortifications by the rulers of the Jochid Ulus in southern and north-eastern Rus' was not controlled. There was a similar situation in Bulgaria after the Mongol conquest. During the conquest the major cities that were stormed were destroyed, and it is probable that some of them had their fortifications dismantled. However, after the division of the united state into several emirates, there followed a period of stabilisation when fortified towns and fortresses were either rebuilt or continued to develop. This is particularly true for those in the Cis-Volga Region.

It is fair to say that enormous fortified towns such as Sarai, Sarai al-Jadid, Hajji Tarkhan, Ukek, Beljamen, etc., existed in the Lower Volga Region, and their archaeological remains have been studied. Medieval towns covering such a large area seldom had defensive fortifications, for example, the Golden Horde town of Bilyar (the second and third

ancient Bilyar settlements) in the Trans-Kama Region, the second ancient Bolsheatryasskoe settlement ('Tysyachedomny Shungat') in the Cis-Volga Region, the Russian-Urmat ancient settlement in the Zakazanye, and others are also known in the Middle Volga Region. But is this evidence of a prohibition? Clearly not. Constructing fortifications was extremely expensive, and the townspeople only erected walls when absolutely necessary. While the Jochid Ulus was flourishing, there was no such need in the Volga Region because there were no active military operations in that area for almost one hundred years, and the state itself was so powerful that an enemy invasion was unimaginable. The following statement by a Tatar merchant is characteristic of the mentality. In answer to a question from Italian diplomat and negotiator, G. Barbaro, who had been admiring the walls of the Genoese colony in Tana, he replied 'Bah! Only those who are scared build towers!' [Barbaro and Kontarini, 1971, p. 148].

All this throws the 'prohibition' theory into doubt. It is likely that there was a whole host of reasons that led to the development of military-defensive architecture or slowed down its construction. In any case, there were no all-encompassing prohibitions, and various implementations of military science were dictated by the particular military-political situation. In this sense, Bulgar Ulus fortifications, especially small towns and castles, did not represent any internal threat to the Golden Horde and its army despite their having defensive constructions. They served as strongholds on the borders between separate domains.

Fortifications continued to be built in the border lands of the Bulgar Ulus all through the Golden Horde's reign. A good example is to be found on the right bank of the Volga—the Cis-Volga Region. This region is characterised by its unusual 'mountainous' relief, which takes the form of a continuous ridge—known historically as the 'Mountain side' ('Tau-ile'). This upland area extends over all the territory from the village of Upper Uslon (opposite to Kazan) to Samara Bend and also covers the area where the Penza Oblast now is, near the ancient settlement of Gorodishe.

Rolling plains are also present. The alternating landscape of plains and 'mountains' means the Cis-Volga Region is complex topographically but also creates natural barriers that are almost impassable for an enemy advancing from the south or south-west. At the same time, the Cis-Volga Region is a comfortable place to live and farm.

Access routes to the Cis-Volga Region from the west, south-west, and south are to be found in the valleys of the Sviyaga River and its tributaries, for example: Tsilna, Bula, Kubn,' etc. This is where the overwhelming majority of Bulgar Archaeological Sites were built. They were constructed there not only for convenience but also with a more important role in mind: defence. The Bulgars' fortified settlements 'locked down' these valleys, thus forming an unbroken defensive chain.

In Golden Horde times control over the Sviyaga valley and its tributaries was not lost. In this period fortified settlements moved in a north and north-easterly direction. The main areas into which the Golden Horde settlements expanded were in the middle and lower reaches of the Sviyaga River. All the rest were con-

Reconstruction of the wall. Bulgar. 13–14th centuries
(according to A. Gubaydullin)

centrated in separate groups at Samara Bend (what is now the Penza Oblast) or were drawn towards the Volga. Thus, the main territory was protected from the west by Tigashevo, Staroyanashevskoe, and Bolshetoyabinsk Archaeological towns controlling the Bula River valley; from the south-west by the ancient towns of Chuvbezdinsk and Gorodishchensk (Kala-Yelginsk); from the south by Staroaleyskoe and the first and second ancient towns of Krasnosundukovsk, which were built on the Sviyaga River.

However, when the Jochid Ulus began to weaken, and internecine wars flared up, the situation started to change. The towns of the lower Volga began to be fortified and surrounded with walls and ditches. In the period of the 'Great Zamyatnya' some towns that had never previously had walls began to be surrounded by them. In the latter half of the 14th century ditches appeared around the ancient towns of Tsarevo (Sarai) and Staroorkheyskoe. The remains of the walls in the ancient towns of Narovchatsk and Uvek are only partially preserved, making their reconstruction more difficult. At that time, no later than the first half of the 14th century, the Bolgar Archaeological Site had walls, ditches, wooden walls, towers, and dragon's teeth to defend itself [Khovanskaya, 1958, pp. 319–320; Krasnov, 1987, pp. 99–123].

The ruins of one of the largest and most significant centres in the Jochid Ulus—Bol-

gar Archaeological Site—can serve as an example. In Golden Horde times it grew significantly from a 25 ha fortified area in pre-Mongol times to nearly 400 ha in the 13–14th centuries. In the first quarter of the 14th century an embankment and ditch with fortress walls and additional fortifications were erected around it [Khlebnikova, 1987, p. 70]. They were largest at the southern and

sou-eastern ends of the site so as to protect the most vulnerable side. In antiquity, this was where the main roads leading to the city met. Bulgar was well protected not only by man-made defences but also by nature itself. To the west there was an area of marshland and small lakes. Bulgar started to erect fortifications while the Jochid Ulus was flourishing. This clearly indicates that the attitude towards fortifications, especially in the sedentary areas of the Jochid empire, was changing. As the townspeople could not rely on the power of the entire state to defend them, they had to start erecting fortifications on their own. However, if military-engineering traditions had been preserved in the Bulgar Ulus, this practice did not exist in the Lower Volga Region. This is the reason why fortification in the cities of the Lower Volga Region was a relative concept. They could not be adequately protected because they were spread over such large areas. As a rule, the inhabitants of Lower Volga cities only attempted to fortify individual areas in the borderlands—defensive areas that were most at threat from cavalry attacks.

For these reasons, military architecture and military engineering as a whole only developed slightly in the Jochid Ulus. This was due to a whole range of factors. Hardly any fortifications were erected, except for in the borderlands and in settled agricultural regions, and the town walls themselves were not part of a system of tactical defense.

§ 3. Organisation of the Army

Iskander Izmaylov

The structure of the military organisation: the command and the army. The military organisation of the army of the Jochid Ulus still remains poorly studied due to an insubstantial source base and the negligence of historians in regard to this issue. At the same time, historical materials provide significant information on the characterisation of the military organisation and the army of the Jochid Ulus.

An analysis leads to the conclusion that this military system was derived from the military-administrative structure formed in the Jochid Empire. The basis of this system consisted of a hierarchically organised system of possessions of Tatar clans. A characteristic feature of it was the intertwining of the military and administrative systems. Such an organisation of military affairs was traditional for the Turkic-Mongol statehood.

According to Arab sources, 'the administration of military and civil matters is the same (in general) as in the state of Iraq and Iran. It is based on a (certain) number of emirs, laws, and officials. However, the emir of a given ulus and the vizier (Dasht-i Kypchak) do not have the right to give orders (at their discretion) as the emir of the ulus and the vizier in that state do' [Grigoryev, Frolova, 2002, p. 299].

In a sense, this is confirmed by the words of Arab officials who, having analysed diplomatic correspondence, came to the conclusion that Öz Beg Khan 'was only paying attention to the affairs of his state in general, without delving into the details of all the circumstances. He was satisfied with the reports that came to him, and he did not give consideration to particular cases in regard to tax collection and expenditure [Ibid., pp. 299–300]. In other words, one can say that although formally the Khan was the Commander-in-Chief, as a rule, he did not take part in military operations. Even when it is reported that the Khan went on a military campaign with the army, it did not always mean that he directly supervised the troops. Moreover, when the Khan decided to command the troops on his own, this led only to a military

disaster, as evidenced in 1285 and 1286–1287 when Tula Buga actually suffered defeat in the military campaign against Hungary and Poland.

Based on the information that we have, ulug karachibek (beklyaribek) was the actual Commander-in-Chief. Official interstate correspondence by Egyptian sultans was addressed to him specifically as to 'the champion of warriors and fighters for the faith, the leader of armies, the associate of monarchs and sultans, the sovereign sword of the faithful' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 348], clearly emphasising the military component of his functions and powers. It is the bearers of this title and position who, as a rule, led the Golden Horde troops during large-scale military campaigns. Under Berke Khan and his descendants, such a military leader was Nogai; under Öz Beg Khan, Kutlug-Timur; during the period of the Great Troubles, Mamai; and in the early 15th century the military leader was Edigu. They spent their lives in campaigns and battles, carrying out the planning and instruction of troops on the battlefield, often risking their lives and suffering from wounds. For example, during the battle against the Hulaguid troops in 1256 Nogai was wounded in the head and lost one eye.

The military organisation of the Jochid Ulus itself was feudal. A characteristic feature was that all the Tatar clan representatives were the social elite of Golden Horde society. As a rule, they had a semi-nomadic way of life, and their everyday life differed little from that of tax-paying people. However, they had one important privilege that distinguished them from the rest of the population—they had the right to bear arms and participate in military campaigns. The relation to military service is what made a person a true Tatar—that is, a representative of the military elite. Outside the clans and the military, no other ethnosocial structure or self-identification existed. Of course, there was a significant class differentiation within the clans, which determined the place of each individual in the social hierarchy and military

organisation. Nevertheless, they had one thing in common—all of them were included into the clan system and belonged to a military-service class by virtue of origin, various merits, and family relations.

The structure of the Tatar military-service class is represented perfectly in the *yarlyks* of the 14–15th centuries. Forming the upper class of society and being the military command of the highest rank were the right and left wing *oglan*s—sultans from the Jochid clan, next came the *ulusbeks* and the *darugabeg*s, followed by the *beks* (emirs) in thousands, hundreds, and tens (for further details: [Fedorov-Davydov, 1973, pp. 89–93; Usmanov, 1979, pp. 206–210]). In general, the analysis of *yarlyks* makes it possible to reconstruct the military system of the Jochid Ulus as a hierarchically organised structure based on the decimal system: from tens till *tumens* (i.e., units of ten thousand) under the command of *beks*, emirs, *ulusbeks*, and *oglan*s. The troop management structure is described by Marco Polo, who was himself an administrator in the Yuan Empire. 'When one of the great Tatar tsars goes to war, he puts himself at the head of an army of a hundred thousand men, and organises them in the following manner. He appoints an officer to the command of every ten men, and others to command a hundred, a thousand, and ten thousand men, respectively. Thus ten of the officers commanding ten men take their orders from him who commands a hundred; of these each ten, from him who commands a thousand; and each ten of these latter, from him who commands ten thousand. By this arrangement each officer has only to attend to the management of ten men or ten bodies of men; and when the commander of these hundred thousand men has occasion to make a detachment for any particular service, he issues his orders to the commanders of ten thousand to furnish him with a thousand men each; and these, in like manner, to the commanders of a thousand, who give their orders to those commanding a hundred, until the order reaches those commanding ten, by whom the number required is immediately supplied to their superior officers. A hundred men are in this manner delivered to every officer commanding a thousand, and a thousand men, to

every officer commanding ten thousand. The drafting takes place without delay, and all are implicitly obedient to their respective superiors. Every company of a hundred men is denominated a *tuc* (according to Pottier, *tuc* = banner), the company of ten thousand is known as *astoman*, a thousand men is known as *min*, a hundred men, *yuz*, ten men, *on*' [Book of Marco Polo, 1990, pp. 81–82, 256].

In pure form, however, it is unlikely that such a system existed, even under Batu Khan. It is quite obvious that this is the general scheme of military-administrative division that united contingents, roughly corresponding to tens, hundreds, and thousands. In fact, such units could be larger or smaller than the stated number. This system was traditional for the military-administrative division of Turkic-Mongol empires of Central Asia, existing apparently since Hunnic times. It was based on the mobilisation principle which allowed conscripting clan militia troops divided into wings and according to the descending decimal system. For example, eyewitness accounts state that when the ambassadors of the Egyptian sultan were in the Jochid Ulus, 'they left the Crimea for the steppes, where they saw the leader of ten thousand horsemen, who controlled this area.' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 63]. At the same time, it was not necessary for all the troops to form in proportion to the area in an administrative-territorial system and *fiefs-iqtas* in the steppe territory, which was divided into *ulus*s between clans. Some of the troops (apparently the majority), despite their territorial location in the steppe, received proceeds from various taxes and duties from sedentary territories—Crimea, the Bulgar Ulus, Khwarezm, and possibly also from Rus'. By receiving proceeds from these territories, the clans could keep significant military forces.

However, there is no detailed picture of how military contingents were formed in practice, who organised the troops, etc. One can only suppose that the leaders of the clans (who were also *ulusbeks*) organised mixed contingents composed of their personal vassals and militias of other defenders given to their corps. It is not excluded that in practice there was a certain

rotation of clans and their premises, and consequently the composition of the troops changed.

In the opinion of G. Fedorov-Davydov, in the second half of the 14th century certain social shifts took place in the Jochid Ulus, which complicated this system. Unfortunately, now it is difficult to establish with certainty whether this was due to the development of feudal legal relationships, the natural and social crises of mid-14th century, a change of clan structure, or due to a redistribution of uluses. Whatever it was, at this time it is clear that the role of clans and the local aristocracy increases considerably. This is when they use their right of ownership of uluses to transform them into hereditary independent principalities. Arab sources provide a clear illustration: 'as for the size of their warriors' wages, according to Shuja-ud-Din Abdur-Rahman, if one person had a plot of land (iqta), it would be handed down to his sons. He also says: the emirs have populated lands. Some of the lands bring 200 thousand dinars of income or less—up to 100 thousand dinars per annum. As for ordinary warriors, they only have money that they receive. All of them are equal, and each man receives 200 dinars per annum.' [Grigoryev, Frolova, 2002, p. 300]. Massive resources allowed some emirs to maintain considerable military forces. For example, Arab sources mention 5 emirs in 1299 who kept 30 thousand horsemen with full armament [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 113]. In other words, the clan aristocracy not only received massive incomes but also usurped the military system under its command, having turned ordinary nobility into their vassals, owing service not to the khan or the empire but to a particular ulusbek and head of the clan. One can agree with the opinion of Israeli historian A. Polyak that the Golden Horde's feudal system was based on a desire to provide the vassal with an annual income corresponding to his rank: 'In the Horde we find a simplified form of this system: the emirs receive fiefs-iqtas, ordinary warriors receive only money. Since the composition of a military-feudal class there was more constant, the ikta inheritance system was steadier' [Polyak, 1964, pp. 56–57].

The military service hierarchy and its gradual differentiation on the level of incomes had a great impact and influence on the evolution of the weapon system. In the early period of conquest the system, judging by archaeological materials, was fairly homogeneous since victorious wars contributed to the capture and concentration of prestigious armaments. Noble warriors stood out with a specific set of belts, costume parts, and cups made of precious metals (see: [Kramarovsky, 2001, pp. 10–108]). However, at the end of the 13–14th centuries there is a gradual differentiation of the weapon system. Some corrections in such estimations must be made due to a significant amount of Islamic non-inventory burials; at the same time, we can identify burial groups containing prestigious categories of weapons. The social elite, as in other countries of medieval Eurasia, stood out by the use of defence weapons (metal coats of mail, helmets, arm shields, shields, as well as equestrian armour) and prestigious weapons (sabres, spears, Saidak kits, etc.). Burials with such weaponry are frequently found in mausoleums or semi-subterranean tombs of the Sagan type. All this indicates that the army gradually differentiates, and the dividing line separates expensive and prestigious weapons from ordinary weapons. The rest of the troops were armed with remote combat weapons and universal close combat weapons (spears, axes, knives). In this regard, it appears that the social division considerably reflected a gradation of troops of the Jochi Ulus, consisting of mounted armour-clad warriors—begs and emirs and ordinary mounted archers—batyrs and Cossacks.

It should be emphasised that there was a practice when during military campaigns the commander would arm a certain number of warriors at his own expense. It is evident that in the Jochid Ulus such a practice was widespread since the clan aristocracy had substantial resources. Such military servants most probably received payment for service, obviously originating from the same clan as the bek himself, and formed the basis of his military contingent, the backbone of the territorial militia. Apart from the warriors themselves, there were also servants in the army. According to

Light-armed horseman, the 14th century
(reconstruction by M. Gorelik)

some sources, one mounted warrior had at least two servants.

Military conscription was universal for the entire military-service class, which was the tradition for Turkic-Mongol nomadic societies. The common practice was military service with weapons, horses, and equipment for campaigns. The advancement of troops for a campaign and the organisation of troops to the theatre of military actions itself were already taught in the army of Chinggis Khan. The troops of the Jochid Ulus learned these principles fairly well. Especially, since the unity of the empire remained intact, and the efforts of the entire staff of bureaucrats and employees of various classes were aimed at resolving this task.

The training of troops for military campaigns was also of great importance. According to Arab sources, before setting off on a campaign, every horseman had two servants, thirty sheep, five horses, two copper pots, and a wagon' [Grigoryev, Frolova, 2002, p. 299]. Apparently, this was the necessary equipment for regular troops, and it included mobile workshop gunsmiths, blacksmiths, leatherworkers, etc.

Moreover, every noble emir and nobleman not only had a special marquee but a whole court of servants, including 'dwellings, families, family members (khavash), possessions, and livestock' [Collection of Works Related to the History of the Golden Horde, 1941, p. 75].

The Tatars themselves like all steppe herders were modest and endured combat conditions well, even when they had to separate from their string of carts. According to eyewitness accounts, the Tatars were extraordinarily modest and hardy. As explained by Marco Polo, 'when they set off on a long journey or go to war, they do not take harnesses with them but will take two leather wineskins with milk for drinking and a clay pot to boil meat. They also take a little tent for shelter in case of rain' [Book of Marco Polo, 1990, p. 82]. The same was written by Venetian writer Giosafat Barbaro: 'each of them (i.e., the Tatars.—I. I.), when separating from his people, takes with him a small goat-leather bag filled with millet flour, kneaded into dough with a small amount of honey. Several wooden bowls were always taken as well. If they do not have enough game—which they usually found in these steppes, being wonderful huntsmen and primarily using bows—they would use this flour, preparing from it with a small amount of water, a sort of drink; that is how they got by' [Barbaro and Kontarini, 1971, p. 142]. Modesty, ability to endure deprivations, and discipline made the Tatars warriors who were able to make rapid and long transitions, overcome great distances, and suddenly burst into enemy territory, without any strings of carts. According to Marco Polo, 'a Tatar will often leave for one whole month without taking any food with him; he will feed on mare milk and wild animals that he hunts for himself, his horse will graze on grass, that is why he needs neither barley nor straw. They are perfectly obedient to their chiefs, if necessity arises, he will stay up all night on horseback armed, whilst his horse will graze on grass. No people upon earth can surpass them in fortitude under difficulties, nor show greater patience under wants of every kind. They are maintained at small expense. They are fitted to subdue the world [Book of Marco Polo, 1990, p. 81]. In another passage, developing this idea, he presents new evidence

showing that 'should circumstances render it necessary, they can march for ten days together without victuals and without lighting fires, during which time they subsist upon the blood drawn from their horses, each man opening a vein and drinking from his own cattle. They also have dried milk thick as dough; they take it with them; they will place it into water and stir it till it turns into liquid form, then they drink it' [Ibid., p. 82].

In this connection, the question of payment for military service is very difficult. It seems that payment for participation in wars and campaigns differed depending on social status and the branch of service. It is possible that military service was never paid for by the state, ulus-begs may have made payments using their own resources.

Most probably, military duty consisted of several different services. Campaign service included not only participation in a campaign but the implementation of it, including support of troops that passed by. In this regard, some terms of khan *yarlyks*, expressions such as 'all those in charge,' or 'those carrying out a specific task' [Usmanov, 1979, pp. 215, 221], may apply to the campaign service organisation. The guard service, in addition to the usual frontier service and military-police service, was a showcase of the nearest reserve, which was always in readiness to march. The frontier service and the military-police service are specially labelled in several *yarlyks*: 'bukaul tutkaul,' 'bukaul chiri,' 'yoasaul bukaul,' 'karaul-chagdaul,' which corresponds to 'burulazhnik and zastavshchik' [Ibid., p. 214]. The troop service included people, weapons, horses, and equipment—that is, it was fully prepared for long campaigns and warfare. It is typical that in khan *yarlyks*, even *tarkhanniy yarlyks*, the military service is not mentioned, thus leading to the conclusion that it was regulated by tradition, custom, and statutes of the *Yasa* of Chinggis Khan. The service was the unconditional responsibility of each serving Tatar having no exceptions.

Unfortunately, the condition of sources does not allow completely restoring the duration and the connection of the service with land keeping or the acquiring of proceeds from a certain territory. One can only assume that, in

addition to unpaid service, the begs and their warriors received some compensation (*ukulka*, *ogliga*), perhaps in the form of an increased share of the spoils of war. As military historians note, during the Middle Ages 'money is an indispensable medium between the authority and warriors' [Kontamin, 2001, p. 105]. It is unlikely that something different existed in the Jochid Ulus. This circumstance had several important consequences. First, it made any war an extremely costly and expensive venture. Second, the military campaign had to be fast-paced, swift and have a specific objective that would promise to compensate for war costs. Third, the war had to be a victorious one, and it had to generate income. It is evident that when a campaign failed or suffered a setback, any military leader, including the khan, could lose control over his subjects, as the case was with Khan Tula Buga after his military campaigns failed.

The khans of the Jochid Ulus tried to achieve constant military readiness with the help of regular military gatherings and troop inspections. It is obvious that such were the gatherings of the aristocracy during the *Kurultai*, when the khan's accession ceremony to the throne took place, and then the oaths of loyalty on their part and the reissue of *yarlyks* for land keeping, various other feudal domains and positions. For example, during a reception of the Egyptian sultan's embassy in 1262 the Berke headquarters held an inspection of the army 'which was in full armour' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 64]. The relocations of the khan's court across the territory of the country served the same purpose, as military gatherings were also held. As a rule, such military gatherings even occurred at different locations during the most important calendrical or Muslim celebrations. Such celebrations were accompanied by military games, various competitions, and inspections. An eyewitness, the traveller Ibn Battuta, describes such a military gathering of emirs. He said that he had seen a reception in the headquarters of Khan Öz Beg where 17 emirs-tumens were present. Ibn Battuta explains that 'the chief of the *tumen* is the person who has 10,000 horsemen' [Ibid.,

p. 299]. During this gathering competitions were held, and each of these 17 emirs pledged their allegiance to the khan and received generous presents from him.

During a campaign it is obvious that a gradual replenishment of forces occurred. First came the troops of several reliable and nearby ulusbeks, having assembled for inspection in the khan's headquarters. Troops were distributed into corps (known as kuls or kols), which were replenished afterwards at the expense of approaching forces. The basis of these kuls was formed by the most capable and well-armed militias united by clan affiliation and fraternity. Other detachments, arriving in small groups, joined one of the corps. These reserves apparently gathered in several locations and joined troops on the move. In other words, it was a kind of march-mobilisation, where forces did not accumulate in one place at once, which would make their supply more difficult. They were dispersed and additional troops joined the corps, gradually increasing their number to the required proportionality of units. It is very likely that the military leader and his entourage were responsible for the assembly of troops and the roll call, the commander of the kul, on the other hand, was in charge of military uniform and the quantity of troops in smaller units. The commander of the kul was appointed apparently by ulug-karachibek and confirmed by the khan. Usually it was one of the oglans, but he always had with him one of the noble emirs who commanded a significant unit or had military achievements and glory. At the same time, oglans did not always become tumen commanders. For example, during the campaign against Tabriz in 1385, Khan Tokhtamysh sent 9 tumens into battle led by 12 oglans [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 151].

Each combat unit (kul, koshun, etc.) had warriors grouped around flags and banners of their commanders. Various sources constantly indicate that each tumen commander had his own flag. The khan's banner had nine horse tails, the army commander's banner had seven, the kul commander's banner had five, and the koshun commander's banner had three. In addition, each unit had the flag of its command-

er—that is, yelenge (khorunga). The flags also differed in size and colour. Most likely, the flag of the khan was blue or green and depicted the Jochid tamga and Muslim symbols—inscriptions in Arabic font, containing phrases from the Quran.

The troops set out on a campaign in strict order and moved apparently in separate columns, with outposts moving far ahead and to the sides of the advancing troops. For example, the Venetian G. Barbaro wrote that the advance guard had appeared several days before the main forces reached Azak, led by the khan Kichi Mohammed. The guard units were responsible for tracking down the enemy and exercising control over the adjacent territory. They also carried out raids (ilgar) for the purpose of capturing food and plunder on enemy territory, as well as demolishing the neighbourhood.

A characteristic feature of the nomadic way of life—and a significant part of the Tatar nobility led such a traditional way of life for at least several months in the year—was their military exercises. Annual military gatherings played an important part in these exercises, they were part of drive huntings, which was one of the most important ways to gain clear and consistent actions of significant equestrian units operating on a huge territory. Individual trainings consisted of combat horse trainings, fancy ridings, and arms exercises. Among them, the most important were glaive throwing and archery on horseback. In particular, Ibn Battuta pointed this out when he noted that during the military gathering in the headquarters of Khan Öz Beg 'shields were placed for shooting for each tumen leader' [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 298]. The Tatar art of archery practice always evoked admiration from strangers, who always distinguished it from other competitions. Giosafat Barbaro, who saw it during a visit to Tana in 1436, gives a fairly detailed description of this competition: 'in these places the competition is as follows,' he wrote, 'to a wooden beam, laid horizontally on two wooden posts (a device similar to the gallows), a silver bowl is placed on a thin string. Archers competing for the prize have arrows with an iron part in the form of a crescent with sharp edges.

The horsemen ride with bows on their horses towards the gallows device, hardly eluding it, and the horse continues to gallop in the same direction. Then they turn back and shoot into the string; the one who cuts it off, making the cup fall, wins the prize' [Barbaro and Kontarini, 1971, pp. 155–156]. Another kind of competition practiced by the aristocracy of the Jochid Ulus was equestrian polo—that is, "ball game" (refer to: [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 64]). With certainty, other kinds of martial arts such as wrestling, arms exercises, etc., existed and were also used for military training.

The Tatar warriors were not only wonderfully trained but possessed courage and fortitude. In the words of Marco Polo, the Tatars 'fight extremely well and very bravely' [Book of Marco Polo, 1990, p. 81]. Giosafat Barbaro wrote that 'military men are extremely brave and courageous, so much that some of them are named 'Talubagater,' which means crazy man of courage. Such a nickname is born among the people, just as we have 'wise man' and 'handsome man'... These heroes have one advantage: whatever they accomplish, even if at some extent it goes beyond common sense, it is considered right since it is done for the reasons of courage, and it seems to everyone that the heroes are just doing their job. Among them are many who in cases of war battles do not value life, do not fear dangers but rush forward and do not hesitate to beat up the enemy in such a manner that even the shy ones are inspired [Barbaro and Kontarini, 1971, p. 146]. Further, this Venetian traveller describes an incident illustrating his words when five Tatars attacked a hundred Circassians, who were intending to attack a neighbourhood of Tana. As a result of the rapid Tatar incursion the Circassians fled, leaving around 40 people killed or captured [Ibid., p. 147].

One cannot help but cover the issue of military training. If training for the possession of military weapons required regular exercising and physical conditioning, the mastering of tactics needed targeted training. In fact, we have no information on the art of war in Tatar literature. However, since such literature was widely spread in the Islamic East, it is possi-

ble to assume that various treatises on military affairs were used for better acquaintance with the canons of military science. These sciences along with sciences on state administration (for example, 'Mirror of Princes,' parts such as 'Blessed Knowledge' by Yusuf Balasaguni and 'Instructions for Lords' by al-Ghazali) were part of the teaching literature collection of the aristocracy of all the Muslim world.

Other types of sources, which seem to have been used in military science education, are various historical chronicles, compositions, and genealogy. They narrated events, describing various incidents of military history, preserving the experience of failures and successes on the battlefield. Various epic legends (for example, 'Edigu'), dastans (for example, 'Kisekbash kitaby') also helped to create the warrior. All of them established the ideal of chivalrous behaviour and put forward the norms of courage and military valour.

Number of troops. It is clear that throughout its history the number of troops in the army of the Jochid Ulus varied. It is difficult to address this issue not only because of a small number of sources but also because of the approximate nature of the data provided there. Several Arab sources of the 14th century report that 'their troops were (so) many (that) it was impossible to count them' [Grigoryev, Frolova, 2002, p. 299].

At the same time, they noted that only one verifiable source remained concerning the number of Golden Horde troops, when a mutiny began, and Sultan of Mawarannahr Esen Buga opposed Tokhta Khan and the Great Khan: 'Then (the khan) sent against him a great number of warriors, one soldier from every group of ten, and their size reached 250,000 of those who had been counted. And this is not taking into account those who joined voluntarily' [Ibid., p. 299]. This information may be found in an encyclopedic work by al-Qalqashandi based on works by al-Birzali, al-Dhahabi, al-Umari, and al-Asadi (see: [Collection of Materials Relating to the History of the Golden Horde, 1884, pp. 174, 206, 240, 446]). A different version of events is presented by al-Ayni, a historian of the mid-15th century, who indicates that the number of Tokhta's troops reached 150,000

horsemen [Ibid., p. 514]. In other words, the indication of a large number of the Jochid Ulus troops was traditionally conditional and relative in terms of descriptions found in Arab historical-geographical sources.

According to other reports of Ibn Wasil, when the war against the Hulaguids began, Khan Berke, having learned about the enemy's invasion, 'made an appeal to his army, asking everyone who was 10 years old (and older) to get on a horse. There were so many people, neither beginning nor end could be identified' [Ibid., p. 74]. At the same time, it is also known that Qalawun's army was allegedly made up of 600 thousand warriors, which makes us suppose that the number of Tatar warriors was close to this figure.

Arab merchant Ibn Battuta, an eyewitness of the troop gathering in Khan Öz Beg's court, specifically indicates that the military gathering in 1333 had 17 emirs, commanding 10 thousand horsemen: 'in attendance were 17 emirs, commanding 170 thousand riders; (however) the Khan's army is larger than this' [Ibid., p. 299]. Despite such a significant figure, the army of the khans of the Jochid Ulus could be significantly larger because apparently the number of such ulusbeks, who commanded tumens, could reach 50–60 people. For example, the ambassadors of Khan Janibek, who arrived in Cairo during Sha'ban in 758 (20 July–17 August 1357), informed him of his victories in Khorasan, they also reported that 'the army of this sultan reaches 700,000 riders' [Ibid., p. 448]. But there is relatively few reliable data confirming this information at our disposal. We can only state that various sources indicate an uneven total number of the Jochid Ulus troops.

During the war of Khan Tokhta with Nogai their militias reached 200 thousand horsemen. It should be mentioned that the basis of Nogai's troops was made up of 17 noble ulusbeks and emirs [Ibid., p. 111]. At around this time Rashid al-Din pointed out that during a struggle between Khan Tokhta and Nogai their troops numbered 30 tumens—that is, their total number could have reached 600 thousand horsemen [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 71]. Marco Polo roughly described the same situa-

tion, who noted that Tokhta's army consisted of 20 tumens, and Nogai's consisted of 15 tumens, the total number being 350 thousand horsemen [Book of Marco Polo, 1990, pp. 205–206]. During the 1265 campaign Berke Khan's entire army was composed of 300 thousand horsemen [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 100]. A Persian source, *Tarikh-i Shaykh-Uvays*, notes that the ruler Tabriz Malik Ashraf pointed out the great number Janibek's army, saying 'this son of Öz Beg Khan, tsar from Chinggis Khan's uruk, has a huge army of 300,000 men' [Ibid., pp. 102, 530].

At the same time, detached units functioning as advanced, outpost, or offensive detachments for action in specific areas could also be of different sizes. The advanced detachments of Tokhta Khan exceeded 10 tumens—that is, around 100 thousand men [Ibid., p. 83]. During Öz Beg Khan's campaign to Azerbaijan in 1318–1319 the military leader Isa Kurkuz was in charge of eight tumens [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 521]. The military leaders Toktamyscha Isa-beg, Yagly-biy, and Kazanchi led a significant number of troops (an army of 9 tumens) to the walls of Tabriz in the winter of 1384–1385 [Collection of Materials Relating to the History of the Golden Horde, 1941, pp. 109, 151]. The advanced detachment of Nogai during the campaign against Hulagu in August 1262 had up to 30 thousand warriors [Ibid., pp. 74, 99], and during the campaign against the Hulaguids in 1264–1265 Nogai's corps consisted of 50 thousand horsemen [Collection of Materials Relating to the History of the Golden Horde, 1884, p. 152].

Thus, although the total number of troops varied, it is impossible to trace the actual number. First, units numbering ten thousand men (tumens), a thousand men, a hundred men, and ten men did not indicate the actual number of warriors but the fundamental mobilisation possibility. And in different years the figures could be either larger or smaller than the roster strength. Second, there are doubts concerning the figures themselves used by Eastern sources because it is unclear whether they describe the size of the whole army or only the warriors. If

only warriors were taken into account, then the total size of the entire army could be 0.75–1 by million men, which is impossible. Therefore, the total number of men liable for military service as well as the size of the whole military-service class of the Jochid Ulus can be calculated only theoretically—that is from 0.6 million in the mid-13th century up to 3 million in the end of the 14th century. Possibly, the total number of warriors during particular military campaigns could have reached 300 thousand, but the army of the Jochid Ulus had this number of troops only in occasional years, during emergency situations, wars with the Hulaguids and Aksak–Timur. In other military actions the number of the corps was significantly lower.

The largest military unit was the *tumen* consisting of 10 thousand riders. It is evident that ideally each *ulusbek* had to provide such a unit in order to wage war. But during fighting in certain areas, trying to solve tactical and even strategic objectives, corps (known as *kuls*) could participate, consisting of 3–5 *tumens*. Based on medieval sources, such units conducted almost every military campaign in the latter half of the 13–beginning of the 15th centuries as well as being responsible for battles and sieges. But their number strongly depended on recruitment and mobilisation possibilities of *uluses* and therefore strongly varied in time and space.

As a rule, troops of several *ulusbegs* participated in combat operations against neighbouring countries such as Byzantium, Poland, and Lithuania, as well as against rebellious Russian principalities. The *ulusbeks*' estates either bordered on the theatre of military operations or their incomes depended on money coming from these territories. Most likely, the khan appointed his emissary, usually an *oglan* with an assigned corps, which became the backbone of the future army (for example, *oglan Tudan* and his 'Dyudeneva army'), or appointed one of the *ulusbeks* (in the second half of the 13th century Kurmyshi, Burundai, later Nogai).

Speaking of the recruitment of troops, we must mention the presence of contingents of dependent countries in the Tatar army, in particular, from Rus'. For a long time in Russian historiography it was thought that Russian troops were not sent for help to the Horde due to the

intercession of Alexander Yaroslavich, who entreated this mercy of the Khan, but this fact is valid only from certain logical assumptions and late biographies of St. Alexander Nevsky. In fact, the only real evidence of this tribute is the participation of several Russian princes in the siege and seizure of the Alanian city of Dedyakov. Although the entourage of these Russian princes consisted of many servants and even members of militia detachments, there is no evidence that they were called for war and took part in combat operations. At the same time, Russian people served as Tatar troops. One of them even found his way to the pages of medieval chronicles, having killed Nogai himself, who as a true Chinggisid had the right to an honourable death [Ibid., p. 114]. However, neither his status nor his place in the military hierarchy is known. Most probably L. Gumilyov is right to a certain extent, when he concluded that some Russian soldiers could have served the Tatar khans and for some even 'the road to wealth and ranks' was open [Gumilyov, 1970, p. 398]. Nevertheless, this was the path of a mercenary. In order to actually receive access to ranks and wealth, the Russian man had to join a given clan. There is much more information on joint military actions of Tatar and Russian troops against Poland and Lithuania. But these are joint campaigns against an external enemy, threatening the interests of southern Russian principalities as well as the Golden Horde itself.

It is possible, according to archaeological data, that some representatives of Mordovian princes actually served as warriors in Golden Horde armies and even had marital relations with the Tatar nobility (see [Golden Horde, 2005]).

The troops: combat arms and military equipment. The *cavalry*, consisting of heavily armed warriors, is unanimously recognised by contemporaries and military historians as the symbol of the Middle Ages. It was the armoured cavalry, consisting of third-generation professional warriors that dominated the battlefields at this time, and they also determined the core of development of armaments and warfare. At the same time, the cavalry were the most privileged warriors, forming the

Weapon systems from Tatar burials of the 13–14th centuries (according to M. Gorelik)

stratum of military-service nobility. In these conditions the formation and development of medieval cavalry is inseparable from the processes of emergence and strengthening of the knighthood—the aristocracy and their military servants.

All this relates to the army of the Jochi Ulus in full measure. As a rule, sources describing the Tatar army claim that the words 'warrior' and 'horseman' are used as synonyms. For example, Marco Polo directly indicates that during battle the Tatars do not dismount [Book of Marco Polo, 1990, p. 256]. During the initial stage of its history, the empire of the Chingisids was created as an empire subordinate to the military-service class, led by the 'Altyn Urug.' In other words, the basis of the socio-political and military-administrative system of this state was formed by hierarchically organised equestrian detachments of Tatar clans.

The most important condition for the formation of huge masses of cavalry was the presence of trained horses. The horses, which were numerous in the Jochid Ulus, with this

being confirmed unanimously by all travellers, allowed for the recruitment of mounted warriors. Horses were continually and easily replenished into the army. In terms of providing horses and their regular care and maintenance, the Jochid Ulus represented a unique phenomenon in medieval Europe where these problems were extremely important. It is clear that noble warriors had stronger, taller, and thoroughbred horses, while ordinary warriors used ordinary steppe horses. The plain steppe horses were excellently prepared for combat operations. According to Marco Polo, the Tatars 'have trained their horses extremely well, and like dogs they move in every direction' [Ibid., p. 82].

Noble warriors arrived for service surrounded by servants (not less than two), with several interchangeable horses and in full arms. At the turn of the 13th century this arms complex consisted of a spear, a cavalry sword, a Saidak kit with a bow and quiver, as well as protective equipment such as armour, a helmet, arm shields, greaves, and a shield. Apparently, some warriors had equestrian armour, especially in mid-13—the first half of the 14th centuries. In order to characterise this arms complex, it is particularly important to note that it is related to specialised weapons and advanced equipment of the mounted warrior. Faceted spikes, Indian clubs, flanged maces, axes, and spike hammers were specific weapons able to increase the effectiveness of the onslaught, break through armour, and stun the enemy.

More noticeable progress is seen in the enhancement of defensive weapons. Apart from chain armour, lamellar plate, and leather armour, known even in pre-Mongol times, there are also modern types of munition: scale armour, chain armour with flat rings (baidans, kuyaks), brigandines, and several combined types of armour. A distinctive feature of this period was the widespread use of horse armour (koyars).

All this clearly shows that the Jochid Ulus had a fighting equipment complex typical for armoured cavalry. This fighting equipment complex was a fusion of Mongol-Tatar traditions and local combat practices, when numerous equestrian detachments were used, and the outcome of the battle was decided during the

clash of heavily armed mounted warriors—that is, who first would deal a blow to the enemy's ankle with a spear. The battle itself came in several stages, and mounted warriors were able to conduct rapid and prolonged battles with the enemy.

We are able to describe the weapons of noble warriors fairly well, however, this is not the case when talking about lightly armed cavalry. There is no doubt that the bulk of the army was formed by warriors—small owners of *iqtas*, military servants, etc., who only had a small number of weapons for fighting at close quarters and protective equipment. It is obvious that they had the whole range of weapons in various combinations, and the most important among these were throwing weapons. This military class differed from medium and lower strata of the military service class due to the non-systematic use of bladed weapons and the occasional use of protective metal equipment. Another feature that distinguishes the armament of the main part of army from specialised units was the versatility of weapons used.

By and large, the fighting equipment arsenal of lightly armed cavalry included a bow and arrows, a combat knife, a battle axe, sometimes a spear, a bludgeon, and a shield. Armour most probably consisted of leather armature and a helmet. Within this set of weapons apparently there could be some differences due to the complex social structure (local militia and warriors equipped at the expense of the feudal lord, etc.), which are difficult to discern as of now.

Most probably, the main part of the army was formed by lightly armed detachments of mounted archers. Their importance on the battlefield was quite crucial since they were responsible for initiating combat, showering the opponent with arrows, and causing considerable damage. It seems they were active on the flanks, covering mounted armour-clad warriors during attack. They were also charged with pursuing the enemy. They played a most pivotal role during campaigns—they were responsible for combat security, outflanking enemy territory, neutralising enemy reserves, and surrounding and blocking fortified enemy locations. In general, we can say that victory on

Armour, 14th century
(reconstruction by M. Gorelik)

the battlefield and the success of a campaign largely depended on the actions of this Golden Horde detachment. It should also be noted that for a several number of reasons this medium lightly armed cavalry unit was instrumental for the military affairs of several post-Golden Horde states.

The *infantry*, by their very nature, did not form particularly important or significant part of the army of the Jochid Ulus. In circumstances where the armoured cavalry was the most powerful unit, the infantry, in its turn, had a modest, supportive role. In the history of the Jochi Ulus warfare there is virtually no information on any regular use of the infantry. Even for the siege of urban fortifications dismounted horsemen were mostly used. For this reason, there is no information in regard to infantry armaments. There are descriptions with some unclear information about the possible presence of the infantry on the battlefield during the battles on the Kondurch (1391) and the Terek (1395), which mention Tatar field defensive installations in the form of ditches and fascines,

Mounted knight-at-arms, the 14th century
(reconstruction by M. Gorelik)

and apparently traces of protection. Perhaps in this case military servants and dismounted cavalry were charged with protecting the camp and such defensive installations. There are also belated and vague references to Muslim, Yas, and Genoese groups fighting alongside Mamai in the Battle of Kulikovo. Even if we admit that this information is accurate, it is an isolated case. Either way, the infantry did not play a decisive role—it had supporting and protective functions.

Perhaps an exception is the territory of Bulgar Ulus where, starting from the second half of the 14th century, some changes are noticeable in the composition of infantry equipment. These include wide oblong-triangular, oblong-foliate, and laurel-leaved spears, axes with tapered blades, as well as universal combat pole-axes.

The increasing significance of the infantry is related to a number of factors. One of these factors is the intensification of internal tension as well as the strengthening of the economic

and political independence of cities, which needed effective defence. Apparently, it was the big cities that formed infantry militias. Since the infantry could not fight against heavily armed cavalry in an open battle, it was mainly used for the defence of fortifications, during river battles, and during the use of firearms. Undoubtedly, it played a crucial role during the performance of engineering works. In this regard, we can notice an increase of its role in military affairs.

The *navy*, as a separate military force, was virtually absent in the Jochid Ulus. There are numerous testimonies when in response to Italian pirates and naval forces of the trading republics of Venice and Genoa, the khans and the rulers of uluses went on overland campaigns against the enemy ports and colonies their, forcing them to ensure the protection of the coast themselves. The navy emerges only in the latter half of the 14th century in the towns of Bulgar Ulus. It was able to resist the onslaught of pirates and Russian princes. These tendencies to increase the significance and consolidate the river fleet appeared later, in the 15th century, during the period of the Khanate of Kazan.

Artillery was the most important military and technical novelty of the 14th century, which, as it developed, began to determine the nature of the further development of military science in the world. Fire artillery arose from a combination of two discoveries of the preceding time—invention of the powder and large-scale casting of bronze and later even of cast iron. The first veracious information about composition of powder is known still from the middle of the 11th century from the Chinese treatise of Wu-jing Zongyao ('The most important of bases of military science'), where the production of incendiary and explosive shells of was described [Scholar, 1980, pp. 159–203]. The Mongols, familiar with achievements of Chinese military science, actively used such powder shells for the seizure of enemy fortresses. The breakthrough was made to the invention of fire proper guns, evidently in the Mediterranean, where the vacuum tubes which used powder charges were being first used for the throwing of arrows and small cannon-balls in the end of the 13th century. And since the 1330s the modified guns

began to throw fairly large cannon balls and around ten-twenty years later widely circulated in Europe. Such a military and technical novelty got to the territory of the Jochid Ulus most probably from the Middle East.

Already in the 1370s the light cannons appeared among the armaments of the Tatars and were used during defence of cities. A Russian chronicle used a vivid description of use of fire artillery when it reported that when in the winter of 1377 on the order of the Moscow Grand Duke the Nizhny Novgorod troops made a raid on the Bulgars, the besieged ones had met them by a cannon: '... they bombed our regiment with a cloud of cores' [Priselkov, 1950, p. 401]. This was actually the first time the Russian troops used a firearm. But already in 1382, during the defence of Moscow against Tokhtamysh's troops, the citizens opened a fire at them from light cannons—tufengs (tufenks): 'the artillerymen started firing...' [Complete Collection of Russian Chronicles, 25, p. 26]. Thus, there is no doubt that the Tatars got acquainted with firearms at almost the same time when it widely circulated across the Old World.

The term that the Russians used for this type of early guns—'tufeng'—is a distorted borrowing from the Turkic 'tüfenk'—that is, a 'small canon.' This term and a number of findings from the territory of the Jochid Ulus give a clue of the design of early guns. They had a wide but short channel of the barrel and a noticeably narrower and longer loading chamber. As a rule, the caliber of such guns was light, and the weight of light tufengs was up to 12 kg. Such guns fired with stones and since the middle of the 15th century with cast bronze and cast iron cannon-balls. Based on findings, such barrels were widely known in the 14th century from Yuan China to Western Europe. According to Russian chronicles, tufengs were usually used during defence and siege of fortresses. Light tufengs could also be used even in field conditions because their light weight allowed transporting them on a usual carriage, as demonstrated by the circumstances of the

Hand-held gun—tufeng.
Central Rus'.
Late 14th–mid 15th centuries
(according
to A. Kirpichnikov)

Vorskla River battle in 1399, when the army of Vitovt employed light cannons against Tatar regiments of Edigu. However, we have no evidence that the Tatars also used guns in field battles.

The design of such guns gradually began to change. In the early 15th century their barrel became elongated, and the charge chamber was reduced. Such bombard guns had already become a frightful weapon, especially during the siege and defence of fortresses. Throwing out huge stone cannon-balls (one bombard weighed 5.5 tons, and its ball weighed 120 kg), these guns broke down stone walls and damaged the attacking party. In this period the variety of fire guns from heavy mortars, kurtodas, and serpentes firing with heavy cannon-balls (weighing 20 kg and more) to manual bombards—arquebuses, hand-cannons, and ruchnitsas shooting with lead balloons—noticeably increased. The design of cannons changed as well. Instead of bombards made from strips of wrought iron, cast iron guns appeared. This immediately increased the reliability and fire-power of guns, turning them into a more frightful weapon. In general, the golden age of fire artillery fell on the 15th century.

The development of fire artillery announced the sunset of the era of *throwing artillery*. Meanwhile, back at the beginning—middle of the 13th century, various types of throwing guns went through a period of prosperity. Catapults and arcballistas played an important role in the achievements of Mongol khans in their military campaigns. Eastern, Russian, and Western European sources constantly point at the guns that smashed city walls, gates and threw fire shells at the city. For example: 'The

Tatars started besieging the town and storming the fortress' [Complete Collection of Russian Chronicles, 15, p. 369], or 'they started throwing balls which four men could not lift' [Complete Collection of Russian Chronicles, 7, p. 144], 'Batu brought his armies to the Polish gate, and they started a battle, and they were fighting the clock round' [Complete Collection of Russian Chronicles, 2, p. 785]. But already later in the late 13th century the Tatars did not employ military machines frequently. Evidently it was explained by the fact that these troops were not so numerous and did not have a possibility to make long regular preparation of an assault, thus they opted for quick violent advances instead of long preparations.

At the same time, in a number of cases later the Tatars also used different types of pre-

fire artillery during the defence of their cities. The most expressive example of it is the siege of Bolgar by Moscow troops in 1377, when automatic guns fired at advancing citizens [Priselkov, 1950, p. 401]. Since this message also deals with the use of tufangs, one can assume that in the second half of the 14th century new artilleries did not displace the old one but coexisted with it. The throwing machines like arcballists were complementing fire guns because their productivity was considered different.

In other words, fire artillery was of great success in this period: it was often applied with missile instruments. All these military and technical novelties were mainly used for defending fortified towns—that is, fortresses of the Bulgar Ulus.

§ 4. Military Art

Iskander Izmaylov

Conducting a war. Strategy. Each army striving to achieve success has two equally important tasks: how to overcome the space and the time. The space is the territory through which you march to a target, conquer and capture it, ensuring supply of your troops so that the opponent would not be able to use these factors. Time is an initiative, speed, and onslaught that create shortage of time for the opponent, not allowing him to adequately react to the threat. The strategy in this sense is the art of mastering the space and time, the sudden onset of an offensive, the rapid march, the creation of a primacy at a certain point, which will not allow the opponent to gather strength for counter-attack. The military leaders of the Jochid Ulus often demonstrated understanding of these strategy basics. However, this understanding did not always spawn the ability to find suitable solutions for it.

The information passed on by Russian chronicles, Arabic and Persian historical-geographical works, and the records of Western European travellers is the primary sources for characterisation of the military strategy and operatively-tactical mastery of the Tatars

of the Jochid Ulus. They all cover this topic fairly incompletely and often even in a biased manner. However, during their complex analysis it is possible to identify some elements of the strategy and operational tactics, which the military leaders of the Jochid Ulus employed on the battlefield.

Unlike the European tacticians, who experienced fear of decisive clashes during field battles and had a 'siege reflex' (striving to build upon strengthened points and hide in them in case of a threat) [Kontamin, 2001, p. 235], the Tatars very resolutely overcome considerable spaces, diverting not only from their border lands but also supply bases. At the same time, as already in the end of the 13th century the khans of the Jochid Ulus did not set a task to conquer new territories; important strategic objectives were replaced by limited successes and the strategy of the 'minor advantage,' which were expressed in a robbery and collection of tribute for a certain territory, and frequently they were used instead of it.

A study of the wars and military campaigns of the the Golden Horde's rulers leads to the conclusion that the strategy and the tactics of

combat operations in different theatres of warfare varied. On the western front the Jochid Ulus did not cease the military and diplomatic pressure on the countries of South-Eastern and Central Europe, even after the completion of the monumental campaign against Poland, Czechia, Hungary, and Dalmatia. Already in 1243 the troop of the Horde people marched on the Principality of Galicia-Volhynia. Powerful pressure from the Horde people forced Prince Daniel, the irreconcilable enemy of Mongols who had warred with them earlier at the battle on the Kalka River (1223), to come to Khan Batu and submit to him as a subject. His submission, however, was not full, was most probably formal and soon, having formed an anti-horde alliance with the brother of Alexander Nevsky, Andrey, he began to oppose the establishment of the khan's power in Southern Rus'. It was only after a defeat of Prince Andrey ('Nevryuy army' of 1252, Russian chronicles) by Nevryuy, the military leader of Batu Khan, that he finally decided to take over South-Western Rus' for himself, starting with the Galicia principality. The campaigns of Kurmyshi Ulusbek (Khurumshi, Kuremsa of Russian chronicles) and Boroldai Bagatur in the 1250s involved devastating attacks on the Galicia Rus', Poland, and Lithuania. A 1259 campaign was particularly ruinous. Boroldai's armies fought through to Poland, demolishing on the way the fortifications of the southern Russian cities, belonging to their ally Daniel of Galicia, and laid waste to everything in their path. They conquered and burned Sandomierz [Schaveleva, 1978, pp. 307–314; Yegorov, 1985, pp. 188–190]. After these wars the western Horde border became stable. It included the Carpathians as well—a traditional and natural border of East European nomadic tribes.

The new military campaigns undertaken by the owner of the western ulus (the Prut-Dnieper interfluvium) Nogai (1275, 1277, 1280, 1286, 1287) did not aim at conquering new lands. Moreover, some of them were held in alliance with Prince of Galicia Leo on his request (campaigns of 1275, 1277, 1280). They rather aimed at the establishment of a vassal dependence of the Balkan States and Poland to impose tribute and war indemnity on them as

Steel chanfron.
Mamluk Egypt. 15th century

well as to secure borders of the empire against assaults, which were becoming stronger [Yegorov, 1985, pp. 190–192].

The campaigns of Nogai Ulusbek in Byzantium are notable. They were caused the khans' desire to defeat the ally of the Hulaguids, with whom the cruel confrontation in Transcaucasia started, as well as to provide the possibility of unimpeded passage over the Dardanelles for trade ships and embassies of horde [Lebedev, 1944, pp. 92–94]. The Khan of Burke's campaign, with an army of 20 thousand, ended with a siege of Constantinople. Bulgaria was destroyed and included in the Horde's sphere of influence (1269). For a little while the loyalty of Byzantium was assured. However, as early as 1270 there was the new Mengu-Timur Khan. When the policy of Byzantium displeased him, he moved in troops from his ulusbek again. Under the walls of Constantinople the Emperor greeted Nogai with docility and royal honour, even agreeing to a payment of tribute and neutrality in a war of the Jochids against the Ilkhans of Iran that had broken out. After this policy of violent military and political activity by the Jochid Ulus there was a period of calm in the west. It was only interrupt-

ed occasionally by local military enterprises (1337), when it was necessary to reinforce the khan's power, in the time of the Öz Beg Khan (1312–1342).

Ciscaucasia and Azerbaijan were the other regions where the Jochid Ulus particularly engaged in conquest. In Ciscaucasia skirmishes with warlike and freedom-loving highlanders almost never ceased. The mountain valleys and the biggest cities in this region had been seized by the beginning of the 14th century. For example, Dedyakov, the Alans' (Yases') biggest city, was stormed and destroyed with the active participation of vassal Russian princes' armed forces. Thus the border in the south became stable in the Caucasian Mountain Range.

Transcaucasia was the district that experienced the most violent conflict, where the Golden Horde strove to occupy the strategically important towns of Nakhichevan, Maragha, and Tabriz—centres of the silk road trade and a bridgehead for the conquest of the entire Middle East. The wars that had broken out there since 1262 continued, with varying degrees of success, until the 1490s. However no side in the conflict managed to drive their opponents away from Azerbaijan and defeat them. Actually it was a drawn out, sluggish war which both parties needed to maintain their military power. It was an important aspect of international politics: Mamluk of Egypt, who made the Jochid Ulus a strategic ally along with the Seljuq Turks of Asia Minor; and the significant adversary of Ilkhans of Iran, the Crusader kingdoms, and Byzantium.

The bloody wars of 1260s, when the army of Berke Khan defeated the regiments of Hulagu Khan (1263 and 1265), and the armies of Nogai were beaten near Shamakhi (1267) by Hulaguids, who in turn suffered a defeat by the Mamluks of Beibars in time of Ain Jalut (Palestine) (1269), were followed by a time of unarmed opposition and diplomatic intrigues. The trend of infrequent conflict was sharpened by successful campaigns of Mengü-Timur (1290) and Öz Beg Khan (1318/19) and by failures (1325 and 1335). One could say that the ideas about the violence of this struggle have a more perfect written origin,

through which the real fury of the sides and their desire to conquer a neighbour's lands are passed on. It is related to the active exchange of embassies by the participants of this widespread conflict and thus the preservation of a fairly detailed description of all the fluctuations of wars and diplomatic negotiations in these sources. In this sense the most known connections between the Volga and the Nile are the diplomatic contacts between the Golden Horde and Egypt.

The strategy of direct assault and the fleeting wars naturally resulted from the nature of the military organisation of the Jochid Ulus, where the militias of Tatar clans formed the main military force. A significant part of an army's number, in some campaigns against the Hulaguids, the sultans of Middle Asia, and Timur, they could reach two hundred and fifty thousand and required massive financial expenditure for their maintenance. Therefore, the khans could not fight a long war, unless it was accompanied by a seizure and plundering of an opponent's territory. As a rule, the success of a campaign was achieved by identifying a strategic point and surrounding it. When the main forces were preparing for an assault, the rest of the troops plundered the neighbourhood and thereby suppressed the resistance in the nearest cities. A seizure or the surrender of this strategic centre marked as a rule achievement of political ends because the opponents preferred to make peace without going on with the war.

In a whole range of cases (it is especially typical for the wars of the Jochid Ulus with the Hulaguids and Timur) the result of a war was decided only in a battle or several decisive battles. This is explained by the fact that there were not enough resources to gather an army equal in size to an opponent's defeated army, without leaving a country exposed to total destruction, as it was during Toktamysh's war with Timur in 1395–1397. The Golden Horde's domination of Northern Eurasia was such that for two hundred years it did not fight a defensive war. It was only in the period of mutinies, in the second half of the 14th century that cities of the Bulgar Ulus began to be attacked by Russian armies, which caused

them to begin to work out the tactics to defend their borders.

The choice of one or another strategy and an operation's plan were based, of course, on an assessment of an opponent's forces, the nature of his influences and own powers, and possible benefits. Obviously, detailed data about an opponent could not be got without a well resourced military intelligence and a developed spy network. The comparable system of collecting information and spies' data was traditional for states of the Chinggisids. Close international and intra-horde trade ties revealed ample opportunities for it. At the same time there was also a very active counterintelligence agency. For example, large military operations, such as attacks on the Toktamysh (1382) and Edigu (1408), were unexpected by Moscow's princes. Apparently, diplomatic agents were very active, influencing activity in Byzantium, the Seljuk sultanates of Asia Minor, and Egypt, as well as in other neighbouring countries in Europe and Middle Asia.

The tactics of a field battle. It is considered that the medieval battle was a disorderly struggle or an unsophisticated battle. Probably it sometimes happened like that. However, in the overwhelming majority of cases the style of pitched battle and the tactics employed by the Tatars were very diverse, as the sources show, and underwent a significant evolution. In general, one can say the medieval battle was a clash of the organised masses of cavalry fulfilling their tactical combat tasks.

The make up of regiments was different at real battles, of course, and depended on particular circumstances. In the 13–14th centuries a large Tatar army's formation on the battlefield (*yasal*) was most probably a system of slave corps organised in five (or even seven) components. There were the advanced (*vertoul*) corps, two wing (*baraunkar and dzhaunkar*), the centre, and the reserve. Sometimes there were the advance guard (*sentry*), flank (*kanbul*) outposts, and even the rearguard (*surgavyl*). All *kuly* consisted of smaller units (*koshuns* (*kushuns*)). By the analogy with organisational structure of medieval European armies one can assume that there were units within these *kushuns*, which had a degree of tactical free-

Mongol and Tatar flags. Medieval miniatures (according to M. Gorelik)

dom. There were smaller tactical units of tactic known as spears. At least the Persian sources constantly mention these units, in descriptions of military clashes with an army from Toktamysh.

Such a formation required different concentrations of combat lines of the armies, which in the crush of battle usually became compact masses. It is understandable that it was rather difficult to manage such a battle. For purposes of more effective command and control over the actions of the various units, command flags along with flags of the slaves, *kushuns*, and spears were used as guides. Across the raised flags they ran a troop count; based on the location of a flag of the supreme commander-in-chief they estimated the centre of combat. Trumpets and drums (*nakars*) as well as the commander's whistles were also used. A Tatar army on the battlefield before an attack was described by Marco Polo: 'The Tatars' custom is: when they are assembled and ready to fight, the *nakar* of the chief will not yet sound, they do not begin swearing, but

Battle on the Vorskla River. 1399.
Illuminated chronicle. Late 16th century

they constantly play the instruments and they sing...' '...When they wait for a battle, unless the nakar sounds, they sing and play on the two-strings instruments; they sing, play, and they have fun lying in wait for a fight. And they were... And they wait by the custom of a nakar's blows and a battle; and it is simply amazing how well they sang and played' to [Book of Marco Polo, 1990, pp. 92, 212].

It is quite evident that numerous ranked units could work on a battlefield, carrying out their combat tasks. Based on data of Persian sources (Shami, Yazdi), one can assume that they ensured that the centre held fast, which guaranteed the security of the whole formation. Most probably it was the centre that was being productively strengthened by Caucasian trenches and supports [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 168]. Most often it was the advanced and flank kuly that went into a battle and fought tactical manoeuvres. In that regard it is unsurprising that it was the flanks of armies of Toktamysch and Timur which at the battle near the Kondurcha River (1391) as well as at the battle on the Terek (1395) played the most important role in the battle. Particularly vivid-

ly such an operational scheme of a battle was shown in the battle on the Terek, where for the first two days the wings and kanbul of Toktamysch's troops fought with a degree of success against the flanks of Timur's troops and even nearly captured an opponent's camp. However, on the third day they were beaten, which destined a common defeat of Tatar troops (see a review of events of these battles: [Mirgaleyev, 2003]). Perhaps the battle on the Vorskla (1399), where Vitovt's troops were bogged down in a battle against the centre of Edigu's troops and were squeezed from flanks and beaten [Izmaylov, 1994], was an example of the brilliant use of such tactics. It appears this is not a chance but a deliberate operational battle plan, when a strong centre absorbs the main forces of an opponent and supplies the wings with reserves. The wings and their combat kanbuls troop were manoeuvrable operational-tactical units that worked on their own flanks and had to break an opponent's flanks, aiming to separate him from his rear. Such tactics could only be planned and realised if the battle order of troops was sufficiently divided, and the operational units could work deciding their combat tasks independently.

The actual battle of that time seems to follow the pattern of introducing the kushuns of the light and heavy cavalry into battle in order to break the opponent's front line. First, the vanguard of mounted bowmen entered the battle. Galloping past the opponent's stationary line, they showered them with arrows continuously. Missiles played a leading role in this battle; these missiles were made stronger by new types of arrowheads and more effective types of bows to increase the fire power and thus the effectiveness of lightly-armed horsemen. Marco Polo gave a vivid description of this stage of the battle, recounting the battle between Berke and Hulagu: 'A short time later the nakar sounded from two sides; and, as soon as they heard it struck, immediately each side rushed at the other; they grabbed their bows and fired arrows, launching them at the enemy. Arrows were flying from both sides, and after a short time the air was so filled with them so that you couldn't see the sky. One could see many men fall to the ground, and also many

horses; and you must believe that it couldn't be otherwise, so many arrows were launched at once. They did not cease to launch arrows as long as there were arrows in their quivers, and all the earth was covered with the dead and dying. And when they had expended all their arrows, they reached for their swords and clubs...' [Kniga Marko Polo, 1990, p. 212].

The essence of similar tactics of mounted bowmen is explained by another author, S. Herberstein (the first half of the 16th century), who was familiar with the tactics of the Tatars from the stories of his Russian informants: 'They enter into a contest with the enemy with the greatest boldness from a distance; they do not, however, continue this mode of warfare long, but pretending flight, take an opportunity while their enemies are pursuing them to discharge their arrows backwards, and then, when the ranks of the enemy are broken, turn their horses suddenly round and attack them' [Herberstein, 1988, p. 168].

The author goes on to clarify this tactical technique, which was probably, to some degree, typical of all ancient and medieval nomad armies (for further details see: [Gorelik, 1990, pp. 155–160]): 'When a battle is to be fought upon their native plains, and they have the enemy within arrows' flight, they do not enter into the engagement in regular battle-array, but draw out their forces into a winding circle, so as to afford themselves a freer and more certain opportunity of discharging their weapons at the enemy. They observe a wonderful degree of order, both in advancing and retreating; for performing which manoeuvres they have leaders, who are very skilful in these matters; but if these should happen to fall under the enemy's weapons, or through fear should make an error in generalship, the confusion of the entire army becomes so great that they cannot again be restored to order, nor be prevailed upon to turn their shafts against the enemy. This kind of contest, they themselves, from the resemblance, call a dance'. The German edition describes how the Tatars '...begin a 'dance,' as the Muscovites call it; the commander or captain approaches the enemy army with his detachment and, after shooting arrows, rides away; another detachment

Battle. Miniature from the book
'History of Abulkhair Khan' by Masud Kuhistani.
Transoxania. Mid-16th century

follows the first, and thus one detachment follows the other, until the first returns after the last. If they successfully arrange matters thus, the advantage is on their side, but if the commanders riding ahead of the detachments are killed or lose courage, they rapidly fall into disarray' [Herberstein, 1988, page 168]. This 'ring dance' was a uniquely efficient arrangement which allowed for continuous mass shooting to be kept up from as close and advantageous a position as possible—into the flank, forward or, especially, backward. It was for exactly this kind of shooting that the Tatars used special arrows with huge tips ('srezni'), as Marco Polo testifies: 'It is their practice that each warrior in the battle should have 60 arrows, 30 small ones for shooting, and 30 large ones with broad iron tips; these they throw at close range—at faces and hands, they cut bowstrings with them and use them to inflict a lot of harm' [Kniga Marko Polo, 1990, p. 193]. The version of the story preserved by Ramusio describes how 'the Tatars, when fighting an enemy, never dismount; everyone gallops around in a circle and shoots' [ibid, p. 256]. During the first phase of the battle the opponent would suffer enormous losses, losing warriors in the front lines, and especially horses. This was accomplished not through horizontal fire from afar, but through aimed

fire, after coming up within shooting distance. Another objective of this arrow shooting was to throw the opponent's ranks into disarray, cause disruption, and spread panic in order to prepare for the second phase of the attack. This began when fully-armed warriors entered the battle after the bowmen, often with armoured lancers in the centre. According to Marco Polo's clichéd narrative about the battles, when the bowmen had shot all their arrows, they attacked the opponent—'after all their arrows had been shot, they reached for their swords and clubs and fight fiercely,' 'all the arrows had been used, they put their bows away in their cases and grabbed their swords and clubs,' '... when they had expended all their arrows and killed many men and their horses, they reached for their swords and clubs...' [Marco Polo, 1955, pp. 193–194, 216–217, etc.]. But the battle itself consisted of several acts and various manoeuvres, attacks, and false retreats. The description of a similar battle by German historian A. Kranz at the end of the 15th century is worthy of notice. Describing the battle tactics of the Russians, Kranz wrote that they usually fought standing in position, and 'advancing in long files, they throw spears and strike with swords or sabres and then quickly retreat' (quoted from: [Kirpichnikov, 1976, p. 14]). It is clear that the Russian warriors borrowed these battle tactics, as well as the main types of armaments, from the Tatars.

Marco Polo gives the following description: 'In battles with their enemies, they gain the advantage in this way: they are not ashamed to run from the enemy; they run away, turn around, and shoot. They have taught their horses like dogs to turn about in all directions. When they are being chased, they fight on the run well and with force, as surely as if they were standing face to face with the enemy; they run and turn back, shoot accurately, and strike down the enemy's horses and men. And the enemy believes they are frustrated and defeated, while he himself has lost, because his horses have been shot down and his men severely beaten. The Tatars, as soon as they see that they have struck down the enemy's horses and a great many men, turn back and fight well

and bravely, routing and defeating the enemy' [Kniga Marko Polo, 1990, page 82]. At the same time, the Koshuns, having shot their arrows, most likely retreated to replenish their quivers. And their place was taken by fresh units, who continued to storm the opponent's positions, alternating between arrow-shooting and attacks by armoured cavalry, attempting to wedge themselves into his formations and disrupt the battle array.

Thus, we can establish that the field battle of the medieval Tatars involved two main phases: battle at a remote distance using bows and arrows and close combat with pole-arms and bladed weapons. It may be assumed with certainty that the second phase of the field battle involved a charge by lancers, armed horsemen of the first one or two ranks. They attacked the opponent by closing in *en masse*, with their spears in a horizontal position and at a gallop, to gather force for the strike. After the first skirmish, the battle broke up into separate fights which were distinguished by their brevity, violence, and a rapid change in the combat environment. The increased intensity of the battle was, to a large extent, due to the flexibility of the combat formations and the divisibility of the subdivisions of the troops, which allowed more and more new troops to be brought into the battle. Various hand-to-hand combat weapons were used in this decisive phase of the battle. At the same time, the Tatars carried out not only frontal attacks, but also flank attacks and envelopment manoeuvres, according to various sources. All these elements of the battle are confirmed not only in written sources, but also in pictorial sources, which complement this information wonderfully.

If the opponent could not endure the successive blows delivered by the mounted lancers and ran away, light cavalry pursued them, capturing the weak and plundering. Sometimes this went on for several dozen kilometers. For example, the Tatars pursuing the escaping Lithuanian-Russian troops after the battle on the Vorskla River in 1399 approached Kiev itself and demanded ransom from it. Most likely the pursuers were fresh reserve troops. They executed an operational and tactical manoeuvre

vre in order not to allow the retreating enemies to come together and suddenly counterattack the Tatar troops, exhausted by the battle.

It is difficult to calculate the combat losses which could have been caused by external and internal wars. They were definitely different depending on battle conditions. For example, it is undoubted that, despite the defeat in the battle on the Kondurcha, Tokhtamysh managed to preserve not just the main forces of his army, but even reinforced it with reserves from Bulgar, Ukek, and Mokhsa. This may be seen from the fact that no great ulusbek or clan chief died, apparently having retreated with their *koshuns*. But Tokhtamysh's losses in the battle on the Terek, which was larger and bloodier, turned out to be catastrophic. No ulusbek who fought in this battle survived, with only rare exceptions. Indeed, total losses in the wars seem to have reached 20%–50% of participants, and most of the warriors died fleeing from the battlefield. It seems that the battles of the Jochid Ulus using mass cavalry led to mortality significantly greater than human losses in Western European battles.

The warriors of the Jochid Ulus did not know courtesy or the manifestation of knight-hood. The opponent was as a rule destroyed completely, if he did not go to the side of the victor in time. Being sold into slavery was the greatest mercy the vanquished could expect. Arab sources repeatedly describe how, after Nogai's victory over Tokhta and after his defeat, the slave markets of Crimea filled with captives. In this sense the Tatars showed no mercy to enemies, nor asked for it themselves. One of the bloodiest stages in the military history of the Jochid Ulus was the wars in Rus'. But it must be noted that Russian princes and citizens repeatedly provoked such wars by massacring the khan's ambassadors.

It is interesting that religious motives were absent in the rhetoric of the rulers of the Jochid Ulus for a long time, though Egyptian chroniclers tried to represent such motives as the impetus for the wars between the Jochids and the Hulaguids. But the curses of Berke Khan ('May Allah bring shame upon this Hulagu, killing Mongols with Mongol swords. If

Siege of a Russian city. Miniature.
Illuminated chronicle. Late 16th century.

we acted together, we would conquer all the Earth' [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy, 1884, p. 75]) eloquently testify to the extent to which religion incited these wars.

However, in the 15th century the religious component of political and military doctrines started gradually increasing, and it became especially significant in the ensuing centuries.

Siege and defence. Sieges and the capture of cities were one of the most important aims of any war in the Middle Ages. Cities and fortresses were an axis in the strategic coordinates of any war, uniting military space and time. The capture of cities offered benefits in terms of the occupation of territory and conveyed a time advantage, while a long and fruitless siege deprived one of the same advantages. For example, the quick capture of Moscow (1382) by Tokhtamysh led to the stabilisation of the situation in the Jochid Ulus and subordination of Rus'. At the same time, the long siege of Moscow by Edigu (1408), which ended in his retreat, caused increased tension, contributing to the collapse of the country. In that regard the siege and defence of fortresses

Manjanik, a type of a trebuchet. Miniature. Iran.
Early 14th century

are highly important elements in the country's entire military culture.

The seizure of huge territories and the delivery of defeats to numerous states would have been impossible if the Mongol troops had not commanded advanced tactics for the assault of fortresses using technical innovations such as stone-throwers (something like *trebuchets* or *catapults*), powder and incendiary shells, various battering rams, and systems of protective fascines. But by the end of the 13th century the troops of the Jochid Ulus were using these tactics of massive assault more and more rarely. Apparently the reason for this metamorphosis is the geopolitical stabilisation of the borders of the empire and the belief that since they possessed a numerous and strong army, the khans of the Jochid Ulus did not have to concern themselves with the perfection of siege and defensive tactics.

Another reason was psychological. In the history of the Jochid Ulus, the capture of enemy cities was often carried out not through direct assault, but by threatening to make one. The glory of the Tatars as warriors who almost

always conquered besieged cities convinced those besieged of the vainness of resistance and caused them to abandon themselves to the conqueror's mercy. For example, during the siege of Moscow in 1382, on the third day of the unsuccessful siege the ambassadors of Tokhtamysh and two sons of Dmitry of Suzdal came up to the city walls and announced: 'The tsar wishes to take pity on you, his people, as you are not guilty, nor are you deserving of death. He has come to do battle not with you, but with your grand prince. You, however, deserve his mercy. He requires nothing more from you but that you come out to meet him with honour and tribute, along with your prince. He only wants to see all of your city and enter into it and stay there, and bestows upon you his peace and love. Open your gate to him' [Polnoe sobranie russkix letopisej, 25, p. 208]. Then princes Vasily and Semyon started asking the citizens to comply with their request. The citizens started arguing, as many of them did not want to resist the khan. So the city opened the gate. In some cases cities did indeed save themselves from ruin and plunder, but often the surrender led only to robbery, albeit on a limited scale. But sometimes a city was plundered anyway, as happened in 1382 to Moscow when the citizens opened the gate and went out headed by prince Ostey, archimandrites, and other high-ranking people of the city. They were killed mercilessly, and the city was absolutely ruined and burnt to ashes.

Sometimes the same effect was achieved with the help of a blockade, leading to a shortage of provisions and water or to a plague. But the attempt to operate in this fashion in the case of Moscow in 1408 did not lead to success. The city was fortified well, and without artillery Edigu was unable to organise an assault. As a result of a mon-long blockade he had to retreat. This case shows the most difficult feature of such tactics. The strategy of a war for obtaining 'quick benefits' required that one act quickly. The khans of the Jochid Ulus could not mount a siege for months and years, as in Western Europe. Their success had to be quick, despite losses.

In this case the army had to start a direct assault. As the besiegers usually were more

numerous, they could try to overcome the city's fortifications without paying much attention to human losses. In addition, there were special technical means of blockading cities to neutralise the firepower of the besieged, and siege engines were used. The description of the siege and assault of Sandomierz in 1259 in the *Galician-Volhynian Chronicle* [Galicko-Voly'nskaya letopis', 2005, pp. 138–139] is a wonderful illustration of the successful application of these tactics. The troops

headed by Burunday, a veteran of the conquest of the West, approached Sandomir in November. The city was immediately surrounded by a bulwark and stockade to cover the besiegers: 'they walled in their city.' After that battle machines were built very quickly, because apparently the Tatars had only the main parts with them, 'and they built catapults, and fired continuously day and night.' At the same time, the Tatar archers attacked the city walls to prevent the citizens from shooting at them: 'and the arrows prevented one from coming out from behind the fortress wall.' The intense fire lasted four days and ended in success—all the barriers were knocked down from the wall, and the defenders, left with no protection, were swept from the walls. At the same time, the attackers filled ditches with brushwood. After that the Tatars 'started leaning ladders against the city walls and climbed into the city that way'. The walls fell down, the gate was opened, and the Tatar-Russian troops broke into the city. As a result, the city was seized, plundered, and burnt down. It was essentially an assault carried out according to all the canons of military art, just as the Mongols carried out assaults on cities during their conquests.

But from the time of the assault of 1259, the siege technique and tactics of the Tatars started to decline. While new, improved defensive tools were being developed in neighbouring states, such as stone walls, firearm

Ceramic incendiary shells. Ukek

artillery, and fortifications in front of walls, the Tatars were using the traditional tactics of sudden raids and captures. These were based on the tactics of the sudden raid and seizure of a city, as it happened in the case of the seizure of Vladimir in 1410 by Tatar-Russian troops. If the sudden raid was not successful, other tactics were used. The Tatars fired intensively at walls, trying to knock down defenders in order to climb the walls without hindrance and open the town gate. This tactic is described in Russian chronicle accounts of the seizure of Moscow in 1382: 'The Tatars came up to the town, and the citizens started shooting arrows at them; the Tatars fired even more arrows at the city, as numerous as rain, so one could not even see. And many of those standing on the city walls fell wounded by arrows, for the Tatar arrows overcame more than those of the city' [Polnoe sobranie russkix letopisej, 25, p. 208].

But starting in the mid-14th century these tactics were becoming less and less successful. The army of the Jochid Ulus did make some achievements in the seizure of cities, for example, the seizure of Tabriz in 1357 or Moscow in 1382, as well as a whole series of other Russian towns. But they were carried out by means of fast raids or intense shooting at town walls followed by the seizure of the gate. When towns had their gates closed and they had a sufficient garrison and the necessary

food, in most cases sieges and assaults failed. This is clear evidence of the degradation of the Jochid Ulus's siege tactics in the 14th century.

As in the Jochid Ulus a significant defence system in frontier uluses did not even exist, the khans did not care much about defence. At the same time, the defence of towns was organised rather well in regions with traditions of constructing fortifications. There is no doubt that in these cases, in addition to walls, ditches, and barriers, special battle machines protected towns. These included stone launchers (*trebuchets*), small and middle-sized pull action catapults (*arrada*), and crossbows (*tircharkh*). For example, a similar arsenal existed in the Khwarezm border fortress Kyat, which fended off the attack of Aksak Timur in 1372 [Materialy' po istorii turkmen i Turkmenii, 1939, p. 515]. These military machines, by increasing the field of fire from the city walls, did not allow attackers to bring their siege engines up to the city walls, fill in ditches, and start an assault. In the latter half of the 14th century, the use of new military equipment, firearm artillery, was recorded for the first time. The garrison, while firing at the assailants, often also organised raids to hamper coordinated enemy action and prevent them from organising a blockade of the city. An example of these tactics is recorded in the Russian chronicles for 1377, when the troops of Moscow Grand Prince Dmitry Ivanovich went on a campaign to attack Bulgar. They approached the walls of the city on 16 March and began to plunder the environs; in response: 'The pagan Besermyans came out of the city opposite them, took up battle positions and began to shoot, while others fired thunder from the city, scaring our men, and others fired crossbows, and yet others rode out on camels, seizing our horses' [Priselkov, 1950, p. 401]. Thus did the besieged try to disrupt the plan for encompassing the city.

The besieged hoped that their selfless defence would force the opponent to retreat, or they would be able to gain time so that a reserve army could join them, or a shortage of food would demoralise the enemy. As a last resort they were ready to accept political conditions of peace, for example, to acknowledge

the jurisdiction of a new power, but they tried their best not to open the gate to the enemy.

Military actions aimed at fortified cities and fortresses often turned into full-fledged military campaigns. One example is the five campaigns of Aksak Timur against Khwarezm. These ended with the seizure and devastation of Urgench in 1388, when its ruler al-Sufi fled, leaving it defenseless. But it also happened where there were serious fortifications, exhausting the enemy through constant sieges and battles. As far as areas without fortifications are concerned, for example, the Lower Volga Region, the defence of towns was left in the hands of the citizens themselves. It was not organised properly and was destined to fail; this led to a military disaster in 1395, when Aksak-Timur went along the Volga as far as Ukek without hindrance.

In other words, the siege and defence tactics of the Jochid Ulus essentially never became central to their military art, and it deteriorated some time after the conquest, having ceased to be a state programme. The tactics of defence were preserved and developed only in some regions which constantly experienced military pressure from their neighbours, Khwarezm and Bulgar.

* * *

The armament and military science of the Jochid Ulus traveled a significant path of development. The initial stage of its formation was related to the grandiose and aggressive campaigns of Chinggis Khan and his offspring. In the period before the late 13th century, the armament and tactics of the Jochid Empire's military forces were similar to the equipment and ways of waging war in other states of the Chinggisids. But the differences, which were mainly determined by the rapid social development of the Jochid Ulus, gradually began to increase. This eventually led to the differentiation of troops by their armaments and the method of their use. At one end of the spectrum were the noble warriors and their servants—armoured cavalry armed with lances, sabres, and maces, and at the other end were mounted archers, who usually only had bows and arrows, along with universal types

of weapons such as axes, spears, and knives. These changes had become particularly noticeable by the early 15th century, when the structure of military organisation and battle tactics themselves changed. Almost the entire period of the history of the Jochid Ulus was marked by degradation in the art of city sieges. While in the latter half of the 13th century the Tatars often besieged cities in Poland and Rus' and took them by storm, in the early 15th century only blockading was used. This was to a great extent connected with the underestimation of fire artillery, which was mainly used in the Jochid Ulus to defend the towns of the Bulgar Ulus. Troop formation on the battlefield consisted of several tactical units or corps (*kuls*), including a whole range of smaller divisions (*koshuns*). As a result, the

battle itself consisted of the constant introduction of all these units into the battle. Traditionally the field battle tactics of the Tatars made wide use of manoeuvres, ambushes, false retreats, and sudden attacks which were supported by intensive cavalry strikes in open battle. For a long time this brought success to Tatar military leaders during battles with enemies, securing the dominance of the Jochid Ulus in northern Eurasia. However, a certain conservatism and underestimation of innovations in military science led to heavy defeats in wars against Poland, Lithuania, and Rus', as well as the mounted legions of Aksak-Timur. At the same time, one cannot help noting the vast and decisive influence of the armament and military science of the Jochid Ulus during the post-Horde era.

CHAPTER 7

Domestic Policy of the Jochid Ulus

§ 1. Central power and Russian principalities

Charles Halperin

Interaction between the Golden Horde and the Russian principalities and city-states was intensive and vast. It affected all spheres of life in Rus', especially the economic, political, social, and cultural spheres. This interaction took place in two stages: 1) directly, during the existence of the Golden Horde from the 13th through the 15th centuries, and 2) indirectly, after the decline of the Golden Horde, through successor states of the Horde, from the 16th through the 18th centuries.

A profound indicator of the extent to which the reaction of Rus' to Tatar rule influenced the study of the Horde is the well-known fact that the name given to this Jochid state—the 'Golden Horde'—is not of Tatar origin, and that it first appeared long after the collapse of the Horde, not earlier than in the 1560s in the Russian literary monument on the conquest of Kazan, the 'Kazan History.' [Halperin, 1986, pp. 162–165]. Likewise, the term usually used in Russian historiography for the Horde's rule—the 'Tatar yoke'—is also an anachronism that emerged in the latter half of the 17th century, most likely on the territory of Ukraine, which was then subordinate to the Muscovite state [Halperin, 1984b].

The predominance of Russian terms in the historiography of the Jochid Ulus is a result of the significant role of Russian sources in its study. The history of the Horde cannot be written without Russian sources, despite their bias, mistakes, and omissions [Halperin, 2006]. Unfortunately, Russian scholarship dealing with the Horde and especially Tatar influence on Rus' has often been characterised by neglect or distortion of the history of the former [Halperin, 1982c; 2000a; 2004]. The views of the Eurasian school, whose historical department was

headed by G. Vernadsky, were an exception to this generalisation; these views were characterised by excessive abstract constructions [Halperin, 1982; 1985a].

There is no doubt that Rus' was conquered by the Mongols in 1237–1240, despite hypotheses to the contrary. The arguments in favour of an alliance between Rus' and the Mongols are refuted by abundant evidence of Tatar government in Rus', which would be inexplicable if an alliance had existed [Halperin, 1998a, p. 109, n. 59].

Russian sources were always fairly ambiguous concerning the recognition of the Tatar conquest in their theoretical framework, preferring to see Russian-Tatar relations as a continuing series of armed clashes [Halperin, 1982b; 1984; 1985, pp. 61–74; 1986; 1998a]. For this reason the victory of Muscovite Grand Prince Dmitry Donskoy over Emir Mamai in 1380 at the Battle of Kulikovo was not clearly framed in the literary record of the Kulikovo cycle as the 'liberation' of Rus' from the 'Tatar yoke' [Halperin, 1976; 1984b; 1986, pp. 94–136]. Even the Battle of Kulikovo could not destroy the myth of Mongol invincibility [Halperin, 1998, pp. 325–335]. Even the great stand on the Ugra River was not presented as the main turning point of Russian-Tatar relations until the third quarter of the following century, but only ambiguously as a 'liberation' [Halperin, 1986, pp. 149–166].

The place of Rus' in the administrative structure of the Golden Horde remains unclear [Halperin, 1998a, pp. 111–112]; the descriptions of Rus' as an *ulus* of the khan or the Russian princes as his *ulusniks* served certain interests and may not have reflected the actual tradition of the Jochid Ulus [Halperin, 1982d].

Instead of a clear concept of Tatar domination, the Russian sources give the one-sided impression that Russian-Tatar relations consisted only of hostile armed clashes. Unfortunately, this distortion often remains in modern historiography.

At first, the conquest and subsequent rule of the Horde had a very destructive influence on the Russian principalities and city-states. The seizure of Russian cities and later the necessity of paying tribute and taxes to support the Tatar rulers and their suite and bodyguards in Rus', traveling to the Horde and giving presents to the khans of the Golden Horde—all of this imposed steep costs on the economy of Rus' which turned out to be so large that a whole century was needed in order to recover from them. The construction of stone churches in Rus' ceased for a century; some artistic crafts, such as nielloed enamel, completely disappeared; and the city of Ryazan was forced to relocate to another place because of too frequent raids. But the economy of Rus' revived, to a great extent due to Tatar patronage of international trade. The khans issued an edict according to which Baltic merchants were allowed to enter Novgorod without paying customs duties. Trade on the Volga, which intersected with the Silk Road, took special advantage of the Pax Mongolica, which in the 13th century extended from China to Iran. The Russian cities on the Volga obtained great benefit from this trade; Nizhny Novgorod flourished as a result of it. Certainly, the ongoing Tatar invasions had a negative influence on the economic development of Rus'. But however difficult these duties were for Rus', apparently they constituted only a minor source of income for the Jochid Ulus, whose main income came from the Silk Road [Halperin, 1985, pp. 75–86].

Rus' was on the outskirts of the Golden Horde, whose main city centres were situated in other places—in Bolgar, Crimea, the Sarais, and Khwarezm. It was spending much greater resources trying rather to seize the rich pastures of Azerbaijan from the Ilkhans than maintaining political control over the Russian forest area. Therefore, Rus' was peripheral to the economic and strategic interests of the Horde, despite the efforts of Russian written sources

to assert the opposite opinion of Russian-Tatar relations.

Politically, the Horde left the infrastructure of princely power in Rus' untouched, but it demanded that all the princes visit the great khan in Karakorum personally in the beginning, and then the khan of the Golden Horde in the nomadic horde or in Sarai, depending on where he was. Although the Tatars respected the lawfulness of the Rurikid dynasty and never assigned non-Rurikids to the princely thrones, the final choice of the Grand Prince of all Russia rested on the khans, which gave them an opportunity for political manipulation and encouraged Russian princes to manoeuvre among factions of the Horde and forces trying to obtain political support. However, the Russian princes hardly needed the Horde's guidance to know how to act as political figures using tricks or ruses [Ibid., pp. 44–60]. It is not surprising that Rus' needed information, and it acquired extensive knowledge about the domestic and foreign policy of the Horde, its geography, and its dynastic and administrative organisation [Halperin, 1982a].

The khans of the Jochid Ulus did not set up garrisons in Russian cities, nor did it occupy the Russian forest area; they ruled from the steppe through a multitude of administrative officials whose functions are sometimes not entirely clear [Halperin, 1985, pp. 33–43]. The presence of the Horde in the politics of Rus' was very noticeable. The execution of such canonised princes as Mikhail of Chernigov and Mikhail of Tver, the invasion of Tatar forces into the forest area, part of the internecine feuds within the principality, and the imposition of taxes and compulsory military service, as in Tver in 1327, demonstrate this fact. Even campaigns of the Horde to defend Rus' from Hungary, Lithuania, or Poland were often very expensive for Rus', through whose territory the Tatar cavalry passed on its way to the border, although Russian princes could obtain some profit from the spoils taken. As the Horde left no internal documentation or even chronicles [Halperin, 2000], it is not clear whether the Horde controlled the competition between Moscow and Tver in the 14th century in order to weaken the opposition of Rus' towards the

V. Smirnov. Prince Mikhail of Chernigov. 1883.
Tretyakov gallery

government of the Horde, or merely minimised the threat to the khan's government in reaction to internal political events in Rus'. Moscow did not owe its greatness to the Golden Horde, but at first it successfully used its ties with the Horde, and then obtained the approval of the people for opposition to its rule.

In the period of the Golden Horde there is no evidence of significant borrowing of the Horde's political and administrative structures by Rus'. For example, the Russian *Boyar Duma* was not an imitation of the Horde's *divan*, which consisted of four *ulusbeks*. The local and the city Russian governors (*namestniks* and *volost* leaders) did not copy the division of responsibility between military and civil functions from the Horde, partly because there was no such division in the Horde [Halperin, 2000].

In the social aspect, Rus' had much opportunity to get acquainted with the people of the Horde, their customs and life, often unintentionally or under pressure, when princes, craftsmen, slaves, and clerics visited the Horde. Apparently, there were few Tatar rulers in Rus'. Although in the 13th and the early 14th centuries interethnic marriages between Russian princes and Ching-

gisid princesses took place on occasion, for example, in the cases of Prince Gleb Vasilkovich of Rostov, Fyodor Chorni of Smolensk and Yaroslavl, or Yury Danilovich of Moscow, and some Tatars assimilated into Rus' and adopted a new religion, most likely these cases were rare. Some recorded cases could have been invented, for example, the conversion of Tsarevitch Peter in the 14th century. Although the author of his biography was well-informed about saints of Chinggisid blood, it may be that the story is fictitious [Halperin, 1975]. The Tatar founders of Russian clans of boyars such as the Godunovs and the Glinskys, who entered Russian service in the same period, are also probably legendary. Certainly, the Russian princes and aristocrats in the 13–14th centuries shared the affection of the Tatar elite for hunting and crude chivalry, as is shown by actions attributed to Batu towards the Russian epic hero Yevpati during the siege of Ryazan in 1237 and the description of the fleeing, defeated Tatars in the epic poem 'Zadonschina' about the battle of Kulikovo. The Horde's patronage of the Russian Orthodox Church undoubtedly made its contribution to the economic basis of the expansion of the church and especially monasticism in the 14th century. Tatar rule did not lead to moral degradation among the Russian people—at least none more significant than what occurred under the Rurikid dynasty [Halperin, 1985, pp. 104–119].

In the cultural aspect, mutual influence was limited by religious factors, especially after Islam became the official religion of the Horde during the rule of Öz Beg-khan in the early 14th century [Ibid., pp. 120–125]. The diverse and sophisticated high Islamic culture of the Jochid Ulus, science, Islamic theology, and law did not have any meaning or use in Rus', which ignored these aspects of the life of the Horde in their sources. However, the Russian Orthodox Church did borrow the Horde's artistic style, using precious metals, especially gold, for the decoration of the handwritten Gospel, icon frames, and church vestments and implements. However, Rus' had to gain an understanding of the cultural horizons of the Horde when carrying out orders to participate in military campaigns against the ilkhans in the Caucasus or sending troops to Yuan China. But

this was most likely passive observation of the parades of papal legates, Genoese and Venetian trade ambassadors, messengers of the Egyptian Mamluks and the Ilkhans of Iran, Central Asian merchants, and ulamas of the Horde.

Since the beginning of their expansion in Western Eurasia, the Mongols had been much more worried about the Kypchaks, a group of related, and thus dangerous, nomadic herdsman, than about Rus'. The Kypchak Turks formed the demographic basis of the Jochid Ulus and became a source of fierce opposition between the Ilkhans and the Egyptian Mamluks. They were also sent to China as part of 'ethnic' military units. The Turkisation of the Mongols is evidence of how much greater the influence of the Kypchaks was in the Golden Horde than in Rus' [Halperin, 1983a; 1985, pp. 21–32; 2000b].

The structure of Russian-Tatar interaction, but not its intensity or significance, changed after the collapse of the Golden Horde in the middle of the 15th century into a nomadic and still dangerous core, the Great Horde; the peripheral Kazan, Astrakhan, and Crimean khanates; the Kasimov khanate, which was a vassal of the Moscow state; and the nomadic Nogai Tatars. There was constant war, but the Russians achieved the so-called liberation from the Great Horde in 1480 only after they had concluded an alliance with Crimea. Crimea later started claiming the right of the only heir of the Golden Horde and continued to demand tribute and organise raids on the Russian State. However, trade also expanded in some respects; the Russian noble cavalry of the 16th century could not have existed without a great number of imported Nogai horses.

Only after the collapse of the Golden Horde, starting in the late 15th century, was there evidence of large-scale borrowing of institutions of the Horde, especially political institutions, by the Russians. The Russian State copied the Tatar organisation of a field army consisting of five divisions (the large regiment, the right and the left hand, the advance regiment, and the guard regiment), as well as Tatar armament, horse trappings, and possibly even Tatar tactics of conducting combat operations. The Russian mail service called 'yam' was borrowed from the Tatar model. Certainly, in relations with Eastern

states, the Russians imitated the Horde in diplomatic ceremonies and rituals. Taxation and coinage also owed much to Tatar influence—the Russians inherited from the Horde the terms for customs taxes (*tamga*), coinage (*denga*), and the treasury (*kaznachei*). It is difficult to define the scale of such institutional borrowing, because sometimes only the etymology of terms testifies to the Tatar source of Russian bureaucratic practice [Halperin, 1985, pp. 87–103].

However, even if Rus' learned respect for the Mongol 'Golden Clan' of the descendants of Chinggis Khan, and even if it continued demonstrating at least social respect for it for a long time, it did not acquire any notion of 'statehood' from the Horde, and the tsar of Moscow and all Rus', starting with Ivan IV, was not a Tatar khan. The ritual of the coronation of Ivan IV and the ceremonial of the court were Byzantine in origin. Despite mercenary Nogai flattery, Ivan IV traced back his origin from the mythical Ryurik to the equally mythical Prus, the brother of Augustus Caesar. The Russians allowed the Nogais to address Ivan IV as the 'white khan', but did not use this title themselves [Halperin, 2003]. After the conquest of Kazan and Astrakhan, Ivan IV declared that he had become the successor of their khans, but not that of the khans of the Golden Horde [Halperin, 2003]. The Russian State did not try to gather the Golden Horde, which would have required not only the invasion of Crimea, but also of Khwarezm and part of territories of the Balkans. The idea that Rus' was trying to revitalise the Mongol empire itself by relocating from the west to the east is nothing more than a Eurasian fallacy. The state of Muscovy was the main active and aggressive force in the steppe regions which once made up the Jochid Ulus, but that was never its original distinguishing feature.

After the founding of Kasimov, more and more Tatars moved to the Russian State. Tatars, at least, on behalf of the government, 'ruled' appanages inhabited by Orthodox Russians, although it is hard to determine whether the Tatar *tsars* and *tsareviches* were directly connected with their Russian-speaking Christian 'subjects' [Halperin, 1985, pp. 109–110].

Many Tatar aristocrats converted to the new faith, married women of the other faith, and

assimilated into the Russian aristocracy, but it is not clear how much their Tatar origin made a contribution to their subsequent identity or actions. But in the 16th century Tatar captives and immigrants could have been quite common in many parts of the Russian State, so ethno-social contacts continued to develop. Still, even baptised Tatar landowners remained socially detached within the borders of the Russian State as new converts, to say nothing of those who had preserved their own religion. Therefore, it was not the case that multi-ethnicity always contributed to cosmopolitanism. The significance of Tatar contingents and Tatar commanders in the Russian armies which invaded Livonia and Lithuania was exaggerated by the enemies of the Russians to make them look 'Asian' and 'Barbarian,' but their presence was evidence of the significant sociopolitical position of the Tatars in the Russian State.

With the development of a strong Russian anti-Islamic and anti-Tatar ideology in the mid-16th century, any potential for the cultural influence of the Tatars on the Russians became even weaker. With typical inconsistency, the Russian Orthodox Church simultaneously preached against unbelievers and requested financial and judicial immunities through *yarliqs* from the rulers of the Golden Horde to obviate attempts of the Muscovite rulers to take even greater government control over church lands and people. Assertions that the famous Cathedral of Vasily the Blessed owes its unique architecture to Eastern influence remain attractive but unproven. Knowledge of the Turkic bureaucratic language of the Horde on the part of Russian scribes (*dyaks*) was purely functional [*ibid.*, p. 92]. Only after the decline of the Golden Horde did Russian

authors manage to acquire a more indifferent attitude towards the history of the Horde, freely distributing fantasies about the defeat and death of a conqueror which had previously terrorised them [Halperin, 1983], although the elite's official respect for the Chinggisids was not affected by this literary freedom. Beginning from the time after the unrest (the Troubles or Time of Troubles) at the turn of the 17th century, the Russian State was turning more and more from the South and East to the West and North.

Of course, the Tatars were not responsible for the history of Rus' becoming more violent. The level of violence in medieval Rus' and Russia of the early New Era was never higher than anywhere else; it was typical for the respective periods in both Europe and Asia. Blaming the Tatars for an alleged 'downfall of morals' in Rus' smacks strongly of those racial, ethnic, and cultural prejudices which relegated 'Asiatics' to a lower level of civilisation. This is a subjective prejudice, not objective history [Halperin, 2005].

The complex and contradictory relations between the Golden Horde and Russian principalities cannot be completely understood, but must not be ignored. 240 years of interaction, from 1240 to 1480, are sufficient in themselves to affect the history of Rus', even leaving aside the post-Horde period, which must also be taken into consideration. All attempts to reduce this history to a simple formula of negative or positive influence are simplistic and false. More extensive research is necessary for the further analysis of this central characteristic peculiarity of the medieval history of Rus' and the history of Russia at the beginning of the New Era.

§ 2. Crimea in the system of the administrative organisation of the Golden Horde

Mark Kramarovsky

Questions about the structure of the ulus system of the Jochids and the history of statehood formation have been arousing interest for several decades. The division of the Jochid Ulus into two sections, the left and right wings,

can be traced back throughout the history of the Golden Horde.

The Crimea was a part of the right wing of the Golden Horde. The new city of Solkhat/Krym became its 'capital' [Kramarovsky, 1989,

pp. 141–157; 1997, pp. 101–106]. The name 'Solkhat' had fallen out of use by the end of the 14th century and was replaced by the name 'Krym'; after 1475 the name of the former capital was applied to the entire peninsula and its population: '*qırım halkı, qırım tatarları*' [Bartold, 1965, III, pp. 467–468]. It is significant that al-Qalqashandi, reflecting information from the latter half of the 14th century, divided the peninsula into the three districts, or '*tumens*' [Grigoriev, Frolova, 2002, pp. 286–287]. Only two purely Crimean districts were marked on the peninsula: Krym, situated in the southeast in the steppe part of the peninsula, and the 'country of the As' (Crimean Alanian) in the southwestern, mountainous part of the peninsula. The population of the city of Kerch and the adjoining steppes with the short ridges of the Parpach range, the main feature of the landscape of the Kerch peninsula, is assigned to the Azov tumen [Ibid., pp. 270, 287–288]. There is no doubt that the administrative division of the Golden Horde's Crimea, which was mostly stipulated by the ethnocultural peculiarities of the territories, reflected the traditional but changing gravitation of different political centers beyond it. Chersonesus, or Sary-Kerman, is mentioned by al-Qalqashandi as a provincial town which is 'smaller than Akcha-Kerman (*Akkerman, Moncastro* in Italian sources)' [Ibid., pp. 270–271, 289].

With the exception of the period of the Crimean khanate, Tavrida never constituted a united state institution in ancient times or in the Middle Ages. This stimulated various alliance vectors in the development of separate territories, as well as the uniqueness of their civilisation. The geopolitical position of the peninsula at the interface of the Great steppe, the Mediterranean Region and the Balkans was reflected in this historical phenomenon.

Several stages stand out in the Mongolian colonisation of Taurica, or Crimea. It began beyond the borders of the peninsula with the displacement of the Kipchaks of Kotyan from Dasht-i Kypchak, part of whom went to Hungary in autumn 1239, and continued with the pursuit of the Polovtsian Hordes, which retreated to Taurica in the year 635/1237–38 under pressure from military units led by three

Chinggisids—Shiban, Buchek, and Buri. The military operation itself, about which we know almost nothing, was only one incident in the grandiose seven-year European campaign of 1236–1242, as a result of which all the Great Steppe from the Irtysh to the Danube came under the power of the dynasty of the Jochids.

Taurica was already known to the Mongols after Subedei and Jebe's military expedition of May 1223. Three princes of royal blood undoubtedly headed the corps of ten thousand men each, but, as one can imagine, seniority belonged to Shiban. The horrors of the famine of 1236–1237 in East Crimea, caused by overpopulation due to the Kypchaks who had fled there for safety, had not been forgotten even one and a half decades later. William of Rubruck noted them in 1253 [Puteshestviya, 1957, p. 90]. In Taurica the activity of the Polovtsians, which did not exclude the presence of their Pecheneg predecessors, became noticeable starting in the last decade of the 11th century. In the period of Kypchak domination before the 1220s, its chief city, according to the report of Ibn al-Athir, was Sugdeya, that is, Sudak. According to archaeological evidence, in that period a Pecheneg-Polovtsian burial rite [Ajabin, 1991, pp. 3–4; 2003, p. 81] formed in the peninsula. Analysis of the burial rite of a late-nomadic necropolis at Yevpatoriya from the late 13–14th centuries showed that the Kypchaks continued to live in traditional pasturing places, and with the advent of the Mongols were getting accustomed to life under new conditions [Anokhin, 1991, pp. 6–8]. Judging from late eastern sources, in the 1260s Crimea belonged to Uran-Timur, the son of Tuqa(i)-Timur [Abul-Ghazi, 1906; Smirnov, 1887, pp. 47–48]. It is probably during his reign (around 1267) that the Genoese settlement of Kaffa appeared, which took the shape of a city in the 1270–80s, when the Genoese community headed by a consul received the status of a colony. Special privileges were granted to the Genoese for trade in Kaffa by Mengu-Timur (1267–1282), serving as a basis of Latin-Turkic interaction. There is good reason to think that the preferences granted by the Horde to the Republic of St. George were part of a sensible and broad trade policy on the part of Sarai.

The events of 1264 in Central Asia forced the khan of the Golden Horde to make two very important decisions: the Golden Horde seceded from the Mongol Empire and became involved in a long confrontation with Hulaguid Iran. The new political situation in Asia and the Middle East led the Golden Horde to enter into an alliance with Mamluk Egypt, which played a leading part in the preservation of the Abbasid Caliphate. From this perspective, it is during the reign of Berke that the external ties of the Golden Horde with the Islamic Levant acquired a bipolar character. Trade relations were also gradually being forged. Mediterranean and Black Sea trade depended on the ports of Crimea. Solkhat was the agent of the khanate's policy toward the Levant. In early spring of 1263 the embassy of Cairo to Berke Khan arrived in Crimea. In the port area of Sudak, they were greeted by the governor or Solkhat, Tayuk (Tabuk), who had post horses (*yulak*) at his disposal. Al-Mufaddal's compilation [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy, 1884, pp. 176, 192] attests to the fact that Sudak was administratively subordinate to Solkhat. Apparently, the governor of Solkhat and the chief of the district were one and the same person. At the same time, a day's journey northward from Solkhat into the steppes, the embassy reached the nomadic camp of the temnik Tukbuga, possibly the Emir of the Crimean tumen. Considering the nomenclature of officials in the yarliq of Mengü-Timur of 1270, one may presume that what we have before us are the primary figures in the region at that time, who could be called ulus princes. Among the addressees of the yarliq, such individuals belong to the second group of officials [Grigoriev, 1990, pp. 76–77].

Thus, the **first stage** of Jochid domination of Taurica (1240–1260s) was completed by structuring the land into the military, administrative and economic system of the Jochids. Crimea gradually transformed from an appendage of Dasht-i Kypchak into one of the notable centres of political and economic influence in an increasingly powerful centralised state. There exists an opinion that at this stage of the colonisation of the peninsula, only the steppes of South-East Crimea belonged to the

Jochids, while the mountainous area retained a certain independence, paying tribute to the Horde [Myts, 1991, p. 72]. This is based on the report of William of Rubruck that in the last ten days of May 1253 its city chiefs (*capitanos*), which had set out in the winter with gifts to Batu-Khan, had yet to return [Puteshestviya, 1957, p. 89]. Does this signify the establishment of special tribute relations, implying that the port city enjoyed a certain independence? Indeed, we know nothing about its leaders nor the targeted purpose of the collection. One can only assume this refers to the *tamga*, customs fees from merchant operations in the form of a percentage of profits. For a seaside centre, the mention of this type of tax does not seem unusual, but it could also have been intended for the great khan. The system for the collection of taxes and conscripts itself was still in the process of being established at this time. In the context of our assumptions, it is worth taking note of al-Qalqashandi's report about Ukek in the Volga Region being 'assigned' to Crimea [Grigoriev, Frolova, 2002, pp. 269, 286]. But from al-Muffadal's report we learn that by the end of the 13th century revenues from Sudak, which included trade duties, were already being divided between 'four Tatar kings' [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy, 1884, p. 195]. Apparently, one among them, along with Mengü-Timur, was Nogai, the legitimate ruler of the right wing of the Golden Horde. In this sense the claims of the temnik and de facto co-ruler (on the 'empire' of Nogai see: [Vernadsky, 1997, pp. 181–195, Myskov, 2003, pp. 112–139]) of at least three Golden Horde khans, from Tuda-Mengü to Tokhta, to a part of Sugdeya's income, as al-Muffadal reported, do not seem to be excessive. The major political actions of Nogai, who minted coins in his own name in Crimea with the legend 'The Just Khan Nukhai' (undated, but the tentative years of issue are 697 AH (1297/98) or 698 AH (1298/99), see: [Severov, 2002, pp. 76–79]), were aimed at turning the right wing of the Golden Horde into an independent state with its centre in Sakja/Isaccea. In such a scenario, Crimea was assigned the role of an eastern province oriented toward Nogai's capital on the Danube [Sbornik materialov, otnosyash-

hixsya k istorii Zolotoj Ordy, 1884, pp. 117, 161]. It is worth noting the similarity of the outline of the state tamga on the Hermitage GE coin No. 1308 (in combination with the solar symbol) and the Jochid tamga accompanied by the moon symbol on heraldic plates from Genoese Kaffa, which M. Balard dates to the 1270s [Balard, 1978, I, p. 118]. In the period from the last third of the 13th century and up to 1308, Kaffa tried to defend itself against the hordes with a moat and embankment with a wooden palisade. On the eve of Nogai's death, his grandson was collecting taxes, probably not only in Solkhat, for which he was killed [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 158]. The death of Ak-taja (according to other information, Karaja) was an indicator of the struggle of the ruling elites for the increasing income from the Levant trade. According to the information of Ibn Khaldun, Karaja was sent to Crimea to seize profits [ibid., p. 382]. Most likely, Karaja expressed claims to the collection of an aggregate tax [Grigoriev, 1990, pp. 78–79], which has already been earmarked for Sarai. We view the series of harsh repressions in 1297–1298 in Crimea in the same light, although the motive of Nogai's personal revenge for the death of his grandson, in addition to a lack of trust in his emirs, is obvious. It may be that in Crimea the same alliances were at work as in the lower reaches of the Don in the autumn 1297 in the first open collision with Tokhta. Not only the market towns of the southeast suffered, such as Solkhat, Sudak, and Kaffa, but Mountain Crimea up to Kherson suffered as well. After this campaign, life died down in Töpe Kermen, Eski Kermen, Süyren, İsar Kaya, and ancient fortresses and urban settlements [Jakobson, 1959, pp. 232–233; Myts, 1991, p. 73]. At this time, apparently, Sudak and Aluston lost their defensive walls. It would be incorrect to view Nogai's pillage of Kyrk-Yer (among another towns of Crimea) as an indirect expression of a certain 'Alanian' independence from the Golden Horde that extended to the end of the era of Öz Beg-khan [Herzen, Mogarichev, 1993, p. 56]. The question of Jochid sovereignization of territorial formations in Taurica was settled under Batu-Khan, as has already been

noted. Even the possible local minting of scyphate copper coins with the names of the despots Manuel and Andronikos, issued around the 1240–60s [Korshenko, 1998, pp. 48–49], is not too weighty an argument in favour of the independence of Mangup-Theodoro, since the Golden Horde's coin minting was only just starting. At the same time, the level of vassalage of local formations within the peninsula was determined by the real state of affairs in Sarai itself. And so the Nogai pillage of Crimea is a result of the struggle of competing elites for control over a part of revenues from individual provinces in a period of factual diarchy. Nogai's death in battle near Kukanlyk (699 AH, 1299/1300) put an end to this.

The **second stage** of the development of the Crimean ulus (mid-1260s–late 1290s) turned out to be poor in symbolic events. However, a few may be pointed out. First of all, in the story of the first Egyptian diplomatic mission to Berke Khan (1263), Solkhat-Krym is described as a settlement (*karya*) where the khan's governor, the Kypchak Tayuk (Tabuk), lived. In the historical chronicle of the Seljuks of Rum, the placename 'Solkhat' has five written forms, one of which is identical that on coins: Solkhat. Puls with the placename 'Solkhat' and the name of Tokhta were coined in situ and were first found during excavations of an archaeological expedition from the Hermitage Museum [Kramarovskiy, 1991, p. 66]. A mint had been operating since 665 AH (1266/67) in the village where the ambassadors were staying, and dirhams of the common Jochid standard were being coined. The Sultan of Konya, Izz al-Din Kaikawus II, was delivered by temnik Nogay to Crimea with his family and suite under Berke. According to the chronicles of Ibn Bibi, the captive of Michael VIII Palaeologos received 'Solkhad and Sutak' as *ikta* (sustenance) [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1941, p. 26]. Most likely these events took place in 1265. The fief belonged to Izz al-Din for almost fifteen years, and for a short time after his death in exile in 678/1279–80 it passed to his son Giyath al-Din Masud. Along with the Sultan of Konya, part of the population, believed by P. Wittek to be Gagauzian Turks [Wittek, 1952, pp. 639–668],

came from Dobruja to the valleys of Eastern Crimea. However, long before him this theory was expressed by F. Brun and supported by V. Smirnov, who considered the Turkic horde of Sarah Saltyk to be nomadic in its way of life and Islamised by confession [Smirnov, 1887, pp. 16–17]. The main achievement, however, was the establishment of an Islamic community (with a district mosque starting in 1263) in the regional centre. This is not a random event for the time of a Muslim khan's reign. The Islamic community made it possible to ensure that multiconfessional Solkhat could fulfill a very important task—the establishment of ambassadorial ties with Mamluk Egypt. Beginning with the time of Berke's reign, the exchange of embassies and diplomatic messages with Egypt became the norm [Spuler, 1965, pp. 346–361].

Solkhat-Krym became the primary point of 'diplomatic transit'. Ultimately, the governors of Jochid Crimea received the right to correspond independently with the Mamluks [Zakirov, 1966, p. 123]. A special form of business letter was established for Solkhat in Cairo [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 413]. Twenty-five years after the embassy of 1287, Sultan Qalawun al-Alfi sent two thousand dinars to Solkhat for the construction of a Friday mosque and a stone-cutter to decorate the portal with an inscription with his name [Polyak, 1964, Note 100]. In the late 1290s control over the Crimean ulus passed to Tokhta. The final act of achieving a new unity of power with regard to Crimea was Tokhta's punitive action against Kaffa became. Details about it can be found in Arabic sources [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, pp. 120, 162].

The reign of Öz Beg (1312–1342) and his successors, his sons Tini Beg (1342) and Jani Beg (1342–1357), make up the **third stage** of the development of Crimea under the Horde, characterised by its prosperity.

In this period the Jochid administration of Solkhat was headed by Tyulek-Timur (1300–1341), who was not the most vivid representative of the Islamic 'party of power,' but he was a relative of Öz Beg. Tyulek-Timur was a comrade of Nogai who joined Tokhta in 1300. A year after the Muslim khan was confirmed

at Sarai, a mosque with the name of Öz Beg was erected in Solkhat [Kramarovsky, 1990, pp. 124–127]. In the years of Tyulek-Timur's administration, the armies of Solkhat ravaged Christian Sugdeya three times: in 1322, 1327, and 1328. The devastation of Roman-Catholic parishes in 1322 caused the pope to address Öz Beg, asking him to restore neglected churches. In 1334 Ibn Battuta found in Sugdeya only a few families of Greek craftsmen. However, based on finding the remains of a copper workshop in the craftsmens' quarter in the same layer as coins of the khans Tokhta and Öz Beg [Dzhanov, 2001, pp. 151–152], the life of the quarter continued even in the early 14th century. The strict administration of Tyulek-Timur, combined with the encouragement of Islamic charity by his wife, Injibek-khatun, who funded the construction of a magnificent madrasah in the mid-1330s in Solkhat, gives us reason to consider the first half of the 14th century to be one of the peaks in the development of a Golden Horde city in Crimea. It is significant that it is during this period that Solkhat-Krym grew from a settlement into a city, as noted by Ibn Battuta, who visited it in 1334 [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 280]. The ascension of Öz Beg to the throne laid the foundation for the development of Islamic institutions in both the Volga capital Sarai and in Crimea. Islamic clergy (headed by *sayyids*, descendants of the Prophet) received a number of privileges, including plots of land and waqfs ([DeWeese, 1994, pp. 90–142]; for a review of DeWeese's work, see: [Arslanova, 2001]). It became a sign of good manners to emphasise the authorities' favour towards *qadis* and *fuqihs* (lawyers) [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 291]; in addition to these, there were also Turkic sheikhs, or *yarguches*, who heard court cases on the basis of Yasa. Sufi sheikhs occupied a noticeable place in urban life. It is no accident that Crimean sheikhs and Sufis received the right to additional privileges in the form of free services and products in accordance with Mengli-Giray's *yarliq* of 1453. Tyulek-Timur could rely on the support of the *qadiyat*. Eight *yarguches*, headed by an *amir yargu* appointed by the khan, heard civil cases in the local court

Portal (on the left) and mihrab (on the right) of Öz Beg's mosque. Reconstruction

[Gryekov, Yakubovsky, 1950, pp. 135–137]. But the importance of the sharia court was great as well. That is why the interaction between civil authorities and Islamic theologians was accorded such great significance. For example, in Solkhat, emir Tyulek-Timur shared judicial authority not only with Hanafi Shams ad-Din as-Saili, the chief qadi of the city, but also with the Shafi'i qadi Khyzr. At the same time, Shafi'i imam Abu Bakr occupied the theological pulpit in the cathedral mosque of Solkhat [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy, 1884, p. 281] The potential of the Islamic community of Solkhat turned out to be so high that in 1382–1385 one more Friday mosque measuring more than 250 sq. m was built [Kramarovsky, 1989, p. 149]. The erection of a mosque in the ancient settlement of Chufut-Kale in 1346 [Akchokrakly, 1928, pp. 172–178] eloquently testifies to the successful Islamisation of mountain Crimea.

One of characteristics of the development of Islamic Solkhat is that it owes its achievements to the era of Öz Beg-khan. It was confirmed in an unusual way by the structure of a treasury of coins consisting of 608 dirhams, discovered

during the excavation of a madrassa in Solkhat in 1983 [Kramarovsky, 1984, Severova, 1990; 2000, p. 77]. The treasury contained coins dated from 710 to 778 AH of ten khans, beginning with Tokhta and ending with Muhammad-Bulak, made at six mints: Sarai, Sarai al-Jadid, Krym al-Makhrusa, Gulistan, Orda, and Majar al-Jadid. 63.8% of them (388 coins) were minted in the period of Öz Beg's reign. But the most remarkable thing is that there are counterstamps on 265 of the coins of Öz Beg dated 720 AH, produced in the mint in Krym al-Mahrusa, which enabled their circulation throughout the 14th century and in the first quarter of the 15th century. This means that the mint in Crimea did not issue silver coins between 720 and 782 AH. During these decades in Solkhat they were replaced with old issues with counterstamps in the form of the word 'khan' or a trident-shaped tamga with a top shaped like a bird's head, or in the form of a Genoese portal.

Thanks to the report of Ibn Batutta, we know that the cities of Krym and Azak were connected by a well-established road with 18 way stations. The ritual of hospitality demonstrated by the ruler of Azak, Muhammad al-Khwarezmi,

to the ruler of the Crimea is evidence of the seniority of Tyulek-Timur [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 285], whose area of responsibility also included part of the Azov Sea Region. The travelling suite of the Crimean governor, which sheds some light on the structure of the regional Islamic elite, consisted of 8 people. Besides his brother and two sons, it included *imam* Sa'ad ad-Din, *preacher* Abu Bakr, *qadi* Shams ad-Din, *lawyer* Sharaf ad-Din, and *muarrif* Ala ad-Din [Ibid., p. 282]. The Islamic entourage of the emir of Azak was represented only by *qadis* and *talibs*, who were joined by Quran readers, or *mukri*, after the official dinner.

For Crimea, the period of Jani Beg's reign began with a conflict with Genoese Kaffa (1344). The reasons are the same—the struggle for the aggregate tax. This conflict was a link in the systemic approach of the central administration to the trading posts of the Latins on territories of the Jochid Ulus. This can be observed by considering the example of neighbouring Azak. In 1343 Jani Beg renewed his father's *yarliq* allowing the activity of the Venetians of Tana (on the condition that they pay a 3% trade tax to the khan's treasury). In 1343 Jani Beg drove all the Latin merchants out of Azak; four years later the Venetians were allowed to return to their quarter. The 1348–1349 pandemic and the war between the Venetians and the Genoese for the Black Sea Region in 1350–1355 caused a break in relations with the Latins. But the Milan peace (of 1355) led to the opposing parties give up sailing to Tana for three years. The imbalance of forces caused by the Milan agreement led to the reinforcement of the positions of Genoese Kaffa. In autumn 1355 the doge of Venice sent the embassy of Andrea Venerio to the Horde, asking to rent a bay in the Crimea to construct the port of Provato. Jani Beg immediately gave the Venetians a *yarliq* allowing them to establish a new Venetian trading post. By the end of 1355, the name of the *darugachi* of Solkhat tumen, Zain ad-Din Ramazan, had appeared in connection with the port of Provato, established as a Venetian consular centre (its Turkic name was *Yangishakhr*, 'New City') [Grigoriev and Grigoriev, 1997, pp. 149–154]. According to the data of

written sources, the trading post in Yangishakhr ceased to exist in about 1380 [Grigoriev, 1994, pp. 28–36]. It seems that Ramazan headed the Crimean ulus from 1349 to 1357, when he was replaced by Tyulek-Timur's son Kutlug-Timur after the confirmation of Berdi Beg (1357–1359). The name Kutlug-Timur was mentioned in the form of Cotolemur among the names of eight known Horde begs petitioning Jani Beg in 1342 for the Venetian merchants of Tana [Grigoriev and Grigoriev, 2002, pp. 68, 71]. Later the name of this ulusbek is found in some other documents: an order from Berdi Beg of 1358 and a notice from Kutlug-Timur himself addressed to the Venetian ambassadors the Khan, Giovanni Quirini and Francesco Bona, dating to the same year as the Jani Beg order [Ibid., pp. 158–191, 192–195, 209]. In 1358 Kutlug-Timur confirmed the rights of the Venetians to Provato bay (they had obtained the authorisation in 1356), and he provided the Venetians with access to Soldaia and Kaliyera (Kalitra) harbour. One can assume that the contacts of the Crimean governor with the Venetians were preserved in his personal treasury in the form of two dress belt sets made of gold and silver [Kramarovsky, 2001, pp. 144–145]. The period of Kutlug-Timur's rule in Crimea continued until the seizure of Sarai by Kildibek (1361/1362), because a *paiza* with his name was found in the above-mentioned treasury [Münküev, 1977, pp. 186–215]. Apparently, under him the Venetians were allowed to trade in Soldaia (1358) where they previously had not been admitted. Summing up our observations related to the third stage in the development of Crimea under the Golden Horde, one specific feature must be noted. In this period the khan's governors possessed broad powers concerning some areas of regional and international policy. The extension of regional authorities as a phenomenon evolves from the practice of the Volga capitals. One can agree with M. Safargaliev, who noted the amplification of the influence of local elites on decision-making in the headquarters of Öz Beg [Safargaliev, 1996, p. 367]. In Crimea the governors solved problems of war and peace themselves on the territory under their authority. For example, in regional wars with Sudak, they carried on cor-

respondence with Venetian legates, albeit with the khan's permission, but they influenced decisions about Provato; ultimately, they carried on independent correspondence with Cairo. No doubt the segmentation of authorities in the Crimean ulus, which was vividly reflected in the structure of military powers of the Horde fighting against Vytautas on the Blue Waters in 1362–1363, is a result of the end of the era of Jani Beg and Berdi Beg, when a new political institution, the principality of Theodoro, was being established in Crimea. The military campaign carried out by the three Crimean emirs, those of Solkhat, Kyrk-Yer, and Mangup [Myts, 2001, pp. 245–256], is rather evidence of their overestimating themselves than that of an offensive inter-regional policy (compare: [Herzen, Mogarichev, 1993, p. 56]). However, it is difficult to understand the logic of interpreting the Battle of Blue Waters as an event marking the liberation of the territory of Ukraine from dependency on the Horde [Ivakin, 2002, p. 108], because it only concerns Podolia, which as a result came under the control of Lithuanian Grand Prince Olgerd (1341–1377). Meanwhile, the protection of the Horde's interests in the Podolsk lands by Crimea only meant that the taxes from this district were going through the administration of the right wing of of the Jochids. Princes Hajji Bey and Dmitry were the emirs of Kyrk-Yer and Mangup, and experienced Kutlug-Buga was the ruler of Solkhat and the Crimean tumen. It may be that the campaign emir of Solkhat and Kutlug-Buga, who took up the position of Crimean governor in 1381, are the same person. In 1387 Kutlug-Buga, 'dominus Solcatensis', concluded a treaty with Kaffa on 12 August, where the government of Tokhtamysh (1380–1398) confirmed the terms of the agreement of 1382 [Basso, 1991, pp. 25–26].

One of the darkest stages in the history of Golden Horde Crimea is the **fourth stage** from the murder of Berdi Beg to the accession of Tokhtamysh (between 1359 and 1380). The central character of these two decades is ulug karachibek Mamai, Berdi Beg's son-in-law and one of his chief emirs [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 389]. It is customary to think

that the center of Mamai's ulus was the Kuchugur Ancient Town identified by V. Egorov as Shehr al-Jadid [Egorov, 1985, p. 85], which is 30 km to the south of Zaporozhye. Probably under him in the early 1360s the inhabitants of Mangup, sensitive to events in the Horde, started to work actively toward the reconstruction of Theodoro [Malitsky, 1933, p. 10; Herzen, 2001, pp. 170, 271]. The beginning of a protracted crisis in the Horde affected Crimea at once: in 1365 the Genoese seized Soldaia and 18 villages of the south coast [Vasilyev, 1936, pp. 177–182]; probably at this time the Venetian harbours Provato and Kaliyera became dependent on Kaffa. In essence, in the mid-1360s the Horde itself shifted to a defensive position in its relations with the Genoese. By the 1370s fortresses were being actively constructed in Soldaia, and one of the earliest construction plates dates to 1371 [Skrzinska, 1928, p. 107]. The internal crisis in the Horde proved to be so great that even the population of the 'capital', Solkhat, frightened by Mamai's coming, started building a defensive belt in the form of an outer moat and walls, according to an Armenian record from 1363 [Kramarovskiy, 1989, p. 144]. Judging by correspondence with the chancellery of the Egyptian sultan, Mamai had only firmly established himself in the Crimea by 773 AH (1371). According to G. Fedorov-Davydov, Crimea under Mamai was a 'possession of the *suyurgal* type' [Fedorov-Davydov, 1973, p. 136]. In October 1374, Mamai was solemnly received by the consul of Kaffa, and several months later the Genoese presented Mamai's ambassador with rich clothing [Balard, 1978, II, p. 457]. In 1375 Mamai restored Jochid control over 18 villages of Gothia [Ibid., p. 161]. The consolidation of the forces of the right wing by the beginning of 1377, the subordination of the North Caucasus in 1379, and the establishment of power in Hajji Tarkhan brought new allies into the camp of Mamai. The analysis of archaeological materials allows us to note the involvement of the Slavic-Turkic settlements of Dnieper Zaporozhye, where Genoese trading posts Tavan and Belozerka were created, in the sphere of economic interest of the Crimea [Ilyinsky, 1991, p. 27]. One tendency in the

life of Crimea under Mamai is the reinforcement of interaction with old rivals, including the Italians.

In the period from 1374 to 1381, the relations of Solkhat and Kaffa were fairly neutral. The consul of Kaffa attended to ruler of Solkhat, Aga-Muhammad, sending him gifts and letters through his officials. Close ties between Solkhat and Kaffa are confirmed by the presence of the vicar of Kaffa at a dinner with the son of the Solkhat darugha [Balard, 1978, II, p. 460], who would be captured by Timur after being wounded in the campaign of 1391 [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1941, pp. 115, 165]. The defeat dealt to the troops of the right wing of the Golden Horde by Dmitry Ivanovich of Moscow brought Mamai to friendly Kaffa very soon. Here in one of the markets he was killed between March and November 1381 [Balard, 1978, II, p. 458]. It is easy to guess that the anti-Mamai campaign was coming from Solkhat. Two groups of horde 'negotiators' headed by Cherkes Beg, who supported Mamai (in the end of 1380), and Ilyas, the son of Kutlug-Buga (1381), representing the interests of Tokhtamysh, opposed the inhabitants of Kaffa at 'Three Wells'. The terms of the treaty were not quite clear, but the removal of Mamai was doubtless one of its provisions. Kaffa gained control over Soldaia, 18 villages of the southern coast of Crimea (Gothia), and a new partnership with the Horde in exchange. Tokhtamysh appointed a new tax collector in Kaffa 'according to the old custom' and an official to administer the Kaffa Tatars. It is quite possible that Mamai's body was given to the community of adjacent Solkhat for burial. The fear of Tokhtamysh made the citizens, among whom were former adherents of the almighty beklaribek, to bury their patron according to the Islamic ritual outside the city, in the necropolis at the Genoese gate [Kramarovskiy, 1996, pp. 38–41]. Based on Tokhtamysh's yarliq of 1381, some territories in the Northern Azov Region [Grigoriev, 1981, pp. 126–136] were still subordinate to the Crimean tumen.

It is noteworthy that the mint of the Crimea was almost completely inactive throughout the fourth stage. I presume that this can be explained by the status of Solkhat-Krym as

a personal patrimony of Mamai. It is hard to imagine that beklaribek Mamai and his supposed father Kutlug-Buga, the former beklaribek in Jani Beg's government, were allowed to come to Solkhat-Krym as darughas. Moreover, Mamai and Kutlug-Buga were oriented towards different political forces. It is no accident that Tokhtamysh advanced the career of Kutlug-Buga in the Crimea after the death of Mamai until 1387.

The town did not obtain a single public building under Mamai, while its function as a trade intermediary in international trade remained constant, despite some turbulence. There is one more weighty reason for the deterioration of social life in these times of troubles; the struggle for political power weakened the state's financial system. That was especially noticeable after Tokhtamysh had occupied Sarai and Azak, the traditional centres of coin emissions. The population of the Black Sea Region did not have enough money, especially after the fateful day of 9 September 1380. During the last months of Mamai's life, the khan's administration tried to compensate for the shortage of coins by introducing golden *dangs*—'dangai aure' [Ponomarev, 2002, p. 116]. These coins, weighing more than 10 g, have not yet been discovered by archaeologists, but they are reflected in the documents of the Massaria Caffae [Ibid., Fig. 2. note 84].

The fifth stage is defined by the period from the reign of Tokhtamysh to that of Timur-Kutlug (from 1380 to 1400). Tokhtamysh entered the historiography of the Golden Horde as a unifier khan who restored the unity of the Jochid Ulus. Meanwhile, the state of Crimean under the Golden Horde depended more and more not only on the powers in Sarai, but on the relations of Solkhat with the territorial institutions of the peninsula, including Genoese Kaffa and Theodoro-Mangup. Under Tokhtamysh the inhabitants of Theodoro did not question the suzerainty of the Horde, judging by a building stone inscribed with name of the khan found in Mangup [Malitsky, 1933, pp. 5–8; Herzen, 2001, p. 261]. In 1381, the Venetians, who had been deprived of the opportunity to sail to Tana for two years according to the Turin treaty, again asserted their interests in Solkhat

Coins of Shadi Beg (806–807 AH). Kaffa

and Provato [Karpov, 1990, p. 72]. While in Solkhat attention was focused on the struggle between the faction of Tokhtamysh, which was gaining ground, and Mamai's weakening faction, the Genoese, concerned about the possibility of the Venetians becoming stronger in the Crimea, doubled the garrison of Soldaia, from 42 people in 1376 to 80 in 1381. In 1382 the garrison of Soldaia was reduced to 12 people (after the signing of the Peace of Turin), but in 1386 it had already increased again to 60 people [Balard, 1978, I, p. 461]. Ilyas, the son of Kutlug-Buga, who came to power in Solkhat in 1381/1382, failed to stop the crisis in relations between Solkhat and Kaffa, and 3 years later the opposing parties started an open confrontation. Kaffa was without a doubt better prepared for the war. Immediately after repairing fortification structures in the citadel (1381–1382), the consuls Jacopo Spinola (1383), Pietro Cazan (1384), and Benedetto Grimaldi (1385) started fundamental work on the construction of an outer defence area of the city [Ibid., p. 207]. Suffice it to say that by 1389 the fortified line of Kaffa's stone walls (which were up to 10 m high), including 8 towers, had reached a length of 5.2 km. The war of 1385–1387 [Basso, 1991, pp. 25–26] ended with the defeat of Solkhat, and on 15 May 1387 the Genoese celebrated its victory by giving out wine in the suburbs of Kaffa. On 12 August Ilyas signed a peace agreement with the Genoese confirming the terms of the agreement of 1382. The agreement was accompanied by a commitment to coin only full-valued dirhams. The Genoese reinforced their control over this area of the East Crimean coast with the construction of municipal castle near the village of Otuzy using funds from Kaffa's communal budget

[Bocharov, 2001, p. 90]. Tokhtamysh's failures in Transoxania and Khwarezm in 1388–1389 led to schism in the camp of the khan of the Golden Horde. In the autumn of the same year, Bek-Bulat, exiled from Sarai, fled to Crimea, where Tokhtamysh continued to pursue him. Ibn Khaldun also gave a report of the siege of Crimea, during which oglan Bulat was killed [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 393]. The victory of Tokhtamysh brought Emir Kutlug-Buga to Crimea as a governor. It is quite likely that under him one, of the most monumental mosques of the city, known as Baybars mosque, appeared in Solkhat (on the date of the erection of the mosque, see: [Kramarovsky, 1991, pp. 69–70, drawing - p. 128, Fig. 2]). We learn the name of the new governor from Tokhtamysh's yarliq of 10 September 1392 given to one of the Crimean aristocrats, Beg-Hajji, who was declared a 'free Tarkhan' [Samoylovich, 1927, pp. 141–142]. The wars against Timur in 1395–1396 brought Tokhtamysh and the Golden Horde in general to the brink of disaster. Coins minted in Crimea in 796 AH (1393/94) bore a legend saying 'The just sultan Tash-Timur-khan'. Timur's puppet Kuyurchak-oglan, Urus-khan's son, was ruling in Sarai at this time. Apparently, Tash-Timur's reign lasted until Timur's troops came to the Crimea immediately after a victory at the Terek in 1395: Ibn Duqmaq speaks of an 18-day siege of Kaffa by the troops of Timur [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 330], and Sharaf al-Din speaks of the burning of Azov [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1941, p. 180]. It is very likely the second son of Kutlug-Buga, Sinan (Dominus Sinan, Filius Chutlubei), was the governor of Solkhat in the

period of the shocks caused by Timur [Malinovsky, 1844, p. 512]. Almost all the information of Arab sources on Timur's devastation of Crimea comes from the reports of the Egyptian ambassador to Tokhtamysh, Emir Tulu-men Alishah, who was supposed to arrange the matter of a military alliance against Timur, which never came to fruition. Ibn al-Furat briefly stated, after reporting the news about Timur's campaign in the Crimea, that in 1396 Tokhtamysh's troops besieged Genoese Kaffa again [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 364]. This new attempt of Tokhtamysh to defend his right to the Crimean ulus allows us to single out one more stage, the **sixth** and last phase in the evolution of Crimea under the Golden Horde. In essence, at this time an independent horde was being formed on the peninsula which objectively played the role of a trigger and set up the separation of the Crimean ulus as an independent khanate under Hajji-Giray (1443). In fighting for Crimea, Tokhtamysh relied on the local nobility, like in 1392, particularly on Shirin bek Ruktemir-bey [Lashkov, 1895, p. 124]. His son-in-law Edigü and Temür Qutlugh were opponents of Tokhtamysh from the end of 1396 to the beginning of 1397. The struggle for the Crimea was started by Edigü with the siege of Kaffa in 799 AH (1396/97), as always happened during a transition in power [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1884, p. 531]. In the spring of 1397, Temür Qutlugh, the first khan of Edigü's pleiad, got the chance to guarantee Crimean Tatars his own preferences. In the yarliq of 27 April 1397, the new ruler satisfied the request for the tarkhanship of Mehmet, the son of Hajji-Bairam, along with his underage sons [Radloff, 1889, pp. 21, 31]. This refers to a family dynasty granted 'true tarkhanship' until 1397 in the days of the 'previous, deceased Sain-khan' (on the title 'Sain-khan' see: [Boyle, 2002, pp. 28–32]). The 1397 yarliq gives an idea not only of the property structure of the local landowning elite, not only the list of 'legal' taxes and the practice of 'extraordinary' duties, but also of the nomenclature of military, civil, and judicial bureaucrats, from the highest-ranking ones to market supervisors. The

indication of a traditionally large number of tarkhans in the 'Crimea and Kyrk-Yer region' is evidence that the privileges of *tarkhanship*, like the institution itself, mainly applied to the elite of the indigenous tumens, not to all the tax-paying population of Crimea.

Temür Qutlugh died shortly after the defeat of Vytautas on the Vorskla in 1399, and Edigü established the 'dummy' Shadi Beg Khan on the throne (1401–1407). Apparently, Edigü's power in Crimea was not absolute until after Tokhtamysh's death. Clavijo, without indicating dates, says that Tokhtamysh's son, operating from Kaffa, openly opposed his rule [Clavijo, 1990, p. 144]. Solkhat-Krym, which suffered damage during the campaign of Timur, failed to emerge from stagnation (according to Johannes de Galonifontibus, most of the town still was in ruins in the early 15th century) [Galonifontibus, 1980, p. 14]. From time representatives of either Tokhtamysh's son Jalal ad-Din (in 1410) or of Timur appeared; the latter was Temür Qutlugh's son and Edigü's son-in-law, who conquered Tana and forced Jalal ad-Din to flee to Vytautas (in 1411). In 1417 one of Tokhtamysh's sons, Jabbar Birdi, supported by Vytautas, fled to Crimea [Safargaliev, 1996, p. 444]. Chasing him, Edigü plundered Tana and soon was in the Crimea besieging Kaffa. A condition of the prolonged siege was the removal of Jabbar-Birdi from Crimea; the latter left for Lithuania.

After Edigü's death, the fate of Crimea ended up in the hands of Grand Prince Vytautas of Lithuania (1392–1430). With his approval and according to the agreed-upon position of the Shirin and Baryn clans, in late 1421 Ulugh Muhammed became the new khan of the Crimea; the latter subsequently became the founder of the first dynasty of the khans of Kazan [Khudyakov, 1996, p. 543; Khamidulin, 2002, pp. 127–131]; for an analysis of the geneology of Ulugh Muhammed see: [Iskhakov, 2002, pp. 63–74]). In the month of Dhu'l-Qa'dah (28 October–26 November) news of this event reached the court of Shahrukh, the ruler of the state of the Timurids [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1941, p. 196]. The following year (825 AH), ambassadors from Ulugh Muhammed

came to Shahrukh with gifts and were well received in Herat. When fighting for the throne against Khudaidat and Barak, Ulugh Muhammad relied on the support of Vytautas. After a short break he returned to the Crimea in 1425, and in 1426–1427 he subordinated Astrakhan and Bulgar, where he had coins minted in his name [Markov, 1896, p. 503]. In summer 1426 Crimea fell out from under the influence of Ulugh Muhammed for a while, and Devlet-Birdi established his base there.

In 1427 three khans were fighting for power in the Jochid Ulus: Ulugh Muhammad occupied the lands of Sarai, Crimea was occupied by Devlet-Birdi, and the eastern part bordering with lands of the Timurids was occupied by Barak [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy, 1884, p. 534]. By the spring of the next year Devlet-Birdi was dead. Al-Ayni reports that Ulugh Muhammad restored his control over the Crimea [Ibid.]. After Vytautas, Ulugh Muhammad's long-time patron, died in October 1430, his chances to consolidate his positions in Crimea diminished. The unstable situation was aggravated by a poorly thought out military campaign in Lithuania in 1431 and a break with the influential Shirin clan. As a result, in 1433 power in the Crimea was seized by Sayyid-Ahmad (1433–1435). Ulugh Muhammad had to leave Dasht-i Kypchak as well, where he yielded power to Kichi-Muhammad. According to al-Ayni, Kichi-Muhammad possessed not only Dasht, but also the Crimea starting in 874 AH (1443/44). Hacı Giray became Kichi-Muhammad's main opponent in the Crimea (around 1428–1456); he appeared on the political stage of Crimea during the period of Ulugh Muhammad's ascent. V. Bartold noted the contradictory character of information about the activity of 'Hacı Giray ibn Giyath al-Din ibn Tash Timur, the tsarevich from the Golden Horde' [Bartold, 1963–1977, V, p. 522]. M. Safargaliev convincingly illustrated the connection between Crimean affairs and the internecine feud of the Lithuanian princes Švitrigaila, supported by Ulugh Muhammad, and Sigismund, who patronized Hacı Giray [Safargaliev, 1996, pp. 491–492]. In Crimea itself he was supported by aristocratic clans which had been trying for a long time to

establish the independence of the peninsula for fear of losing their own privileges. But while in 1434 the activity of the influential Kungrat clan (in the first half of the 14th century they controlled the Kypchaks and Mangyts [Bregel, 1982, pp. 357–398]) was enough to overcome the separatist sentiments of the Shirin, Baryn, Argyn, and Kypchak clans, within a few decades this advantage disappeared... along with the Golden Horde itself. In Crimea the Shirins and Baryns were considered elders [Syroec-hkovskiy, 1940, p. 29; Manz, 1987, p. 286]. Since the time of Tokhtamysh these influential clans were noted in other regions of the Golden Horde. The identity of clan structures lies in the story of the *els* of Tokhtamysh, which is based on the data of the 'Chinggis-Name' by Ötemish Hajji (16th century) [Yudin, 1992, p. 115].

To define the political segmentation of Crimea under the Golden Horde more accurately on the eve of the disappearance of Ulugh ulus as a united state, we will examine the actions of Hacı Giray in the position of governor of Solkhat, representing the interests of the khan of the entire Horde, Ulugh Muhammad. In 1433 Hacı Giray was an ally of Prince Alexey of Mangup in opposition to the Kaffa commune. In that year the Greek community of Cembalo fortress, which was under the Gothic Captaincy, revolted, doubtlessly with Alexey's assent, and drove the Latins away [Vasilyev, 1936, pp. 203–208]. But the plans of the prince of Theodoro, who strove to gain access to sea, were doomed. In June the Kaffa commune called for a squadron from Pera headed by Bartolomeo di Levanto against the rebelling fortress. As the inhabitants of Theodoro managed to hold Cembalo, in March 1431 another squadron of 20 vessels headed by Admiral Carlo Lomellino was sent there from Genoa to regain Cembalo. In the beginning of July the rebellion was put down. The letter of the admiral from Kaffa to Genoa contains the following list of victories: Cembalo, Calamita, Brosoni and all Gothia (tota Gotia) [Agosto, 1977, pp. 514–515]. The inhabitants of Kaffa supposed that the citizens of Theodoro should be followed by Alexey's ally—Hacı Giray. The battle took place on 22 June near the village of Karagoz. The expeditionary detachment of Lo-

mellino numbering 10,000 infantrymen with a train of 700 wagons was attacked on the march by the cavalry of Hacı Giray and defeated; Lomellino was also killed ([*ibid.*, pp. 511–517]); Gatari's documents provide a different number of combatants [Colley, 1913, pp. 110–120]. According to the peace treaty of 13 July, the Genoese were obliged to remove their ships from the harbour, disarm two rowing galleys and one more ship, and pay Solkhat 100,000 aspers for 25 captive Latins [*Ibid.*, pp. 119–120]. In essence this is the last Horde victory in the Crimea. In the course of the 1434 campaign, the main political forces on the peninsula were clearly defined. The Tatars, the Theodorites, and Genoese Gothia headed by Kaffa were among them. None of them was a political monolith and each searched for support beyond the borders of not only the Crimea, but also of the Golden Horde. In autumn the victor of the battle of Karagoz had to leave the peninsula and seek refuge in Lithuania at the court of Sigismund. Crimea found itself temporarily in the hands of Sayyid-Ahmad, who relied on the support of the head of the Kungrat clan, Haidar-Murza ([Smirnov, 1887, p. 215]; the toponym Kungrat can be seen in Crimean judicial books of the 16th century, see [Inalzhik, 1996, pp. 319, 322]).

For our topic, it is important to emphasise that Sayyid-Ahmad and Hacı Giray were Crimean separatists who had no claim on participation in 'greater' Horde politics. The struggle of Ulugh Muhammad against Kichi-Muhammad finally ended in the separation of the Kazan khanate (in 1438 or 1445), where the power of the dynasty of Ulugh Muhammad was established, from the Golden Horde. Kichi-Muhammad remained in power in Dasht-i Kypchak. A Cairo chronicler, who was still well informed of Crimean affairs, reports that in 874 AH (1443–44) '...Muhammad-khan was the sovereign of the Crimea and Dasht' [Sbornik materialov, otnosyashixsya k istorii Zolotoj Ordy, 1884, p. 534]. It follows from the analysis of the report of Munajim-basha (17th century) of the building of Bakhchisaray by Ulugh Muhammad that the khan lived among the Shirins in Solkhat before he moved his residence to the new capital [Safargaliev, 1996,

p. 506]. The narrowness of social support of the new khan, who attracted such foreigners as the Mansur princes to Crimea, undoubtedly at the expense of the local Tatar elite, did not enable Ulugh Muhammad to consolidate his position on the peninsula. Having taken the Crimean throne from the hands of Grand Prince Kasimir of Lithuania in Vilno, Hacı Giray returned to rule in Perekop. Judging by the fact that in 1443 Hacı Giray was minting coins in Kyrk-Yer bearing the title 'Supreme sultan' [Markov, 1896, p. 583], the initiative to change power originated from the influential clan of the Yashlav (Sulesh) begs, probably taking into account the consolidated opinion of the Shirins, Baryns, and Argyns. Thus a new stage called the period of the Crimean Khanate started in Crimea.

Our analysis of the place of the Crimean ulus in the administrative-territorial system and partly in the political history of the right wing of the Golden Horde showed that one of the main functions of the central local authority was in creating a new area of Turkic-Latin-Byzantine contact controlled by Solkhat-Krym with two basic vectors of associations. The first one, mainly political, was aimed at Cairo. The second one, that of a trade intermediary, met the needs of Levantine and Latin trade [Fedorov-Davydov, 2001; Heller, 2002, pp. 113–120] up to the territories of Central Asia and China. The Latin possession Gazzaria, with its administrative centre in Genoese Kaffa, became its agent in the Mediterranean direction. This significant trade was secured with bars of silver of a two-hundred-gram standard, stores of which have also been found in the Crimea [Kramarovsky, 1980, pp. 68–71; 2001, pp. 86–88; Myts, Adaksina, 1999, pp. 159–169; Ponomarev 2002, pp. 102–116; Yemanov, 2003, pp. 129–130]. The formation of large savings led to the appearance of golden dinars from Northern India in treasuries of the Crimean nobility [Kramarovsky, 1983, p. 12; 1989, p. 153; 2001, p. 115, catalogue, No. 612–621]. In this sense the Crimean nobility acted in the same way as the elites of the Volga Region and the North Caucasus [Fedorov-Davydov, 1978, pp. 253–254; Rtveladze, 1972, pp. 69–71; Volkov, 2001, pp. 109–113]. The traces of Lat-

in and Byzantine trade in cities of the Crimea (Solkhat, Soldaia, Kherson) and the Azov Sea Region (Azak-Tana) can be seen in discoveries of gold Venetian ducats, silver dinars and quartari of Genoa, and gold and silver Byzantine coins [Kramarovsky, 1989, pp. 152–153; Frondzhulo, 1974, p. 147; Fomichev, 2001, pp. 40–41; 2003, pp. 93–94; Slepova, 2001, pp. 112–114].

Until the middle of the 15th century, despite the defeat in the war of 1385–1386, real power in the Crimea belonged to Solkhat. At the same time, Solkhat-Krym relied more on the power of money than on military power, as the mint of Krym had a monopoly on the regional issue of national denominations. In the latter half of the 13th century, the emissions of the Krym mint met the trade needs of the entire North-West Black Sea area (up to the mouth of the Danube). The monetary circulation of Azak-Tana depended on Solkhat-Krym until the first quarter of the 14th century. Therefore, based on the dynamics of growth of mints in the region, one can distinguish three stages in the life of the western contact area. In the first, from the 1260s to the early 14th century, the emission of coinage took place in Solkhat-Krym. In the second, from the first quarter of the 14th century to the early 1450s, coins were being produced in Krym and Azak (on Azak coinage see: [Fomichev, 1981]). The third was from the middle of the 1420s to the collapse of Kaffa in 1475. In this period the Latin possessions of the

Northern Black Sea Region gradually came out from under the monetary control of the Golden Horde khans and started minting their own coins. The mint of Genoese Kaffa was founded not earlier than 1453, in the period when Genoese Gazzaria was again subordinated to the Bank of St. George, although starting in the 1420s a two-language denomination with the tamga of the Golden Horde had become widespread here. The coin findings of recent years revealed a group of non-dated silver dirhams coined on behalf of khan Devlet-Birdi after 825 AH by the Kafa al-Jadid mint. Apparently, initially the dies for the new mint were cut by the masters of Solkhat-Krym. One might suppose that in Kaffa Devlet-Birdi was supported by the community of the northern suburb of the city known as Shor Bazar [Kniga Puteshestviy, 1999, p. 94]. Apparently, the first Genoese-Tatar coins with the name of Bek Sufi were also made here several years earlier. Most likely Cairo's trading post was located on the territory of this suburb as well. Starting in 1433 coins with the tamga of the Girays were being made in Kaffa, but in 1453 the image of St. George replaced the Genoese portal. This only confirms the fact that even under Edigu the Crimea was only nominally an integral part of the Golden Horde. The interference of Vytautas in the affairs of the right wing of the Jochids created the objective conditions for the transformation of the Crimean ulus into an independent political institution.

§ 3. The Bulgar Ulus: Bulgar and other emirates

Iskander Izmaylov

The formation and flourishing of the Bulgar Ulus from the late 13th to the mid-14th centuries. The Bulgar emirate showed the longest and fiercest resistance to Batu-khan's troops. But in the end the Bulgars were defeated, and all their major towns and fortresses were seized or surrendered. The territory of the former Volga Bulgaria became an integral part of the possessions of Batu-khan and was completely integrated into the Jochid Ulus.

Giovanni da Pian del Carpine named Bulgaria among the countries conquered by the Mongols in his report, but he did not specify the degree of its dependence [Puteshestviya, 1957, pp. 57, 72]. William of Rubruck also mentioned Great Bulgaria in enumerating countries subordinate to the Mongols, and then he listed it among the lands subordinate to Batu's son Sartaq [Ibid., pp. 111, 117–119, 123, etc.]. Oriental sources testify to the same. For example, the Persian historian Juzjani, who was a con-

temporary of these events, wrote in his story 'Tabaqat-i Nasiri' (1259) that 'all the lands of Turkestan (beginning with Khwarezm), and the Bulgars, Burtases, and Saqaliba up to the boundaries of Rum' fell under the power of Batu [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy, 1941, p. 15]. This information becomes traditional in later sources. For example, the 'History of Wassaf' (early 14th century) says that Jochi came into the possession of 'lands from the edge of Kayalyk and Khwarezm and the limits of Saqsin and Bulgar to the edges of Derbent of Baku' [Ibid., p. 80].

While the fact of the subordination of the lands of the former Bulgaria is beyond doubt, the character of the hierarchy of local authorities and the role of the Bulgarian tradition of statehood in this process is still under discussion. There are several points of view on this problem. Some historians believe that the territory of former Bulgarian emirate was integrated into the Mongol Empire while having a certain autonomy, like that of ancient Russian princedoms [Smirnov, 1963, p. 67; Gimadi, 1948, p. 197; Fakhruddinov, 1984, pp. 111–112; Khalikov, 1994, pp. 51–57; Mukhametshin, 1994, p. 101; Khamidullin, 2002, p. 97]. Others claim that these lands were turned into 'an integral part of the Golden Horde without any hints of autonomy' [Egorov, 1985, p. 44]. This problem is hard to solve because of the insufficient resource base and the conceptual blurriness of many historical realities.

When reconstructing the political and administrative situation in conquered Bulgaria, historians usually turn to the 'Life of Fyodor Yaroslavsky.' One of its variants, which is part of the Great Menaion Reader, says: 'Russian princes and Bulgars started going to the Horde to their superior tsar to ask the tsar to enthrone them' [Great Menaion Reader, 1869, columns 1263–1265]. It seems that this fragment of the extensive biography of the prince of Yaroslavl and Smolensk, an active participant of military and political events in Rus' and the North Caucasus in 1276–1299, grants us the opportunity not only to correlate the practice of princes receiving investiture to reign from the khan's hands, but also to reconstruct the political and administrative system of power in Bulgaria

after its conquest, which in this case seems to be separate principalities possessing a certain autonomy or vassalage within the Jochid Ulus. Russian and Soviet historians held this point of view until the 1950s [Shpilevsky, 1877, p. 162; Gimadi, 1948, p. 197; Smirnov, 1951, p. 54]. But this position was questioned by M. Safargaliev, who believed that 'a careful examination of the text of the 'Life' does not give us an affirmative answer to the question of the possibility of a vassal Bulgar principality on the Kama... Apparently, the 'Life' is referring to the Danube Bulgars' [Safargaliev, 1951, p. 78; 1960, p. 38]. This question was reexamined by G. Fedorov-Davydov, who believed that this fragment referred precisely to Volga Bulgaria, which consisted of principalities which were vassals of the khans of the Jochid Ulus [Fedorov-Davydov, 1973, p. 27, Note 3]. The authority of his research was so high that almost all historians and archaeologists used this fragment to characterise Bulgaria of the latter half of the 13th century (for example, see: [Fakhruddinov, 1984, pp. 103–105; Khalikov, 1994, pp. 54–56; Alishev, 1995, p. 188; Khamidullin, 2002, pp. 98–99]).

However, the problem is not which 'Bulgarians' this fragment refers to, because in the context it clearly refers to the Volga Bulgars. Rather, the problem is whether we can consider this story from the Menaion, as well as the text of the Life from the Book of Degrees, a historical source on the history of the latter half of the 13th century [Polnoe sobranie russkix letopisej, 21, pp. 307–314; Kloss, 2001, pp. 311–319]. The analysis of the history of the text of this Life conducted by B. Kloss shows there are no reasonable grounds for that. His main conclusion: 'an examination of manuscript repositories showed that there were no biographical texts dedicated to Fyodor Yaroslavsky until 1463' [Kloss, 2001, p. 252]. At the same time, the earliest versions of the Life (a brief one was created in 1467, and an extensive one in the 1470s) contain no details about the stormy life of this prince or about Bulgaria (see: [Ibid., pp. 252–274]). Even the next, fairly lengthy version of the Life, edited by Andrey Yuryev and composed between 1470–1492 (the oldest copy dates from 1515), also contains virtual-

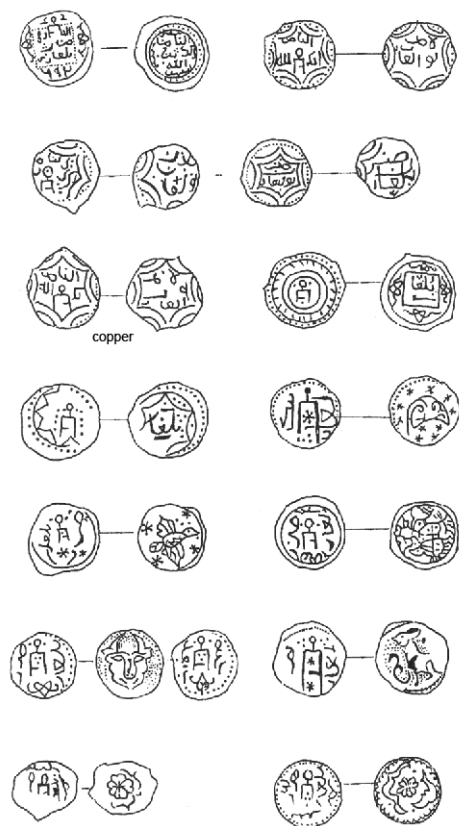

ly no historical realities, except for an indication that Satan, having entered into the eastern tsar Batu, sent him against the Russian lands 'for our sins' (see: [Ibid., pp. 275–284]). The next stage of the development of the text was Anthony's version, apparently composed in 1505–1520s, an abbreviated form of which was included in the Great Menaion for September [Ibid., pp. 289–306, Great Menaion Reader, 1869, columns 1255–1261]. But no 'Bulgar realities' were found in this text either. Indications of Bulgarian princes who supposedly went together with the Russians to receive yarliqs and the theme of Prince Fedor Rostislavovich's participation in a campaign against Bulgaria on the orders of Mengu-Timur appeared, as well as the unique news about this prince's marriage to the khan's daughter, who adopted Orthodoxy, and their later receipt of 36 cities, including Chernigov, Bulgar, Kuman, Korsun, Tura, Kazan, Aresk, Gormir, Balamaty, etc., as a dowry. All this news can be read only in the text of the Life written for the Great Menaion Reader, composed by Metropolitan Macarius in connection with the canonisation council of 1547. If one keeps in mind the historical background of this council and the ideological preparation for the conquest of Kazan which was expressed in the editing of the chronicle collection (the Nikon Chronicle) in order to present proofs of the 'age-old rights' of Russian princes to the lands of the Kazan Khanate, the reason for mentioning the Bulgars and the dowry in the form of Bulgarian cities (Bulgar, Kazan, Arsk, Tura, etc.) in this version of the Life is clear. It is quite evident that it is not a rendering of annalistic or even oral tradition, but just one more politically relevant imperial proclamation composed by Macarius to justify the legitimacy of the conquest of the Kazan Khanate. Furthermore, in the version of the Book of Degrees created around 1563, the Bulgars themselves disappeared, and only the Bulgarian cities given as a wedding gift of the khan to Prince Fyodor Yaroslavsky remain [Kloss, 2001, pp. 310–319; Polnoe sobranie russkix letopisej, 21, pp. 307–314]. The phrase about participation of the prince of Yaroslavl in the campaign against Bulgaria as a part of Mengu-Timur's troops disappeared in this ver-

NM RT (according to A. Singatullina)

sion as well. Thus, the argument about which Bulgars went to receive yarliqs is completely irrelevant. This mention is not part of a narration about real events, but rather a piece of ideological rhetoric from the mid-16th century reflecting only the notions of church and state historiography about the past. In essence it is an extrapolation of the current and future policy of the 'Chosen Rada' of young tsar Ivan IV onto the past, and does not contain any historical realities at all relating to the 13th century, except for vague memories of the 'conquest of Batu.' On this basis, the campaign of Khan Mengu-Timur against Bulgaria decidedly cannot be considered a historical fact either.

Authentic sources provide very poor and incomplete information about the historical processes which occurred in the latter half of the 13th century in the Middle Volga Region. But there are grounds to believe that the Volga Region was not just the centre of the empire of the Jochids, but the demesne holding of the

The 13th century. NM RT
(according to A. Singatullina)

khans. And by all appearances Bulgar became a seasonal capital of Batu-khan. For example, the Polo brothers, who were in the Jochid Ulus in 1250, said that they had 'come to Berke-khan, who ruled the Tatars and lived in Bulgar and Sarai' [Kniga Marko Polo, 1990, p. 39]. According to their data, there was a road leading from the Crimean port Soldaia (Solkhat) in the Black Sea Region, through Bulgar, and down the Volga to Sarai via Ukek [Ibid.]. William of Rubruck testifies to this as well; heading to the court of the great khan, he crossed the Volga not far from Ukek, where in August 1253 he saw Batu's headquarters. At the same time, he mentioned that the court of Batu-khan made seasonal movements from the south to the north: from January to August the khan himself and all the rest headed to cold countries, and in August they started to return. Thus, in the summer Batu and his headquarters were to be found in Bulgaria [Puteshestviya, 1957, p. 118].

The absence of any kind of autonomy and the full subordination of Bulgaria to Batu-khan, and not the great khan, is confirmed by the absence in our sources of any mention of Bulgars at the court of the great khan, while Russians, Armenians, Ases, and others were mentioned in passing. That leads us to believe that the lands of Bulgaria were only subordinate to the Jochids and became a part of their personal ulus. Clearly, a whole range of circumstances contributed to this state of affairs. First, long and persistent resistance against the Mongolian conquest made this land potentially disloyal to the power of the khan and required regular demonstration of the might of the new power. It is possible that the ruling dynasty and aristocracy to a great extent were simply annihilated during the uncompromising struggle against the conquerors. Second, as the lands of the former Bulgar emirate were virtually the most economically developed region of the empire, Batu did not want to share his income with the other Chinggisids. Third, traditional ties between Bulgaria and the Lower Volga Region and convenient water routes along the Volga made the Middle Volga Region an organic part and the backbone of the new Jochid empire.

As to the name of this country, it should be mentioned that by historical tradition, set down in the written literature, it was all called 'Bulgaria'—'the land of the Bulgars' of the Russian chronicles. But it does not follow from this that it preserved any traditions of pre-Mongol statehood. Obviously, it would be more accurate to call Volga Bulgaria as a part of the Golden Horde the 'Bulgar Ulus', as this term definitely more accurately reflects the administrative Turkic-Mongolian system in the Middle Volga Region in the 13th and 14th centuries. One must probably also understand the use of this term in eastern literature even later, up to the end of the 16th century, as a reflection of this tradition. In the late sources of the 14–16th centuries this administrative unit was also called a *vilayet* (possession). In particular, the term 'Bulgarian vilayet' with respect to the khanate of Kazan of the 16th century is mentioned in the composition 'Zafar Name-i vilaiyati Kazan' by S. Hajjitarhani (1550), which contains the expressions 'Kazan, which is the capital of the

Bulgarian vilayet,' and 'ruler of the Bulgarian region' [Hajjiitarkhani, 1997, pp. 77, 81]. But this term can be hardly considered a 'parallel name of the khanate of Kazan' [Iskhakov, 2004, pp. 9–10]. First, here we are dealing with an ancient literary tradition, a canon of sorts. Second, the very concept of a 'vilayet'/'possession' is not noted in the Tatar tradition and is of Seljuk origin (since the poem itself was written for Suleyman Kanuni and obviously was copied in Turkey, such terms could appear in it). And third, in the diplomatic correspondence from the Kazan khans to Muscovy and the Rzeczpospolita, the self-designation 'Kingdom of Kazan'—that is, the khanate of Kazan, since it was ruled by khans—was recorded, albeit in translation. As for the 'Bulgar' terminology, one more obvious source is Kazan's historical tradition itself, which aimed to 'root' its power in the region [Izmaylov, 2006, pp. 99–128]. Therefore, the possession which emerged on the basis of the land of the former Bulgar emirate can be conditionally called the 'Bulgar Ulus' from the name of the chief town of this possession, Bulgar.

The minting of the Chinggisids' first coins in Eastern Europe in Bulgar also confirms this fact. At that time it was the first and only minting centre of the Jochid Ulus. The mint of Bulgar was unmatched in all the Volga Region in the amount of coins produced, surpassing even Sarai, the capital of the state [Mukhamadiyev, 1983, p. 43; Singatullina, 2003, p. 16]. This was determined by the fact that the Middle Volga Region had a dense, settled urban population, retail trade and currency were developed, and there was a need for monetary equivalents there [Mukhamadiyev, 1983, p. 43].

A specific feature of Jochid coining in Bulgar was the absence of dates and the names of Jochid khans. In their place were the names and dynastic signs of the khans Möngke and Arig-Buga, as well as coins produced with the name of the Caliph of Bagdad an-Nasir (1180–1225), who by that time was deceased. Copper coins of an-Nasir were also being recoined using new dies with the name and tamga of Möngke Khan [Singatullina, 2003, p. 16].

For a long while the existence of a considerable quantity of coins coined in the name of the

deceased Baghdad caliph an-Nasir was seen by some historians as a sign of a certain independence of the Bulgar Ulus or even 'disloyalty' to the Jochids. As the analysis of the Kazan numismatist A. Singatullina showed, this opinion is not confirmed by facts. First, for a long while the Bulgar mint was practically unique, serving the entire territory of the country, and was not an independent territorial or political unit. Second, these coins were minted on the instruction of the khans of the Jochid Ulus; therefore, this coinage was in keeping with their policy and did not reflect any regional interests. Third, the weight norms, the traditions of coinage, the range of weight norms, and other features of Bulgar coinage conformed not to their special rules, but to the tradition of the whole of the empire. All this leads us to presume that the Bulgar coins of the second half of the 13th century do not provide grounds to consider them symbols of some autonomous possession, despite the differences from those coined in Sarai. The differences as a whole did not go beyond the peculiarities of different mints and their die-making traditions [Ibid., pp. 16–40].

There is a conventional view in Soviet and Russian historiography that Bulgar archaeological culture did not go through any significant changes in the period of the Golden Horde, which was alleged to be evidence of full continuity of the population. It seems to us that in general that is true, but if we look at details, it will emerge that there were rather significant changes in the culture of the Middle Volga Region in the latter half of the 13th century.

Let us note only the most important differences. The structure of settlements went through serious changes. Old Bilyar declined, and Golden Horde Bilyar was erected at its outskirts; Valynskoye, Bogdashkinsk, Yulovskoye, and a whole range of other settlements ceased to exist. Judging by coins from the 13th to the first half of the 14th centuries, Bulgar (Bolgar al-Makhrusah, Bulgar al-Jadid) and Bilyar, as well as Mukhsa in the Mokhsa River Region, were the main urban centres of the Bulgar Ulus [Mukhamadiyev, 1983, pp. 11–19]. Bulgar, Suvar, and Bilyar were mentioned in epitaphs of the 13–14th centuries in takhalluses (pseudonyms) as a place of

birth or perhaps a historical region. Apparently mentioning Suvar and Bilyar was a tribute to a declining tradition, as they stopped being mentioned after the middle of the 14th century. There were many reasons for that, but the main ones are the decline of their political and economical influence, as well as the suppression of Bulgar historical tradition.

Other new centres were towns which had not previously been significant centres (Kazan, Yelabuga, Kashan, Djuketau, etc.); only Bulgar can be considered an exception to the rule in some sense. These new centres appeared as focuses of political power and tax collection, as well as of trade and various handicrafts (for example, Russkourmat, Bolshenyrsin, Bolshe-atryassk, Imenyev, Laishev, and other ancient settlements). As a rule, a concentration of Islamic cemeteries with headstones was found near them.

The size of the population and topography of villages abruptly changed (the population was reduced to one half to one third of the previous size). Such changes were usually considered to be the catastrophic consequences of the Mongol conquest. Currently, Russian archaeologists believe that the conquest itself was only a general background for significant cultural transformations in Eastern Europe in the 13th century [Makarov, 2003, pp. 5–11]. A decrease in the population in many long-settled areas took place in Volga Bulgaria as well as in Rus', and ancient settlements themselves had fewer buildings. The development of watersheds and outflow of population to new lands such as the Cis-Kama and Cis-Volga Regions, Iks-Belsk Interfluve, and the Moksha River basin occurred [Fakhrutdinov, 1975, pp. 50–78; Belorybkin, 2003, pp. 37–42]. Most likely this is connected with changes in the structure of power and a certain agricultural crisis in old farming areas in the 13th century. Only resettlement and internal colonisation contributed to relief from this crisis.

In any case, the similarity of the Bulgar and Golden Horde archaeological cultures is beyond question; changes are also significant. Although almost all household tools and objects were preserved, a significant impoverishment of the types and nomenclature of

items had occurred by the middle of the 14th century. The example of ceramics is extremely illustrative in this connection. In the 13th century it essentially continued its previous traditions, but differences in the shapes of the dishes, the technology of pottery ornamentation, and even stamping marks became increasingly noticeable. Kashin ceramics, which replaced plainer glazed dishes, represents the most striking contrast. But differences in the assortment, forms, and style of decoration of costumes were especially great. This primarily relates to the socially prestigious details of the costume which were subject to empire-wide fashions: decorations, belt sets, etc., which were under the greatest influence of changing ethnosocial fashion.

The population of the Middle Volga Region remained Islamic, but their burial ceremony went through a transformation in the context of Islamic ritual. In the period of the Jochid Ulus, deviations from the tradition of the universal ritual, which was identical for urban and rural settlements, started to show. Brick mausoleums and headstones with epitaphic inscriptions appeared, arm and body position of the deceased became more varied, personal belongings were included in burials from time to time, etc.

Taken together, this is evidence of serious changes in the funeral ritual and, more broadly, in Muslim jurisprudence and, accordingly, the madhab itself. One can assume in the territory of Bulgaria, where previously a quite rigid, state-regulated and unified Muslim law had been in effect, a regionalisation of sharia occurred, and a variant of madhab more friendly to local customs was approved. In this regard one may note the choice of khans Batu and Berke of Caliph an-Nasir (1180–1225) as a secular patron. However one might interpret this choice—as a certain opposition toward the great khan, or an attack directed against Nestorian Hulaguids—one cannot but note that Caliph an-Nasir died not only before the conquest of Bulgaria by Mongols, but also before their campaign in the West. If Batu were looking to select a patron in order to humiliate Hulagu, it would have been more logical to name Caliph Musta'sim (1242–1258) as patron. It is evident the choice of an-Nasir was dictated rather by

Finds from male (left) and female (right) burial sites.
Balymer burial sites, 13th century (according to E. Khalikova)

internal goals. Perhaps this was because an-Nasir was known for his practice of lawmaking and jurisprudence. His magnum opus was the famous *manshur* (manifesto) of 1207, whose aim was to combine various religious, sectarian, moral, ethical, and social elements into a single whole, uniting society within the limits of the Caliphate. At the same time, he contributed to the development of moderate Sufism and Aliism, trying to create a single religious and political brotherhood like a military religious order—a *futuwwa*—in the framework of all Islamic lands which recognised the Caliphs' authority. He then addressed all the rulers of Islam to seek support for his initiatives, which he received from a number of Seljuk emirs and sultans (see more detailed: [Mikhaylova, 1990, pp. 84–89]). With respect to the Jochid Ulus, his program could be refracted into the strengthening of Sufi *tariqas*, expansion of the rights of sheikhs to establish some *sharia* norms within their communities, support of moderate ethical doctrines, and an end to religious intolerance. We can assume, then, that the minting of coins in the Jochid Ulus in the name of an-Nasir is a

peculiar (though simply the only one that has come down to us) act of public accession to the *manshur* of an-Nasir and its principles in internal policy.

One can judge about changes in the Islamic commune of the Bulgar Ulus by such indirect facts as the as texts on epitaphic monuments. They not only mention a significant group of clerics (sheikhs, imams, hajjis), but also single out a rather large group of clerics who were migrants from Transcaucasia and Middle Asia, judging by their *takhalluses*, for example, Sadr ad-Din Shirvani, Hasan Samarkandi, Muhammad al-Jendi, Mubarek-shah Kurastani, Muhammad-sheikh al-Kardari, Rsa ash-Shamakhi, Ismahil ash-Shamakhi, Jafar-aga al-Afrikenji, et al. [Mukhametshin, Khakimzyanov, 1987, p. 119]. It is interesting that part of them came from the regions of the Jochid Ulus, Khwarezm, and the eastern Aral Region, while others came from the Seljuk regions of Transcaucasia. By all appearance, Islam was spreading to the territory of the Jochid Ulus from these regions, along with new schools of theology, legal traditions, and spiritual practices. In particular,

Gravestone with epitaph. Kazan. Late 13th century

the emergence of sufism, Sufi tariqas, and Islamic mysticism was a new phenomenon. It is significant that the Middle Volga Region was also involved in the process of reforming sharia practice.

All this is evidence of the fact that, despite its continuity, the population of the Middle Volga Region went through significant chronological, phase, and ethnosocial changes. First of all this concerns the disappearance of the former Bulgar nobility, at least from the cultural and social point of view. Apparently, it was annihilated to a great extent. Some of them managed to survive and even interact with the new rulers. However, they did not represent a united social corporation, but rather separate families involved in the structure of imperial power. The complete absence of continuity in the assortment, makeup and appearance of socially prestigious items of the pre-Mongol and Golden Horde periods is vivid evidence of this state of

affairs. The Bulgars' peculiar Turkic-Muslim culture was replaced by the luxuriant imperial culture with its Central Asian sources.

The appearance in the Bulgar Ulus of a new ethnosocial elite—the Tatar clan aristocracy with its military troops composed partly of nomads with their families—was another new phenomenon. Numerous findings of items from the early Golden Horde sphere at monuments of the 13–14th centuries in the Middle Volga Region (see [Treasures of the Golden Horde, 2000; Golden Horde, 2005; Valeyev, Rudenko, 2005; Rudenko, 2006]), as well as the materials of the Balymer burial site, can serve as archaeological evidence of a new ethnocultural situation. This monument was discovered and examined in 1961 by Y. Khalikova [Khalikova, 1965, pp. 114–116]. The burial ground consisted of 21 barrows, 4 of which were examined. Three barrows contained one burial site each, and one contained two. Traces of fires (burnt soil and coals) are found under the barrow embankments, and horses' skulls were found in three barrows. They all were buried in shallow rectangular pits (40–80 cm from day level) with small recesses on one or two long sides. In one case the remains of the wooden ceiling can be seen. The buried were lying with their heads to the north with a slight deviation to the east. A layer of coals (filler or the remains of rotted wooden constructions) is found at the bottom of the pits. Men's and women's (two) burials were distinguished by items buried with them: women's were accompanied by metal mirrors, iron awls, hinged scissors, and beaded jewelry, and men's by knives, arrowheads, fire steels, ringed bits, belt buckles, etc., [Ibid., Fig. 41, 42].

Similar burial rituals are known to have been practiced in the steppe part of the Jochid Ulus since the middle of the 13th century, though they were not very widespread. Kurgan burials with a northern orientation, according to the archaeological data, constitute a small (up to 6%) group of the burials, which are put into a mass of other types of rites with a mainly latitudinal orientation [Fedorov-Davydov, 1966, pp. 120, 127, 159, Tab. 17; Garustovich et al., 1998, pp. 261–264]. These burials can be dated with the help of the discovery of a bronze

mirror with an ornament in form of a grid from four-petal rosettes, which are encountered in the Far East and Aral Sea Region, where they date to the 12th–13th centuries, and in isolated examples from barrows of the Golden Horde period [Fedorov-Davydov, 1966, pp. 84, 116; Polyakova, 1996, pp. 228, 237, Fig. 71, 8; Rudenko, 2004, p. 121]. This allows this finding to be dated fairly clearly to the latter half of the 13th century. The rest of the burial equipment, including arrowheads, a ringed bit, and other items, does not contradict this dating. The sources of this population group can be quite clearly linked to the district of Altai-Sayan and the Baikal Lake Region, where ground and kurgan burial places are also found with a northern orientation [Mogilnikov, 1981, p. 194; Tishkin, Gorbunov, 2005, pp. 146–147; Dluzhnevskaya, Savinov, 2007, pp. 162–167]. One may presume that the Balymer burial sites were left by the nomadic population from tumens which were gathered in the ulus given to Jochi in 1208. Based on peculiarities of the rite, this military contingent had come relatively recently to the Middle Volga Region in Batu-khan's army and had preserved their burial customs. The dating of the Balymer burial sites to the first stage of formation of Jochid authority in the Middle Volga Region is also confirmed by comparison. Burials with a northern orientation, which obviously date to a later time, the late 13–early 14th centuries, are found in the Dnieper River Region, but they are all burials in the ground there, and the rite has a mixed character, combining various elements, including Central Asian [Yelnikov, 2004, pp. 86–110].

The population group which left the Balymer burial sites was clearly a military contingent which ensured the stability of the new power in the lands of former Bulgaria. The khan himself had supreme power here, and ulusbeks and darughas exercised his power while he was away. They performed major administrative and financial functions, supervising the collection of taxes and levies, the fulfillment of various duties, and the loyalty of local population. At the same time, it is obvious that the territory of Bulgaria was divided between Tatar clans and was not a united independent possession.

While in the 1240–1260s the system of power on the territory of the former Bulgaria was defined by direct subordination to the khan, the fourth quarter of the 13th century witnessed important changes. They seem to have been caused by the weakening of central power in the period of internecine feuds between the khans and karachibek Nogai. It is during this period in the Middle Volga Region that the power system which would play a decisive role in the military and administrative government of the Middle Volga Region began to crystalise.

The social structure of population of Volga Bulgaria has been fairly thoroughly examined thanks to headstone epitaphs [Yusupov, 1960; Khakimzyanov, 1978; 1987; Mukhametshin, Khakimzyanov, 1987; Mukhametshin, 1994] and represents a complicated class hierarchical structure. Here one can identify rulers such as *sultans*, *emirs*, and *beks*. One can also see terms denoting the wives and daughters of these aristocrats: *khatun*, *bika*, *bi*. A unique and apparently traditional Bulgar term is *elchi*, mistress or madam. One more term which is supposed to denote a noble lady or a man is the traditional term *khum*, which is believed to have been used to denote the descendants of servants and slaves [Khakimzyanov, 1978, pp. 93–94; Mukhametshin, 1994, p. 105]. The semantics and etymology of this term are not quite clear, but there are no reasons to consider all of them the descendants of slaves (as some historians have already noted, see Mukhametshin, 1994, p. 105).

The military service class is represented by the term '*yor*' (*churi*), which most likely denoted professional warriors [Khakimzyanov, 1978, pp. 80–82]. It is significant that their genealogy partly dates to the pre-Mongol period. The presence of officialdom can be proved by the term '*tamgachi*,' that is a tax collector [Yusupov, 1960, Table 12; Khakimzyanov, 1987, pp. 96–97; Mukhametshin, 1994, p. 105]. Most likely other noble people were called *aga*, *hoja* [Ibid., p. 103]. There is also a term for guild affiliation—*altunchi*, that is, a jeweller, and *temirchi*, a smith [Ibid., p. 105].

The clergy is represented by several terms. The most significant, apparently, was *great sheikh*, as well as simply *sheikh* and *imam*

[Ibid., pp. 104–105]. The term '*hajji*' was also fairly widespread in epitaphic monuments; this is a traditional prefix for the names of Muslims who have performed the hajj to Mecca. A whole range of other titles—shakh, malik, inal, as well as bek and emir (mir)—were clearly a part of compound names of aristocrats.

The titles of *sultan* and *emir* are of special interest for understanding the ethnosocial structure of the society. Both are found fairly rarely. The term 'sultan' is encountered twice on a monument from Bolgar and Kazan (the end of the 13th century?). In the latter case it forms a rather complex hierarchy: 'This sepulchre of the great sultan, most noble aide of the sultans, honoured emir...victorious...honoured and great ones, a banner... to the victorious one, of two honours, the pride of the clan and the faith, the shade of Lord Khasanbek, the son of mir-Mahmoud' [Mukhametshin, Khakimzyanov, 1987, p. 98; Mukhametshin, 1994, p. 100]. But one needs to consider that G. Yusupov read this inscription somewhat differently, considering the term 'sultan' not a special title but the ruler's designation: the grave of the 'great and noble ruler, the assistant of rulers, honoured emir...' [Shpilevsky, 1877, pp. 475–477; Yusupov, 1960, Table 2]. It will apparently be difficult to resolve this question without new materials. But if these epitaphs really are using the title 'sultan' with respect to Khasanbek ibn Mir-Mahmud, this is the most important evidence of an influx of Tatar aristocracy to the Bulgar Ulus, because in the Jochid Ulus the term 'sultan' was applied solely to representatives of the line of Chinggis Khan. There simply could be no local rulers with such a glorious title.

The title 'emir' was more widespread and was applied to representatives of the aristocracy. For example, an epitaph from Bulgar contains sophisticated titles: 'this is the tomb of the great emir, the sublime, exalted, most honourable, noble, glorious, high-minded, illuminator of scientists, support of the weak Ahmed Hajji, son of Mumik, son of Mir-Husein Nazar al-Bulgari' [Mukhametshin, Khakimzyanov, 1987, p. 94; Mukhametshin, 1994, p. 100]. Other emirs had much more modest epitaphs. For example, an inscription from

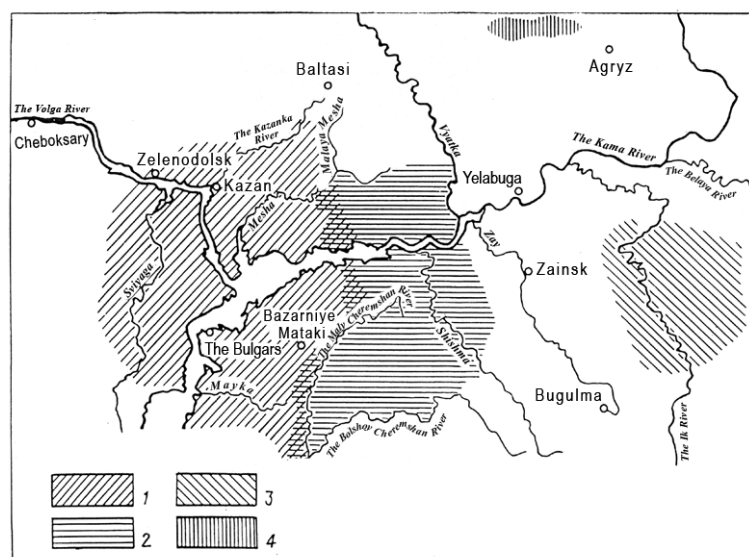

Bulgar (1323) says: 'The tomb of emir...Bulyartay, son of Byulemshak-bek' [Berezin, 1852, p. 109; Yusupov, 1960, p. 56; Khakimzyanov, 1987, pp. 100–101]. It would probably be reasonable in this light to distinguish emirs as representatives of the nobility from governing emirs who administered towns and suburbs.

Unfortunately, it is impossible to say anything about their origin, whether they were representatives of the old Bulgar nobility or those of Tatar clans. Even the takhalluses 'al-Bulgari' and 'as-Suvari' do not clarify the situation, because they indicated not ethnic affiliation, but place of birth and residence. At the same time, it should be noted that the descendants of migrants from Middle Asia and the Caucasus were recorded in epitaphs from the Middle Volga Region [Mukhametshin, 1994, p. 103]. As a matter of fact, to some extent anthropological data can be evidence of the migrant nature of the higher ranks of aristocracy from Bulgar, because a series of skulls from burials of the central cemetery of Bulgar are similar to those from lower Volga towns of the Golden Horde [Yablonsky, 1987a, pp. 124–142].

In other words, the presence of different strata of aristocracy was recorded in the lands of former Bulgaria in the late 13–early 14th centuries. There were Chinggisids (sultans) and a hierarchically organised service class headed by emirs and beks, as well as officials (tamgachis), military nobility (yuri), and untitled nobility. At the same time, there are no grounds to consider anyone among these emirs to be a ruler of Bulgaria who restored the unity of the country and was a vassal of the khans of the Jochid Ulus [Mukhametshin, 1994, p. 101]. On the contrary, there is reason to believe that the higher ranks of the aristocracy originated in the southern steppe regions.

The whole range of indirect but rather illustrative facts show that Bulgar Ulus was not an autonomy but a part of administrative system of the Jochid Ulus. Trying to accommodate this evidence with the hypothesis about autonomy, G. Fedorov-Davydov supposed that the sovereignty of Bulgar princes was eliminated in the first half of the 14th century, when the khan's power was reinforced under khan Öz Beg, so the power of the khan in Bulgaria

became powerful and direct [Fedorov-Davydov, 1973, p. 27]. However, the general dynamics of regional development from the late 13–first half of the 14th centuries was completely different.

Having recovered from defeat, the population of the Middle Volga Region began to increase production of products of land cultivation and home industry, and under the conditions of the flowering of trade cities began to become wealthier. The revival of industry and city life led to a strengthening of power and influence of ulusbeks who administered the Bulgar Ulus. Objective reality was contributing to the expansion of independence and inculcation of the Tatar aristocracy into a local urban environment, to a certain mutual infiltration of local and alien aristocracy, and to a levelling of their political ends and expectations. Mutual penetration was coming through marriages even by means of other forms of establishment of kinship that allowed local nobility to be infiltrated into Tatar clans as well as the creation of a syncretic and cohesive stratum of local nobility. One must also consider the territory of the former Bulgaria which apparently was not a single political organism before a certain time. Most probably from the end of the 13–beginning of the 14th centuries it was a conglomerate of the possessions, which were hierarchically co-subordinated to certain regional centres. One can assume in this military-administrative system that the Tatar military-service estate, syncretic by origin and organised by clan sign, played a dominant role. At the same time, in the cities, among the administrative classes,

craftsmen's workshops, and in part the clergy, greater weight was put upon representatives of the local Muslim population. This was fixed in Russian chronicles under the term 'Besermyans'—that is, Muslims, obviously a loan translation given by its ethno-confessional self-identification.

All these factors do not allow us to agree with the hypothesis that the Tatars emerged in the Middle Volga Region in the 1360s and formed the so-called 'Tatar land,' the size of which was unclear as well as its administrative status [Rudenko, 2002, p. 154]. The problem is not about the fact that the Middle Volga Region was a part of 'the Tatar land' named after the dominating ethnic class like Kievan Rus', which was called 'Russian land' because it belonged to the dynasty of the 'Rus.' Rather it is about the lack of proof that there were any other Bulgar princedoms or possessions in the Middle Volga Region. Available sources did not register any Bulgars in the Volga-Ural Region, while a whole range of evidence shows that the term 'Tatar' meant the highest ranks of society [Izmaylov, 1993, pp. 17–32; Iskhakov, 1995, pp. 95–107; Iskhakov, Izmaylov, 2007, pp. 169–200]. Consequently, the Tatars, being a service class of the Jochid Ulus and corporation of feudal lords, owned all the territory of this state since the period of conquest, so it was called 'the land of the Tatars,' which was registered in authentic sources.

At the same time, there is no data about any single governor or even a nominally principal emir and a sense of political separatism related to the central khanate's power. Some historians discern this aspiration by judging the interpretations of some historical facts about the allegedly international contacts of the Bulgarian governor.

For the first time, it was written by the historian Amin al-Kholi. Referring to the testimony al-Maqrizi, he wrote that in 731 AH (1330/31), during the reign of Sultan an-Nasir, the Bulgar tsar, eager to obtain favours from him, sent ambassadors with a letter to Egypt. He asked the sultan to send him a sword and a banner, which would help him in defeating the enemies. In reply the sultan sent the tsar two swords, an emblem, and fast horses [al-Kholi, 1962, pp. 21, 38, Note 46]. Meanwhile, although the historian emphasised that the story was about the governor of the Danubian Bulgars, he concluded that the medieval author was mistaken, and 'they were probably Volga Bulgars and not Danubian Bulgars. To be precise the Volga Bulgars obeyed the lord of Sari and were Muslims' [Ibid., p. 38, Note 46]. This opinion was supported by S. Alishev, who described in detail why they were Volga Bulgars. His main idea was that 'it did not matter if the embassy of the Bulgar Khan was sent by the permission of the powerful Öz Beg-Khan or in circumvention of the Golden Horde. In any case, it signified autonomy and a possibility to perform independent political actions by the Bulgarian kingdom' [Alishev, 1995, p. 189]. Al-Qalqashandi also related the story about the arrival of the embassy from the country of the Bulgars and Serbs [Grigoryev, Frolova, 2002, p. 289]. At the same time, the author mixes up the location of two Bulgar states, and following his source, al-Masudi unites the facts about the Danubian and Volga Bulgars and tried to reconcile conflicting accounts. Thus, knowing that the Danubian Bulgars were Christians, they appealed to the Egyptian sultan. He writes the story that at ancient times it was a country of Islam.

However, it was not the medieval authors who were mistaken but modern historians. First, the message of al-Maqrizi does not

claim that the Danubian Bulgars were Muslims, and accepting a banner as a gift does not mean adopting Islam. Second, the references of the message: the titulary ('tsar') and some terms (the names of the governors 'Istefan'—Stephan, 'Iskander'—Alexander). Third, it was not the only contact but a real system of political contacts between the Mamluk Egypt and the Bulgar State, which was written about in the Arab sources (see details: [Polyak, 1964, pp. 47–48]). All this proves that the diplomatic contacts of the Bulgars with Egypt as well as their diplomatic autonomy are a result of misunderstanding. By the way, V. Tiesenhausen, who brilliantly knew the Arab sources, while making his collection of sources, tried to resolve this issue and excluded this message as irrelevant to the history of the Jochid Ulus (see: [Collection of Works Related to the History of the Golden Horde, 1884, p. 441]). Diplomatic autonomy at the time of the Jochid Ulus was possessed not by the regions but by the sovereigns. Those were khans and karachibeks, who were state officials, and some very powerful ulusbeks from the Jochids, for example, Nogai. The Bulgar Ulus, linked to the Lower Volga Region with numerous clan, political, trading, and economic relations, could not and did not have that autonomy—it was simply one of the regions under the khanate's domain.

By the middle of the 14th century, in accordance with the data available to us, Bulgaria not only kept its significance as one of the most important regions in the Jochid Ulus but also strengthened it. In the Arab sources the Bulgar area is mentioned among the main territories of the khanate. For example, by al-Qalqashandi, it was one of the ten regions in the Jochid Ulus [Grigoryev, Frolova, 2002, pp. 288–290]. This was prompted by a gradual growth in agriculture, a development of handicrafts, and an expansion of trading. By some Arab authors, profit from the Bulgar trade could reach 200%–300% [Fedorov-Davydov, 1998, pp. 53–54]. Consequently, among other indicators, cities were developing, their territory was expanding, new districts of merchants and craftsmen were set up. An example of the growth of urban welfare and of the strengthening of urban political influence was the rebuilding of the Jami

Mosque in Bulgar, which was decorated with peculiar 'bastions' in the corners. At the same time, by a similar project, probably the mosque in Yelabuga was being built. Evidently, there was an intensive construction of official buildings in other cities.

The most important centres of the Bulgar Ulus by the middle of the 14th century were the cities of Bulgar and Djuketau. This was not a coincidence as Bulgar probably controlled the Volga trading, and Djuketau, the Kama trading route. By the Russian chronicles, they were the main cities of some property of the emirates, which were called 'principalities' in the Russian sources. Unfortunately, it is impossible to say anything accurate about their military and administrative structure or about their territory. However, indirect data is at hand. Studying the inscriptions of the epitaphs in the Middle Volga Region, D. Mukhametshin [1989, pp. 32–37; 2004] found out the regularities in the styles of ornamentation, graphics, formulas of using the Quranic sentences, and the language of these monuments in different regions and outlined their areas. He singled out two areas: 1) the Bulgar one, including the Western Zavolzhye, the Cis-Volga Region and Cis-Kama Region in the basin of the Kazanka, Myosha, and Oshta Rivers; and 2) the Kermen Djuketau one, including the Trans-Kama region, the basin of the Cheremshan River, and the Cis-Kama Region in the basin of the Vyatka River. Taking into account that the stone-written epitaphs were placed over the tombs of the aristocracy, it should be admitted that these workshops were in tight interaction with the upper classes and jointly developed their canons and fashion to decorate gravestones. In other words, the separation of the courts of the regional governors could not but lead to the development of some fashion and traditions, which were rather unique in decorating tombs. If it is true, the configuration of the administrative division of the Bulgar Ulus reminds us of the traditional Turkic-Mongol division into two wings, which, in their turn, are divided into small areas. Unfortunately, it is impossible to trace the formation of this system since the middle of the 13th century, but there are grounds to believe that it was deeply traditional at least in the first half

of the 14th century. These estates were hardly inheritable principalities, like Russian ones, as there is no data about local dynasties or that they were obtained by investitures from Golden Horde khans. On the contrary, the interference of the khans and their absolute governing the Bulgar territories, directly or through their sultans, underline that there was no local dynasty here, and the authority structure copied exclusively the Golden Horde rules. In this case, the system itself, the military and administrative system, and the ethnosocial structure of the Bulgar Ulus was the Tatar-Golden Horde one but not the local Bulgar one.

It is interesting that two other areas of the tombs around the archaeological site Gurya-Kala and the concourse of the Iks-Belsk Interfluve [Mukhametshin, 1989, pp. 36–37; 2004, pp. 14–15] also can be compared with some estates. In the basin of the Cheptsa River there was a certain fixed estate called 'Chulyman/Juliman' [Collection of Works Related to the History of the Golden Horde, 1884, p. 378], which was located in the later known Tatar Karin principality, and around the Ik and the Belaya Rivers, with its centre in the modern settlement of Chishma, where there could have been a historic land, called 'Bashgyrd/Bashgird' [Ibid.], included later in the Kazan Khanate.

The Bulgar Ulus during the period of the 'Great Troubles.' In the late 1430s the Jochid Ulus went through some serious crisis, which damaged a stable development of this state (see details in Section VI). This crisis was aggravated by a plague pandemic which in 1346 broke out in a lot of districts of this state: '... there was a great plague that people suffered from... in the Horde, and in Ornachi, and in Sarai, and in Bezdezh... the Besermyans, and the Tatars, and the Ormens, and the Obez, and the Zhids (Jews), and the Friez (Italians), and the Circassians living there' [Priselkov, 1950, p. 368; Complete Collection of Russian Chronicles, p. 95]. By this in 1346 the pandemic only touched the Bulgar Ulus. However, it came back more than once within several decades. In 1364, for example, the plague came from the Lower Volga and killed 100 people per day in the Russian Upper Volga cities [Complete Collection of Russian Chronicles, 18,

pp. 102–103]. That is why it can be supposed that the Middle Volga experienced all the fears of the Black Death at their full scale. By Yu. Schamiloglu, precisely this pandemic became the main factor that led to the disappearance of the speakers of the sacred language, which was used for writing most of the epitaphs until the 1370s (see Chapter 1 in Section VI).

The decrease of trading and the decadence of the Great Silk Road also deteriorated the situation in the Bulgar Ulus. The current crisis made in action the social and political mechanisms of destabilisation in the Jochid Empire as the dynastic strife and inter-clan clashes started. The war for power between different groups of the Tatar aristocracy of the White Horde, which involved also the khans of the Blue Horde, was going with ups and down for 20 years. Under these conditions there was not only a separatism in different regions but also violent conflicts between regions and raids of pirates and robbers.

The Bulgar Ulus could not avoid a common destiny. Moreover, owing to its location, it happened to be too close to the epicentre of destructive impulses. The first sign of the future destabilisation was the raid of the Novgorod pirates, 'the ushkuiniks' (from the word 'ushkui,' a longboat for up to 50 people), headed by the Dvina boyar Anfal Nikitin, who 'took... Djuketau and killed a lot of Besermyans, both men and women' [Complete Collection of Russian Chronicles, 4, p. 289; 15, pp. 69; 27, pp. 242, 326; 30, p. 112]. In reply the governors of Djuketau sent an embassy to Khan Khizr with a request to punish them from the raid. The khan sent to Rus' three ambassadors 'the eldest Ourusm, the second Kaibeg, the third Altynbey, and there were problems to the Russian Princes' [Complete Collection of Russian Chronicles, 27, p. 242]. It is interesting that the later Nikon Chronicle mentions that in order to take revenge after the raid of the ushkuiniks 'for plundering, Christians in Bulgar were robbed by Tatars' [Complete Collection of Russian Chronicles, 10, p. 232]. This news is not read in authentic chronicles, but it was probably in the Tver Chronicle, where after the phrase 'the pagan Besermyans got into rage,' there was a break in the text [Complete Collec-

tion of Russian Chronicles, 15, p. 69]. Forced to meet in Kostroma, the princes regarded the complaint and 'gave out the robbers and let the ambassador go back to Horde' [Priselkov, 1950, p. 377; Complete Collection of Russian Chronicles, 25, p. 181]. It is not known what culprits of the raid were given out by the princes, but Anfal Nikitin continued pirating on the Kama some time later. It is not impossible that under the conditions of the violent civil strife in Sarai no one paid attention to the Novgorod raiders.

This raid and a doubtful success of attempt to solve a problem of safety in a diplomatic way embodied a beginning of radical changes in a political life of the Bulgar Ulus. Under the conditions when the governors of the Bulgar emirates suddenly faced military threats from their hostile neighbours and were left without a support of the central power, they tried to strengthen their authority and to increase their military power.

It is more complicated to say how this authority was organised. Most probably, the head of the Bulgar emirate was a governor leaning upon the local Tatar aristocracy and executing military and administrative power on this territory. Here it is also necessary to state that for the first half of the 14th century much data is not available, and ethno-political processes can be reconstructed only retrospectively. However, after the 1360s, when the Middle Volga Region by some circumstances was involved into the internal Golden Horde conflicts that included the Russian Princes, this was reflected in a set of Russian chronicles, there was a gradual involvement of the Bulgar emirs into the military and political events of the Jochid Ulus, which made them active participants of the process. Owing to their military and economic potential and their beneficial strategic location, the support of the Bulgar lands for this or that side could influence the balance of power, which made the khans follow the political orientation of the Bulgar governors and often offered them a certain autonomy in exchange for their loyalty.

As the central power was getting weaker, the governors of the Bulgar Ulus were becoming more independent. The logic of the events was pushing them towards autonomy.

The crucial event was the arrival of the Emir Bulat-Timur in Bulgar in 1361, who took Bulgar and all the cities and uluses of the Volga, and all the Volga way' [Complete Collection of Russian Chronicles, 18, p. 101; Priselkov, 1950, p. 378; *ibid.*, 15, p. 70]. At his time, analysing the coins made in 768 AH (1366/67), P. Savelyev read the stamps on them as 'the l(ate) Sultan Janibek Khan, long may (his) r(eign) last, Bulat-Timu(r), Nugan's son.' He also pointed out the coins, made on behalf of Bulat-Timur but already representing the current Khan Aziz Sheikh (1364–1366) [Savelyev, 1858, p. 208 ff.; Markov, 1896, p. 472 ff.]. M. Mukhamadiyev read the name of Bulat-Timur's father on his coins as 'Toklabi'—that is, one of the karachibek Toglubiy (or Tovlubiy in the Russian chronicles) [Mukhamadiyev, 1983, pp. 93–94]. We can agree with M. Safargaliev that coining was an attempt of the Emir Bulat-Timur to prove his power on behalf of the late khan [Safargaliev, 1960, p. 119]. At the same time, it shows that Bulat-Timur was a representative of the elite Tatar aristocracy, perhaps, a son of one of the karachibeks Toglubiy (although possibly Nanguday (Mankytay)), who was assassinated a year before these events [Fedorov-Davydov, 1973, p. 137]. It can only be supposed whether Bulat-Timur was sent to Bulgar to help in strengthening the power of the khan in this most important region of the empire, or he by himself, leaning upon his father's clan, obtained power there. All in all, he stabilised the authority in the Bulgar Ulus for almost five years and probably acted for his own interests, although in some periods he was forced to express loyalty to the central khanate.

However, in 1366 Bulat-Timur evidently fell under the displeasure of Khan Aziz-Sheikh. In 1367 he started fighting against the Novgorod princes, though it is unclear whether by order or contrary to the instructions of the khan. The aim of this actions was probably an aspiration to stop the expansion of the influence of the Novgorod princes in the Trans-Oka Region and the Moksha River Region, a traditional area of the Bulgar dominance. By the chronicle, 'the Golden Horde Prince named Boulat-Temir came with the Tatar army and robbed the dis-

trict, up to the Volga, up to Sundoviti, and up to the village of Prince Boris' [Complete Collection of Russian Chronicles, 15, 1965, p. 85; 18, p. 106; 4, p. 291]. Perhaps, performing this raid, Bulat-Timur thought that a recent strife between Dimitry and Boris Konstantinovich for power in Nizhny Novgorod would not let them come out together. However, he was mistaken. The brothers went out together and 'by gathering a large army' headed out to meet the Tatars. Bulat-Timur did not fight and went back to the Pyana River. Retreating turned into fleeing, the result of which part of his troops were defeated, and part were drowned in the river [*ibid.*]. The emir himself 'ran from there to the Golden Horde... and was killed there by Tsar Aziz' [*ibid.*]. Some time later Khan Aziz-Sheikh also was killed as a result of internal conflicts.

The weakening of the emir military power in the Bulgar Ulus and the obvious disfavour of the khan immediately made the ushkuiniks (pirates) active. In 1366 the fleet from 150 ushkuis under the command of three Novgorod voivodes came up to Nizhny Novgorod, where they 'killed many Tatars, Besermyans, and Ormens... many people, men and women, and children, and grabbed a great deal of goods, and damaged all their vessels, ships and boats, and shallows, and wherries, and skiffs' [Priselkov, 1950, p. 382; Complete Collection of Russian Chronicles, 15, 1965, p. 81; 4, p. 292]. From there the ushkuiniks 'went from the Kama and came to the Kama and came up to Bulgar, did the same while fighting' [*ibid.*; Complete Collection of Russian Chronicles, 25, p. 183]. This campaign incited the rage of Grand Muscovite Prince Dmitry Ivanovich, who expressed his dissatisfaction through the ambassador: 'why did they (go) to the Volga and rob a lot of my guests?' They replied that the raid was performed by 'young people without our word'; moreover, they 'did not rob your guests but only beat the Besermyans' [Complete Collection of Russian Chronicles, 4, p. 294]. Evidently, the discontent of Prince Dmitry was caused not by the fact of the attack on the Muslim merchants but by the possibility of using this raid for a punitive action against Rus'.

In 1369 the Novgorod people tried to perform a new attack on the Bulgar Ulus. Two fleets, one of 10 ushkuis went along the Volga, the other one, along the Kamskoye Ustye. The ushkuiniks joined at the Kama estuary and left for the Bulgars but 'were beaten near Bulgar' [ibid., p. 295]. At least, it proves that the Bulgar authorities could gather the military force and resisted the raid of the Volga pirates.

After the escape and death of Bulat-Timur, the emir of Bulgar was Hasan (Osan, Asan by Russian chronicles). M. Safargaliev paid much attention to this title and those who carried it. He expressed the opinion that 'the Bulgar Prince' Hasan was Khan Hasan, who ruled in Sarai in 1368; he 'ran away to Bulgars a year later and headed the Bulgar Principality in 1369.' M. Safargaliev associated his personality with Sultan Hasan-oglan from Shiban's descendants. As for 'Saltan, Bak's son,' this researcher sees in him 'Tsarevich' (Sultan) Muhammad (Mahmat Soltan/Mahmet Soltan/Maamat Saltan), 'who was declared as the Bulgar Prince' and ruled 'together with Prince Asan' [Safargaliev, 1960, pp. 125–126]. A. Mukhamadiyev considers 'Prince Hasan' to be 'the governor of Bulgar,' forced into subservience to Muhammad-Bulak (Mamat-Soltan) in 1370, enthroned that year as the khan in the Mamai Horde [Mukhamadiyev, 1983, p. 95]. R. Fakhrutdinov also calls Asan 'the ruler of Bulgar' or 'Bulgaria,' supposing that this prince 'ran away from the Horde,' and in 1370 had to share power with 'Sultan, Bak's son' [Fakhrutdinov, 1984, pp. 120–123]. Recently there have been interesting and trustworthy hypotheses about the situation in Bulgar and Kazan, coming out of the fact that 'the Bulgar Prince' Hasan and Sultan Muhammad, most probably also 'Bak's son,' took different positions in the ulus hierarchy and reflected not a certain hypothetic 'co-government' but an ulus structure, when under the Chinggisid sultan there was always a karachibek, head of local Tatar clans [Iskhakov, 2000; 2004a, pp. 123–128]. That is why the attempts to connect Hasan with the Shibanid dynasty seem artificial as Emir Hasan was not and could not be from the Chinggisids, otherwise the sources would not have missed this fact. The same can be said about the attempt to refer to this peri-

od an appearance of some 'Tatars' and mythical 'Tatar land' within the Jochid Ulus in the 'Bulgar' environment and, moreover, to find the proof of this hypothesis in a random set of archaeological monuments of different periods and different types [Rudenko, 2002, pp. 154–160].

All in all, the Bulgar Ulus by 1370 was a military and administrative unit; the territory in its turn was a complex system from the hierarchically co-subordinated feudal estates, which were owned by the representatives of the Tatar clans. It is not excluded that this ulus, in its turn, was divided into wings (or emirates), the centres of which were Bulgar and Djuketau. In the conditions of an general war and riots the Bulgar Ulus was one of the key regions of the empire. Now the success of the candidate for the khan's throne and the duration of his power depended a lot on its loyalty and support. The power strengthening and growth of the political authority of the governors of the Bulgar Ulus urged them to act in the internal affairs of the Horde. And it was precisely this which involved them in the internecine feud of the Horde.

By that time a severe war between Mamai against the khans of the Blue Horde and the aristocracy of Sarai made him recall Bulgar. It looks like the Bulgar Ulus was an important base and an inner resource for the Sarai khans. For this reason Mamai decided to defeat his enemies with a turning movement. In 1370 his ambassador Achi Hoja (Ata Hoja) was sent to Moscow to arrange an attack on the Bulgar Ulus. Perhaps, the embassy included Sultan ibn Baki ('Mamat Saltan, Baki's son'). The Muscovite Prince Dmitry Ivanovich, obliged to Mamai with an yarliq for the grand principality, agreed to fulfill his orders. Evidently, it was dictated not only by gratitude but an aspiration to hit the rival for the power in the Sura-Oka interfluve. That is why the campaign with Achi Khoja included the troops of Dmitry Konstantinovich from Novgorod, headed by his brother Boris and son Vasily 'with a lot of forces' [Priselkov, 1950, p. 389]. However, the Bulgar Emir Hasan did not wait for the beginning of intensive military actions. He 'sent an ambassador with a petition and a lot of gifts. They took the gifts, made Saltan, Baki's son, the Prince,

and turned back to Rus' [Ibid., pp. 389–390; Complete Collection of Russian Chronicles, 25, p. 185]. Thus, Emir Hasan, managing to keep power, obeyed the Khan of Mamai's Horde and accepted Muhammad-Sultan as a nominal governor.

As a result of this campaign, Mamai was a winner, who not only managed to conquer a rich ulus but also defeated the Blue Horde khans by depleting the central power and took Sarai. Although three years later he started losing his positions, Mamai was forced to abandon the capital Sarai and all the Lower Volga Region and got involved in a long-lasting conflict with the Grand Principality of Moscow. With a view to increasing 'the Horde's exit,' the Muscovite Prince Dmitry Ivanovich replied with a denial, Mamai started intrigues as he wanted the Muscovite Prince to be opposed by the other candidates for the grand principality: Mikhail from Tver or Dmitry Konstantinovich from Nizhny Novgorod. As a result, in 1374 the relations between Dmitry Ivanovich and Mamai were broken off, and an open war between them was started (see details: [Gorski, 2000, pp. 83–90]).

The growth of military tension immediately caused the appearance of the ushkuiniks, ready to hit the unprotected peaceful cities and settlements on the banks of the Volga and the Kama. In 1374, by the words of the chronicler, 'going down along the Vyatka, the ushkuiniks, the robbers, on 90 ushkuis, robbed Vyatka and took Bulgar.' Evidently, they conquered the foothill part, the district of the merchants, and the craftsmen, and in order to save it from being robbed and burnt down, the residents paid them a ransom at 300 rubles. Here the ushkuiniks split. One part of '50 ushkuis went along the Volga down to Saray, and 40 ushkuis went up along the Volga, got to Obukhovo, and robbed all the Trans-Sura and Markvash Region' [Priselkov, 1950, p. 396; Complete Collection of Russian Chronicles, 15, 1965, p. 106; 25, p. 189; 30, p. 120].

The most famous and ruinous raid was performed by the ushkuiniks in 1375. The moment was chosen wisely: the main troops of the Nizhny Novgorod, the allies of Dmitry, were engaged in the campaign against Tver, and the Lower Volga Region suffered from the interne-

cine feud, when the fight against Mamai and the local emirs was started by the Blue Horde governor Urus Khan. Having waited for the ally army of the Muscovite Dmitry to go to Tver, the Novgorod people went along the Volga to Kostroma. At that time their detachment consisted of a thousand and a half warriors, headed by the voivodes Prokop and Smolyanin, and their fleet consisted of 70 ushkuis. Having applied a skillful manoeuvre, they defeated a more numerous garrison and conquered the city, systematically robbing it for a week. From there they 'went down along the Volga, robbed Nizhny Novgorod, and captured a lot of people... and burnt the city.' Then, making raids on the river settlements and trading ships, they went to the Kama and then turned to Bulgar, where they 'sold all the Christian prisoners.' Later they moved down the Volga by 'robbing the Christians and killing the Besermyans.' Their bloody way was stooped only at the walls of Hajji Tarkhan, where 'they were defeated by the Hajji Tarkhan Khan named Salchei without mercy, no one was left alive' [Priselkov, 1950, pp. 399–400; Complete Collection of Russian Chronicles, 4, pp. 304–305; 15, 1965, pp. 113–114, 435–436; 18, pp. 116–117].

Under the conditions of a rising war with the Mamai Horde, the Grand Prince of Moscow, after defeating Tver, decided to strengthen his power on the Volga. In winter of 1377, by the order of the Muscovite Grand Prince Dmitry Ivanovich, the Nizhny Novgorod Princes Vasily and Ivan, the sons of Dmitry Konstantinovich and the Muscovite Voivode Dmitry Mikhaylovich Volynsky, made a campaign against Bulgar. They came up to the walls of the city on 16 March and started ruining the premises. 'The pagan Besermyans went out of the city against them, started to fight and shoot, and the others made a noise from the city to frighten our people. They were shooting with crossbows. Some went out on camels and frightened our horses' [Priselkov, 1950, p. 401]. However, this excursion was repelled with the losses for the besieged. As they did not manage to defeat the Muscovite troops, Emir Hasan and Muhammad-Sultan proposed to make peace. The Russian voivodes did not want the siege to last long either as spring

(by A. Mukhamadiyev)

1–3—Shadi Beg, 4–5—Bulat, 6—Chekre,
7–15—Dervish

was setting in, with ice drifting and impassibility. As a result, they made peace with the condition of recognising the suzerainty of the princes from Nizhny Novgorod and Moscow, 'with all their will,' and Bulgar had to accept the prince's daruga and customs official and to pay a huge ransom: 2 thousand to the princes and 3 thousand to the voivodes and the troops [ibid., pp. 401–402; Complete Collection of Russian Chronicles, 15, 1965, pp. 116–117; 18, pp. 117–118; 23, p. 120].

The Bulgar Ulus got under the Muscovite protectorate. It is unclear whether this dependency was long and durable. Most probably, it was quite unstable and did not last long. Hardly had Mamai made the pressure upon Moscow more severe, the Bulgar emir received his absolute power.

It is a mystery which khan was supported by the governors of the Bulgar Ulus. In 1375–1377 the Volga Region came under a complicated and confusing situation. Nizhny Novgorod at that time was ruled by one of the supporters of the Blue Horde Khan Urus. In 1377 one of them, Arabshah, made a rapid raid

on the Trans-Sura Region and robbed it [Complete Collection of Russian Chronicle, 15, 1965, p. 119; 18, p. 119]. The successes of the Blue Horde governors were significant, but there is no information about the subordination of the Bulgar Ulus to their power. A vague mention in one of the late records, full of the legendary motives from the text 'Daftar-i Chinggis-name,' about the fact that the Bulgars belonged to 'the yurt of Urus Khan' [Safargaliev, 1960, p. 130] can hardly be considered trustworthy testimony.

However, the power of the Sarai khans in the Middle Volga Region was unstable. Mamai and his emirs remained more important. Thus, having come out against Arabshah, the army of the Nizhny Novgorod Prince behind the Pyana River was attacked all of a sudden by the troops of Mamai and was totally destroyed. Even Prince Ivan Dmitriyevich died. After it the Tatar detachments very rapidly came up to Nizhny Novgorod, took it 'by attacking out of the blue,' robbed and burnt it. Evidently, on the way back they besieged and burnt down Pereyaslavl-Ryazansky [Priselkov, 1950, p. 403; Complete Collection of Russian Chronicles, 4, pp. 307–308; 15, 1965, pp. 118–119; 18, pp. 118–119]. However, the next year Mamai was severely beaten: his army headed by the Emir Begich on 11 August 1378 on the Vozha River was defeated by the troops of Dmitry Ivanovich [Complete Collection of Russian Chronicles, 15, 1965, pp. 134–135; 18, pp. 126–127]. It is interesting that actually at the same time with this battle, on 24 July 1378, 'Tatars out of the blue attacked' Nizhny Novgorod and again ruined and burnt down the city and its premises without even taking a proposed ransom [Priselkov, 1950, p. 415; Complete Collection of Russian Chronicles, 15, 1965, pp. 133–134]. By the grounded opinion of V. Kuchkin, this campaign could hardly be performed by Mamai's army, which was concentrated against the troops headed by the Muscovite Prince Dmitry Ivanovich himself, and that is why the attack was arranged in Bulgar or less probably in Sarai [Kuchkin, 1980, pp. 107–108]. If this presumption is true, it means that the Bulgar Ulus did not simply get autonomy back but started a war against the principalities of

Nizhny Novgorod and Moscow and perhaps coordinated its actions with Mamai.

All in all, the Volga-Kama Region remained being at situation of civil disorder and war, which got complicated with a permanent threat of the raids by the Novgorod ushkuiniks, urging to fight against them even in winter (about the campaign of the Vyatka people against the ushkuiniks, see: [Complete Collection of Russian Chronicles, 18, p. 129]).

In general, trading and economy were going through difficult times. The facts of the trade were decreasing, and the Balkanisation of life resulted in an increase of cutting and spoiling coins, a rapid uprise of a number of money and and goods treasures [Fedorov-Davydov, 1987, pp. 180–181]. Only the strengthening the power of the khan could stop the advance of the Russian princes and get back stability to the economy and the internal policy in the Middle Volga Region.

The rise of Kazan from the end of the 14–beginning of the 15th centuries. The defeat of Mamai at the battle of Kulikovo (1380) determined his final loss and facilitated the climbing of Khan Tokhtamysh to power. Having strengthened his power, the khan received the recognition of the formal supreme rights for the Russian lands from the Muscovite prince, but he did not acquire absolute obligations to obtain the payments of the debts for the 'Horde tribute' and regular supplies in Sarai. Under these conditions Tokhtamysh began to prepare a huge campaign against Moscow (about the politics of the parties, see: [Gorsky, 2000, pp. 100–107]). His first action in this direction was a demonstrative strengthening of his power in the Bulgar Ulus: 'Tokhtamysh sent people to Bulgar and ordered them to rob the Russian guests, and take their money and goods' [Complete Collection of Russian Chronicles, 18, pp. 131–132; 15, 1965, p. 143]. He himself secretly crossed the Volga and suddenly entered Rus', besieged and took Moscow (see details: [Complete Collection of Russian Chronicles, 18, pp. 132–133; 15, 1965, pp. 143–146; 3, p. 378]).

Thus, Khan Tokhtamysh finally got back his power over the Bulgar Ulus. Unfortunately, nothing is known about the details of the

internal structure in the Jochid Ulus, but it can be presupposed that inner stabilisation did not happen. However, the increase of the dependency of the ulus from the central power and the involvement of these lands into the politics of the khanate can be noted. Thus, in 1391 Tokhtamysh 'sent his tsarevich named Bektut with the army to Vyatka. He went there and took Vyatka, killed some people and captured others, men and women and children' [Complete Collection of Russian Chronicles, 15, 1965, pp. 160–161; 18, p. 141]. Perhaps the campaign became the consequence of the territorial conflicts between the Vyatka people and the Tatars. It also shows that the meaning of the Bulgar Ulus for the khan's power increased. The region had a stable economy, did not become an arena of a severe civil strife, and preserved its military resources. All this raised up its significance for the central power and its influence in the power hierarchy. It is then no wonder that since that time here and there the sultans, 'tsareviches,' are mentioned as the representatives of the khan's power in the guise of military chiefs and administrators.

The main evidence of the active participation of the Bulgar Ulus in the military and political efforts of the khanate is the episode of the war against Aksak-Timur, when before the battle on the Kondurcha River, he was forced to initiate the beginning of the battle as he feared that Tokhtamysh would be reinforced with the troops from Azak and Bulgar [Complete Collection of Russian Chronicles, 2, p. 164]. The strength and power of the army of the Bulgar Ulus is demonstrated by the fact that Aksak-Timur did not risk invading its territory neither in 1391 nor in 1395–1396, preferring to pass it by.

At the end of the 14th century, for the first time together with Bulgar, Kazan started being mentioned as one of the most important regional centres. According to the data from the Russian chronicles, in 1391 'the people from Great Novgorod and Ustyug went out in the boats and ushkuis down along the Vyatka River and took Zhukotin and robbed it, and Kazan, and went to the Volga and robbed all the guests and went away' [Priselkov, 1950, p. 438; Complete Collection of Russian Chronicles, 18, p. 141].

In a set of later and partially cut chronicles, this message contains only the name of the city of Juketau (see: [Complete Collection of Russian Chronicles, 23, p. 132; 30, p. 129]).

The next time Kazan is mentioned on the pages of the chronicles during a great campaign of Prince Yuri Dmitriyevich against Bulgar in 1399 and was clearly called a centre of one of the emirates, together with Bulgar, Juketau, and Kermenchuk. The events that caused the campaign of the Russian princes are related to the general Horde policy upon the weakening of the power of the Grand Prince of Muscovy. The reason for the campaign was the claims of Semyon Dmitriyevich from Suzdal for the Principality of Nizhny Novgorod. Evidently, the Great Emir Edigu supported his claims for power and sent with him Sultan Yentyak with the army. Judging from the context and further events, Yentyak was the sultan of the Bulgar Ulus and got directly interested in the situation when the prince of Nizhny Novgorod was his ally, not his enemy. The army of Yentyak—'a thousand Tatars' with Prince Semyon—came up to Nizhny Novgorod and began a siege. Some time later the residents surrendered and on 25 October 1399 made peace with the attackers, but the latter perfidiously broke it and robbed the city. Prince Semyon could not stop the destruction of the city, and it set the residents against him. As soon as it became known that the Muscovite troops were coming up, the Tatars together with Prince Semyon hurried up to retreat. In reply, Grand Prince Vasily sent the army headed by his brother Yuri Dmitriyevich, 'and with him the voivodes and the eldest boyars and a lot of forces. He went to conquer the city of Bulgar, Zhukotin, Kazan, Kremenichuk and took all these lands, laid waste to many Besermyans and Tatars, and captured the Tatar land. Three months later he came back with a great victory and a lot of benefits to the Russian land' [Priselkov, 1950, p. 453; Complete Collection of Russian Chronicles, 4, p. 380; 15, p. 470; 25, pp. 225–226]. The success of the campaign was serious. Typical was the maxim of the chronicler, who described this campaign: 'no one will remember ages hence when Rus' conquered the Tatar land' [Complete Collection of Russian Chronicles, 4, p. 380]. Later

in 1402 this 'Tsarevich Yentyak' was called as an ambassador of Edigu to the Grand Muscovite Prince Vasily [Priselkov, 1950, p. 456; Complete Collection of Russian Chronicles, 25, p. 232]. This proves that he was loyal to the central power and acted for its interests [Gorsky, 2000, p. 126].

Meanwhile, around 1406–1407 Edigu again conquered the Bulgar Ulus. The information about it is placed in the memories of a German soldier, who had been captured by Turks, then taken to the service of Sultan Chekre; he took part in the military and political events in the Jochid Ulus during 1405–1427. He wrote that Chekre after his returning was taken to the court of Edigu and fought together with him in Siberia and the Volga Region. At that time, after conquering Siberia, '...Edigu and Chekre invaded Bulgaria, which was also conquered by them. After that they went back' [Shiltberger, 1984, p. 35]. Perhaps this campaign had an aim to strengthen the powerful authorities of Edigu before a more important and significant military campaign against the Muscovite Principality. Most probably, at that time Sultan Yentyak was dismissed, and a new representative from the khan in the Bulgar Ulus was appointed.

After concentrating the power in his hands and suppressing the discontent of the ulus-beks, Edigu decided to bring the Grand Prince of Muscovy to obedience and made him pay out the 'Horde tribute' in the same amount as Vasily Dmitriyevich stopped paying the tribute and started his independent policy from the beginning of the reign of Edigu. Having been assured by fruitless peaceful negotiations, in autumn 1408 Edigu suddenly invaded Rus' (Ruthenia) and besieged Moscow. At that time his troops started ruining the main cities and 'volosts' in the north-east of Rus' [Priselkov, 1950, pp. 468–471; Complete Collection of Russian Chronicles, 15, 1965, pp. 177–185; 15, pp. 482–484; 4, p. 400; 25, pp. 238–239]. At the same time, with the main forces along the Volga within the principality of Nizhny Novgorod, the other army led by 'another tsarevich' invaded; as he was not named, evidently, it was not Yentyak but the other Sultan—Talych. His army included 'a lot of Tatars, Bulgars, and Mordvins.' They conquered and robbed a lot of

cities, Nizhny Novgorod, Gorodets, and Kurmysh and almost reached Kostroma and Vologda [Complete Collection of Russian Chronicles, 15, p. 484]. Evidently, together with them came Prince Daniil Borisovich, who with the help of Edigu was restored in his father's demesne on the throne of Nizhny Novgorod, together with his brother and relatives and the descendants of the princes from Suzdal. Further these princes became active supporters of the khan's power and opponents of the Grand Prince of Muscovy.

The war caused new raids of the ushkuiniks. In 1409 the famous Dvina Voivode Anfal Nikitin again gathered a significant ship army and decided to rob the Bulgar Ulus. The movement was to start from two sides, one fleet with 100 ships—'flat-bottomed boats' had to go along the Kama, and the other 150, along the Volga. However, the Volga fleet delayed, and the Kama fleet was defeated: 'They were beaten on the Kama by Tatars, and Anfal was captured and brought to the Horde' [Complete Collection of Russian Chronicles, 25, p. 239; 23, p. 143]. Later he was probably set free for a ransom and died in 1417.

Meanwhile, in Rus' (Ruthenia) there was a war between Vasily of Moscow and Daniil of Suzdal [Gorsky, 2000, p. 134]. In summer 1410, having taken advantage of the absence of the Muscovite troops, Daniil called Sultan Talych and made a joint raid on Vladimir. Prince Daniil Borisovich sent to the city a detachment of 1,500 warriors led by the boyar Semyon Karamyshev, which was joined by the similar detachment of Sultan Talych. On 3 July their detachments 'came to Vladimir through forests secretly from the Klyazma River' and suddenly conquered the city, ruined it and 'burnt it with fire...' [Complete Collection of Russian Chronicles, 18, p. 160; 25, p. 240; 23, p. 143].

In reply, in January 1411 Vasily of Moscow advanced on Nizhny Novgorod with troops led by his brother Prince Pyotr Dmitriyevich. Daniil and Ivan Borisovich called all their allies for help. The ruling elite of Bulgar probably replied on their request and sent its army with '... the princes of Bulgar, Zhukotin, and Morodova.' The army of Nizhny Novgorod joined the allies and started waiting for the Muscovite regiments on the island of Lyskov. The battle

took place on 15 January 1411, on the ice of the Volga. The fight was severe and bloody: 'And there was an atrocious struggle between them, and the Prince of Suzdal Daniil Vasilyevich was killed, and a lot of people died from both sides.' However, the winners 'the Nizhny Novgorod princes... stood upon the bones' [Complete Collection of Russian Chronicles, 15, 1965, p. 186; 15, pp. 485–486]. It was an obvious success, both the demonstration of the military power of the Bulgar Ulus and the diplomacy that showed the ability of the Bulgar and Juketau emirs to carry out an active diplomatic exchange in the Volga Region. However, success was not complete as that year's summer Edigu was dismissed by Khan Timur, and the Jochid Ulus was involved in a new period of conflicts.

The political situation in the Bulgar Ulus is only actually known due to the numismatic data and is defined with the issue of the coins by a new mint. The place of coinage was pointed out as 'the city of Bulgar al-Jadid' ('New Bulgar'), and as G.A. Fedorov-Davydov surmised, Kazan was hidden under this name. In 'Bulgar al-Jadid,' as the capital of the ulus, the coins were made on behalf of the ruling sultan from the Jochids, Ghiyath al-Din (1422–1425) [Mukhamadiyev, 1983, pp. 124–135]. Judging by them monetary reform was taking place under his reign, and they started to make coins with the title 'Highest Sultan' and with their own coat of arms, a lyre-shaped tamga. Evidently, at the reign of this sultan the Bulgar lands were actually united under the power of Kazan. At his time the Bulgar Ulus tried to influence the internal affairs of the Horde but failed. Since 1426 the monetary court 'Bulgar al-Jadid' again made coins on behalf of the khans of the Jochid Ulus. Perhaps, it was not a coincidence as exactly at that time the power of Khan Ulugh Muhammad in the Jochid Ulus was strengthened. It is not excluded that he dismissed Sultan Ghiyath ad-Din, who was obviously eager to obtain autonomy, and appointed his protégé.

The support of the khan and increasing military power led to the situation where the Bulgar Ulus tried to play an active role in politics by defending the interests of his lands. In the

winter of 1428–1429 the rulers of the Bulgar Ulus began a war against the Galich Principality. By the chronicles, in winter 'the Tatars went to Galich,' though despite a sudden attack and a one-month siege, they ruined the premises but could not take the city. Having made a rapid march on the Epiphany, 6 January, they took Kostroma 'out of the blue' and 'captured it,' and later they 'took Plyos and Lukh.' Having taken the loot and the prisoners, Tatars started retreating 'down the Volga.' Having reached Nizhny Novgorod, the troops turned back. However, the Bryansk voivode Fyodor Konstantinovich and the Suzdal Prince Fyodor Davydovich the Spotted, at their own will, without notifying the chiefs, continued following up and managed to get and defeat the rear guard of the rival. Having heard of the raid, from Moscow the chase was prepared and 'sent to pursue them with their uncles Prince Andrey and Kostyantyn, and with them Ivan Dmitiyevich, with their regiments.' However, the Muscovite princes were acting with fear and were not in a hurry. As a result, they 'did not catch up with them and got back.' Only Princes Fyodor Paletsky the Spotted and Fyodor Konstantinovich secretly continued following and managed to get the prisoners back [Complete Collection of Russian Chronicles, 25, p. 248; 27, p. 102; cf.: Complete Collection of Russian Chronicles, 4, p. 451]. Nevertheless, it was an impressive success, which demonstrated the high military organisation and skills of the chiefs and a strengthening of the Bulgar Ulus perhaps at the dominance of the Kazan Emirate.

According to the chronicler, the Tatars were commanded by 'the tsarevich and prince Ali-Baba' [ibid.] There are some doubts about the name of the last sultan as in the chronicle he is not mentioned by name. A.A. Gorky thinks that, perhaps this 'tsarevich' was Mahmud Khodja (Makhmud-Hozya) [Gorsky, 2000, p. 142], who was mentioned in the agreement between the Galich Prince Yury Dmitriyevich and the Ryazan Prince Ivan Fyodorovich: 'Tsarevich Makhmut-Hozya with his army was also in your Galich...' [Spiritual and Contractual Charters, 1950, p. 86, No. 33]. As the Russian campaign in 1431 was performed as a reply to the raid of 1429, when Bulgar was

ruined, it is reasonable to suppose that it was carried out by the rulers of Bulgaria.

This raid could not remain unpunished, and in 1431 the Muscovite troops, led by Prince Fyodor Davydovich the Spotted from Stary Dub, were sent to the Middle Volga Region. The chronicles quite briefly note that the army was sent to 'the Volga Bulgars,' and the prince 'went there to take them and to conquer their entire land' [Complete Collection of Russian Chronicles, 25, p. 248; 27, p. 102, 269; 23, p. 147]. It is unusual that, for this mostly successful campaign, the chronicles do not contain mention about the prisoners taken and war loot. It makes one suppose that the success of this raid is exaggerated. In historiography disproportionate significance is given to this campaign as after 1431 in the chronicles the mention of Bulgar and the Bulgar land disappears forever. Only Kazan and the Kazan land are met. It is not excluded that the military events in the beginning of the 1430s sped up the final fall of the political significance of Bulgar, yielding to Kazan.

Summing up all the scant information from the Russian chronicles about the territory of the historical Bulgaria, it can be concluded that in the end of the 14th century 'the Bulgar land'—that is, the Bulgar Ulus, was divided at least into two parts: one was in the centre of Bulgar (perhaps, the capital), and the other one had its centre in Juketau. The first information about the autonomous political actions by the possessors of Juketau could be referred to 1360, when in reply to the attack of the ushkuiniks they complained to Khan Khizr, and he made the Russian princes deliver the raiders [Priselkov, 1950, p. 377; Complete Collection of Russian Chronicles, 30, p. 112; 25, p. 181; 27, pp. 242, 326]. The latest information where the Juketau emirs together with the Bulgar ones are mentioned as an independent military political force is referred to 1411, when they, being in alliance with the Suzdal Prince Daniil Borisovich, defeated the Muscovite troops at the battle of Lyskov [Complete Collection of Russian Chronicles, 15, p. 186, pp. 485–486].

On the contrary, the sources fix some elements of new centres increasing, an obvious process of a gradual decline, the loss of the

importance of old powerful centres, and the establishment of new ones. At least, from the 1360s to 1380s the sources point to four centres instead of two (Bulgar and Juketau).

A very important stage on the way for the union of all the Bulgar lands under the power of Kazan was the invitation to the sultan of the Jochids Giyath al-Din (1422–1425) to the throne. And Kazan was likely to be a centre of the Bulgar Ulus. It can be seen from a gradual decline of Bulgar as a leading centre of the Bulgar Ulus, while Kazan was strengthening step by step. At approximately the same time Kazan started making its own coins mentioning the place of coinage as 'Bulgar al-Jadid' [Muhamadiyev, 1983, pp. 118–135]. All this depicts the increased military power and political influence of the Kazan beks and sultans and their rising ambitions for sovereignty from the end of the 14–beginning of the 15th centuries.

To understand the structure of power in the Bulgar Ulus, it is important to underline that together with 'princes' on the territory of the Bulgar Ulus between the 1370s and the 1420s there are tsareviches (sultans). Evidently, the sultans ruling in Bulgar were Muhammad-Sultan (the 1370s), Bektut (ca. 1391), Yentyak (1398/99), Talych (1410), Giyath al-Din (1422–1425), and Mahmud Khodja (1429). Thus, there are clear testimonies that since the 1370s the Bulgar Ulus was ruled by a sultan from the Chinggisid dynasty, appointed by the khan. This conclusion not only excludes the existence in Bulgar of any local Bulgar dynasty but underlines the inclusion of these lands into the Tatar all-Horde clan system.

It is interesting that 'Prince Ali-Baba' was also mentioned as a participant in the campaign of 1429 against Galich [Complete Collection of Russian Chronicles, 25, p. 248; 27, pp. 102, 269]. If to connect the Kazan 'Votchich Libey' with 'Ali-Baba,' who headed the attack of the Kazan Tatars in 1429 on the Russian lands [Iskhakov, 2000, p. 151; Gorsky, 2000, p. 142], probably his name sounded as Ali/Hali, and the title was 'Bey/Bek.' Some researches relate him to Alim/Halim/-Bek, according to the Tatar historical narratives, recorded in the 'Daftar-i Chinggis-name' [Usmanov, 1972,

pp. 97–133], who was a son of the Bulgar ruler, 'Khan' Habdulla, killed by Timur. However, the legend itself about Alim-Bek is most probably a part of a historiographic tradition of Kazan and the mythologema of the khanate, underlining its origin both from the Jochid Ulus and from 'Saint Bulgar' [Izmaylov, 2006]. On the other hand, the name 'Libey' could hide the title 'ulubek' or 'ulusbek'—that is, the ulus ruler. It makes clear his title 'votchich,' which could not be referred, for example, to Giyath al-Din from the Chinggisid. It is not excluded that this term meant the ulusbek or the daruga as a chief of the Tatar clans and the governor of the military, political, and fiscal affairs in Kazan and in the Bulgar Ulus. All in all, by the present times there is no evident position about the origin of this Kazan 'votchich' or 'ulusbek,' but it can be noted that it played a key role in the system of the power in Kazan before an establishment of the dynasty of independent khans there.

This mention is also interesting because it allows us to confirm the idea that the real power in the Bulgar Ulus was performed by the representatives of the Tatar clans through their darugas (or later karachibeks), who had real power and commanded the military forces of the ulus. Taking into account these facts, it becomes clear that the Bulgar Ulus from the second half of the 14–beginning of the 15th centuries was in a situation when here power belonged to a sultan from the Chinggisids, and rule was carried out by the 'prince'/emir—daruga-bek or ulusbek. If to extrapolate this situation upon the structure of the central power, being at that time in Sarai, a total correspondence can be discovered. In the Jochid Ulus at the time of the Chinggisid khan the head of the state and military affairs was an ulug karachibek, as well as in the uluses at the times of the governing sultan there was a daruga-bek—that is, an ulusbek, or a prince-daruga, from the yarliqs to the Russian metropolitans. This structure by copying the governing system of the entire Jochid Ulus was a potential root of state power. There was only a need for a powerful sultan with authority who could defend his lands in the Middle Volga Region from the ambitions of Moscow and Saray.

The ruling Giyath al-Din did not carry out this mission, although he was close to it in the 1420s. However, from the middle of the 1420s Bulgar had started making coins with the names of the Horde khans. This demonstrates a decrease in the Kazan rulers' aspirations to power.

At the same time, the failures at the wars with the Grand Principality of Moscow (for example, the destruction of Bulgar by the Russian troops in 1431) made evident the incapability of the Bulgar governors to separately oppose the Russian troops and the absence of help from the Horde khans who were involved in the internecine wars. Thus, Bulgar as a regional centre and the capital of the united ulus gave the leading position to the other centre of power-Kazan. The later 'Kazan History' though tried to degrade Kazan by pointing to 'its humility for a short time, and its quiescence, and falling into decline, and being empty for 40

years' [Complete Collection of Russian Chronicles, 19, p. 13]. In fact, at that time the Kazan Emirate faced a significant economic and political growth, becoming a real centre that had united the lands of the Bulgar Ulus into one state. Precisely Kazan, being in the centre of a newly-cultivated agricultural region, without suffering from the wars of the previous decades, became a concentration of power and military force from all the ulus. Though, there was no political and military leader with authority in order to make a union.

That is why, when on the borders of the Kazan lands in winter 1438 there appeared Khan Ulugh Muhammad with a little squad, being exiled from the Lower Volga Region and fighting against Vasily II the Blind, the Kazan aristocracy most probably made a union with him and started a process of setting up an independent khanate.

§ 4. Finno-Ugric Peoples of the Middle Volga Region and the Cis-Ural Region in the Golden Horde Epoch

Finno-Ugric Peoples of the Middle Volga Region and the Cis-Ural Region by the early 13th century*

*Vladimir Napolskikh,
Vladimir Churakov*

Lands to the south of the Oka River in the basin of the Sura River and Volga-Moksha confluence were occupied by ancestors of the Mordovians: Erzya in the north and Moksha in the south of the region. It is quite probable that other Mordovian groups also lived there; among them there were ancestors of Tengushevo Mordovians, or Shoksha Mordvins, now populating the extreme north-east of the Republic of Mordovia, whose language and culture are marked with combination of traits both Erzyan (probably because of closeness of this group to the Erzya) and Mokshan (perhaps a

result of later influence) and by some original traits not evolved directly from these two components. In addition, groups of population kin to the Mordvins could move there from the regions further north: creators of the Ryazan burial sites culture, descendants of Muroma, the Meshcheras, and probably Merya mentioned in the chronicles who were pressed by Russian colonisation of the Oka River Region, as well as Eastern Slavonic and Baltic groups.

Politically, these territories were a kind of buffer zone between the Volga Bulgaria and the Rus' (Vladimir-Suzdal and Ryazan principalities). As early as 12th century the right bank of the Sura River probably was controlled by Bulgaria, whose influence in the early 12th century spread further west, to the upper reach of the Alatyr River (the Sarov Archaeological Site) and upstream of the Moksha River (the town of Narovchat). Russian principalities in their turn controlled the right bank of the Oka River and in the early 13th century extended their power to the lower stream of the Moksha (town of Kadom) and the mouth of the Oka

* The provisions of this part of the essay are mainly grounded in the article of one of the authors in the previous volume of 'History of Tatars' [Napolskikh, 2006].

(Nizhny Novgorod) [Belorybkin, Zelentsova, 2006]. Yet, in the 1220–30s the principality of Vladimir-Suzdal was weakened by several appanages appearing at its territory, all headed by sons of Vsevolod the Big Nest (1154–1212), and this contributed to the de-facto independence of the Mordvinian principalities. There between the Volga Bulgaria and the Vladimir-Suzdal Rus', where laid an important economical and political road between Bulgar and Kiev, the struggle with pro-Russian orientated partisans, *Puresh* and his son mentioned by the chronicles among them, was won by Mordvinian prince *Purgas*, who rose with some military help of the Bulgarian rulers and spread his power not only over the Mordvins but over the 'Rus of those from Purgas' [Complete Collection of Russian Chronicles, 25, pp. 122–123, 125]. Ponetayev or *Purgas* archaeological site of the 12–13th centuries in the upper reach of Tesha, could be the centre of the union [Mokshin, 1977; 1991].

Nor-east of the Mordvin lands, on the left and right banks of the Volga, between the Sura and the Kama Rivers, a community of Mari tribes had largely formed by the 13th century. However, the left bank of the Volga and Vetluzhsko-Vyatskoye Mezhdurechye had almost no exposure to the Bulgar presence and direct influence. The area covered with thick forest, with relatively infertile soil, and no important trade routes passing through it, was obviously not very attractive for the Bulgars, who preferred to be on friendly terms with the local inhabitants, without interfering in their internal affairs. The Mari were a kind of buffer between Bulgaria and Rus' (Ruthenia), which became even more important with the establishment of Nizhny Novgorod in 1221 and the appearance of a Russian enclave in the middle Vyatka Region no later than the turn of 12–13th centuries [Makarov, 2001]. The role of the Maris, who acted like federates for Volga Bulgaria, can be reconstructed from several circumstances: 'Cheremis,' the earlier, external name of the Maris, was apparently derived from the Turkic stem* *čer-* 'troops, to make war,' and initially (probably in the times of the Khazars, when the first Turks penetrated the Middle Volga Region) denoted the 'warlike' population of the

border area; in conflicts between the Russians and the Kazan Khanate field Maris always took the side of the latter and after the fall of Kazan, in the period of the Cheremis Wars at the latter half of 16th century, remained the last active force in the struggle against Moscow, although up to now no reinforced Bolgar Archaeological Site have been discovered in Mari Lands; despite the early involvement of the (*Cheremis*) Mari in the sphere of political interests of the Turkic states in the Volga Region (at least since the 10th century, judging by a letter by Joseph, a Khazar Khagan, who mentioned them), researchers date borrowings from a Bulgar language (Chuvash) no earlier than 13th century, which means the Mari ancestors did not have very close contacts with the Turks in the pre-Mongol period.

The right bank of the Volga, the Volga-Sura interfluvium, and the territory of modern Chuvashia were most likely populated by people close to the Mari (this follows from obvious parallels in traditional culture and anthropological type of the Maris and the Chuvash, numerous traces of language links, both lexical and systemic structural similarities of the phonetic systems in both languages, parallels in morphology and syntax), who at least since the early 13th century were known by their Mordvin name *ved'en* (the name of the Chuvash in modern Mordvin languages) recorded in the form of *Veda* in the 'The Word on the Death of the Russian Land' [Begunov, 1965, p. 150] and *Wedin* in a letter of Julian the Hungarian (see below). These areas were suited for intensive agriculture, and as early as the 11–12th centuries a strong Bulgarian influence was established there, and gradual assimilation and organic integration of the local population into the social system of the Bulgar state evidently began quite early. Besides the ethnolinguistic component *Veda* ~ *Wedin* related to the Mari, Mordvin groups in the west and *Burtas* in the south of the region could have been involved in the process (the ethnolinguistic affiliation of the people has not been established to date, although the hypothesis of its Alanian origin seems to be the most preferable) as well as other Finno-Ugric and Turkic groups of Volga Bulgaria.

The indigenous lands of Volga Bulgaria on the left bank of the Middle Volga from the Samara Bend in the south to the Kama River region in the north, besides the Bulgars proper (who by the early 13th century were also not ethnolinguistically homogeneous, as according to Bulgar epigraphics, besides R-Turkic, the Bulgar language itself, a Z-Turkic language of Oghuz-Kypchak type was also in use there), along with numerous members of the Old Russian, Armenian, Jewish, Khwarezm and other diasporas who mostly lived in towns, Finno-Ugric groups were also present. First of all, the so-called '*Julian Hungarians*' must be mentioned in this regard; they were evidently semi-nomadic pagans who lived somewhere within the borders of Bulgaria and spoke a language so close to Hungarian that Julian, a Dominican monk from Hungary who traveled east in search of his tribal kin, had no difficulties in understanding them [Anninsky, 1940, pp. 81–100]. Archaeologists are looking at the possibility of correlating the builders of the Bolshoi Tigan burial site made over the 8–10th centuries on the left bank of the Lower Kama and some other sources from the area of Volga Bulgaria [Khalikova, 1976] with this people: '*Julian Hungarians*' are assumed to be part of the Old Hungarian tribal community that remained in the Middle Volga Region, whereas most of the Old Hungarians embarked on further historical migration from the hypothetical Ugric ancestral home in the south of Western Siberia, through the southern Cis-Ural and Volga Regions to the steppes of Kuban River Region and the Northern Black Sea Region region, which ended with a new homeland in Pannonia, which the Hungarians captured in the 9th century.

In the Bulgar epoch the region of the Lower Kama, especially its right bank (modern Zakazanye, lower reach of the Vyatka River), was most likely populated by the direct ancestors of the Udmurts and the Besermians, who were culturally and linguistically close to the former; they originated in the Perm ancestral land in the middle Cis-Kama Region, and their close contacts with the Bulgars (or more precisely, inclusion in the Bulgar sociocultural environment) were marked by numerous old Bulgarisms observable in the Udmurt language. It is

thought that there, within the borders of Volga Bulgaria, was the birthplace of these two ethnic groups with typical traits of their languages, traditional cultures, and self-names. In Bulgaria they formed a mostly peasant agricultural population that paid regular tributes (Udm. *kerś* - Bulg. Chuv. *χῑrâś* / *χῑrśâ* 'poll tax, public fees'—Arab *ḥarj*' expense; share, contribution, tribute) and refused to adopt Islam (the Besermyan ancestors should be noted for their special piety for Islam and its recognition as a component of folk religion). On the eve of the Mongol invasion it was evidently the Udmurts who, compared to other Finno-Ugric peoples of the region, were most deeply involved in Bulgar society; they were actually one of the ethnic groups of the country. Their organic integration into Bulgar society was the obvious reason why the Udmurts were never mentioned in written sources up to the second half of the 15th century.

The Bulgar (R-Turkic speaking) population, at least since the 14th century (Bulgar epitaph from the village of Gordino in northern Udmurtia), lived in the basin of the Cheptsä River, and there is reason to assume that no later than 13–14th centuries some groups of Bulgars, who were ancestors of the Cheptsä (Karin) Tatars, together with the Udmurts and the Besermians began moving northwards up the Vyatka River. Today there are no grounds to say for certain that the Udmurts and the Besermians lived on the Cheptsä during the pre-Mongol period, and yet this possibility cannot be excluded. In any case, the formation of the northern Udmurt massif should have followed the appearance of the Vyatka Lands, a Russian enclave in the Middle Vyatka Region, as the self-name of Cheptsä Udmurts, *Vatka*, was derived from the Russian name for both the Vyatka River and town of Vyatka, and the Vyatka Lands.

Beginning in the 9–10th centuries a system of fortified settlements known in the archaeological literature as the Rodanovo and Chepetsä archaeological sites began developing in large areas of the upper Cis-Kama and Cheptsä Regions at the northern periphery of Volga Bulgaria. The period when these sites existed coincides with Volga Bulgaria; their population conducted active trade with Bulgaria, and materials

of these sites prove mass hunting of fur-bearing animals, beaver in particular; according to pre-Mongol Arab sources, fine beaver furs were brought to the Bulgar land from a northern land called *Aru*. The name *Aru* (ارو) can be traced to the general Turkic root *aru 'the one on the opposite side': perhaps that was the name the Bulgars used for the northern lands beyond the Itil—that is, the modern areas of the Kirov Region, Udmurtia, and Perm Krai. Later the word became the base of the Tartar name for the Udmurts (*ar*) as the main people of the former *Aru* country and closest to the Tartars (see: [Belykh, 1996]). Some of the largest Rodanovo and Chepetsa archaeological sites revealed traces of a fairly large Muslim Bulgar population. On the other hand, none of the sites had any traces of any local polity organisation: residences of princes or rulers, public sanctuaries, etc. These circumstances give reason to regard Rodanovo and Chepetsa archaeological sites as Bulgar outposts with collecting furs as their main function; the sites could have been managed by both Bulgar groups of merchants, officials, and warriors and by members of the local leading tribe. Archaeological cultural traits originating from the Cis-Kama Region, the ancestral land of the Perm, led to the hypothesis that the main population of the sites spoke the Perm language, yet discussions (in the way of archaeologists) of its closeness to the Komi or Udmurt languages make little sense. However, non-Perm and non-Turkic speaking peoples might have lived there since Udmurt folklore has preserved the names of powerful rulers of Chepetsa sites of neither Perm nor Turkic etymology.

When the Chepetsa-Rodanovo ancient towns ceased to function in most of their area following the demise of Volga Bulgaria in 14th century, the local Perm population went on to different destinies. The people of Chepetsa joined the Udmurts—*Vatka*, who had moved upstream of Chepetsa from the Middle Vyatka. The Udmurts' assimilation of the Perm population of Chepetsa, who spoke a similar language, was quite fast and trouble-free, which is proved by the fact that above-mentioned tales of Chepetsa bogatyrs, whom the Udmurts saw as their own kin, were widespread in the folklore of the Chepetsa Udmurts.

The destiny of the northern Perm population was linked to the increasing role of Russian (Novgorod and Vladimir-Suzdal') influence in the north-east. The population of Vychehda was primarily reoriented to Rus', as the founders of the Vym archaeological culture, where ancestors of the Komi-Zyryans can be seen mixed with the local Perm-speaking population originating from the Cis-Kama Region. Russian sources named them *Vychehda Perm*. The population of the Rodanovo-type ancient towns in the Upper Kama River Region on the demise of Volga Bulgaria became dislocated. The foundation of these centres was also gradually reoriented to Rus'; and this can be observed in particular in the growing role and importance of the northernmost part of the Rodanovo site area, the area of Cherdyn, *Great Perm* of Russian sources, in the 14–15th centuries, with the simultaneous decay of what were formerly the largest ancient towns in the southern area. The process of economic, political, and cultural reorientation of *Perm* ended with the baptism of the Komi in Vychehda and then in the Upper Kama Region (see below).

The Mongol conquest and the fate of the Finno-Ugric peoples. The aggressive Mongol campaigns became a curse for many peoples and states of the Old World. Among the first to experience the destructive power and cruelty of the nomads in Eastern Europe were Finno-Ugric peoples of the Middle Volga and Cis-Ural Regions, which in the beginning of the 13th century had evolved into different integration models, the structures of political, socio-economic, and cultural spaces of the Bulgar State, Vladimir-Suzdal Rus', and Veliky Novgorod.

The massive campaign of the Mongol army, which, according to the decision made at the quriltai in 1235, aimed to conquer 'the countries of Bulgar, the Ases, and Rus' [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 22], started in 1236. Volga Bulgaria was the main target for destruction, the plight of whose capital was recorded in Eastern and Russian chronicles [Ibid., p. 23; Complete Collection of Russian Chronicles, 25, p. 117]. After crushing individual attempts to resist the invaders in 'other areas' of Bulgaria,

the Mongol tsareviches 'after calling a council each went with their armies to the rout, starting battles and conquering all the areas along the way' [Rashid al-Din, 1960, II, p. 38].

Worth noting is the story of Julian about two princes in the Mordvin land, one of whom 'with all his people and family obeyed the Tatars,' and the other one 'with a few people went to highly fortified places to defend themselves if they were strong enough.' This record, dated 1237, resembles the reports of Russian chronicles about the suppression that erupted in the Mordvin lands in 1239, on the eve of a Mongol campaign to Western Europe [Complete Collection of Russian Chronicles, 25, p. 130], and also the information of William of Rubruck that he received in the Lower Volga Region in 1253, reporting on the difference in the position of the two neighbouring nations, *moksel* (*Moxel*) and *merdas* (*Merdas*) [Travels, 1957, p. 110]. Concerning the first, Rubruk wrote that 'they have no cities and live in small huts in the forest. Their sovereign and most of the people were killed in Germany. It was the Tatars who led them before coming to Germany.' Concerning the *Merdas*, it was only stated that they were 'Saracens.' In view of the reports, it can be assumed that as a result of a failed uprising against the invaders, a certain Mordvin prince, possibly the same about whom Julian wrote 'to defend themselves if they were strong enough,' ultimately had to recognise the power of the Mongols. The conquerors, for their part, as was frequently the case in other countries, forced the defeated forces to take part in the military campaign to Hungary and Germany in 1241.

The consequences of the Mongol campaigns for agrarian peoples, such as the Finno-Ugric peoples of the Middle Volga Region, were devastating. Destruction of urban and rural settlements, the damage to crops by the numerous mounted troops, physical destruction of a large number of people, and carrying off spoils had a huge impact on their social development. Lands that escaped a large-scale invasion of the nomad conquerors, which may include the main resettlement areas of the Mari and Udmurt, were also in an untenable position: an influx of refugees and the destruction of the social infrastructure that linked the pe-

riphery with Bulgarian centres of political, socio-economic, and cultural life had far-reaching implications for their development. The period of the Mongol campaigns was obviously a turning point with respect to a change in the pro-Bulgarian position of the Upper Kama River Region and its gradual involvement in the rising influence of Veliky Novgorod and north-eastern Russian principalities.

The catastrophic events of the Mongol conquest, which caused large population movements, increased the assimilation processes in Volga Bulgaria. This was apparently the time (latter half of the 13–beginning of the 15th centuries) when the final assimilation of the Finno-Ugric population from the right bank of the Middle Volga Region and the formation of the Chuvash people took place. The complexity and diversity of the phonetic correspondence of the Chuvash language with Turkic can be understood only by accepting the hypothesis of several successive waves of Turkisation of the proto-Chuvash population, and consequently, of a continuous process of transition of these populations to an R-Turkic language. It is likely that the 'Julian's Hungarians' were assimilated during the same period (and possibly partially eliminated, since they were nomadic and had a population of military value involved in the Mongol campaigns): ethnotoponyms such as *Machar*/*Mozhar* occur in Russian (predominantly) historical sources of the Kazan Khanate era, but there is no evidence that there was a corresponding group with a special language and self-awareness [Vásáry, 1977].

After the active phase of the aggressive Mongol campaigns, the establishment of the Golden Horde contributed to a gradual stabilisation in relations with the agricultural periphery and nomadic nucleus of the state. New forms of organisation of social links were worked out (first of all, in managing the collection and delivery of tributes to the Horde), and wherever possible, the old links were rebuilt (mainly trade contacts, which were broken in the previous period, since providing intermediary services was also one of the main forms of replenishing the Khanate treasury). Lands of the Udmurts and Mari people were probably included directly in the Bulgar Ulus of the Gold-

en Horde and were governed by its authority. The Mordvin land with its princes was apparently a vassal political entity, in which, however, there was a centre of the Horde's authority, the town of Mukhshi (Narovchat), which had also emerged. In the latter Mordvin princes repeatedly helped the Golden Horde khans by participating in the campaigns to Russian lands [Complete Collection of Russian Chronicles, 25, pp. 122–123, 125, 193], and according to Sharaf al-Din Ali Yazdi, the Mordva(m.k.s) are mentioned within the multi-tribal troops, gathered by Khan Tokhtamysh from all the Jochid Ulus and sent in 1388 against its recent benefactor—that is, the Middle Asian sovereign Timur [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 156].

Well-known sources of the 13–15th centuries say little about the everyday life of the Mari and Udmurt in the Golden Horde but contain slightly more details about the position of the Mordvins, stressing that the main activities of these people were agriculture, livestock management, various forest activities, and fisheries [Travels, 1957, p. 110; Barbaro and Contarini, 1971, pp. 134, 159]. Obviously such a complex economy based on cultivating fields was inherent for the Maris and Udmurts. Various authors have also repeatedly noted the 'pagan' manner of Mordvin beliefs. One of the most elaborate early descriptions of specific religious practices can be found in an essay by Giosafat Barbaro, who held that he had 'some experience with the Mordvins (*Moxia*)' [Barbaro and Contarini, 1971, pp. 134, 159]. Obviously, even after Islam became the official religion of the state during the reign of Khan Öz Beg, in relations with the dependent population the rulers of the Golden Horde did not make any active efforts aimed at Islamisation. This, of course, does not in itself mean that the adoption of Islam by the representatives of the Mordvins, Maris, and Udmurts was official. Furthermore, it should be recalled that one of the last events since Bulgarian times under the influence of neighbouring Muslims was the disconnection of the ethnosocial group of the Besermyans.

Dynastic crises, which shook the Golden Horde in the latter half of the 14th century, led to a gradual weakening of its authority in the

dependent territories. Many princes and simply noble and arrogant aristocrats began to occupy some remote territories. Thus, in 1361 prince Bulat-Timur, after capturing Bulgar and 'capturing the whole Volga Trade Route,' obviously extended his power over the eastern regions of the Mordvin, Mari, and southern Udmurtia lands; in 1362 the Mordvins were conquered along the Pyana River by a native of the Azov Sea Region Segiz-Bek; 'and another prince of the Horde called Tagay from Bezdezh, and seized the country of Naruchyad' and remained there' [Complete Collection of Russian Chronicles, 25, p. 181; 15, p. 71]. At the same time, the Vyatka Lands on the Middle Vyatka became stronger. Among its subjects were the Northern Udmurt-*Vatka* (that is, inhabitants of Vyatka). Taking advantage of the weak Horde, the princes of Nizhny Novgorod, Suzdal, Novgorod, and Vyatka in the 1460–1470s frequently 'went on campaigns' to its Volga Region lands, looting the Mordvin, Mari, and Southern Udmurtia settlements on their way along the Volga, Kama, Vetluga, and Vyatka Rivers. Russian chronicles report that one of these detachments was crushed in the Arsk Lands in the territory of the southern Udmurts [Complete Collection of Russian Chronicles, 25, p. 201]. The temporary revival of the Golden Horde's power during the reign of Khan Tokhtamysh (1380–1398) and Edigu, who reigned on behalf of Khan Shadi Beg (1399–1407) and Bulat (1407–1411), could not stop the disintegration processes. A large part of the Mordvin land was joined to the Ryazan and Moscow Principalities by the end of the 14th century, and with the establishment of the Kazan Khanate by the former Golden Horde Khan Ulugh Muhammad and his son Mahmud in 1438–1445, the Mari and southern Udmurts became its subjects.

As mentioned above, just before the Mongol invasion of Eastern Europe, two integration processes were starting to take place in an area populated by Komi farmers. The Komi who lived in Vychegda had to pay tribute to Veliky Novgorod. However, by the end of the 12th century the princes of Vladimir-Suzdal started to intervene persistently in these relations, making their claims to the right to own this

wealthy fur region. In 1178 Prince Vsevolod founded the 'town of Glyaden' in the estuary of the Yug River; and in 1212 his son Konstantin Vsevolodovich, the prince of Rostov, 'founded the city of Ustyug' [VVL, 1958, p. 257]. Ustyug later became a stronghold for entering and establishing grand-ducal power in the Vychehda Perm land. The other part of the Komi living in the Upper Kama River Region, as early as the 10th century, was inclined to maintain close socio-economic and cultural relations with Volga Bulgaria, the destruction of which in 1236 by the Mongols was the reason for the gradual involvement of the Upper Kama River Region in the sphere of interests of the north-eastern Russian lands.

The Grand Princes of Vladimir were the most active in the 13–14th centuries in the nearer Vychehda Perm, gradually forcing the people of Novgorod people out. Although the Mongol campaigns did not reach this area directly, part of the tribute collected from it by the people of Novgorod and Ustyug was payment of 'a black exit' to the prince of the Golden Horde.' In 1333 the Great Prince of Vladimir Ivan I, obviously because of a delay in delivering the 'door,' supposedly extending 'from Vychehda and from Pechora,' 'drew his anger against the people of Ustyug and Novgorod,' as a result of which the latter were forced to give him 'Vychehda and Pechora, and since then the Prince of Moscow began to collect tribute from the people of Perm.' In 1364 Grand Prince Dmitry Ivanovich took 'Rostov and Ustyug and Perm in Ustyug areas' from Konstantin, the Prince of Rostov. In 1367, after the conflict with the people of Novgorod, he 'took for himself Pechora, Mezen,' Kegrol.' The people of Perm kissed Cross for Prince Dmitry, but the people of Novgorod did not intend to' [Ibid., pp. 257–258].

A further step toward strengthening his positions in Vychehda Perm was support from Grand Prince Dmitry Ivanovich of the mission of Stefan, a monk of Ustyug, to convert the Komi to Orthodoxy, endorsed by Metropolitan Alexis. His missionary work began 'on Pyros and Viled' in 1379, where he baptised 'impious tribes of the Perm people.' Like 'the illuminators of the Slavs' Cyril and Methodius, Stefan

created a 'Permic alphabet' and translated a range of ecclesiastical texts into old Permian. His efforts to teach neophytes formed the basis of the old Permic script. The success of Stefan of Perm's activities made it possible to establish the Bishopric of Perm in 1383 with the centre in Ust-Vym, with 'the Apostle of the Zyrians' himself appointed as its first bishop [Complete Collection of Russian Chronicles, 25, p. 211]. However, the Christian confession was consolidated in Vychehda Perm immediately: in 1389 'the Permyak idolaters...' who came to Yaransk from Udora and Pinega '...burned a monastery of the Holy Virgin Mary, robbed and flogged local people'; in 1392 the supporters of Perm sotnik Pam, an active enemy of Stefan's missionary work, plundered the churchyards near Ust-Vym together with the Vogul prince Asyka [VVL, 1958, p. 260].

At the beginning of the 14th century the residents of Vychehda Perm were drawn once again into the relations between Moscow and Veliky Novgorod [Ibid.]; and starting in the second quarter of the 15th century the Vychehda lands became the scene of bloody confrontations of the contenders to the grand-ducal throne—Vasily II and his uncle, the Prince of Galicia Yury Dmitriyevich, after whose death Dmitry Shemyaka, a son of Yury, led the struggle against Vasily. In 1451 Yermolay—one of the members of the side branches of the princes of Vereya—who started the dynasty of the 'princes of Vym,' was appointed as regent to Ust-Vym with the right 'to rule in the Vychehda Perm land... granted by the order charter and patent' issued by the Grand Prince Vasily II for organising a battle against Shemyaka (died in 1453). At the same time, his eldest son Mikhail was sent as a regent to Cherdyn, the centre of Great Perm, where he became an ancestor of the dynasty of 'Great Perm princes' [Ibid., p. 261]. Thus, by the middle of the 15th century both historical settlement areas of Komi, Vychehda Perm, and Great Perm were already firmly under the socio-economic and cultural influence of Muscovite Rus'. However, the administrative disunity, which historically prevailed there, and the later start of the baptism of Great Perm related to this became the main factors in the formation of two closely

related nations—Komi and Komi-Permyaks—in 1455 during the time of Pitirim, the fourth bishop of Perm.

The Mordvin lands as part of the Golden Horde

Gennady Belobrykin

In the early 13th century the Mordvin were situated in the Sura and Oka interfluvium and lived in compact groups in the basins of the Moksha and Tesha Rivers. This is shown by the large number of settlements and burial sites with cultural characteristics of the Mordvin [Shitov, 2000].

The number and area covered by the monuments were constantly changing under the influence of the political and military situation. In the Moksha River Region in the south, due to the expansion of Volga Bulgaria, Bulgar-Burtas settlements spread quickly, which were not only located among the Mordvin but also had a great influence on them [Belobrykin, 2003]. A striking example of this is the distribution of red circular pottery on Mordvin monuments and the appearance of imitation pottery.

The situation was the same in the northern Mordvin territory at the mouth of the Oka River. Penetration of the Russian population from the north and Bulgars from the south into Mordvin territory was followed by military campaigns and mutual raids of Mordvins to Russian fortresses and Bulgarian military detachments.

That means at the beginning of the 13th century the Mordvin land was the scene of battles between Rus' and Volga Bulgaria. But the situation changed abruptly as a result of the Mongol invasion.

At the end of the summer of 1237 the Mongol-Tatar army crossed the Volga (Itil) with all its wagons and moved towards Rus', but on reaching the Uza River, they stopped and remained there until the end of the year. Persian historian Rashid al-Din described these events thus: '...in the year of the chicken—that is, the 634th year of Hegira, the sons of Jochi—Batu, Orda, and Berke, a son of Ughetai-Khan—Kadan, a grandson of Chaghatai—Buri, and a son of Chinggis Khan—Kulkan made war on the Mokshas, the Burtases, and the Arjans

and conquered them' [Collection of Materials Relating to the History of the Golden Horde, 1941, p. 36]. As a result, almost all cities and villages of the Burtases and the Mordvins were destroyed, and today archaeologists only find some parts of the burned buildings mixed with Mongol arrowheads and traces of the destruction in the settlements. A picture of the battle has been preserved especially clearly in the ancient town of Zolotarev, where the defensive walls and ditches are strewn with arrowheads, and the surroundings are littered with bones of slain warriors and town residents [Belobrykin, 2001].

People still remember the legends about the Tsarina Narchatka, who fought the Mongol army on the ice of the Moksha River, and seeing that the battle was lost, plunged into an ice hole with her horse [Lebedev, 1958].

In 1239, before moving towards Kiev, Batu sent part of his troops to conquer the Mordvin lands. With fire and sabre, they reached as far as Nizhny Novgorod and back. As Mordvin scholars have rightly assessed, this was due to the need to replenish Mongol troops with conquered peoples [Grishakov, 2004, p. 57]. However, the Mongols only managed to conquer the local population in 1242, when Batu sent his best commander Subutai to the Middle Volga Region. As a result, the population of the Sura and Oka interfluvium were nearly decimated. Archaeologists know only of three or four small settlements of that time in the Upper Sura River Region and a few dozen in the Upper Moksha River Region. Most of the surviving Burtases and the Mordvins moved north to the Middle Sura River Region and the Moksha Region. The Golden Horde uluses emerged later in the Mordvin lands. Bakhmet, one of the first of the Golden Horde 'princes,' captured the Meshchera lands in the lower reaches of the Moksha River Region in 1298. The Mishar, Beklemishev, and Bakhmetyev princes were descended from him. The Moksha Ulus was formed in the beginning of the 14th century. In 1361 the 'prince' of Azov Region Sekiz-Bey subordinated the territory south of the Pyana River. Another emir of the Horde founded the city of Nuridzhan (Mokshi) at the same time. In the second half of the 14th century 'prince'

Spear. Tatarskaya Laka burial site. 13–14th centuries.

Bekhan settled in the middle reaches of the Moksha River in the area of Temnikov. All of this was followed by a mass migration of Tatars to the Mordvin lands.

The events that followed the Mongol invasion were described in detail by Giovanni da Pian del Carpine: 'This country beyond the Tanais River is very beautiful and has rivers and forests, where two peoples live, namely the Moksel, who have no law and are pure pagans. They have no cities and live in small huts in the forest. Their king and most of

the people were killed in Germany. The Tatars ruled them before coming to Germany, so the Moksel approve the Germans, hoping that they will help them to become free from Tatar servitude. If a merchant comes to them, whoever hosts him for the first time must take care of him for the whole time he wants to stay among them. If someone sleeps with another man's wife, he does not worry about it until he sees it with his own eyes; hence, they are not jealous. They have an abundance of pigs, honey, wax, valuable furs, and falcons. Other people live among them, who are called Merdinis by the Latins, and they are Saracens. Etilia is located beyond them' [Giovanni da Pian del Carpine, 1997, pp. 108–109].

Signs of the existence of two peoples and two princes in the Sura and Oka interfluvium are quite evident from the sources. One people, the Moksel (probably Moksha), was ruled by a prince who, according to Julian, obeyed the Tatars; and William of Rubruck adds that they were pure pagans, and their ruler was killed in Germany. The other people were Merdas, whose prince, according to Julian, tried to resist the Tatars; and the people themselves, according to William of Rubruck, were followers of Islam.

Based on the fact that those two peoples belong to the Mordvin, researchers believe that William of Rubruck was mistaken. However, given that there were a large number of settlements of the Burtases in the Moksha River Region integrated into Volga

Bulgaria, where Islam was established as the state religion, the existence of Muslims among the Mordvin cannot be explicitly denied. A comparison of the names Merdas and Burtases shows their similarities. Based on those findings, it is fair to assume that one of the peoples were Bulgar-Burtases living in the Upper Moksha River Region and the Sura River Region; and other were Mordvin, who lived on the Moksha and Tesha Rivers. Representatives of these particular peoples were taken by the Tatars on a military campaign—it is not by chance that the majority of burial sites on the Tesha River and in the Moksha River Region region ceased to exist.

Information on the princes or sovereigns of these peoples support the records in the Russian manuscripts about Prince Purgas, the ruler of a volost in Mordvin territory, the capital of which was most likely located between the Moksha and Tesha Rivers. The most appropriate settlement in this regard is the ancient town of Sarovka located in the centre of this land.

The capital of the prince of the Merdas (Burtases) was situated in the Upper Moksha River Region most likely at the Narovchatskoye archaeological site, which subsequently became the capital of the Golden Horde Ulus of Moksha. This is also shown by the fact that there is no gap between the pre-Mongol and Golden Horde materials.

At the same time, the Bulgar-type monuments in the Upper Sura River Valley and the Upper Moksha River Region have been almost completely destroyed. Separate settlements reappeared in the Sura River Region only at the end of the 13th century, but already with Golden Horde pottery and Polovtsian burial mounds [Polesskikh, 1977]. Simultaneously, Mordvin-Moksha burial sites appeared far south of the Sura, in the upper reaches of the Medveditsa River.

Golden Horde settlements also appeared in the Moksha River Region at the end of the 13th

century, after the ruin of the Bulgarian-type settlements. However, there were many more of them than on the Sura. The formation of the Golden Horde settlements was accompanied by the concentration of Mordvin monuments near them and the disappearance of the settlements and burial sites in the middle reaches of the Moksha River. In addition, the Mordvin Starostensky burial site appeared right in the city of Moksha, the centre of the ulus. Taking into account the appearance of Mordvin-Mokhsha historical monuments on the Samara Bend and in the upper reaches of the Medveditsa River, the tendency of Mordvin monuments to spread from the Moksha River Region to the south and east should be noted.

The Volga-Tesha group of monuments also suffered losses. Monuments in the middle reaches of the Tesha River almost completely disappeared, while graves appeared under the burial mounds [Martyanov, 2001]. At the same time, the monuments on the Pyana River and on the right bank of the Volga River were fully preserved and even increased.

The situation in the Oka River Region during this time was relatively stable. At the same time, there was a rapid spread of Old Russian burial sites, indicating the displacement of the Mordvins from the northern lands.

Thus, one part of the Mordvin-Mokhsha historical monuments in the Vad-Moksha interfluvium is concentrated around the city of Moksha, and another one has been moved to the east (Samara Bend) and south (the upper reaches of the Medveditsa River). Monuments of Mordvin-Erzya almost completely disappeared on the Tesha River but remained intact on the Pyana and Volga Rivers.

Although the Horde 'prince' Arabshah defeated the Russian army on the Pyana River in 1377 and plundered the outskirts of Nizhny Novgorod, he probably did not touch the Mordvin settlements, since the Mordvin princes attacked the villages of Nizhny Novgorod themselves and robbed them in the same year. However, the Russian chronicles report that Russian princes and defeated Mordvin detachments had plundered their land: '...attacked the Mordvin land, burnt neighbouring towns and villages, and robbed their churchyards and

Stirrup. Tatarskaya Laka burial site.
13–14th centuries.

huts, and killed them and captured their wives and children, and emptied their land' [Complete Collection of Russian Chronicles, 11–12, p. 29]. However, there were no abrupt changes in Mordvin settlement in the 14th century either on the Pyana River or on the Moksha River.

According to the archaeological data, all of these areas were occupied by Mordvin tribes. Most archaeologists consider a group of archaeological monuments of the 12–14th centuries in the basin of the Tesha and Pyana Rivers (Sarleysky, Korinsky, Guginsky, I–II Bornukovsky, and Ml. Kuzhendeevsky burial sites) to be the burial sites of the Mordvin-Erzya [Finno-Ugric Peoples, 1999]. The settlement area of Erzya is still located there. The monuments of that time are enhanced by ethnographic features: the northern position of the buried became consistent, ring-shaped clasps were becoming widespread, and most of all there were no items or distinctive features typical of Mordvin-Mokhsha historical monuments. The first reliable mention of the ethnonym 'erzya' dates to the 13th century [Rashid al-Din, 1960, II, p. 38].

The Moksha River basin is the location of the Yefayevsky, Panzhinsky, Krasnoslobodsky, 'Zarya,' and other burial sites of the 12–14th centuries, which preserve the ethnographic features of the Ancient Moksha—that is, the southern orientation of the buried, the predominance of dead women who were laid on their

side in a crouching position, the preservation of temple pendants with rhombic plummets (Yefayevsky burial site) and their replacement during the 13–14th centuries with pendants in the form of a question mark, the widespread occurrence of syulgamas with trapezoidal patterned plate corselets, and thick splints of 'puloker' type [Alikhova et al., 1959].

The area where the monuments are located, which is usually considered to be Ancient Moksha, coincides with the present-day settlement of the Mordvin-Moksha. The first reference to the name Moksha also dates to the 13th century. William of Rubruck, who visited lands conquered by the Mongols in the mid-13th century, wrote about the people thus: 'The Moksel, who have no law, are pure pagans' [Giovanni da Pian del Carpine, 1997]. As we have already seen above, Rashid al-Din put them together with the Burtases and the Arjans.

Obviously, some groups of the Moksha fled to the Bulgarian lands as a result of the Mongol invasion. This was how groups of the Mordvin might have appeared near Samara Bend and in the Kazan Volga Region, where they left the burial sites of Muran, Kartashikhino, and other types [Alikhova, 1954]. A small group of the Mordvin-Qaratays may have remained on the Volga River, opposite the mouth of the Kama River since that time.

By the mid-15th century almost all of the territory occupied by the Mordvin-Erzya was included in the Russian State. The Mordvin-Moksha, who occupied the more southern regions, continued contacts with the Turkic-speaking population of the Western Povolzhye, the developing Tatar-Mishars. In the 16th century almost all the lands inhabited by the Mordvin became part of the Russian State, which strengthened the process of convergence between the Mordvin-Moksha and Mordvin-Erzya and the formation of a single nation.

The integration of the Mordvin territories into the Jochid Ulus had a great impact on their economic growth. In the southern regions it appeared first of all in agriculture and handicrafts. In the northern lands the influence of the Golden Horde had an impact on the spread of jewellery; however, it had almost no effect on forestry—the basis of the economy.

At the end of the 13th century, under the influence of the Golden Horde Ulus of Moksha, a plough started being used in the Moksha River Region, as proved by the discovery of a ploughshare in the ancient settlement of Panzha and on shelves in the Staraya Sotnya burial site. However, both a wooden plough with metal tips and a heavy plough were mainly used on the forest-steppe black soils, around the city of Moksha. Ploughs started being used in forest areas only in the 14th century. This is evidenced by the Nizhniye Borki treasure, which consisted of 4 ploughshares, 1 sickle, 5 arrowheads, and tools [Tsirkin, 1971].

At the same time, there is some evidence of livestock breeding in the Moksha River Region as a result of osteological studies at the Ityakovo archaeological site (layers of the 13–14th centuries) [Golyshenkov et al., 1970]. They revealed that undersized horses of a steppe appearance and cattle, also undersized and underweight, prevailed in domestic herds. Bones of small livestock and dogs are also found. Bones of the same animals are also found in graves but rarely, apart from horse burials. Horses and pigs were generally most common in Mordvin settlements.

The most common activities of the Mordvin throughout most of the Middle Ages were handicrafts. Hunting for fur-bearing animals and honey collection prevailed in the Mordvin lands. The composition of the fur game can be seen in the fact that there are still foxes, martens, weasels, squirrels, wild boars, and ferrets in the forests of the area as well as beavers and muskrats in the floodlands. Apart from fur-bearing animals, the Mordvin hunted elk and bears, which were found in the forests until recently.

The bones of wild animals and birds were also found at Ityakovo settlement in the Moksha River Region, which together with arrowheads are evidence of hunting, while fish bones and scales with fishhooks and spears are evidence of fishing.

Written sources report on the development of apiculture in Mordvin territory. In the mid-13th century William of Rubruck wrote: 'They [Mordvin] have an abundance of pigs, honey and wax, valuable furs, and falcons' [Giovanni da Pian del Carpine, 1997].

ni da Pian del Carpine, 1997, p. 109]. This is also shown by discoveries of wax fragments.

In the 15th century Giosafat Barbaro wrote about the handicrafts of the Mordvin-Moksha: 'This is how they worship it [the horse.—*G.B.*), offering sa-
bles, ermines, gray squirrels, foxes, and other furs... These people live mainly on meat, most of which is wild meat and fish they catch in local rivers. This is all I can say about the 'Moksha' [Barbaro and Kontarini, 1971, p. 159; Mokshin, 1993, p. 16]. Forest animals and mushrooms and berries were also a common part of their diet.

We may make judgments about Mordvin beekeeping activities based on the text of 'The Tale of the Ruin of the Russian Land' of the mid-13th century [Slovo, 1957, p. 253]. Although all of this information relates to a later time, we can assume that the handicrafts mentioned in them had existed previously.

In our opinion, hunting for fur-bearing animals became especially important at the time when international trade routes were established, passing through the region and large states appeared.

The town of Mokhshi, the destination of products and goods, was a major consumer of Mordvin agricultural products and handicrafts. Handicrafts, which were dominated by pottery and cast iron cookware, iron tools, and household items as well as jewellery and money spread from there.

Starting in the 16th century red circular pottery was found in large amounts at southern Mordvin settlements. The most prevalent forms were pots, jugs, and dishes. Black Old Russian circular pottery still prevailed in the northern Mordvin settlements. On the Samara Bend, where a large group of Mordvin historical monuments were built, pottery typical of Barabashovo appeared, which mixed the tradi-

Hand-thrown pottery and pipes.
Nuridzhan. Mokhshi. 13–14th centuries.

tions of Mordvin, Bulgar, and Russian pottery represented mainly by pots and bowls [Alikhova, 1954].

Owing to the high demand for iron in the city of Mokhshi, metal working began to grow rapidly in the Moksha River Region.

Iron-smelting furnaces have been found in the ancient settlements of Polyanka and Panzha and Starodevichye II in the Moksha River Region. There are traces of ore, slag, and blooms around them. In the 19th century an ancient mine in the form of a deep trench and iron-smelting furnaces were found near the village of Rybkino, where iron was mined. There were many fragments of burned clay, charcoal, slag, and blooms.

Under the influence of the Golden Horde new jewellery emerged, changes were also occurring along with old ones. The most remarkable in this respect was syulgamas, spread over the whole territory of the Mordvin. Examples of this style included rings with spirals at its end and blades. The first appeared in the 12th century, and the bladed ones throughout the Golden Horde period acquired specific forms. Blades gained a flat convex shape in the form of a triangle, and a tip of the lug of these syulgamas was hammer-flattened in the form of a rhombus. Bells were also changed, which then began to make two engraved halves.

In the Moksha River Region a splint attached to the headgear had disappeared from the Tesha River Region, while a splint with a braid inside continued to be used, and head-dresses were widespread and appeared even in Samara Bend. In fact, a splint was additionally placed into a wooden or bast case and wrapped with a leather string and bronze wire (Dolgorukovo, Staroye Badikovo I, Bednodemyanovsk, Krasnoye I, Muranka burial sites). All head-dresses were divided into two types: with and without a rod.

Braided and laminated bracelets with an engraving portraying lions' heads and floral rosettes, ribbon-like bracelets with snake heads at their ends, rings and embroidered patches with Arabic script, mirrors, earrings, and new types of cover plates for belts and buckles prevail among the mass jewellery of the Golden Horde. Braided bracelets with carnelian inserts at their ends and syulgamas with triangular blades in cross section became popular. At the same time, there were rare items, for example, linings for leather bags. An inlay depicting an animal with its head twisted round and a long tail curled behind its back and six figured rays was found at the Narovchatskoye archaeological site [Lebedev, 1958]. One of these inlays each was found in Novgorod and Ukek [Varfolomeyeva, 1994, Table III; Nedashkovsky, 2000, p. 33].

A large amount of imported jewellery from Rus' was also found [Alikhova et al., 1959, pp. 158–160]: slate spindle whorls, glass bracelets, carnelian and silver necklaces, engolpions (crosses), and lunulas.

Coins of the Golden Horde along with decorations became widespread and may be found mainly as treasure troves. Several large treasure troves of Golden Horde coins were found in the Moksha River Region [Fedorov-Davydov, 1960]. The centre of the ulus of Moksha, the city of Nuridzhan, had become an important centre of trade and coinage [Lebedev, 1958; Belousov, 1995; Golubev, 2001]. The discovery of troves of Golden Horde coins on the Alatyr and Pyana Rivers, where there were no settlements in the 14–15th centuries, is of particular interest. In the 15th century Russian coins started spreading along the Oka, Moksha, and Tsna Rivers, where large troves of coins

(up to 825 coins) (Murom, near the village of Okulovo, on the left bank of the Tsna River) and silver bullions (near the village of Kadykovo) were found [Alikhova et al., 1959, p. 161, Table 66]. All this suggests that the Mordvin carried on active trade with the surrounding towns and states.

The integration of the Mordvin into the Golden Horde, on the one hand, had been accompanied by military raids and deaths, and on the other hand, it had brought the Mordvin into the sphere of world trade, which contributed to development of the economy. The emergence of the Golden Horde ulus of Moksha was critical in this regard.

In political terms the Jochid Ulus stopped the expansion of Volga Bulgaria into the Mordvin land, and Russian colonisation was only temporary and eventually resulted in the integration of the Mordvin land into Rus'–Russia.

Relative autonomy within the Golden Horde allowed the Mordvin to complete the formation of the general ethnic features and pagan cultural traditions of the Moksha and Erzya. At the same time, the Mordvin adopted the latest achievements of those years in agriculture and handicrafts. The main territory inhabited by the Mordvin in the Sur-Oka interfluvial area remained one of the largest fur and honey suppliers, resulting in an influx of money and jewellery, and thus became a desired trophy in the struggle of the Golden Horde feudal lords among themselves and with Russian princes. As a result, numerous groups of displaced people settled in the territory of the Mordvin, including Mishar Tatars, Russians, Meshchera, and Kasimov Tatars. These contacts formed the basis of modern Mordvin traditions.

The Cis-Ural Region in the 13–15th centuries

Andrey Belavin

Starting with the first conflict with the Mordvin troops in 1223, Volga Bulgaria resisted the conquerors for many years.

After the destruction of Bilyar in 1236, many residents of Bulgaria fled the country to the Principality of Suzdal, to the Mordvin lands,

and to the Cis-Ural Region. It is likely that some of the campaigns of the Mongol troops that conquered Bulgaria, repressing numerous attacks of the Bulgars, also occurred in the Ural Region. The Middle Volga Region was integrated into the Horde as the most economically developed part of the country. Apparently, by the latter half of the 13th century the Bulgars had already restored their wide trade operations in the Cis-Ural and Trans-Ural Regions.

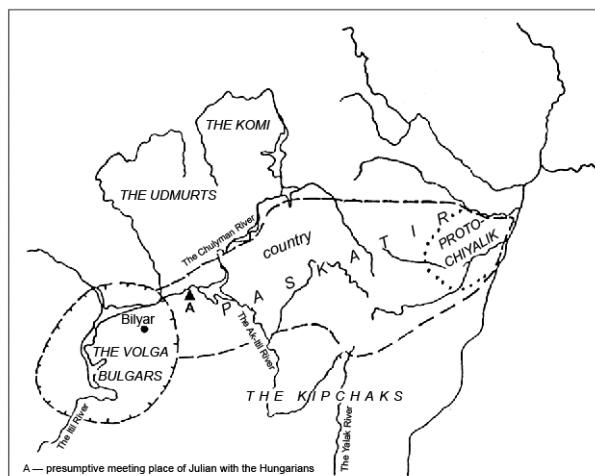

Archaeological finds at settlements and burial sites of the Cis-Ural Region and, first of all, the discoveries of Golden Horde coins, including coins minted in Bulgar, are evidence of this. The most famous trove of Golden Horde coins was discovered in 1888 in the Udmurt Cis-Ural Region near the village of Tashyaludskoye on the Lekma River, which includes 4 'Tatar-type' bracelets and 242 coins of the 14th century [MAERP, 1896, p. 81].

Items of the latter half of the 13–14th centuries that were brought from the East and had equivalents in materials of the Golden Horde period of Bulgaria were found at the Ragozinsky burial site (two copper handles from knives or forks in the collection of F. Teploukhov); bronze and iron locks in the form of horses and dogs were found in Kudymkar and Rozhdestvenskoye archaeological sites, Vakinsky ancient settlement, and Cherdynsky Uyezd; temple rings in the form of a question mark with kashin, glass, or silver beads on the end were found in Vakinsky ancient settlement, Kudymkar ancient town, in grave No. 5 of the Telyachy Brod burial site, Verkh-Borovsky burial site, and other sites. A copper bracelet with ends in the form of a lion's head was found in Verkh-Yazva. Finds of an intricate copper lamp used in mosques in Rozhdestvenskoye archaeological sites and an aigrette from a foreign-made band of a horse bridle from Cheptsa ancient town of Malovenizhsky Porkar are of interest. The first item along with finds of green tiles indicates the existence of a mosque in Rozhdestvenskoye archaeological sites during the time of the Golden Horde, while the second item, according to A. Ivanov, is associated with the presence of a mounted detachment of Golden Horde tax collectors near Cheptsa River [Ivanov, 1998, p. 135].

A number of metal medallions with an image of a 'falconer' date to the Golden Horde period; in particular, two such items found at the Telyachy Brod burial site from grave No. 5 and lifted material date to the Golden Horde period. A medallion from grave No. 5 is well dated by finds of temple rings in the form of a question mark in this burial site. It should be noted that finds of similar plates on sites in the Ob River Region are mainly dated to the Golden Horde period. It is difficult to determine where these items were produced, but a stigma in the form of an acute angle with a ray on a horse's chest found in grave No. 5 indicates their possible origin. A similar sign was found on an item from the Saygatinsky IV burial site in the Ob River Region, dated to the 13–14th centuries. Such stigmas are known from ceramic materials found in Bilyar and a number of other items from Volga Bulgaria of the late pre-Mongol and early Golden Horde periods.

Beads made of turquoise glazed kashin stand out from beads found in the Cis-Ural Region. These beads were produced in the cities of the Volga River Region [Lesman, 1994]. In the Cis-Ural Region such beads were found in a number of Chepetsk burial sites, in Telyachy Brod ancient settlement and burial site, Rozhdestvenskoye archaeological sites, and Antybarsky burial site.

Numerous finds of pottery from the Golden Horde period in a number of sites in the Perm Cis-Ural Region show that Bulgars and other representatives of the Golden Horde lived in settlements of the Cis-Ural Region in the 13–14th centuries (Rozhdestvensky, Kudymkar and Kylasov archaeological sites). Pottery from Rozhdestvenskoye archaeological sites includes 215 pieces of brownish green, green, and yellow-green glazed pottery. This kind of pottery was common in both pre-Mongol and Golden Horde Bulgaria [Bilyar pottery, 1986]. Several pieces of albarello type vessels made of reddish brown clay decorated with vertical grooves and covered with dark green glaze were found in Anyushkar. Similar vessels dating from the latter half of the 13–14th centuries were found in Urgench, Tsarevo ancient town, Azak, Uvek, and other Golden Horde sites [Nedashkovsky, 2000, p. 105]. Finds of pieces of kashin ceram-

Location of Chiyalik records
of the Ural-Volga Region

ics made of grayish pottery mass and turquoise or white glazed with brown and reddish frescoes are of special interest. This kind of ceramics was found in Anyushkar, Kudymkar, and Idnakar ancient towns. Similar watering vessels were found in the Golden Horde cities in the Middle and Lower Volga Regions.

I. Talitskaya presents an interesting fact—a burial in a bronze coffin was found at the Chernoyevsky burial site on the Inva River [Talitskaya, 1952, p. 140]. According to V. Oborin, this kind of burial was commonplace among Tatars of the Golden Horde [Oborin, 1957, p. 314].

Finds of all types of arrowheads, which specialists believe were brought to Europe during the Mongol invasion, show that the Cis-Ural Region was involved in the military and political events in the latter half of the 13–14th centuries. In Rozhdestvenskoe and Redikor archaeological sites, this kind of arrowhead was found not only on the site but also in a ditch. Arrows in the form of a wide short supported spatula were found. Armour-piercing, awl and chisel-shaped heads and Mongol arrows in the form of a narrow spatula were collected in Idnakar ancient town in the ditch and between the ramparts. Their concentration in this part of the ancient town is evidence of military clashes that in our opinion involved [Ivanova, 1995, p. 18] some Tatar detachment.

The relatively small amount of Eastern materials of the Golden Horde period in the

Cis-Ural Region shows both significant reorientation of Bulgaria towards trade with other territories (in particular, Trans-Ural Region) and gradual replacement of Bulgar goods with Old Russian and Western Baltic-Finnish imports. Bulgaria was seriously weakened by plague that broke out in 1346–1350, while the Cis-Ural Region (Nothorn and Perm) was affected by plague that broke out twice (1352 and 1363) in north-eastern Europe.

However, the attention of the Jochid Ulus directed towards territories in the Middle and Upper Kama River Regions eased only at the end of the 14th century. It was only then that intensified Russian influence over the lands of peoples of the Cis-Ural Region, and gradual penetration of Russian settlers into the Cis-Kama Region began.

Ugrians of the Eastern Trans-Kama Region within the Jochid Ulus

Eugene Kazakov

In all periods of history the Turkic-speaking Muslims maintained close political, economic, cultural, and other contacts with the large world of Finno-Ugric neighbours [Kazakov, 2006, pp. 629–630]. Written sources that in recent decades have been supported by a mass of archaeological material prove that Ugrians lived in the Eastern Trans-Kama River Region.

Various Western European sources contain valuable information about the country of Bascart and its inhabitants, the Pascatirs. For instance, William of Rubruck mentioned that their language is the same as the language of Hungarians, who had left their country, and also that the country was inhabited by shepherds who had no cities at all, which is indicative of the nomadic traditions of the population. William of Rubruck then adds the following: 'What I said about the land of Pascatirs, I learned from missionary brothers who had gone there before the arrival of the Tatars, and since that time the inhabitants were conquered by neighbouring Bulgars and Saracens, and many of them became Saracens' [Travels, 1957, p. 74].

The discovery of Chiyalik culture sites, dating from the 13–14th centuries [Kazakov, 2007, pp. 59–65], confirmed the aforementioned written notes with archaeological materials. More than 20 Chiyalik ancient settlements and more than 30 burial sites have been found on a broad area from the Urals to the Eastern Trans-Kama River Region [Kazakov, 1978; Garustovich, 1998]. The name of the culture comes from a settlement studied in 1969 near the village of Chiyalik (Chiyalek) in the Aktanyshsky District of the Republic of Tatarstan [Kazakov, 1978; pp. 42–43]. The ancient settlements are characterised by a small cultural layer. Finds included winter and summer camps of semi-nomads, stationary and portable buildings (yurts, tents, huts), auxiliary (cellars, pits) and religious buildings with stone paving. Summer camps were heated by fires, sometimes covered with stones; and winter camps, with chuvals (stoves).

Tools, clothes, pottery pieces, including pieces of molded round-bottomed vessels, decorated with comb-rope ornaments, including a large number of animal bones, were found in the settlements. Judging from the latter, cattle and horses dominated in the herd.

The cultural origins of the Chiyalik antiquities are found in the Makushinsky records left by the cattle breeders of the Trans-Ural Region. They apparently moved to the Ural-Volga Region and occupied the territory, which in the pre-Mongol period was inhabited by Ugrians, who left records of the post-Petrogromsky culture.

Most of the Chiyalik graves were studied in the Aktanysh Region of the Republic of Tatarstan. The Taktalachuksky, I Izmetevsky, and Derbeshkinsky burial sites were extensively excavated here, with nearly 500 burials, mainly performed according to Islamic custom. Bodies were found in shallow graves (usually 35–40 cm deep), in line with Qibla, stretched head to the west, slightly turned to the right side, so that the face was turned to the south, in the direction of Mecca.

The burial ceremony is characterised by shallow graves, the presence of wooden frames serving as a coffin and fire pits, as well as the presence of silver temple pendants of Bulgar origin, beads, rings, coins of Khan Öz Beg and

Items from Chiyalik burial sites

Janibek, and metal parts of burial masks. Apparently, young children a few years old, who had not accepted the monotheistic religion yet, were accompanied by molded round bottomed vessels with a rope-comb ornamentation.

In the Golden Horde period these sites of the Eastern Trans-Kama Region existed apart from the settled Muslin population. The number of ancient settlements with layers containing remnants of the Bulgar-Golden Horde material culture (circular pottery, jewellery, weapons, etc.) increases. These sites are located both on the left bank of the Kama River and along the Ik and Belaya Rivers (Semiestrovsky I, Baskulsky VI, Bikbulovsky, Mellyatamasky I, Novokhutorsky I, and other ancient settlements). Cemeteries with Islamic gravestones were also found here (Utyashkino, Sredniye Chelny, Klyatli). These materials, like the written sources, clearly describe the Islamisation and Turkisation processes of the later Ugrians.

Monuments of the Golden Horde nomads were found here at the same time. A burial site found in Bavlinsky District of the Republic of Tatarstan, near the village of Bayraka-Ta-

mak, and dating to the 14th century, was made according to pagan custom [Kazakov, 1978, pp. 93–95]. However, by the end of the 14th century the pagan burial mounds in the Southern Cis-Ural Region had already been replaced by Islamic burials, as evidenced by brick or adobe mausoleums (*keshene*) of the 14–15th centuries. All of these show that by then almost the entire

population of the region had been Islamised, to a large extent culturally assimilated, and finally, had become part of the medieval Tatar ethnos. However, according to the ethnographic data, the culture of Perm Tatars and the population of the Nor-Eastern parts of Bashkortostan had preserved some elements of the Ugrian culture: plate-like jaw harps, *kharasues*, etc.

§ 5. The North-Western and Central Caucasus in the Golden Horde era

Alexander Kadyrbaev

The peoples of the North-Western and Central Caucasus were first invaded by the Mongol hordes in 1223, when the tumens under the command of Chinggis Khan's generals Subutai-Bagatur and Jebe-Noyan were running a reconnaissance raid across the countries west of the lands that were under the control of their ruler. This raid could more accurately be called a reconnaissance in force. During this era, just as now, the North-Western and Central Caucasus was an ethnographically diverse region with peoples at various levels of social development. The most numerous among them were the Iranian-speaking Alans, whose 'Alanya Mountains... were located to the west... of the Caspian Sea'; they were called *As* or *Asu* in Mongol-era Chinese sources and *Yas* in European chronicles, and by that time they had established states in the mountains and foothills of the North-Western and Central Caucasus; the mountain-dwelling *Adyghe-Abkhaz* tribes, also known as the *Circassians* and *Abazins*, in whose communities the early forms of statehood had only just begun to appear; and the Turkic-speaking *Kipchaks*—the *Polovtsians* from the Old-Russian chronicles, who inhabited the broad territory of the *Dasht-i Kipchak* (the Eurasian steppes stretching from the Altai to the Carpathian Mountains, including the *Ciscaucasian Steppes* of the Black Sea Region, adjacent to the North-Western and Central Caucasus) and who as a society were in the process of laying down the foundations of rudimentary statehood.

Having made their way across the Main Caucasian Ridge, the warriors of Jebe and

Subutai invaded Alanian territory. This event is recorded in Arab-Persian sources and in the Chinese dynastic history 'Yüan shih,' both of which made it possible in the previous chapters to provide a detailed account of the Mongols' conquest of the Alans and the Kipchaks of the North-Western and Central Caucasus, whose alliance the Mongols managed to break using cunning diplomatic methods, thereby dooming both of them to be defeated and subjugated by the Mongols; however, this occurred only at a later point in time—during the reign of Chinggis Khan's son, the great Mongol khan Ögedei, when, according to Rashid al-Din, the united Mongol army of Batu Khan was sent from 1236 to 1242 to conquer the Western countries, including *Circassia* [Rashid al-Din, 1960, II, pp. 71–72].

It is known that the *Ases*, who did not submit to the Mongols during the new wave of the Mongol invasion, which resulted in the conquest of Kiev—or more precisely, 3,000 *As* families along with 40,000 *Kipchak-Polovtsians* under Khan Kotyan—retreated to Hungary, where they began to serve the Hungarian kings and became known as the *Yases*, who preserved their language up until the 18th century and now belong to a separate ethnographic group of the Hungarian people.

However, not all of the *Ases* resisted the Mongols. Some of them submitted to the conquerors, which is evidenced in the biography of *As Atachi*, who, according to the 'Yüan shih,' served the Mongols and whose father *Kanguz* (*Khankusyi* in Chinese), the head of

one of the state formations of the Ases, voluntarily submitted to the Mongols during the invasion; in return, Ögedei Khan allowed him to continue ruling his lands, awarded him the title of honour of Badur ('bogatyr'—hero), and presented him a paiza, the state symbol of the Mongol Empire, which reaffirmed his power. In line with the decree of Mongols, Kanguz marshaled one thousand As warriors to participate in the Mongol raids, and they were headed by his son Atachi [Yüan shih, 1958, juan 132, p. 27475 (1523)].

The As Yuvashi family, whose father Yanbadur (*Elibadur* in Chinese) submitted to the Mongols along with As Kanguz, was well-known in the court of the Great Mongol Khans [Ibid, p. 27478(1527)]. The 'Yüan shih' also contains biographies of other As people who served the Mongols and participated in their conquests: Kanguz's grandson Baydar and great-grandsons Oros and Fudin, the senior As Mongol commanders Georgii (*Kouertsy* in Chinese), Shari (*Cheli*), Shilabadur, Petr (*Fude*), Georgii's father, Dmitrii (Demidir) and his son Syanshan, Yuruktam and his son Badur and grandson Nogaychin, Anzorbuki (*Utszoerbukhua*), Matarsh, Betszelyan, Nikolay, Ilya, Arslan and his son Asanchen, Khurdudar and his son Khudutimur [Ibid, juan 135, p. 275(1557), pp. 27512 (1560)–27513(1561); juan 132, pp. 27476(1524)–24777(1525); juan 123, p. 27394(1442)]. As is clear from the biographies in the 'Yüan shih,' many among the first generation of As to submit to the Mongols had Iranian and Christian names, which bears witness to the spread of Christianity throughout their society, while the latter generations of As people have Mongol and Turkic names, a result of the influence of the Mongol and Turkic peoples—particularly, the Kipchaks, who were dominant in the Mongol Empires, especially in the Golden Horde.

Chroniclers writing in many different languages provide scarce and fragmentary information about the other peoples of the North-Western Caucasus in the period of the Mongol invasion and Golden Horde. Interestingly, the Chinese source 'Menuershitzi' tells of the death of As Asanchen, who served the Mongols, during an attack by the Tuerge tribe,

which the author of this work, historian Tu Ji, identifies with the Circassians [Tu Ji, 1934, juan 177]. In the later period of the Golden Horde the Circassians were mentioned by Western European traveller Johann Schiltberger: '...the country [land] of the Circassians, as on the Black Sea coast, is inhabited by Christians who profess the Greek [Orthodox] faith. However, they are base people who sell their own children to pagans [Muslims] and steal them from other people. They plunder and speak a peculiar language...' [Schiltberger, 1984, p. 45]. Al-Umari, referring to the 'adoption of Islam' by the Circassians and As/Alans, notes that 'they still violate its [the religion's] rules in many cases... they kidnap their [Kipchak] children and sell them to merchants,' 'even though they [the Kipchaks] beat out the army of the Circassians and Yas people' [The Golden Horde in the sources, 2003, 1, p. 105]. In their turn, Russian writers note: 'It is a well-known fact that these peoples live in the Caucasian mountains and are divided into many different domains with various names. Courage, contempt for death, military exploits, and the acquisition of profit by the force of arms are considered honourable, and they are not subject to any powerful ruler because they worship liberty like a precious gift, which is often abused when they raid and rob each other and the surrounding countries. Their dwellings are located in inaccessible places, and courage has saved them from being conquered by other peoples.' [Bronevsky, 1996, p. 28]. However, not all of the tribes of the North-Western and Central Caucasus managed to defend their freedom against the Mongol encroachment. According to al-Umari: 'They [Circassians and Yas people] are unable to hold out against the sultan of these countries [Khan of the Jochid Ulus], so they have become his subjects, even though they have their own tsars. If they were obedient to him and provided him gifts and other offerings, he left them alone; otherwise he robbed and sieged them; many times he had their men killed, captured their wives and children, took them to other countries as slaves...' [The Golden Horde in sources, 2002, 1, p. 103].

William of Rubruck notes that even though 'Cherkizes' [Circassians] and Alans, or Aas

[As] people... profess the Christian religion,' they 'still fight against the Tatars...' A French envoy notes that on his way to the headquarters of Batu Khan, the ruler of the Golden Horde, 'we were very afraid: that is... Alans, their slaves [Tatars?], quite large in number, form into groups of 20–30 people, head out at night with quivers and bows and kill everyone they encounter. During the day they hide out, and when their horses get tired, they approach the herds on the pastures at night, change out their horses, and take one or two with them... Our guide was very afraid to encounter them...' [Travels, 1993, pp. 96, 102]. Rubruck faced the same problem a year later as he was returning home from Mongol-controlled lands. 'We left... Sarai... headed to the south and approached the mountains where the Alans live... Alans in these mountains are not conquered yet, so two out of each dozen of the people of Sartaq [the son of Batu Khan and heir of the Golden Horde throne] were designated to guard the mountain gorges to prevent the Alans from coming down from the mountains and stealing their herds from the plain, which stretched between the domains of Sartaq, the Alans, and the Iron Gates [Derbent]... and so the Tatars, who lived at the foot of Alanya Mountains, felt it necessary to provide 20 people to chaperone us...' [Ibid, p. 165].

As evidenced by the above, attacks by the Alans on neighbouring Golden Horde lands forced the Mongols to establish special guard posts near the paths out of gorges. This information, which reflects the state of affairs in Alanian in the mid-13th century, when Mongol garrisons were posted in the fortresses that stood near mountain passes, is reproduced with remarkable accuracy in the folk literature of the descendants of the As and Alans—the Ossetian epic 'The Narts.' As it turns out, the names of the Golden Horde rulers can be found in 'The Narts': khans Saynag-aldar (that is, Sain Khan, 'the glorious khan,' Batu Khan, Baty in the Old Russian chronicles), and Berke, the brother of Batu Khan, who deposed his nephew Sartaq and the temnik (warlord) Nogai from the throne. In the epic the enemy of the Narts, Balga-Berke, sits at the path out of the gorges with his many troops

and keeps watch over the young Nart men who foray out to carry herds off into the mountains. The Alans in particular suffered at the hands of Berke, who was 'firmly entrenched in Ossetia,' when large numbers of them were crossing over the Main Caucasian Ridge and entering the service of Hulagu Khan, the ruler of the Mongolian state in Iran, against whom the Golden Horde was constantly in battle. The epic 'The Narts' presents an account of the historical situation in the North-Western and Central Caucasus during the Mongol invasion in which there are clear anti-Mongol motifs. In this respect, H'andzargas (Chinggis Khan), the enemy of the Narts, a rapist and kidnapper of girls, is a very illustrative figure [Guriyev, 1981, pp. 104–106, 115].

William of Rubruck gives an interesting account of the Alans as skilled craftsmen, gunsmiths, and gardeners who grew grapes and produced wine. 'When we approached a dangerous crossing, only two people out of twenty had armour. I asked where they had acquired it. They said that they bought the armour from the aforementioned Alans, who were good at manufacturing armor and were skilled smiths... Before we reached the Iron Gates, we found an Alanian castle that belonged to by Mangu Khan [Möngke, the great Mongol khan] himself, for he had conquered that land. There for the first time we found grapevines and drank wine...' [Travels, 1993, pp. 165–166].

As evidenced by the above, the Alans and Circassian communities of the North-Western Caucasus felt quite autonomous even after the Mongol invasion. It seems that the power of the Mongol Empire and later the Jochid Ulus over this region was not firm, as evidenced by their way of life, which included raiding their neighbours (including their fellow tribesmen) and intense involvement in the slave trade, which the authorities did not actively suppress, at least prior to the adoption of Islam by the Golden Horde khans. The peoples of the North-Western and Central Caucasus became famous not only on the battlefield as raiders and slave traders but also as skilled craftsmen and gardeners. According to the Arab chronicler al-Umari, the Circassians and Yases 'live in well-planned and populous cities as well as

forested, fertile mountains. They grow seeded bread, the udders flow [that is, they raise cattle], the rivers flow, and the fruits grow...' [The Golden Horde in the sources, 2003, 1, p. 103].

Thus, some of the Alan and Circassian tribes that dwelled in mountainous regions that were inaccessible for the Mongol troops preserved their independence from the Jochid Ulus. In the latter half of the 13th century the Golden Horde khans continued to fight against them. While the Northern Caucasian steppes were entirely under the control of the Golden Horde, this could not be said even of the foothills of the North-Western and Central Caucasus. It must be taken into consideration that the North-Western and Central Caucasus had been a part of the personal domain of the Golden Horde khans since the reign of Batu Khan, and for this reason the rulers of the Jochid Ulus were especially interested in the pacification of this region. The duration of this struggle, which prevented the Golden Horde from expanding its power into the depths of the foothills, is evidenced by the campaign of the Golden Horde khan Mengu-Timur in 1277 against the Yases (Alans), during which Dedyakov, their main city, was captured and burnt to the ground. We know about this campaign because of the Old Russian princes' involvement in them, which was recorded in the chronicles. It resulted in the defeat of Alans and apparently other mountain peoples of the North-Western Caucasus. The Russian regiments fought alongside the tumens of Mengu-Timur. As a result, on 8 February 1277 Dedyakov was conquered, and the allies—the Golden Horde people and Russians—'conquered the great greed' [Complete Collection of Russian Chronicles, 5, p. 199; 18, p. 75]. This was the most prominent instance of participation of Russian troops in the military campaigns of the Golden Horde khans. The memory of this event is preserved even in Russian folk songs, although the exact route of the campaign was not recorded in written sources and can be traced only conventionally [Yegorov, 1985, p. 194].

The constant warring in the North-Western and Central Caucasus was a result not only of the incessant raids of independent Alanian and Circassian tribes from the mountain regions

and rebellions of their fellow tribesmen, who were subjects of the Golden Horde, but also of the geographical location of the region, which shared a border with Hulaguid Ilkhanate, the Mongol state in Iran and the Middle East against, which the Jochid Ulus was constantly waging wars following the dissolution of the greater Mongol Empire; these wars directly affected the North-Western and Central Caucasus Region, even though the military operations were conducted on the lands of Georgia and Azerbaijan. The Alans and Circassians could become allies of the Hulaguids and operate in the rear of the Golden Horde troops, taking advantage of their departure to the Transcaucasia, which raised fears among the authorities of the Jochid Ulus. As a result of the prolonged struggle the power of the Jochid Ulus had extended to several deep regions of the Caucasian Mountains by the 14th century. According to written sources, in the 14th century there were ongoing tensions on the Black Sea coast, which was inhabited by Circassians. The Circassians that lived in the Kuban and on the Taman peninsula, had been subdued back in the 13th century. In the 13th century the Taman peninsula was a part of the Jochid Ulus; however, because of the struggle against the insubordinate Circassians, its borders could not extend far to the south along the coast of the North-Western Caucasus. The lands of the independent, so called 'white' Circassians, who lived along the Caucasian coast of the Black Sea, extended to the vicinity of the modern city of Tuapse. Eastern sources indicate that at the end of the 1320s the Golden Horde Khan Öz Beg was still waging wars against them [Egorov, 1985, p. 46]. Al-Umari, who died in 1349, reports that the Kipchaks, who made up a significant portion of the Golden Horde troops, 'defeated the Circassian... and Yas... troops' [Zolotaya Orda v istochnikakh, 2003, 1, p. 105].

The Chinese political terms used to signify the forms of social organisation of the As people in the 'Yüan shih' are of special interest. In the context of the era of the Mongol invasions a study of the relevant terminology is particularly interesting because the peoples of the North-Western and Central Caucasus were

beginning to organise themselves into states during that period. For instance, in reference to the As people, the 'Yüan shih' uses the term 'Go'—state [Yüan shih, 1958, juan 132, p. 27475(1523)]. Use of the term 'Go' with respect to the formations of the As people is useful in determining the level of social development that they achieved. This is supported by the fact that Chinese historiography had from its earliest days used clear terminology in identifying the level of development of tribes and peoples. According to the Rashid al-Din, 'the Chinese rulers gave nicknames to people only for a certain reason. Now they still follow the same custom: they use an unusual number of nicknames, and the degrees corresponding to each tribe and region are extremely similar and appropriate...' [Rashid al-Din, 1952, I, 1, p. 139]. Mongol-era As and Circassian society was likely marked by social stratification and income inequality; influential and prominent clans and families stood above their compatriots, and they had their 'own tsars,' as reported by al-Umari. The adoption of a global monotheistic religion—Orthodox Christianity—and the appearance of scripts indicate the level of cultural development of the Alans and Circassians. William of Rubruck noted that 'the Alans, who are called... Aas, Christians according to the Greek model, have the Greek script and Greek priests.' [Travels, 1993, p. 92]. The Circassians did not have their own script or a borrowed one, and whenever it was necessary they used the Old Jewish script, according to Giorgio Interiano, an Italian, who lived in the North-Western Caucasus at the end of the 15th century, most likely in one of the Genoese colonies [Adyghe, Balkars, and Karachays, 1974, p. 48].

As for the level of economic development of Alanian society, it was non-migratory, and al-Umari notes a general tendency their settlements to evolve into cities. The existence of a large number of settlements in the North-Western and Central Caucasus in the 9–12th centuries, a majority of which were interrupted by the Mongol invasion, which prevented them from becoming full-fledged cities, indicates the presence of the rudiments of urban culture in Alan and Circassian society. In the Golden

Horde period small but populated settlements were replaced by intensely developing large cities, which quickly became prominent centres of craft and trade. One such city in the North-Western and Central Caucasus was Majar, whose remnants can be found on the banks of the Kuma River, near the modern city of Prikumsk in Stavropol Krai. The heyday of the city is dated to the Golden Horde period, although it is possible that there was a small settlement there before the arrival of Mongols. According to archaeologists, the ruins of this city were 2 miles in diameter at the beginning of the 19th century. This estimate of the size of Majar indicates not only the vast amount of space it occupied, which makes it possible to consider it the largest city in the North Caucasus during the Golden Horde period; it had additional significance because it played a prominent role in the political and economical life of the region. This is proved primarily by the fact that the city had the right to mint coins during the 14th century.

At the end of the 18th century there were still quite a large number of monumental brick buildings from the Golden Horde period among the ruins of Majar, which is described well by Ibn Battuta: 'A big city, one of the best Turkic cities.' Here archaeological investigations revealed not only the remnants of dwellings but also traces of various crafts and a complex city water pipeline system. In the 14th century Majar was the centre of transit trade in the North Caucasus. Two caravan routes arrived here from the north—one from Hajji Tarkhan and one from Azak—which were used to supply goods from the east and west. In turn, products from the entire North Caucasus region, mainly various metal goods, were imported to the markets of Majar.

At that time the city of Matrega, located on the Taman Peninsula, on the site of present-day Taman, and founded long before the arrival of the Mongol conquerors, was famous in the North-Western Caucasus. The name of this city is well-known from Italian sources. Matrega's importance increased significantly during the Golden Horde period after a Genoese colony was founded there at the beginning of the 14th century and maintained active trade relations

with the local population. The population of Matrega was composed mainly of Greeks and Circassians. It was also inhabited by Italians, Alans, Turkic people, and Slavs. By the 15th century, due to the weakening and dissolution of the Jochid Ulus, the Genoese strengthened their power in Matrega and made haste to build fortifications on account of frequent conflicts with the surrounding Circassian population.

From the end of the 13th century the city of Copa, which was founded by the Genoese and specialised in the trade of fish and caviar, stood at the mouth of the Kuban River. The sources describe an annual spring fair held there that was attended by fish sellers and buyers. In the 14th century there were 39 Genoese colonies, minor settlements that we know about from medieval maps, on the Black Sea and Azov coasts of the North-Western Caucasus. Such a significant number of colonies indicates the vigor with which the Italians were trading with the local population. The Genoese offered the local population cotton, cloth and expensive fabrics, salt, raw cotton, carpets, spices and blades. Among the goods that were being exported from the North-Western Caucasus, the sources mention various types of fish, caviar, leather, fur, cotton, wax, bread, wine, saffron, silver ore, fruits, and slaves [Yegorov, 1985, pp. 122–123]. It should be noted that the slave trade played an important role not only in economic but also in political relations between the Golden Horde and Egypt, the Horde's ally in the wars against the Hulaguid state, the ruling military stratum of which—the Mamluks—was by the end of the 13th and increasingly in the 14th centuries composed not only of slaves but also of the natives of the North-Western Caucasus, whom the Mamluk sultans of Egypt considered a 'strategic commodity.' The Golden Horde authorities justified the slave trade from the North-Western Caucasus by the fact that the slaves were not Muslims.

The North-Western and Central Caucasus at large was one of the important economic regions of the Golden Horde, and the extent of its participation in international trade is clear evidence of this.

However, as was mentioned before, during the Golden Horde period the natives of the

North-Western and Central Caucasus lived not only in their homeland. Many of those involved in the Mongol conquests, who involuntarily became both victims and participants of the campaigns, found themselves scattered about various Mongol-conquered countries, from Hungary to China. However, in China, at different periods of time throughout the 13th and 14th centuries, 10,000 As people, not including their families, served the great Mongol khans in specially chosen elite guard units. The As people served as bodyguards of the Mongol rulers [Yüan shih, 1958, juan 99, p. 27188(1236)]. They played an active role in the Mongols' Chinese campaigns and suffered heavy casualties [Travels, 1993, p. 146]. The As people and Alans also served and lived in the Jochid Ulus, far away from their native mountains, where they are mentioned among the 62 main tribes and peoples, predominantly of Mongol and Turkic origin, which made up the bulk of the Golden Horde's military power and strength over the entire course of its history [Klyashtorny, Sultanov, 2000, pp. 202–209]. Ibn Battuta tells of neighbourhoods in Sarai, the capital of the Golden Horde, which were inhabited by As people and Circassians. At the same time, he notes that the As people in Sarai became Muslims, while the Circassians continued to profess Christianity [The Golden

Horde in the sources, 2003, 1, p. 143], although al-Umari, a contemporary of Ibn Battuta, mentions the 'adoption of Islam by these peoples' [Ibid, p. 105], not only by the As people but also by the Circassians. We know about existence of Alanian communities in the part of Crimea that was controlled by the Jochid Ulus—in particular, in the city of Stary Krym (Solkhat). In his turn, Giovanni da Pian del Carpine makes mention of one Mongol vicegerent in Rus'—the Alan Mikhey, who is presented as 'a man full of malice and deceit' [Travels, 1993, p. 59]. The year 1358 is associated with the Circassian Zikhabey, who was promoted in the ranks of the Golden Horde and became vicegerent in Azak, modern-day Azov. During the period from 1379 to 1386 the Golden Horde vicegerent in Crimea was Cherkesh-Bek, known in Russian chronicles as Zikhy Cherkesy, who resided in Solkhat. He support-

ed the beklyaribek (supreme commander) Mamai and in 1379 forced the Genoese from Kafa to mobilise troops in support of his patron, who was then preparing to lead a campaign on Moscow. According to an Old Russian chronicle, Mamai Khan in his struggle for power in Sarai relied on the lands of the Jochid Ulus that were under his control—Crimea and the North-Western Caucasus. 'The Golden Horde prince Mamai... came with the entire Tatar and Cuman force and in addition to that hired a regiment of... Circassians and Yas people' [Khotko, 2001, p. 105]. Circassians and As/Alans took part in the military campaigns and raids of the Golden Horde khans during the 'great zamyatnya' (internecine war), sometimes on opposing sides of the internecine wars fought between contenders for the throne in Sarai. According to al-Umari, 'the army of the sultan of this state (the Golden Horde khan) consists of Circassians, Russians, and Yas people...' [The Golden Horde in sources, 2003, 1, p. 103].

During the Golden Horde's wars with Timur, the ruler of Samarkand, which mainly took place on territories under the control of the Golden Horde, his troops invaded the North-Western Caucasus. The Circassians were the first to be attacked. Timur's warriors under the command of mirza Muhammad-Sultan, mirza Miranshah, and emir Jehan-Shah headed out from Azak (Azov) to Kuban. The Circassians resorted to scorched earth tactics and 'burnt down the meadows between Azak and Kuban,' depriving Timur's troops of a source of sustenance, and the herds of cattle that were accompanying them died from starvation. However, despite these hardships and losses, Timur's warriors 'plundered the Circassian ulus, gained enormous spoils... and returned back safely...' Timur himself 'with all of his troops moved towards the Mount Elburz [Elbrus]' and 'with the intention of conquering the disbelievers' attacked 'Burakan, the ruler of the As people.' During the campaign his warriors levelled the forest and laid a road, which allowed him to ascend Mount Elbrus. 'In the mountain fortifications and protected gorges he had many clashes with the enemies of the faith and in all cases [his] army... won, by putting to the sword... many of those

disbelievers [the As people], their fortresses were toppled, and the victorious army took immeasurable spoils from the property of the disbelievers as a grace of fate. Returning victorious from there... with immeasurable spoils, [Timur] stopped in the highest Horde...' But that was not the end of campaign—the warriors under the direct command of Timur decided to conquer the high-mountain fortresses, the last stronghold of the rebellious highlanders, 'inhabitants of Elburz,' which 'were incredibly difficult to access owing to their height, which was so great that when a person looked at them, everything became blurry before his eyes, and his hat slid from his head... so high that they could not be reached by an arrow...' But the Samarkand commander successfully solved this battlefield conundrum; he 'ordered the troops to erect several tall ladders and fasten them to one another and, by placing them on the first ledge of the mountain, climb upwards, then place them on the third ledge of the mountain, where the fortress was located... the brave fighters one by one climbed the ladders. Another group of brave fighters, once they reached the top of the mountain, girded themselves with ropes and attached the ends of the ropes to the top of mountain... and descended to a spot just across from the fortress...' [Ibid, pp. 303–304, 359–361]. Then both detachments from different heights attacked the fortress and, despite the hail of arrows and stones fired by the besieged, conquered it and massacred its defenders. Next to fall was the high-mountain fortress of Pulad, where one of the senior emirs of the Golden Horde, Uturku, had been hiding. He was captured and taken into custody by Timur. Timur completed his campaign 'in Abas,' which was inhabited by Abazins and Abkhazians. The peoples of the North-Western Caucasus paid dearly for their loyalty to the khans of the Golden Horde and resistance to Timur's army—their lands were devastated. However, following Timur's Golden Horde campaigns, which he later directed into Middle Asia, the steppe empire never recovered again and fell by the end of the 15th century, losing its grasp over the North-Western and Central Caucasus.

All the same, despite the tragedy, the Mongol era for the North-Western and Central Caucasus was not simple and straightforward. Formed mainly as a result of conquests, the Golden Horde, with all its rejection of violence and blood, also played a civilising role for the peoples of the Caucasus because the creation of an empire—which the Golden Horde was—is an attempt by humanity, though far from perfect, towards integration. Following the annexation of the North-Western and Central Caucasus to the Jochid Ulus, its lands became more stable politically compared to previously. Moreover, lack of regional partitions and boundaries in this vast Eurasian empire—that existed for about three centuries, throughout the lives of five to six generations—allowed peoples under its rule to be brought closer together. For a long time the cultures of the Caucasian peoples formed and developed within a single system of ties to the civilisations of other peoples of the horde, both from the steppe—the Mongols and the Turkic people—and the settled—Eastern Slavs, Finno-Ugrians, and Iranians—bringing them together and resulting in an amalgamation into unified multinational states such as the Golden Horde. This was the first experience in the history of the peoples of the North-Western and Central Caucasus of a multi-century existence as communities within a global empire. In contrast to the following periods, with all the wars with the Mongols and their Golden Horde successors, it did not bring these peoples to the brink of destruction and of existence as individual ethnic groups on their historic lands. However, this does not deny the consequences of the Golden Horde era.

Long and intense historical contacts of peoples of the North-Western and Central Caucasus with Mongol and Turkic steppe tribes, both in this region and beyond, had objectively created the conditions for cultural interaction. For instance, the contacts can be judged from the language of descendants of the As-Alans, the Ossetians, whose lexicon contains a significant number of borrowings from the Mongol

language, particularly in vocabulary, toponymy, and family nomenclature. This prompts a suggestion of the presence of a Mongol-speaking ethnic element in Alania, which perhaps assimilated in the Alanian environment. The contacts of Alans and steppe conquerors in the Mongol era are prominently reflected in the content and structure of Ossetian Nart sagas, particularly in the As-Alans' borrowing of Mongol legends and heroes from Mongol knightly sagas.

The impact of the Golden Horde era on the ethnic history of the North-Western and Central Caucasus is important because at that time impetus was given to the formation of new ethnopolitical communities, known today as Karachais, Balkars, and Nogais, speaking the Kipchak branch of the Turkic languages. By the beginning of the 13th century the predominant official language was Kipchak, and an irreversible process of Turkisation of a part of the North-Western and Central Caucasus highland tribes was under way, which resulted in the formation of new Turkic ethnoses. The Golden Horde's impact can be clearly traced in the genealogical legends of the Karachais, the Balkars, and the Nogais, a significant part of whose ethnic elite—their most eminent names—derived their origins from natives of the horde [Borazbiyev, 2003, pp. 84–89]. The ethnogenesis of the Karachais and the Balkars, whose origins date back to the 14th century, developed with the involvement of local Adygo-Abkhazian highland peoples, the As-Alans, and the Turkic-speaking Bulgars, reflected in the name of today's Balkars. However, the predominant cultural influence on this process, when a part of this population was speaking the Turkic languages, was exerted by the Kipchak-Polovtsians, who also played a decisive role in the ethnogenesis of the steppe Nogai people. Thus, the birth of the Karachais, the Balkars, and the Nogais—the contemporary peoples of this region—is inextricably connected with the age of a steppe empire, the final chord of whose existence was the fall of the Golden Horde.

§ 6. The Eastern Ciscaucasia in the 13–14th Centuries

Lyudmila Gmyrya

In the 13–14th centuries Dagestan was in an area of military and political interests for the Mongol rulers: Chinggis Khan, the Golden Horde khans, and the Hulaguid Ilkhans (see [Magomedov, 1940; Lavrov; 1965; The History of Dagestan, 1967; Krishtopa, 1974; Magomedov, Krishtopa, 1978; The History of the Peoples of the North Caucasus, 1988; Magomedov, 1991; Magomedov, Magomedov, 1994; Gadlo, 1994; Gadzhiyev et al., 1996; The History of Dagestan, 2005, etc.])

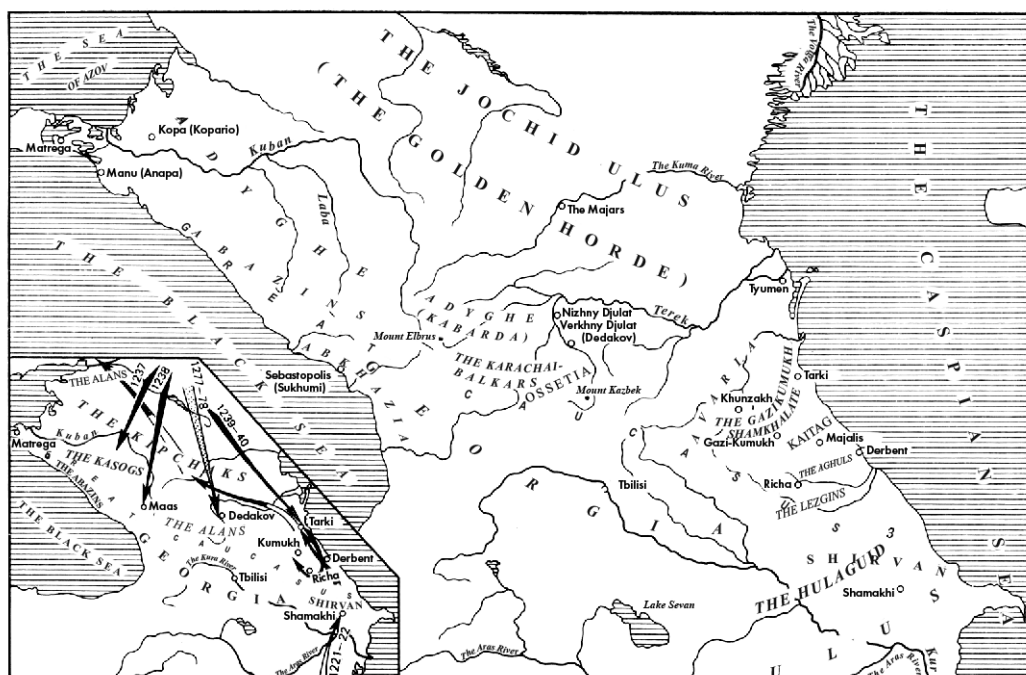

In the middle of the 13th century the Mongol Empire split into a number of independent states (uluses). Northern Dagestan and Derbent were taken by the Jochid Ulus [Gadzhiyev and others, 1996, p. 301; The History of Dagestan, 2005, pp. 228–229]. Southern Dagestan (territories south of Derbent) came under the rule of the Hulaguids [The History of Dagestan, 2005, p. 229]. The Hulaguid Ilkhans' state (1256–1353), founded by Chinggis Khan's grandson Hulagu Khan (1258–1265), took over countries of Middle Asia, the Middle East, and the Transcaucasia [Petrushevsky, 1970, pp. 229–230; Ali-Zade, 1956, pp. 265–310; Ashurbeyli, 1983, p. 157].

Both uluses—of Jochi and Hulagu—were engaged in a bitter struggle for dominance in the eastern Caucasus for almost a century (1262–1357) [Krishtopa, 1974, pp. 96–118], the first stage lasting for five years. As Kirakos indicates, military campaigns were usually held in the autumn and winter months '...for they could not [fight] in summer because of heat and floods' [Gandzaketsi, 1976, p. 237].

In August 1262 Golden Horde troops of three tumens (30,000 warriors), headed by Nogai Khan, crossed the territory of Caspian Dagestan from the north to the south, invaded Shirvan, and approached Shamakhi. This military campaign was undertaken because of the death in the Hulagu ulus in 1261–1262 of three tsareviches of the Golden Horde, Balakan, Tutar, and Kuli, grandsons of Jochi and nephews of Batu, commanding an auxiliary unit at Hulagu. The operation failed, Nogai's

army was defeated, and together with the remaining part of the army he retreated to Derbent. But on 8 December, under the pressure of Hulagu's pursuing army, he left the city and retreated fighting to the River Terek. According to research, Hulagu reached the right bank of the Terek, then sent his 70,000-strong army after Nogai, under the command of his son Abak Khan [Krishtopa, 1974, pp. 98–99]. Beyond the Terek this army 'destroyed the Golden Horde's camp' [Ibid.]. However, Kirakos describes the military campaign's course slightly differently: '...Berkai gathered countless troops to take revenge on Hulagu for the blood of his compatriots. The great Hulagu also gathered a big army and divided it into three: he gave one [army] to his son Abaga Khan, provided him with the ruler Argun's support, and sent them both to Khorasan to help Algu from this side; he gathered the second army near the Alanian gates; and, taking the rest of the army, headed out and invaded [the territory] away from the Derbent gates because there are only two ways to get there: through the Alans and through Derbent. And, destroying parts of the Jochid Ulus, he reached the great and bottomless river Terkn Itil, which many rivers fall into and which flows spilling like a sea and falls into the Caspian Sea' [Gandzaketsy, 1976, p. 237]. According to Kirakos, the vanguard of the Hulagu troops under the command of Abaka Khan pursued Nogai, who was retreating to the Terek, moving from south to north. Another part of the troops, under the command of Hulagu, invaded the domains of Jochi in the North Caucasus from the Daryal Pass (the Alanian gates) and, moving from the west to the river 'Terkn Itil,' destroyed 'parts of the Jochid Ulus.'

Here on the banks of the 'Terkn Itil' the huge army of the Golden Horde—in Kirakos' words, 'a powerful army'—assembled the day before by Berke Khan, fought against the forces of Hulagu. This battle dates to February 1263 [The History of the Peoples of the

Settlement of people in the North Caucasus in the 13–14th centuries. Inset: Mongol campaigns in the 13th century (According to [Istoriya narodov Severnogo Kavkaza, 1988, map 6, p. 190]).

North Caucasus, 1988, p. 204]. Kirakos calls this battle a 'bloodbath' and describes its terrible consequences: 'There were many dead on both sides, but a great many of them were on Hulagu's side because they froze to death, and many people drowned in the river' [Gandzaketsi, 1976, p. 237].

Researchers disagree about the location of the battle. Some say that it took place 'on the Terek River' [Magomedov, Kryshstopa, 1978, p. 9; *The History of the Peoples of the North Caucasus*, 1988, p. 204; Gadzhiyev et al., 1996, p. 302] or 'beyond the Terek' [Kryshstopa, 1974, p. 99]. S. Gadzhiyeva says that it was fought on the lower reaches of the Itil River (Volga) [Gadzhiyeva, 2000, p. 57]. In his notes on Kirakos' text, L. Khanlaryan mentions that by the name 'Terkn Itil,' used by Kirakos, should be understood the Itil (Volga) [Gandzaketsi, 1976, ch. 65, n. 6, p. 312, ch. 55, n. 1, p. 307]. The description of the 'Terkn Itil' provided by Kirakos is comparable to the Volga. The capital of the Golden Horde, Sarai Batu, was located on the lower reaches of this river, and that was likely where Hulagu was heading. The danger of the situation can also be explained by the high degree of mobilisation in the Gold-

en Horde on the eve of the battle—'eight of every ten people' [Kryshstopa, 1974, p. 99].

The remainder of Hulagu's troops, pursued by Berke Khan, returned to the Transcaucasia through Caspian Dagestan. According to Kirakos, the courage of one of Hulagu's commanders, who held back the onslaught of Berke's army, saved Hulagu from final defeat. Hulagu's troops moved to the Mugan steppe for the winter but 'set a watch at the Derbent gates' [Gandzaketsi, 1976, p. 237].

In the spring of 1263 Golden Horde troops again invaded the Hulaguid domain through Derbent. Sources record that Georgian troops were also involved in fighting back. Hulagu forced Georgia, where an anti-Mongol uprising had earlier been crushed, to send vanguard troops to Derbent to be the first to withstand the hit of Berke's army. The Golden Horde's advance was apparently stopped with great effort because some of the princes, who distinguished themselves in this operation, were awarded 'with great decorations' [The History of the Mongols in Armenian Sources, 1873, p. 48].

In 1265 the army of the Golden Horde, headed by Berke Khan and taking the advan-

The battle of Sultan Jalal ad-Din with the Georgians. Miniature to Masud Kuhistani's book 'The History of Abulkhair Khan.' Transoxania. Middle of the 16th century.

tage of Hulagu's death, invaded Caspian Dagestan again through Shirvan [Rashid al-Din, 1960, II, p. 82; 1946, p. 68; Collection of Materials Relating to the History of the Golden Horde, 1884, pp. 121, 152, 203–205, et al.; 1941, pp. 92, 99, 210].

Despite heavy losses in the 1265 military campaign, the Golden Horde managed to keep Derbent. Rashid al-Din's statement that Ilkhan Abaka assigned his brother Yushumut the command responsible for the protection of north-eastern Caucasus border areas and granted him the domain of the Arran and Derbent regions [al-Din, 1946, III, pp. 67–68] is interpreted in some investigations that the il-khans' possession of Derbent was a fact. But Yushumut was assigned to these posts prior to the 1265 campaign, when Derbent was a part of the Golden Horde, and its transfer to the member of the Ilkhans' family indicates Ilkhan Abaka's mere claims to the border town [The History of the Peoples of the North Caucasus, 1988, p. 205]. This is indirectly proved by information from the sources that, following the events of 1265, Abaka Khan built a line of defence on the left bank of the Kura River (a palisade and deep ditches) [Collection of Materials Relating to the History of the Golden Horde, 1884, pp. 153, 510; Gandzaketsi, 1976, p. 238], which would not have been required if Derbent had been possessed by the Ilkhans.

Following the war of 1262–1267, the Golden Horde's military activities in Derbent changed, with the tactic of strengthened defence of both the city and the adjacent territory to the north. A special district was established, consisting of the plains of modern Dagestan and Chechnya. A battle-ready 'watchdog army' ('lashkar-i karaul') undertook border protection and putting down uprisings by the local population. The district was led by a family member of the khans, Toktai, the son of Tsarevich

Balakan, who had been executed in 1261 by the Hulaguids. Rashid al-Din wrote that he was also called Tama-Toktai or Murtad-Toktai. Apparently, his name got the prefix 'Tama' when he was a commander of the Derbent fortifications (the Mongol word 'tanma' means detachments that perform garrison duties) [Rashid al-Din, 1960, II, p. 103]. Researchers believe that the form of his name with the prefix 'Murtad' may indicate sympathies to Islam [Kryshtopa, 1974, p. 105]. For his border service, Tama-Toktai was given a 'winter camp,' pastures on the Terek River [Rashid al-Din, 1960, II, p. 103].

Tama-Toktai had wide-ranging authority, which included conducting independent military campaigns against the Hulagu state.

According to the written sources, during the reign of Mengu-Timur, brother of Berke Khan, the situation in the eastern Caucasus remained turbulent, but the two warring forces were trying to avoid large-scale operations. In the 1270s the eastern Caucasus was not in Golden Horde's sphere of interests, leading to the Hulaguids' increased influence in the pass of Derbent.

In 1277–1278 the Hulaguids seized territories of southern Dagestan ('Lekzistan') and the city of Derbent itself, all peacefully with the help of 'benign activities' [Rashid al-Din, 1946,

III, p. 90]. In 1288 Derbent was still under Hulaguid rule. Tama-Toktai, according to Rashid al-Din, conquered Derbent and robbed local merchants on his way to Shirvan [Ibid, p. 120]. In 1290 he again staged a plundering raid on Shirvan, a campaign that lasted for five weeks (see for details [Kryshtopa, 1974, pp. 101–102]).

As shown in Rashid al-Din's message, dated 1298, about sending Emir Nurin to Arran to 'protect the Derbent Region,' the ruler of the Hulaguid state Gazan Khan (1295–1304) kept guard contingents in the Derbent area.

The withdrawal of Tama-Toktai's troops from Northern Dagestan in 1299 contributed to the entrenchment of Hulaguid influence in the Derbent area. As Rashid al-Din mentioned, he had been recalled by Tokta Khan, who was assembling a strong force for a war against Nogai [Rashid al-Din, 1960, II, p. 85] that lasted until 1300.

At the beginning of the 14th century Northern Dagestan—the site of Tokta Khan's headquarters in 1301, according to Rashid al-Din [Rashid al-Din, 1946, III, pp. 188–189]—was under the rule of the Golden Horde.

In the winter of 1301–1302 Gazan Khan held a 'hunt' in Shirvan and southern Dagestan, a kind of military manoeuvre showing the Hulaguids' claims to these territories [Ibid., p. 189]. At the same time, anti-Mongol resistance was crushed in southern Dagestan. As Rashid al-Din describes these events: 'At that time, emirs of Lekzistan, who had long hid in these inaccessible mountains, rebelling and revolting, obediently and voluntarily submitted and sincerely turned their faces towards serving [the ruler], and held the strongest hilt of obedience and submission. The crowd of thieves and vagabonds that ran from Azerbaijan and, hiding in those mountains, preferred looting and robbery on the road, was caught and killed' [Ibid.]. The measures taken had strengthened the Hulaguids' positions both in southern Dagestan and in the Derbent area.

However, Tokhta Khan soon renewed the Golden Horde's claims to Azerbaijan. In 1302–1303 his embassy was sent to Caspian Dagestan and announced a demand for the surrender of Azerbaijan and Tokhta Khan's threat of war if it was not met.

Envoys said that Tokhta Khan massed ten tumens of guard troops (100,000 soldiers) on the southern borders of the Golden Horde, from Crimea to Karakum and Derbent [Collection of Materials Relating to the History of the Golden Horde, 1941, pp. 82–83]. Gazan Khan dismissed these claims and rebuked the horde's envoys for excessive extravagance. They arrived at the court in three groups on 325 post horses hired in Derbent. Gazan Khan said that 'five nōkers are enough for a messenger; the use of so many post horses ('ulag') from Derbent, constituting the border line between our domains... means a deviation from the rules of yasak...' [Ibid.] The mention of post horses in his speech indicates the existence of a post office in Derbent at that time and its inclusion in the chain of a single state post road of the Hulaguid state [Kryshtopa, 1974, p. 108]. This data is confirmed by a Persian inscription found by A. Komarov in Derbent, which states that a resident of Derbent on 10 May 1301 handed over to the waqf of the post office (*chapar-khane*) a source of water and well [Lavrov, 1966, pp. 114–115, inscription No. 276]. The term *ulag*, used by Gazan Khan to refer to post horses, may indicate the existence of a cart tax in Derbent, the provision of a required number of horses for an unlimited period on the demand of authorities [Kryshtopa, 1974, pp. 108–109].

Shortly before his death in 1304 Gazan Khan identified Derbent as one of the border regions of the Hulaguid state [Rashid al-Din, 1946, II, p. 285]; this remained the case until 1318–1319.

In the middle of the winter in AH 718 (1318–1319) the Golden Horde undertook a campaign against the Hulaguid state. Öz Beg Khan's cavalry passed through Caspian Dagestan and conquered Derbent: 'Öz Beg... appeared from the borders of Saqsin and Kipchak with great and countless troops, putting horses into gallop and baring the gleaming swords; every man was followed by three horses. Before the news was received, like a furious flow and roaring lion, planning devastation, they passed through the Iron Gates' [Collection of Materials Relating to the History of the Golden Horde, 1941, pp. 86–87]. The author of this

report explained the speed of Derbent's conquest by the fact that the local population ('the tribe of the Lezgians') felt a sympathy for the Golden Horde and did not pass along information about their army's approach.

Öz Beg's army exceeded 80 soldiers. Reaching Kura and conducting a number of military operations that failed, he quickly took the troops beyond the lands ruled by the Ilkhans. Hulaguid troops, headed by Emir Choban, pursued them and conquered Derbent [Ibid., p. 100].

The Golden Horde repeated the campaign that same year, 1319, but it failed again. Hulaguid troops pursuing them reached the Terek River [Ibid., pp. 100–101].

In 1324–1325 the Hulaguids made a retaliatory raid on the lands ruled by the Golden Horde. Emir Choban's troops invaded the central Ciscaucasia from Georgia and devastated it significantly. Choban returned to the Hulaguid ulus through Caspian Dagestan and Derbent, which indicates that the Golden Horde's domains in the north-eastern Caucasus had been lost.

In 1335 the large army of Öz Beg Khan invaded Shirvan through Caspian Dagestan. The campaign failed [Ibid., pp. 93, 101, 143], but Derbent was secured for the Golden Horde.

In 1356–1357, 300,000 Golden Horde troops, headed by Janibek Khan, crossed the Terek River and invaded Shirvan through Derbent. They managed to conquer the city of Tabriz in Northern Iran. Most of the fighters returned through Derbent and Caspian Dagestan, and two months later the same route was used by the 50,000 troops that remained in the Transcaucasia [Ibid., pp. 102–103].

On European maps of the time the border between the two states' domains is drawn south of Derbent. A fortress under the flag of the Hulaguids to Derbent's south is marked on a Pizzigani brothers map of 1367, with the legend 'Patrol.' The Catalan Atlas (1375) also indicates a point south of Derbent called 'Patrol' [Yegorov, 1985, pp. 134, 137].

Sources contain no information about Golden Horde rule in the North Caucasus following the defeat of Mamai at Kulikovo Field in 1380 [Magomedov, Kryshstopa, 1978, p. 15;

The History of the Peoples of the North Caucasus, 1988, p. 213].

However, as early as 1385 Tokhtamysh Khan, who had seized power in the Golden Horde, invaded Shirvan with 90,000 troops through Caspian Dagestan and fortified his position there [Collection of Materials Relating to the History of the Golden Horde, 1941, pp. 110, 151]. The minting of Tokhtamysh coins in Baku and Derbent [Markov, 1896, p. 485, Nos. 1077–1078] shows that at that time the power of the Golden Horde extended to Shirvan, Caspian Dagestan, and Derbent. In Derbent the minting of Jochid dirhams with the name of Tokhtamysh started in 1388–1389 [Pakhomov, 1956, p. 49]. The majority of preserved coins with the name of Tokhtamysh were found in hoards of the latter half of the 19th century. The most representative collection of Tokhtamysh coins, minted in Derbent, Shamakhi, Shabaran, Mahmudabad, Gushtaspi in A.H. 788–791 (1386–1389), were found in the hoard dated 1851, discovered in the steppe near Aleksandrovskoye (Voskresenskoye) in the present-day Dnepropetrovsk Region in Ukraine. It contained 7,992 Tokhtamysh coins [Gusev, 1995, pp. 92–93]. According to written sources, some feudal bodies of Ciscaucasian Dagestan cooperated with the administration of Tokhtamysh [Magomedov, Kryshstopa, 1978, p. 16; The History of the Peoples of the North Caucasus, 1988, p. 213].

The strengthening of the Golden Horde's positions in the eastern Caucasus led to an aggravated relationship with Timur's state, resulting in a relentless struggle between the two rulers.

In 1395 Timur and a huge army started an ambitious military campaign aimed at the conquest of the North Caucasus. He gathered and inspected his troops on the lower reaches of the Samur River. The army stretched from the feet of the mountains to the shores of the sea [Sbornik materialov, otnosyashhixsya k istorii Zolotoj Ordy', 1941, p. 174]. The troops passed through Derbent and attacked 'the region of the Kaitags' (north-western Derbent), supporters of Tokhtamysh. According to Nizam al-Din Shami, 'out of many (even) a few did not survive,

and one in a million... all those regions were plundered' [Ibid., p. 119]. Advancing further to the north, to Tarki, Timur got a message that Tokhtamysh's advance guard was at the Sulak River, guarding the crossing, and he sent his troops there. Timur defeated them and pursued them to the confluence of the Terek and Sunja Rivers [Istoriya Dagestana, 2005, p. 231]. The two armies clashed on 15 April 1395, resulting in the complete defeat of Tokhtamysh [Istoriya narodov Severnogo Kavkaza, 1988, pp. 214–215; Istoriya Dagestana, 2005, p. 231].

After plundering the western uluses of the Golden Horde, the lower reaches of the Don, the Middle Volga, and the states of the north-western and central Caucasus [Istoriya narodov Severnogo Kavkaza, 1988, pp. 215–216], Timur moved through south-eastern Chechnya to the region of the river Andi Koisu and then to the Ciscaucasian Plain. Crossing the Terek River, he stopped to camp for the winter on the lower reaches of the Kuma River.

Timur resumed his expansionist campaigns in Dagestan in spring 1396. Regions of central mountainous Dagestan were plundered and devastated [Istoriya narodov Severnogo Kavkaza, 1988, pp. 214, 216–217; Gadlo, 1994, p. 186; Gadzhiev et al., 1996, pp. 306–309; Istoriya Dagestana, 2005, pp. 232–234.] Having established his authority here, Timur returned to Derbent. He ordered that the city's fortifications be built up and strengthened and gave Shirvanshah Ibrahim Derbendi (1382–1417) the commission to guard the city.

Research shows a wide range of deep negative consequences of the Mongol conquests, affecting the economic and social spheres of Dagestan's individual political units as well as of the entire region in general [Istoriya Dagestana, 1967, pp. 205–207; Krishtopa, 1974, pp. 117–118; Magomedov, Krishtopa, 1978, p. 16; Istoriya narodov Severnogo Kavkaza, 1988, pp. 188, 195, 204, 207; Gadzhieva, 2000, pp. 56–57, 63; Gamzatov, 1982, p. 8; Gadlo, 1994, p. 187; Gadzhiev et al., 1996, pp. 300, 309–311; Istoriya Dagestana, 2005, pp. 234–235]. Local residents who resisted the Mongol armies were killed; the Mongols seized wealth and cattle, enslaved people, and destroyed communities. Evidence is record-

ed both in written sources and inscriptions as well as in Dagestan folklore.

The plain regions of Dagestan (Caspian Dagestan), which were under the direct sway of the Mongol Empire, suffered the most. Mongol military campaigns, involving large resources (from 30,000 to 300,000 cavalry, carts with equipment, food, people, plundered cattle, valuables, etc.), which were passing mainly through this region, caused irreparable effects to its ecology, destroyed the local people's economy, and led to its depopulation.

As noted above, sources describe eight major military campaigns during the century-long confrontation of the Golden Horde with the Hulaguid state (1262–1357), which involved the territory of Caspian Dagestan. In 1262, 30,000 Golden Horde troops went to Shirvan through the region and came back via the same route; 70,000 Hulaguid troops from Shirvan went to the lower reaches of the Volga, pursuing and fighting the Golden Horde army; the remnants of the Hulaguid force fought its way back to Shirvan on the same route, pursued by the Golden Horde. In 1263 troops of the Golden Horde went to southern Dagestan through Derbent and fought with the Hulaguids and a Georgian advance force near the city. In 1264 a Golden Horde force again went to Shirvan through Caspian Dagestan and came back using the same route following a defeat.

During a relative stand-down (1266–1318) there were only minor regional military operations (1288, 1290, 1301).

But then, between 1318 and 1356, there were five more large-scale military campaigns. In 1318–1319, 80,000 Golden Horde troops went to Shirvan through Caspian Dagestan and came back using the same route; pursuing them, the Hulaguids reached Derbent. In 1319 the Tatars repeated their raid on Shirvan; in pursuit the Hulaguid troops reached the Terek River. In 1324–1325 the Hulaguids entered the central Ciscaucasia and returned to Shirvan through Caspian Dagestan, devastating local communities. In 1335 a huge Golden Horde army invaded Shirvan and returned through Caspian Dagestan. In 1356–1357, 300,000 Tatar troops went to Shirvan and Northern Iran

and returned to the Terek River through Caspian Dagestan. The last big campaign of the Jochid Ulus dates to 1385, when 90,000 troops of Tokhtamysh Khan invaded Shirvan through Caspian Dagestan, remaining entrenched there until 1395.

All of these military actions broke out on the narrow Dagestani coastline, 3–10 km wide, the farmland of the local people. Part of the communities was destroyed, and the inhabitants of other communities moved to the foothills. In the final period of Mongol dominance sources note just one community in the region: Tarki (the suburbs of present-day Makhachkala), where Timur was encamped during his 1395 campaign.

Derbent was strongly affected by the military campaigns. Periodic assaults and seizures of the city led to the destruction of its fortifications and the reduction of its inhabited area. Arab geographer Abu'l-Fida (d. 1357) wrote that 'according to some travellers, Bab al-Hadid is a city similar to the villages on the Khazar Sea's shore... Bab al-Hadid is a minor, little-populated, small town' (Quoted in [Istoriya Dagestana, 2005, p. 235]). The reduction of the urban area in the Mongol period is also shown in the archaeological evidence [Gamzatov, 1982, p. 10].

Scholars note that the highland political units of central and north-western Dagestan were directly affected neither by the power of the Golden Horde nor by its military confrontation with the Hulaguid state. Even though the main burden of the Mongol invasion fell on the population of Caspian Dagestan, however, it was not completely absent for the mountain population. Traditional economic relations between the mountain and plain regions were destroyed, leading to stagnation.

The international land route through Caspian Dagestan and the marine transit route through Derbent to the lower reaches of the Volga were closed off in the Mongol period, affecting Dagestan's economic development, even though during the relative stand-down the rulers of the Golden Horde and the Hulaguid state tried to renew international trade.

Members of the family of the khan of the Golden Horde seized vast pastures in North-

ern Dagestan, bringing them into the service of the army for the territory's protection, and occasionally established the khans' headquarters and major commanders' summer camping grounds there, thus reducing grazing areas for the local population.

The sources contain no information about taxation of the Dagestani population on the territories ruled by the Golden Horde, but local lore preserved evidence of tribute in the form of girls for harems [Semenov, 1891].

The population of southern Dagestan, ruled by the Hulaguids, also suffered from the Mongols' military campaigns and was also subject to punitive actions (1301). On the territories bordering the Golden Horde the Ilkhans settled foreigners (Persian Muslims), providing them with land in exchange for military service and protection of the mountain crossings [Istoriya narodov Severnogo Kavkaza, 1988, pp. 209–210; Istoriya Dagestana, 2005, p. 230]. There were cases when the local population had to provide all necessary supplies to the Hulaguid army [Istoriya narodov Severnogo Kavkaza, 1988, p. 210].

During Hulaguid rule Derbent was included in the system of the state's economic development. It was home to the final post office, connected with the state post-road system. The local population had a responsibility to provide horses for the post office's needs. Authorities supported the city's economic development, encouraged the activities of craftsmen and merchants, and minted coins circulated in many countries [Istoriya Dagestana, 2005, p. 236; Gusev, 1995, pp. 89–90].

During the reign of Öz Beg Khan, when the Golden Horde reached the zenith of its political and economic prosperity and strengthened its international trade relations [Yegorov, 1985, pp. 47, 56], the role of Derbent in the Volga-Caspian trade grew [Gusev, 1995, p. 89; The History of Dagestan, 2005, pp. 236–237].

The Mongol presence in Dagestan affected the development of military affairs and construction. The highlanders adopted some modern forms of weaponry used by Mongol troops [Abakarov, 1974, pp. 256–261]. The scale of the construction of fortifications in the foothills and highlands increased [Istoriya Dages-

tana, 2005, pp. 286–287]. Artistic glazed pottery from cities of the Golden Horde spread in Derbent [Gamzatov, 1982, pp. 13, 15].

Researchers note the significant role of the Hulaguid and Golden Horde rulers in the further Islamisation of the Dagestani population (second stage) [Istoriya Dagestana, 2005, p. 252]. Berke Khan—in whose reign the Islamisation of the ruling class of the Golden Horde began—and his successors actively supported Muslims on their territory, including Dagestan. Merchants and traders were allowed privileges. The Golden Horde actively used Islam in their struggle with the Hulaguids. The ruling class of the Golden Horde supported the Muslim clergy of the North Caucasus

and the Volga Region, contributing to Islam's advancement in these regions. In the territories that were a part of the Hulaguid state during the reign of Gazan Khan, who adopted Islam and declared it the state religion [Istoriya Dagestana, 2005, p. 229], Muslims also had preferential rights.

The names of the Mongol khans, the members of their families, and their commanders are preserved in the place names of Dagestan, recording locations of their headquarters, appanages, military camps, routes of troop movements, and places of major battles [Gadzhieva, 2000, pp. 58–59, 61]. Dagestani folklore captured numerous instances of heroic struggle against the Mongol invasion.

CHAPTER 8

Foreign Policy of the Jochid Ulus

§ 1. Relationship with the Papacy

Alexander Yurchenko

In the 13th century the eastern policy of the Roman pontiffs was realised in the Crusades, the reverse side of which was the commercial expansion of Italian bankers and businessmen, while diplomatic missions were headed by members of the Franciscan and Dominican orders [Pelliot, 1922–1932, 23, pp. 3–30; 24, pp. 225–235; 28, pp. 3–84; Sinor, 1956, pp. 39–62]. Sometimes the case was simpler. For example, in 1271 the diplomatic message of Pope Gregory X to the Mongol Kublai Khan was carried to China by the Venetian merchants Niccolò and Maffeo Polo [The Travels of Marco Polo, 1956, pp. 48–49]. In 1278 Pope Nicholas III sent to Kublai a mission consisting of five Franciscans, headed by Gerardo of Prato and financed by Florentine bankers, who had lent 998 lire to the pope for this purpose [Golubovich, 1913, pp. 427–429; Soranzo, 1930, p. 238]. The collection of information was usually the responsibility of brothers from the mendicant orders; that was the mission of Hungarian Dominicans in 1237, whose route comprised the North Caucasus and the Volga Region [Sinor, 1952, pp. 589–602]. According to Vincent of Beauvais, the missionary brothers, who had a monastery in Georgia, investigated on commission from the pope the Nestorian priest named Rabban Ata, who was with the Mongol army and had significant authority [de Saint-Quentin, 1965, p. 70].

Turning to the language of symbols, we can indicate three elements that determined the driving forces of Papal policy: the sword, gold, and the cross. With all the conventionality and the metaphorical nature of such an approach, it clarifies the true reasons that affected the shift of the Curia's geopolitical interests from the Jochid Ulus to the Iran ruled by the

Ilkhans. The case is that it was equally possible to come into contact with the Mongol khans both in Eastern Europe and Asia Minor. It is no coincidence that the first Papal messages, having similar content and dated 5 and 13 March 1245, were given to the Franciscan Giovanni da Pian del Carpine, the Dominican Ascelin, and Brother Laurent de Portugal, who was sent by the Pope to the countries of the Middle East [Lupprian, 1981, pp. 141–149].

The route of the first mission lay through Poland and Rus', while the second lay over the Mediterranean Sea to the Transcaucasia. However, from the diplomatic point of view, the final result looked the same: both papal bulls were taken to Mongolia, Karakum, where the office of the great khan was preparing an answer. It is known that in matters of foreign policy, Batu Khan was guided by the decisions of the great khan, who in turn took into account the views of the kurultai members. At the request of Batu, diplomatic missions from the West or from the Caucasus were sent to Mongolia. Thus, initially the question of the geography of contacts was not of decisive importance for the Curia. Until 1260 the Mongol world appeared as one before the West. Accordingly, there is no reason to talk about the existence of an independent diplomatic programme involving close relations between the Holy See and the Jochid Ulus. The Curia tried to lay these contacts on the Russian princes Daniel Romanovich [Bolshakova, 1976, pp. 122–129; Lederer, 1961, pp. 191–192] and Alexander Nevsky [Roshko, 1988, pp. 92–114]. The princes were assigned to inform papal nuncios about Mongol plans [Matuzova, Nazarova, 2002, pp. 351–364].

After receiving comprehensive information from the Franciscan mission of 1245, the

pope declined to take further steps in this direction. Missionaries replaced diplomats. In Eastern Europe the Curia led only passive intelligence-gathering, in contrast with its diplomatic activity in Asia Minor Region. Soviet historiography saw double standards in this papal policy because, on the one hand, the popes hampered the rapprochement of Hungarian kings with the rulers of the Jochid Ulus, but themselves honourably held the embassies of the Ilkhans [Pashuto, 1961, pp. 210–211]. In fact, it was about setting priorities. Strategically, the Ilkhans were potential allies of the Crusaders, while the rulers of the Jochid Ulus, starting with Berke (1257–1266), were focused on a union with Egypt [Vernadsky, 1927, I].

Here is one of the early episodes of Western policy aimed at the conclusion of a treaty between the French and the Mongols. The diplomatic mission of the envoys of King Louis IX, which met with the regent Turakina in Mongolia in 1248, ended without result, according to Joinville. In 1253–1255 William of Rubruck, concealing his mission from Louis IX, conducted secret negotiations with Sartaq, Batu Khan, and the Great Khan Möngke about military aid to the Crusaders. It was about an alliance against the Egyptian sultan and the fate of the Latin Kingdom of Jerusalem. We do not know the content of the negotiations or their results, but apparently it is not a coincidence that Louis, despite the Crusaders' desperate condition, did not leave the Holy Land and was waiting for a notification from his messenger. Regardless of these negotiations, in February 1258 Hulagu conquered Baghdad and Iran. In 1260 the Mongols, in alliance with the Armenians and the Franks, conquered Damascus, Aleppo, and other Syrian cities.

In the latter half of the 13th century the interests of Genoese and Venetian trading houses concentrated on Crimea and Mongol-ruled Iran. The map of the Genoese colonies surprisingly coincides with the map of Franciscan missions [After Marco Polo, 1968, pp. 56–59].

The dissolution of the Mongol Empire into a number of independent uluses and the military confrontation of the Golden Horde with the Persian Ilkhans most likely tweaked the policy of the Curia. Beginning in 1264

The Pope's Embassy to the Great Khan.
Miniature. France. After 1333.

the activity of contacts between the Holy See and rulers of the Golden Horde significantly lessened but strengthened the relationship with the Hulagu dynasty, because they had a common enemy—Mamluk Egypt. The Popes and Ilkhans were openly negotiating common military projects. At that period of time Indian spices arrived to Europe through Tabriz, bypassing Egypt, leading to the shift of the main caravan routes to the southern regions of Iran [Petrushevksy, 1937, p. 112].

Thus, a new diplomatic axis Genoa-Rome-Tabriz had taken shape. The Council of Lyon in 1274 gave priority to the relationship with the Persian Ilkhans [Borghesio, 1938, pp. 319–331; Roberg, 1973, pp. 241–302; Sinor, 1978, pp. 55–72].

That is the overview of the facts that allow for explaining why the successful mission of Giovanni da Pian del Carpine, which was accepted by Batu Khan, was not followed by another. At least during the next one hundred years (until the embassy of Giovanni Marignoli who visited the Golden Horde in 1339–1340 on the way to Khanbaliq in the reign of Öz Beg Khan) there were no official contacts between Avignon and Sarai. Genoese consuls took up the initiative. Franciscans continued missionary activity on the territory of the Golden Horde, which is evidenced by the letter of Friar Johanca the Hungarian to the head of the Order, brother Michele da Cesena [Anninsky, 1940, pp. 90–94]. As the starting point for the re-

view of the relationships between the Holy See and the Mongol Khans shall be considered the events of the Fifth crusade, namely the period of battles in Damietta in 1219–1221. Among the crusaders there spread a rumour about an extraordinary ally that inflicted a crushing defeat on the Muslims in the east and which will soon appear near the borders of Egypt [Zancke, 1879, pp. 1–22].

Obviously, this concerned the military campaign of Chinggis Khan against Khwarezm-Shah. The leaders of Crusaders imagined Chinggis Khan as a descendant of the legendary Prester John, and this association was supported by information about the actual success of the Mongols in Iran [Kunik, 1854, pp. 761–764]. In 1219 Mongol troops approached the eastern boundaries of the Baghdad caliphate. The Crusaders assumed that their new ally in the fight against the Muslims was ready to help to protect the Holy Sepulchre. Such surprising news generated incredible hope in the hearts of Crusaders, who, however, ended up with great disappointment. But we are more interested in the motivation that determined the behaviour of the Papal legates in the Middle East.
