FOREWORD

Ildus Zagidullin

Russia's power and might increased greatly in the 19th century, which was an important stage in the transformation of the multicultural state's territory, economy, and ideology. Apart from the consistent development in the state, new trends appeared in Russian society that set the stage for the modernisation processes. However, vestiges of feudalism survived in Russia even after serfdom was abolished in 1861 despite the positive changes. There was no civil society.

The empire's formation was completed in the 19th century. As the empire's territory expanded, the ethnic composition of its population changed qualitatively. The titular ethnic group accounted for less than half of the country's total population in the post-reform period. The First General Census of 1897 estimated the percentage at 44.31%. The so-called ethno-religious minorities with their indigenous cultural traditions and varying levels and rates of socio-economic, social, and cultural development were numerically the majority. After the Ukrainians (17.8%), the Turkic peoples were the largest group of Russian subjects numbering 13.6 million people (10.8%). Qualitative changes in the religious topography of the Eurasian empire were another important outcome of Russian expansion. Muslims became the second largest group of subjects (11.1%) after Orthodox Christians (69.4%) [Rossiya, 2002, pp. 88–89].

The Tatars were the first Muslim people to become part of Russia. It took them a long time to adjust to the new political and legal conditions. According to written sources, the relations between the titular ethnic groups and the ethnic groups of the Volga-Ural Region took the form of 'us-them.' Starting in the late 18th century the imperial government applied the umbrella term 'inorodets' (non-Russian) to the peoples of the Volga-Ural Region, the east and south of Russia. This became well-established in the mid-19th century. At first, the concept of 'non-Russians' referred to a

lifestyle. However, origin was later added as a criterion. This term had fundamentalist potential and was consistent with the political and religious movements in Russian society of the latter half of the 19th century [Kappeler, 2012, pp. 32–33].

The specific Tatar economic lifestyle was shaped by their dispersion across the vast Eurasian territory covering areas with different natural and climatic conditions. Before the reforms most local migration flows and Tatar enclave establishment were directed south-east towards Russia's periphery, where stable areas of contact with the Kazakhs and Middle Asian peoples formed. However, the high urbanisation in Tatar diasporas on the south-eastern margin of the country caused no qualitative changes in their sociocultural development. The steppe areas were peripheral to Russia in economic and cultural terms. The cities were relatively small by Russian standards. Modernisation ideas came from the Middle Volga Region. At the turn of the 20th century Tatar urbanisation was directed towards Russian industrial areas, Central Russian cities, where migrants, predominantly poor ones, moved from densely populated areas in search of jobs. In the Volga-Ural Region and in Siberia (traditional Tatar areas) the percentage of Tatars in the urban population was much lower than the Russian average.

The social and legal status of Russian subjects was determined by their class affiliation at that time. When Peter I destroyed the Muslim feudal elite, the Tatar community turned into a group of peasants who were in an economically unenviable position and legally discriminated against within the Empire's social class hierarchy. Sources report no material changes to the local administration even after 'Lapotnik murzas' were permitted to be registered as noblemen at the end of the 18th century. It was still controlled by Russian noblemen and public officials. Even though most of them ran peasant households, representatives of the Tatar nobil-

ity were the sector of the Tatar population that showed the greatest inclination to obtain a Russian education. Their high social status enabled them to get jobs as public officials, usually low-ranking. They contributed to the development of Tatar culture and education as alumni of Russian educational institutions.

But the small size and economic weakness of the nobility had other consequences. The Islamic clergy became the only authoritative corporate group and acquired extended functions. The clergy gave preference to the 'religious aspect of culture,' which caused the Tatar community to develop culturally in a lop-sided manner, with the secular part stunted [Usmanov, 2010, p. 7]. Autocratic policies largely determined that religious discourse would dominate in the cultural development of the Tatars. The policies consisted of derailing Tatar initiatives to found secular schools or publish periodicals in their native language.

Due to the regimentation of their functions and the number of administrative duties that the government gave them, the Tatar clerical intellectual elite were able to form a corporate group that enjoyed great authority and a high social status in the congregations, even though the parish clergy of the OMSA region were not formally recognised as a privileged class.

When the merchant class was introduced in 1775, Tatar traders and industrialists, enterprising peasants, and burghers were able to enter the new semi-privileged corporate group, which came after the nobility and the Orthodox clergy within the new Russian hierarchy of classes, thus improving their social and legal status. However, guild merchants had to confirm their financial standings annually to preserve their status.

Thus, the social development of the Tatar community had a number of characteristic features. It contained very few public officials as Tatars were poorly represented in zemsky institutions and city dumas. Their opportunities were essentially limited to peasant self-government bodies.

It was largely due to the position and activities of the higher social classes that the Tatar community adopted certain reformist ideas during the modernisation of Russia and the

development of capitalistic relations. Depending on the specific historical and local situation, these social groups began to act as local and all-Tatar ethnic elites.

Due to the state of affairs in the country and the central governments' ambition to economically and politically integrate the Kazakh steppe and Middle Asia in the latter half of the 18–former half of the 19th centuries, the Tatars became involved in establishing and reinforcing diplomatic contacts, mediation, and commercial and economic relations between Russia and Eastern Muslim peoples and countries. In the south-east of the country Tatar entrepreneurs controlled all of Russia's trade with the Kazakh Zhuzes and largely Middle Asia. They succeeded in engaging the vast nomadic region in the whole Russian market, turning exchange houses and bazaars into markets for selling domestic industrial products. These new phenomena, which had long-term effects on the social development of the Tatars, helped to create ethnic capital, brought merchants into industrial production, and brought about the emergence of the merchant class as the modern ethnic elite, which was both open to transformations and pro-active.

The large-scale establishment of Muslim educational institutions, in which scholastic principles were paramount (they were to become centres of the Tatar renaissance) by Tatar merchants in the pre-reform period, when capitalistic relations were developing in the Volga-Ural Region, and mass publishing of religious and prayer books are largely attributable to economic interests of entrepreneurs, which were highly determined by the Oriental market [Gubaydullin, 2002, pp. 171, 175, 176].

In order to raise funds for trade and industrial development, Muslim merchants received loans from Russian entrepreneurs and each other, used borrowed cash and promissory notes, and often traded on credit [Gobäydullin, 1989, p. 255; Gaziz, 1994, p. 178]. As a system of governmentally funded, public, and private credit institutions formed in the Empire, it became more common for large-scale Tatar entrepreneurs to obtain loans [Istoriya Kazani, Book 1, pp. 382–399]. Tatar land communities, farmer groups, burghers, and

peasants engaged in business took loans when necessary [Istoriya Kazani, Book 1, pp. 459, 460, 478, 489].

Tatar peasants and burghers traditionally did petty trade with their coreligionists and local peoples of the region, which gave them a different lifestyle than the peasant farmers [Alishev, 2005, pp. 333–334].

Economic development patterns in specific regions of European Russia had a major influence on social processes. In the 1860s most of Russia's industrial output was attributable to the Central Non-Black Soil (43.9%) and North-Western Regions (25.4%), though they accounted for as little as 14.6% and 4.7% of the population, respectively. The Middle Volga Region (7.1% of the population) produced only 3.9% of the industrial output, and the Cisural Region (7% of the population), 4.4%. The Volga Region harvested 9.9%, and the Cisural Region, 12%, of the total crops produced in the European part of the country [Smykov, 1984,¹Table 6, p. 46].

The development of agricultural and industrial production, new means of transport (steamboats and trains), the governmental situation, and other factors favoured the development of bourgeois relations in Tatar society.

Soon after Russia's conquest of Middle Asia, the Tatar bourgeoisie lost the Middle Asian market that it had been selflessly trying to create for over a century. The Russian bourgeoisie supported the Russian government in order to fully control the economic sphere. After the Governorate-General of Turkestan was established, non-Christians were forbidden to own real estate on its territory (from 1886). When the market dwindled, entrepreneurs had to become more active on the Kazakh Steppe to keep existing markets and win new ones inside Russia. The Tatar dry goods industry had in fact dropped out of the competition by the mid-20th century due to the cheaper and better products of capitalistic Central Russian plants.

¹ Data for 7 out of 12 regions of European Russia is used, namely North-Western, Central Black Soil, Central Non-Black Soil, Middle Volga, Western, Southern Steppe, and Cisural. The data on industrial production does not cover mining, alcohol distillation, and tobacco industries.

Following the reforms, the government began to suppress Tatar schools in order to gain control over the key institution that ensured the ethno-confessional identity of the younger generation of Tatars, which raised the issue of resisting assimilation. This new situation required brand new ideas, secular knowledge, and well-trained ethnic professionals to meet the modern requirements. Advocating for a renewed social life, the ethnic bourgeoisie also protected its corporate interests. People who possessed basic secular knowledge and could manage businesses and develop capitalistic production were sought after. For the ethnic bourgeoisie, making Tatar trade and industry competitive would not only help them to survive in the tough Russian market but also to preserve their high social status among Muslim Tatars.

The renewal of the Tatar social life largely depended on the position of the Tatar bourgeoisie. The fact that Tatars relied on Tatars to ensure is characteristic of the ethnic nature of Jadidism. They had to invest in an undertaking that was expected to produce more material wealth for the people, thus increasing their capacity to buy commodities from the ethnic bourgeoisie and to change their attitude to West European luxuries. It was also expected to produce well-trained employees in commerce, industry, economy, education, science, and culture. This would require great expenditures, perseverance, and effort because nearly all spheres had to be reformed amidst domination of the scholastic Muslim world view and opposition of the traditionalists.

The seasonal work of the Tatars, which was dependent on economic principles and the developing capitalistic relations, caused non-privileged social strata to integrate into Russian society, sparking new trends in the Tatar economy, migration, and settlement.

The liberal laws that determined the development of Russian society also affected social processes in Tatar communities. Of particular importance was the introduction of universal military service for all classes in 1847. Young Tatars returned from the army after five to seven years of living in a Russian environment, familiar with the country's economic progress and Russian language, often having learned

to write, which created favourable conditions for entrepreneurial and economic activities in the multi-cultural environment. Compulsory military service for men aged 21 put an end to traditional long-term studies at traditional educational institutions. Shakirds left the madrasas for the army. When retired, soldiers became clergymen, their opinion on new phenomena in the Muslim lives differed greatly from the older clergy. They largely constituted the social platform for spreading reformist ideas. At the same time, as the peasant workforce dwindled due to universal conscription, this reduced not only the number of shakirds in madrasas but also the number of girls taught by the abystai, the mullah's wife [Fäxretdin, 2012, No. 2/3, p. 89].

The autocratic government was the primary exploiter of Tatars, as it financially and ethnically oppressed them through the local administration represented by Russian Orthodox bureaucrats. The famous Soviet historian N. Druzhinin introduced the concept of 'state feudalism,' the emergence of which he attributed to a number of laws instituted by Peter the Great that levied a poll tax and obrok on chernososhny (peasants that farmed state-owned land) and small land holders. N. Druzhinin highlighted the following legal restrictions on state peasants: joint responsibility, local authorities' custody over them, impeded migration, and transition between classes. In the 19th century the autocratic regime maintained the domestic policy of 'state feudalism,' characterised by heavy fiscal oppression and restricted rights of peasants, which was inconsistent with the liberal reforms of the 1860–1870s.

Given the class restrictions and traditionalism in land communities, the Tatar population was isolated from the sociopolitical processes taking place in the country. The experience of the Tatars in city and zemsky self-government bodies as well as volost administrations gave them useful contacts with other cultures and unified them to protect local interests.

It must be noted that Russian society was pre-industrial. As Gellner said: 'The agrarian society with its relatively well-established division of labour and clear division into regional, clan, occupational, and class groups has a

distinct social structure. It is well-ordered and not random. Its subcultures enhance and reinforce the structural division. It does not impede the functioning of the whole society by creating or accentuating cultural differences within it. On the contrary, the society does not regard such cultural differences as offensive but views their emergence and manifestations as appropriate and decent. Recognising them is in essence observing moral and etiquette standards [Gellner, 1991, p. 141].

In the 19th century Russia's various ethnic groups began to build national identities, the Tatars in particular. The term 'Tatars' was not yet well established in the Volga-Ural Tatar community during this time because the people were highly dispersed, the military and service class had privileges, and the mindset was predominantly Islamic. This is why Tatars commonly referred to themselves as 'Muslims' [Ibrahimov, Vol. 7, p. 5] as well as 'Turks,' 'Teptyars,' 'Meshcheryaks,' and 'Bashkirs' [Rodnov, 2011, pp. 81–86]. The absence of any profound social contradictions, the influence of the social class status—which guaranteed economic privileges in the Cisural Region—on ethnic self-identification, and the foreign cultural environment had all helped to create a 'Muslim nation' of Tatar and Bashkirs in the OMSA region.

Ş. Märcani was one of the first to mention the need to identify themselves as Tatars. K. Nasyri played a major part in building the Tatar nation. He formulated the first definition of the Tatar nation. The scholar singled out the following criteria of the Tatar people: origin ('Tatars living in Siberia and in the Orenburg, Kazan, and other Guberniyas on the right side of the Volga and in the Astrakhan Guberniya), common state ('living in Russia'), culture ('have their own literature'), and language ('we usually define the Tatar language as the Middle or Tatar vernacular spoken by peoples of the Turkic tribe'). After 1905 most of national newspapers were published in a Tatar language that was understandable for all population groups (concept by K. Nasyri) [Yuzeev, 2002, pp. 27–28].

Apart from the 'Muslim nation' of the Volga-Ural Region and Siberia, the so-called Russian Ummah arose as a result of the common political, legal, economic, cultural, and informa-

tion space. It covered several historico-cultural regions populated by Turkic peoples with centuries-old distinctive traditions, whose legal status was usually determined by regional regulations. The Muslims formed common ideas and interests due to Sunni Islam, their historical memory, linguistic and cultural affinity, as well as similar mindsets. This took on a new meaning due to the fact that they lived in an Orthodox state.

The uniform system of religious education and network of Islamic institutions created the general Tatar religious mindset and unique everyday culture, which was a synthesis of Islamic laws and folk traditions.

The fundamental principles of 'Disciplining of Islam' established by Catherine II brought about a confessional state that controlled and legally regulated the conditions, under which religious requirements were satisfied, as well as the observance of the religious rights of ethno-confessional minorities whose religions were officially recognised as 'tolerable.' To quote Crews, 'tolerance in Russian was a structure to integrate non-Orthodox Christian subjects, the number of which had been growing constantly as the empire expanded.' The practice hinged on the belief developed by enlighteners across Europe that different religions always share some characteristics. As well-developed systems of disciplining, tolerable religions could be valuable to 'enlightened' rulers. In places where violence would be too crude, appealing to a religious authority could help to turn people, who would not listen to their rulers but could be persuaded to obey God, into loyal and disciplined subjects' [quoted by: Dolbilov, 2010, p. 43]. As a result, a legal framework was created for Islamic religious institutions to function in the OMSA Region.

While Alexander I took some steps that could be interpreted as attempts to create a united Russian nation, Nicholas I and his successors were guided by 'Orthodox Christianity, autocracy, and national spirit' and deliberately broke with the imperial tradition [Tsimbayev, 2004, pp. 30, 32]. Riding on the wave of the liberal reforms of the 1860–1870s, the government began to construct a 'national state' in European Russia, which attached little, if any, importance

to ethno-confessional minorities' interests and needs. At the same time, the autocratic regime increased pressure on the borderlands to transform along the lines of the whole empire.

Neither the Tatar elite nor common people were subject to Russification in this period. However, the government's domestic policy aimed at increasing control over the Islamic educational system and the missionary activities of the Russian Orthodox Church caused most Tatars to develop an ambivalent attitude towards Russian educational institutions and distance themselves from them.

The colonisation of new territories, the growth of Russia's Muslim population, and modernisation in the Tatar community brought the 'Muslim issue' to the imperial level at the end of the century. Representatives of ethnic elites came to view the regional autocratic policies towards the Turkic peoples as part of a common domestic policy for the 'Russian Ummah.' As the government took measures to increase control over religious and cultural autonomies, they responded by trying to enforce their legally guaranteed rights. The cultural renaissance that Tatar Jadids advocated was in fact a challenge to their oppression by the autocratic regime. Language and religion became something of a Europeanisation marker for them. The development of Russian culture and the activities of Kazan University and Orientalists, the Kazan Tatar Teachers' School, government-founded Muslim educational institutions, book printing, etc., all created the conditions and helped to Europeanise Tatar society.

Tatars had established close economic and cultural contacts primarily with Kazakhs and Middle Asians throughout the 19th century. However, as Jadidism developed, the Tatar model for developing a modern 'Muslim nation' began to attract the local elites of the Northern Caucasus as well as Shi'ite Azerbaijanis. 'At the turn of the 20th century the Tatar diaspora, with its modernist mindset and economic resources that enabled it to fund a wide range of printing, educational, religious, economic, linguistic, and social reforms, represented a development model that many Turks, facing the question of whether they should preserve the old modes of existence or develop into a new

modern society, found attractive' [Lazzerini, 2011, p. 22].

The formation of new Tatar elites at the turn of the 19th century, who were incorporated into the class hierarchy (merchants and nobility) and enjoyed a high social status among their coreligionists (Muslim clergy), brought about qualitative changes in the people's sociocultural development, primarily in Muslim reformist movements, enlightenment, and Europeanisation of national education. By the early 20th century Tatar society had brought up a group of educated young people with knowledge of Russian and European languages that were eager to develop their culture to the average European level, while preserving traditional values. They set themselves the goal of reforming Tatar society, its socio-philosophical, aesthetic, and scientific approaches and practices. Scholars educated at foreign and Russian educational institutions were at the helm of the social modernisation.

Jadidism was initially an urban phenomenon as it emerged in the foreign cultural environment of the city. However, the large maktab network, high Tatar literacy rates, the large coreligionist group willing to absorb new ideas from printed materials, financial support from entrepreneurs who helped to secure employment for innovative teachers and founded innovative schools in villages, as well as secular book publishing transformed Jadidism into a sociocultural phenomenon in the early 20th century.

The processes left their mark on Tatar literature, which was guided by the Renaissance in its development, and had secular culture and anthropocentrism (primarily interested in humans and their actions) as its cornerstones. In the first half of the 19th century Tatar literature represented a complex picture, some elements of which were preparing for the transition from the medieval religious concept of man to that of the Enlightenment. In the post-reform period it developed into a powerful enlightenment movement expressed as a gradual realisation of the inherent value and civic purpose of man. The next stage was the High Renaissance of the early 20th century, known as the Golden Age of Tatar culture. The explosive development of Tatar print media and publishing industry,

the new course towards secular education, and change of cultural focus from East to West all gave momentum to the formation of new cultural tendencies.

In the early 20th century Tatar social activists founded Ittifaq al-Muslimin all-Russia Muslim party, thus marking a new stage in the development of the Tatar nation and in the national movements of the Turkic peoples of Russia.

Due to the missionary educational system of N. Ilminsky, non-Russian Christian peoples in the Middle Volga Region developed a national intelligentsia at the end of the century that became a 'national driver' and ensured, along with Russian ethnographers and linguists, the peoples' transition to the national movement cultural phase ('A') [Kappeler, 2000, pp. 189–190]. Christian Tatars developed a Cyrillic alphabet (an alternative to the Arabic script) and primary schools that provided instruction in the native language, and religious intelligentsia were educated that were, however, prone to Russification (which was typical for the intelligentsia of the region's Christian non-Russian peoples). New phenomena caused Christian Tatars to distance themselves from Muslim Tatars for religious reasons. However, they did not bring about any national movement.

What happened to the Tatars of Russia? What part did they play in the development of the Turkic peoples and the Muslim world? What was their contribution to the consolidation and development of the Motherland? These and many other questions are explored in this Volume 6 of the 'History of the Tatars since Ancient Times.'

* * *

The authors of Volume 6 of the 'History of the Tatars since Ancient Times' were guided by the principles of historicism, objectivity, and social approach.

Historical processes are described within the framework of the civilisation approach, which is based on respect for all peoples and countries without exception. Of particular importance were studying the social and cultural processes of the Tatars as an integral part of Russia's polyethnic and multi-confessional society and determining the distinctive features

of the national culture and mutual interactions with other peoples.

This balanced scientific approach to historical events was aimed at tracing the connection between the history of the Tatar people and that of the Russian state. National history was used to illustrate the sociocultural ideological paradigms of a number of Muslim and Turkic peoples in Russia.

Territorially, the book covers the Russian Empire and the states in which the Tatars were destined to live and form diasporas. The approach was taken because of the way the Tatars opened up new lands in multiple directions. It shed light not only on the historic demographic processes, basic directions of migration, diaspora formations, and contact areas in which interaction with other peoples took place but also—within a comparative framework—the dynamic social and economic development of regional compact Tatar groups.

Separate sections deal with the history of the Crimean and Lithuanian-Polish Tatars due to the specific nature of the Turkic cultural development of the particular periods when religious self-identification was crucial to ethno-confessional minorities.

The book's chronological span (from the 19th century to 1905) was chosen due to general trends in the development of the Tatar-Muslim community and key changes in its life brought about by Russia's capitalistic development and autocratic domestic policy. A number of governmental legislative initiatives marked the last quarter of the 18th century. For example, merchant guilds were established, which became 'social elevators' for entrepreneurial burghers and peasants. 'Lapotnik murzas,' descendants of the medieval Turko-Tatar elite in the Volga-Ural Region, were allowed to enter the Russian nobility, and the Muslim clergy were recognised as leaders of a 'tolerable' religion, thus enshrining the high social status of the parish clergy.

A landmark for the Muslim population of the Cisural Region was the introduction of the canton administration system, within which Bashkirs and Meshcheryaks enjoyed the status of military service people and privileges as compared to the rural tax-paying population.

New governmental and public Tatar institutions were founded in the late 18th century. The new canton system brought about canton heads and officials, who were the first Tatar officials of a new age that did not last long (cantons were abolished in 1865). Self-government went through dramatic changes. While earlier Tatar self-government had been concentrated in rural agrarian communities, the cantons established in 1789 formed vast territories controlled by Muslim officials. The Law of 7 August 1797 established state peasant volosts, extending the rights of elected delegates of the tax-paying peasantry. Where the Tatar population was compact, village heads (of Tatar origin) formed a larger percentage of volost administrations. Volost administrations that invited in clergymen 'for governmental issues' also favoured closer contacts with the local imams. Positive changes took place in urban self-government. As the number of Tatar merchants and burghers increased, so did Tatar percentage in local merchant self-government bodies. Tatar burgher communities or administrations emerged in a number of cities. The Tatar City Halls of Kazan and Seitov posad were established in the 1780s.

The establishment of the Orenburg Muslim Spiritual Assembly (OMSA) in 1789 was of special importance in terms of enhancing consolidation and Islamisation in Tatar society. It covered the main Tatar-inhabited territories. As the population grew, the network of Islamic parishes expanded, and Islamic religious institutions became more numerous.

The emergence of new elites, whose status was enshrined in the Russian law, as well as the development of capitalistic relations laid a foundation for unprecedented social changes in Tatar society. It was representatives of the elite who had the most contact with the authorities and were the most integrated into the Russian cultural environment. The groups shaped the people's further progress. Their activities in a number of fields were of national importance, largely determining the rate and specific features of Tatar nation building.

The book's upper chronological limit (1905) was determined by the dramatic changes in Russia's social and political life brought about by the First Russian Revolution. The events of

1905–1907 catalysed the development of Tatar culture, pushing it towards its golden age. Unprecedented democratic freedoms for Tatars, democratic transformations in Russian society, and the liberal atmosphere favoured high levels of civil activity, with the idea of Tatar national development acting as the centrepiece. The Tatars and Muslims of Russia found their niche in party construction and the country's political development. This was the beginning of a new stage, marked by large-scale Europeanisation in Tatar society. However, all these changes were set in motion by the social processes that took place in the Tatar community in the 19th century.

It should be noted that the desire to present the events as a cohesive historical process motivated the authors to offer short side trips into the 18th century or even earlier within some sections.

In order to estimate the extent to which certain phenomena and events affected Tatar society in the period in question as well as to identify the places and significance of the processes at the turn of the century that continued in the following decade, the authors sometimes extended their narrative beyond the chronological limits, up to the fall of the autocracy.

The absence of landowners and serfs in the Tatar social hierarchy, the fact that most Tatar farmers were state peasants and other free groups, and the low social status of the Muslim population and, consequently, its isolation from essential Russian sociopolitical processes made it unnecessary to divide the book into pre-reform and post-reform periods, which is of fundamental importance in presenting the history of the Russian Empire and the Russian people.

* * *

Leading experts from Kazan and other academic centres in Russia and abroad co-authored the present volume. The editors wanted to ensure the collective work was cohesive and written in a seamless style. Some facts are mentioned several times to ensure each section is as cohesive as possible.

The authors used the Turkic tradition for spelling anthroponyms, toponyms, terms, and personal names.

The following persons made as much of a contribution to some of the sections as the edi-

tors did: *A. Kappeler* (Section VII), Candidate of Historical Sciences *M. Farkhshatov* (Literature Review).

Translation of the articles by M. Kemper and M. Tuna from English by *I. Salakhov*, the article, by E. Lazzereni, by *L. Almazova*, the article by Alper Alp from Turkish, by B. Nogmanov.

The Appendices to the volume were prepared by *L. Baybulatova*, *I. Zagidullin*, *R. Iskhakov*, *Kh. Bagautdinova*, *N. Tagirova*.

Reference and Abbreviation Lists by *L. Baibulatova* and *Kh. Bagautdinova*.

Indices by *R. Iskhakov*, *B. Khismatullin* and *R. Zalyaletdinova*.

Illustrations to the present volume include drawings and photographs from books and magazines published before the revolution, contemporary historical literature and albums, and exhibits from the Russian Museum of Ethnography and the K. Nasyri Museum (Kazan); materials from collections of the Russian Museum of Ethnography, Russian State Historical Archive, Peter the Great Museum of Anthropology and Ethnography, the National Archive of the Republic of Tatarstan, the Central Historical Archive of the Republic of Tatarstan, the Department of Manuscripts and Rare Books of the Lobachevsky Library, the Archive of the Galimdzhan Ibragimov Institute of Language, Literature, and Art, the Archive of the Ethnology Department of the Sh. Marjani Institute for History of the RT Academy of Sciences, and reconstructions by N. Khalikov.

Drawings by *N. Khalikov*, *L. Baybulatova*, *D. Denisov*, *I. Zagidullin*, *G. Gabdelganeva*, *R. Iskhakov*, *F. Sharifullina*, *N. Tagirova*, *D. Usmanova*, *M. Akhmetzyanov*, *Z. Tychinskikh*, *M. Khabibullin*, and *A. Starostin*.

Illustrations in the attachment and part of the illustrations in the text selected by *R. Iskhakov* and *L. Baybulatova*. The maps by *N. Khalikov* are courtesy of the leadership of Moscow Publishing and Production Centre Design. Information. Cartography, Moscow (Atlas Tatarika. The History of the Tatars and Eurasian Peoples. Kun are courtesy of the administration of the State Historic Architectural and Art Museum Reserve of the Kazan Kremlin.

REIVEW OF SOURCES AND LITERATURE

1. SOURCES ON THE HISTORY OF THE TATARS IN THE 19–EARLY 20th CENTURY

Liliya Baibulatova, Radik Iskhakov

There is a wide range of sources on the history and culture of Modern Tatars, which can be divided into three main groups—written, material and graphic.

In the 19th century, growth in the quantity and types of written sources can be attributed to the changes that had been taking place in Russian society and in the individual consciousness. In any study into the history of the Tatars, it is necessary to use the following types of written sources: 1) legislation and regulations, normative materials; 2) acts; 3) clerical materials; 4) fiscal accounting materials; 5) statistics; 6) periodical press articles; 7) sources of personal origin; 8) historical narratives; and 9) folk material.

Among the rich variety of legislative acts, crucial importance is given to the absolute highest ordinances, statutes and regulations, which make it possible to more fully trace the policy of the autocracy in relation to the Tatar people. In the 'Complete Collection of Laws of the Russian Empire'¹ and 'Code of Laws of the Russian Empire', there are laws governing the relations of the sovereignty and Tatar population on land use, trade, taxation and duties, relocation, military service and the status of class groups and use of Islamic law in everyday life. The legal status of the various social classes, including Muslims, can be found in the 'Code of Laws of the Fortunes' [Zakony' o sostoyaniyax], 'Regulations on the Agricultural Condition' [Polozhenie o sel'skom, 1903], 'Regulations on the Provincial and Zemstvo State Institutions' [Polozhenie o gubernskix, 1892], 'City Conditions' [Gorodovoe polozhe-

nie, 1892], 'Civil Law' [Zakony' grazhdanskie, 1900], 'Code on Criminal and Correctional Penalties' [Ulozhenie o nakazaniyax, 1885], 'Charter of Criminal Proceedings' [Ustav ugovnogo, 1892], 'Statutes of Religious Affairs of Foreign Confessions' [Svod uchrezhdenij, 1857; Ustavy' duxovny'x, 1896], and other documents. The legal status of Muslim soldiers was regulated by the 'Code of Military Regulations' [Svod voenny'x, 1838, Part 2, Book 1; Part 3, Book 2; Svod voenny'x, 1869, vol. 16, edition 4; Svod voenny'x, 1869, part 4, Book 17, etc.].

Government rules, regulations, orders and precepts were all endowed with legislative power from the following departments: Ministry of Internal Affairs [Sbornik, 1894; Sbornik czirkulyarov Ministerstva vnutrennix del, etc.], Ministry of National Education [Svod glavnejshix, 1882; Sbornik postanovlenij po Ministerstvu narodnogo prosveshheniya, etc.], War Ministry [Spravochnik, 1911, etc.], Chief Directorate of Jail Facilities [Sbornik czirkulyarny'x, 1880], Orenburg Muslim Spiritual Facility [Sbornik czirkulyarov, 1902; Sbornik czirkulyarov, 1905], Department of Orthodox Confession [Rukovodstvenny'e, 1879, etc.] and others that nullified or amended the existing regulations, clarified the procedure for applying active legislation (including anything related to the military, service and tribute-paying Tatar classes), carried out the religious policy, etc.

The application of Sharia norms in the regulation of family relations, the division of property and issues of inheritance among Tatars led us to distinguish Muslim law as a separate subgroup of legislative acts, i.e. norms of Sharia [Shariatny'e, 1910; Nofal, 1886; Efendiev, 1911; Marginani, 2008].

A thorough selection of legislative actions related to Muslims and their classes has been compiled in a number of documents and materials [Sbornik, 1899; Inorodcheskie, 1903;

¹ The Complete Code of Laws was published in three collections. The first was published in 1830. It contained decrees dated 1649–1825. The second code followed from 1830–1884 and contained those pertaining to the period from 1825 to 1881. The third code of decrees dated 1881–1913 was published from 1885 to 1916.

Islam, 1998; Zakony', 1999; Islam, 2001; Nacional'ny'j, 2009], which greatly simplifies the search for this particular set of historical sources.

The sources of acts played a major role in the study of legal relations, as their active expansion in the New Time was thanks to prominent growth in the scope of contractual relation regulations and the development of the law of obligation [Istochnikovedenie, 1998, p. 385]. Private acts that contain information on the legal status of separate classes in the sphere of contractual and obligation relations are particularly informative for researchers. As a result, Tatar private acts assume great importance as legally arranged contractual (buy and sell, endowment, will, division of property), family (marriage, divorce) and public (conflict regulation, selecting of spiritual, election agents, etc) relations. Despite the fact that these documents were kept in Tatar and often in the absence of a unified format, they were legally valid, the fact of which was officially established in various government institutions [Minnullin, 1988, p. 7–10].

A large portion of sources on the history of Tatars in the 19–beginning of the 20th century are made up of managerial and record keeping documents that highlight the public and economic processes in the lives of Tatars. In the 19th century collegiums were replaced by ministries with documentary activities regulated by law, and new types of unified documents were created for all social institutions [Shepelev, 1968, p. 119].

Among all the diversity of the published managerial documents, the documents most crucial for the study of Tatar history are the reports of governors containing information on their activities as an element of the state structure and their relations with the population. In the 19th century the format of the report was changed. Its textual part consisted of sections containing information on life in the governorates, including productivity, forms of taxation, the population, social amenities, public health, education, administrative operations, legal proceedings, and others. Appendices with registers contained the figures to corroborate the textual part of the report. The most reliable data is in the characterisation of the admin-

istration's direct functions, as any distortion would have held legal ramifications. The study of governors' reports from different governorates where Tatar communities were present paints a numeric picture of the Tatar population based on religion, the number of confessional schools, birth rate, and other factors [Litvak, 1979, p. 154–155, 185].

The most humble annual reports of the Attorney General of the Synod published first in 1837 are of great importance in the history of missionary politics among the Tatar people [Iz vlecheniya iz vsepoddanejshix, 1837–1885; Vsepoddanejshie otchety', 1886–1914]. They contain information on the state of the church's authority, certain diocese and parishes, the operations of missionary organisations and successes in the Christianisation of non-Orthodox populations in national regions of the empire. This group of documents is our greatest resource on the developmental history of Orthodox institutions by christened Tatars, and it makes it possible to highlight their function and influence on the religiosity of this confessional group. The church statistics in the reports are also of great value, as they clearly depict the number of Orthodox parishes, churches, monasteries and religious educational establishments, as well as the number of clergy and parishioners, and the number of converts to the Orthodoxy of neophytes from other confessions. Another important source on the history of the Christianisation of Tatars are the annual reports of missionary organisations: Brotherhood of Saint Gury (1867–1914) [Otchety' Bratstva svyatogo Guriya, 1867–1914], Translation Committee of the Orthodox missionary community (1892–1915) [Otchety' Perevodcheskoj komissii, 1892–1915], Orthodox Missionary Community (1871–1905) [Otchet Pravoslavnogo missionerskogo obshchestva, 1871–1906] and its Volga region committees (1870–1905) [Otchety' Vyatskogo komiteta, 1872–1906]. In addition to just information on the operations of these missionary establishments and their methods, they also contain information on the development of schools among the Tatars-Kryashens, and ethnographic data on the dynamics of their religious beliefs and way of life. Much atten-

tion in these documents is paid towards the 'anti-Muslim' activity of the Russian Orthodox Church, along with ways of combating the cultural influence of Tatar Muslims in the region.

A thorough study of the social life and social activity of Tatars from a regional perspective is only made possible by the indubitable value of the published and non-published materials on class and city [Protokoly', 1884; Postanovleniya, 1896; Zhurnal, 1895; 1895a; Zhurnal, 1896, etc.] and zemsky [Sbornik, 1899; Protokol, etc.] institutions, and also reports of Tatar social organisations [Otchet, 1901; 1903, etc.]. For example, the record management documents of Kazan Tatar City Hall (1781–1855), or the self-regulatory body of merchants and petty bourgeois [National Archives of the Republic of Tatarstan, f.22] both used registers, which make it possible to outline the range of issues handled by this establishment, its work flow and regular personnel. Cases handled in this matter were put on record, and city hall also had books to register the incoming decrees and orders of higher-ranking provincial authorities. Their study helps determine city hall's place in the system of state institutions [Izmaylov, 2009, p. 26–30].

Regional archives contain diverse data on land communities and Muslim debtors. The socio-economic status of different classes of Tatars can be observed in the funds of the offices of the Orenburg governor general (State Archive of Orenburg Region, f. 6), the administrators of governorates and regions, governorate authorities, treasury chambers, governorate statistical committees, and others. This is mostly present in the reports of local authorities and administrative officials. The decrees and orders of governors concerning the local administration or peasant self-government bodies and communities characterises the relations inside the administrative apparatus and are evidence of a certain dialogue between the population and social organisations on the one side, and governmental bodies on the other.

Violations of the law by both the population and administrative officials were considered in court hearings. Here the data on circuit courts and public prosecutors of circuit courts, courts of justice, etc. is important.

Materials from the Orenburg Mohammedan Spiritual Assembly fund [Central Historical Archives of the Republic of Bashkortostan, f. I–295], which used to be a government entity that supervised the activities of parish clergy and the religious life of communities, are a very valuable resource for the study of state-Islamic relationships and religious institutions. The everyday operations of the Assembly were registered in journals with the surnames of those present, advance notice on the issues under discussion, and delivered judgments. There are also documents on the examinations of individuals applying for clerical and scholastic positions, permits for the construction and repair of mosques, marriage, family and contractual relations, etc. in the Spiritual Assembly archive.

The record management documents of central government entities are also of the utmost importance, as they show both the interrelation of the government and institutions, along with the institutions and the population. A large volume of source material on the history of the Tatars has been discovered in the record stores of central government authorities. Materials from the Department of Religious Affairs of Foreign Faiths (DRAFF) [Russian State Historical Archive, f. 821], the central government body responsible for approving issues of its capacity with other departments and administrations, the Orenburg Mohammedan Spiritual Assembly, the heads of governorates and regions, prepared export reports and draft laws all shed light on the religious life of the Muslim population of the Russian Empire. They cover mechanisms of regulation and control over various aspects of Russian Islam by imperial authorities, including the administration of spiritual affairs, parishes, clergy, institutions of divine service, metrics, the administration of oaths for Muslims, the property of religious institutions, and so on.

The main source of information on the history of the cultural and religious life of christened Tatars are materials from the bodies of the central (Synod office and its attorney-general [Russian State Historical Archive, f. 796, 797]) and local (spiritual consistories) administration of the Spiritual Department. This collec-

tion contains various records and managerial documents which reflect the issues of government and church regulation, and the completion of a course focused on the Christian education of christened Tatars, building Orthodox churches, opening parishes, the appointment of clergy and the overall functioning of a system of religious educational institutions, etc. It also includes materials that aid in the analysis of the evolution of religious ideas and beliefs of christened Tatars, and the process of forming a religious syncretism among them.

Various aspects of the development and implementation of the government's school policy in regard to the Tatars can be observed in the record-keeping documents of the Department of National Education [Russian State Historical Archive, f. 733], which was the supreme deliberative body of the Ministry of National Education, and fulfilled administrative and executive functions, as well as acted as the chancellery of trustees of Kazan [National Archives of the Republic of Tatarstan, f. 92] and Orenburg [Central Historical Archives of the Republic of Bashkortostan, f. 109] school districts, principal of public schools, etc. The notes and reports of officials, decrees, correspondences between the structures and other internal and external documentation illuminates the purpose and objectives of the Ministry of National Education, and relations between the central and regional authorities on matters of education among the Tatar population of the Volga-Ural region.

The socio-economic and legal status of various groups in the rural tax-paying Tatar population, and their execution of duties entrusted by the government and tax payments before the reforms are reflected in the reports of the provincial chambers of the Ministry of State Property and appanage offices of the Appanage Department.

The applications and complaints of officials and authorised persons of rural communities and city communes, parishes, separate groups of Tatars and individuals were in fact a method of informing the authorities of their attitude towards the reforms and the political course of imperial authority. A major portion of this source group of is made up of complaints on the unsanctioned application of laws by offi-

cials, policemen, mullahs, etc. They are important for studying the national character of the population, its prejudices and the level of trust of Russian citizens towards the imperial authorities throughout different historic periods.

Applications and petitions were addressed to the administration of supreme, central and local public authorities according to their competences in implementing the internal course of the autocracy. Although the Applications Accepting Chancellery of His Imperial Majesty received applications from the Tatars addressed to His Imperial Majesty [Russian State Historical Archive, f. 1412] on various aspects of life in hopes of justice, most applications concerning spiritual and educational issues were sent to the Orenburg Mohammedan Spiritual Assembly, the Department of Religious Affairs of Foreign Faiths, the Ministry of National Education, and other institutions. Applications concerning domestic and zemsky issues were sent to the Economic Department of the Ministry of Internal Affairs [Russian State Historical Archive, f. 1287] and the Department of General Affairs of the Ministry of Internal Affairs [Russian State Historical Archive, f. 1284]. Applications concerning the public administration, domestic system or military service of the peasantry were addressed to the Zemsky Department of the Ministry of Internal Affairs [Russian State Historical Archive, f. 1291], etc. Written initiatives of Tatars regarding the creation of a national periodical press were preserved in the fund of the General Directorate for the Press of the Ministry of Internal Affairs [Russian State Historical Archive, f. 776]. These funds preserved the correspondence between the departments and administration, and their correspondence with the spiritual department, governors, etc.

Materials collected in the funds of the Ministry of Internal Affairs Chancellery [Russian State Historical Archive, f. 1282], the Department of Police of the Executive Ministry of Internal Affairs [Russian State Historical Archive, f. 1286], the Ministry of Internal Affairs Police Department [State Archive of the Russian Federation, f. 102], the Third Department of His Imperial Majesty [State Archive of the Russian Federation, f. 109] and the Governorate

Gendarme Administrations make it possible to trace the general picture of anti-government strikes among the rural Tatar population as part of the Russian peasant movement, the Islamic social movement, modernisation processes of the national social life of the Tatars on the scale of the Russian Empire under the influence of European ideas.

Another large group of sources consists of fiscal accounting materials, census records being one type. In the 19th century census was taken five times (in 1811, 1815, 1833, 1850 and 1857), and its aim was auditing the taxable population for tax purposes and military service. Its data served as the basis for the definition of classes, showed the number and composition of the population (in 1811–1812 only the male population), and in some cases the place of birth and nationality were indicated. As a source, census records are rather limited, as families hid males for the purpose of avoiding taxes and increased the number of females, as they are not taxable [Gozulov, 1972, p. 47–48]. These census materials help trace the changes in the location and class composition of the pre-reform period population [Kabuzan, 1959, p. 128].

Parish registers that contained records of acts of civil status (birth, marriage, death) form a special group of accounting and fiscal sources. From the second quarter of the 18th century up to 1829, before this duty was placed on Muslim clergy as well, parish registers² 'were kept only for christened Tatars' [Antonov, 2006, pp. 17]. Two copies were kept of Muslim parish registers, and at the end of the year one was sent to the Orenburg Mohammedan Spiritual Assembly. This source also contains some information on the economic status of specific Tatar Muslim families (a column on marriage contained information on mahar sizes) and on the status of women (a column on divorces).

² The Register of Births, Marriages, and Deaths consisted of the following three basic sections: 1) 'On Births,' giving the birth number, date, and place; the father's class affiliation, name and patronymic; and the baby's sex and name. 2) 'On Marriages,' giving the wedding number, date, and the newlyweds' ages. 3) 'On Deaths,' giving the date of death, place of residence, class affiliation, name, age, and cause of death.

Exclusive material can be found in the statistics used for the preparation of managerial decisions. Therefore, the general materials of the First General Census of the Russian Empire of 1897 contain data on the quantity of Muslims in regions of the Empire [Raspredeleynie, 1901; Kratkie, 1905], provincial notebooks [Pervaya vseobshhaya] contain numerical data on the number of Tatars in cities and districts, on their sex and age, marital and kinship relations, class, occupation, religion, native language, literacy, etc.

Statistical compilations are also important historical sources. The first such case dates to 1830 with the publishing of the 'Overview of the Situation in Cities of the Russian Empire for the Year 1825' [Panin, 1960, p. 179–192]. As such, this data was included in the military and statistical reviews of the Russian Empire by the General Staff [Voenno-statisticheskoe, 1848; Voenno-statisticheskoe, 1852, Vol. 14, etc.].³ From 1859 up to 1868, 'Materials for Geography and Russian Statistics Collected by Officers of the General Staff' was published in Saint Petersburg [Laptev, 1861; Lipinsky, 1868, etc.], which contained detailed statistical data, geographical descriptions, maps and plans gathered from across 25 governorates and regions of the Russian Empire⁴.

Owing to the efforts of P. Kappen and K. Arsenyev, who developed the system of statistical and geographical descriptions for the Russian Empire, the Central Statistical Committee of the Ministry of Internal Affairs (established in 1863) published 43 editions of the provincial 'List of Localities' [Spisok naselennyx

³ The edition contains a topographical description; information on natural conditions, communication channels, population size, population location and migration, and folk customs; the condition of agriculture, trades, handicrafts, industry, and trade (with a list of factories, plants, and trading establishments); uyezd centre data; and a description of the spiritual, educational, and charity institutions and historical places of interest.

⁴ At the beginning of each volume there is an overview of the history of the region and ethnographic information on the local peoples. In addition, educational and religious issues are analysed. The history of city construction and population is presented. The district's administration, economy, spiritual life, geography, and demography are described. Land and forest statistics as well as data on prices and price setting were presented.

mest, Vol. 14; Spicok naseleenny'x mest, Vol. 31, etc.] from 1860–1885. This work utilised data on the demographic, social and economic development of the population, the geographic location of settlements, etc. to the fullest extent possible at that time. Along with the Central Statistical Committee of the Ministry of Internal Affairs, work on the drafting of these specific 'Lists' in the second half of the 19th century—beginning of the 20th century rest in the hands of the statistical authorities of the Ministry of National Education, the spiritual department and the local zemstvos.

The 'Provincial History' published by the local (provincial) executive authorities is similar to the reference and statistical sources in terms of its subject-matter and structure. Information on the administrative divisions, settlements, government, cultural, public and ceremonial centres of the governorate, methods of communication, statistical data on the state sector of industry, trade, agriculture, national education and other aspects can also be found in this book.

In the latter quarter of the 19th century, zemsky institutions carried out complex inspections (according to special programmes) of the domestic way of life of the local population by uyezd [*Materialy' dlya sravnitel'noj*, Ed. 1; *Sbornik statisticheskix svedenij po Samarskoj*, Vol. 5, etc.] and governorates [*Svodny'j sbornik*, Ed. 1; *Obshhij svod*, 1896; *Krest'yanskoe zemlevladienie*, Ed. 13]. Household investigations were also carried out [*Trudy*, 1884; Belkovich, 1887; Palitsyn, 1890]. Said sources contain information on peasant households, including those of the Tatars, on the number and composition of the family according to the sex, age, size of land ownership, beasts of burden, cattle, craft, etc. There are stories explaining the reasons for the poor quality of life among Tatar peasant households, details of the everyday life of Muslims, and other writings.

The study of the economic state and way of life of the Tatar peasants of Kazan guberniya recorded by N. Vecheslav, the Secretary of Local Provincial Statistical Committee who published a number of research studies on the economic structure of rural communities, enjoys

a special importance [Vecheslav, 1871; 1879; 1879a].

The periodical press is important for the analysis of socio-cultural processes. The materials of Russian periodicals can be nominally divided into two groups according to their orientation. The first group includes governmental department publications, such as those from spiritual departments (periodicals of the diocese, the 'Orthodox observer', 'Orthodox interlocutor', 'Orthodox Blessed Messenger', etc.) that addressed the inter-religious situation; from the department of education (*Journal of the Ministry of National Education*, *Central Committee of Education Management*, *Central District Department of Education*) with materials concerning the implementation of school policies relating to the Tatar Muslims and christened 'foreigners'; from power structures (*Journal of the Ministry of Internal Affairs*), etc. The second group consists of other secular publications where notes on the charity of Tatars, their national and religious holidays and everyday life were published ('*Bulletin of Guberniya*', '*Kazan News*', '*The Kazan Stock List*', '*Newsletter*', '*Samara Newspaper*', etc.).

In I. Gasprinsky's '*Tärjeman*' ('Translator') newspaper, published since 1883 in Bakhchysaray in both Tatar and Russian, numerous different facts and events concerning modernising processes in the cultural and public life of Muslims were discussed.

In 1900 in Saint Petersburg the '*Miryat*' ('Mirror') almanac by G. Ibragimov was first published. Up to 1909, 23 editions were published, 18 of which had already been published by 1903 (inclusive). Up to 1905 both '*Miryat*' and '*Tärjeman*' were the only periodicals where Tatars actively voiced their opinions on trending topics of modernity, which makes this source important in the study of their education level and definition of their public position on how to resolve social and religious issues.

Materials on the history of the education and culture of the Tatars in the 19th century can be found in the '*Şura*' ('Advise') magazine, which was published in Orenburg from 1908–1918. Articles on social, financial, philosophical, religious and historical topics, along with

works of fiction, flooded the pages of the magazine [Gosmanov, 2000].

The national periodical press can also nominally be said to include Tatar calendars, as they include two main features of this source type. Firstly, they influenced the formation of public opinion among the Tatars [Zayni, 2004; Minulina, 2006a, p. 25, 27], which was aided by the inclusion of social, political and historical notes; secondly, calendars were intended for replication and circulation⁵.

Sources of private origin relating to the history and culture of the Tatars may be considered as both materials embodying the stages of development of a consciousness of their own personality, and as unique written evidence of the events in which the author took part. Autobiographical sources are mainly composed of diaries kept by well-known missionaries, such as E. Malov [Malov, 1872; 1892; Bayrash, 1999], V. Timofeev [Timofeev, 1887] and S. Bagin [Bagin, 1909]. They reflect the details of missionary activity in the Middle Volga region, and contain ethnographic data on the way of life and religious life of christened Tatars and Muslims with whom these missionaries had to communicate. It is especially important to emphasise the travel diaries, notes, and correspondence of N. Ilminsky, the founder of the religious and educational system of christened non-Russian peoples of Eastern Russia. His correspondence with numerous persons, which have been published in part [Ilminsky, 1883a; 1895] and partly preserved in the National Archives of the Republic of Tatarstan (f.968), the Manuscripts Department of the Russian National Library (f.573), the Manuscripts Department of the Russian State Library (f. 424) and in the Russian State Historical Archive (f. 796), is very important for the study of the culture and religiosity of christened Tatars, the national politics of imperial administration and inter-religious relationships in the Volga-Ural region.

Sources of interpersonal communication (private correspondences, memoirs) do an excellent job of fully transporting modern read-

ers to the time and circumstances in which they were created. The social and moral state of society at that time, manners, customs and many aspects of the everyday life of Tatars are recorded in such sources. Therefore, a large number of epistolary sources from religious clerics (private and official letters of muftis, the correspondence of Sh. Marjani) and shakirds was preserved in the 'Asar' collection by R. Fahretdin, who to the fullest extent possible quoted them fully, while preserving the style and orthography of the author. Among the memoirs is 'Tärçemäi xälem' ('My Biography') by Gabderashit Ibragimov [Ibrahimov, 2001] and Rizaetdin Fakhretdin [Rizaeddin, 1999].

Historical narratives on the history of the Tatars can be found first and foremost among private Tatar historical literature, which appeared as a genre at the end of the 18th century and served as a premise for the appearance of regional ethnography. The authors of such works were lovers of the history of native places who used the sources available when recording the history of a certain settlement, and often resorted to the historical memory of the local population by collecting all the necessary information through surveys. Such works described the history of the origin of a village, the origins of its population, the history of separate clans, their way of life and festive culture. Depending on the object of study, national regional works can be divided into several groups: 1) On the history of villages⁶, information on the participation of the local population in unrest and the deeds of certain people is of great interest. 2) On the history of clans and specific people. This group includes the biographical essays of R. Fakhretdin devoted to outstanding Tatars. Such essays were published in the 'Şura' magazine [Fakhretdin, 1915; 1913; 1914; 1917] or in separate books [Fakhretdin, 1910; 1917a].

⁵ The first printed Tatar calendar, titled 'Gorränamä' (published by R. Amirkhanov) appeared in 1841. There were over 20 calendar publishers in the second half of the 19th to early 20th centuries [Alishev, 2006, p. 112].

⁶ Those included 'Bäräñge tarixı' ('The History of Baranga') by A. Barangivi, 'Yaña Tinçäle tarixı' ('The History of Novye Tinchali') by K. Bikkulov, 'Tarixe karya-i Ämin' ('The History of the Amin Village') by I. Dinmukhamedov, 'Tarixe Sterlibaşı' ('The History of Sterlibash') by M. Tukayev, 'Tüntär avılı tarixı' ('The History of the Tyunter Village') by M. Tyuntari, and more.

The works of historians Sh. Marjani and R. Fakhretdin have a special place among historical narratives. In the second book by Sh. Marjani, *'Möstäfadäl-äxbar fi äxvali Kazan vä Bolğar'* ('Accounts on the History of Kazan and Bolğar'), published in Kazan in 1900, information can be found on the history of the Orenburg Mohammedan Spiritual Assembly, the Tatar city hall, on the mosques of Kazan, and also biographical essays detailing the lives of outstanding individuals, such as Tatar merchants and clergymen [Märcani, 1900; 1989].

'Asar' by R. Fakhretdin is a collection of bibliographical data on the most well-known people from the Tatar and other Turkic nations, including khans, clergymen, poets, *mudaris*es, and others. Apart from traditional biographical data, this work also contains epistolary, epigraphic sources and poetic works [Fakhretdin, 1900–1908; 2006; 2009; 2010].

The works of Sh. Marjani and R. Fakhretdin differ from local folk historical essays in their use of historical methods for the selection of sources and materials, which can be observed in their critical approach, analysis of the available data and sufficiently objective narrative. They are written using a broad source base, and in addition to historical works the authors also used 'non-traditional' sources for historical studies (such as epitaphic texts, *shejere*, *colophons*).

The hand-written and published works of Tatar theologians and religious figures are a most valuable source for the study of Sufism traditions and religiosity, as well as the Muslim reformation among the Tatars. The heritage of G. Kursavi, G. Utyz Imyani, M. Bigiev, relating to the Muslim reformation is published in the series *'Anthology of Tatar Theological Thought'* [Kursavi, 2005; Utyz Imyani, 2007; Bigiev, Vol. 1; Vol. 2].

In this case, 'non-traditional' sources include writings such as *shejere* (genealogies) and epigraphic documents. According to M. Ahmetzyanov, genealogies contain the ethnic history of the Tatars, and at the same time are a source for the history of the Tatar language and literature, as well as for onomatology [Ahmetzyanov, 1991, p. 7]. But the usage of these sources requires a multi-faceted approach in-

tegrating an analysis of the *shejere* with other official acts, epigraphic and historical documents⁷ [Ahmetzyanov, 1991, p. 31].

Another special group of narrative sources are Russian-language ethnographic materials. The revival of ethnographic research on the way of life, religion, everyday life and culture of the non-Russian peoples of Eastern Russia occurred in the 1830–1840s. The formation of professional Russian ethnography was promoted by the formation of a positivist methodology in scientific research, which expanded the range of socio-anthropological and geographical research related to an increase in public and state interest in the ethnographic landscape of the empire [Nayt, 2005, p. 147].

In the 19th century, Kazan University became a centre for ethnographic studies in the Volga-Ural region. The staff of this institution stood at the very foreground of all future studies of the ethnography of this region's peoples. A particularly noteworthy role was played by the famous naturalist, ethnographer and professor of medicine K. Fuchs (1776–1846). In 1844 his classic work *'The Kazan Tatars in Terms of Statistics and Ethnography'* was published, in which the Tatars are presented not as a united community, but as a complex social structure. Through his descriptions on every social group, especially that of the Kazan merchants, the author emphasises their interconnectedness and relationships [Busygin, 2005, p. 357–361]. New momentum for the ethnographic study of the Tatars and other peoples of the region found steam in 1877 with the establishment of the Society of Archaeology, History and Ethnography of Kazan University (SAHE). In its press organ, the *'Reports of SAHE'* on their operations, including those written by Tatar authors, were published and dedicated to other Tatars. The articles published included *'Wedding traditions of Kazan Tatars'* by M. Pinegin [Pinegin, 1891], *'Wedding Customs and Ceremonies of Christened Tatars of Ufa Governorate'* by S.

⁷ The Manuscript Department of the Galimdzhan Ibragimov Institute of Language, Literature, and Art of the Academy of Sciences of the Republic of Tatarstan has a rich collection of *shejeres* dating back to the 18th to 19th centuries (Collection 99).

Matveev [Matveev, 1896], 'Examples of Folk Literature of the Kazan Tatars' by K. Nasyri [Nasyri, 1896], 'Historical Songs of the Kazan Tatars' by N. Katanov [Katanov, 1896], 'On the language and Nationality of the Mishars' by G. Akhmarov [Akhmarov, 1903], and others.

Another large scientific and educational centre that studied the life and culture of the people of Eastern Russia was the Kazan Spiritual Academy (KSA). With the creation of classes on Oriental languages (1844) and missionary departments (1854), its staff and students began focusing more attention on the religious beliefs of the region's peoples. As a result of the special missionary tasks faced by the Kazan Spiritual Academy, research in the spheres of comparative ethnography and the study of religion were actively developing. Much attention was given to the beliefs of christened Tatars and the study of the ethno-cultural processes among them. The ethnographic essays of M. Mashanov [Mashanov, 1875], I. Sofiysky [Sofiysky, 1878; 1891], N. Odigitriyevsky [Odigitriyevsky, 1895] and other authors take this issue as a focus.

Some works of historians (ethnographers) are devoted to the Tatar classes, first and foremost the peasant class [Nevzorov, 1803; Sboev, 1856; Cheremshansky, 1859; Shino, Vol. 81; Rittich, 1870; Ovsyannikov, 1878; Shile, 1879a; 1879, Nechaev, 1891; Pirogov, 1881; Dudkin, 1890; Sultanov, 1901; Krukovsky, 1909; Korolev, 1912; Speransky, 1914] and officials [Grigoryev, 1876, Guryich, 1879; Yuzefovich, 1883; Steinfeld, 1894; 1894a; Sbornik, 1896; Rybakov, 1895; 1897; 1899; 1917; 1913; Zorin, 1912]. They also described the way of life of the Tatars, their economic practices, everyday life and religious institutions.

Starting in the 1870s, representatives of the christened Tatars [Gavrilov, 1874; 1877; Apakov, 1877; Dauley, 1903a; Filippov, 1915] started to play a significant role in the materials related to the history of the traditional religious, mythological, festive and ceremonial culture of this confessional group. Their works contain information based on their lives, recollections and other materials unavailable to outside ob-

servers, and they reveal little-known facts on the socio-cultural life of these communities.

The historical narratives of missionaries are interesting in their approach to determining the influence of Tatar clergymen and confessional schools on the Muslim population. In most cases, their works exposed a system of confessional Muslim education that did not correspond to modern requirements. At the same time, in the writings of famous church publicists there was a wealth of factual data, including descriptions of the structure and particularities of the madrasah and mektebe, teaching methodology and key teaching materials [Malov, 1910; Koblov, 1906; 1908; 1916; Znamensky, 1910]. Issues of the school education of christened Tatars were reflected in the works of Orthodox missionary figures [Kazanskaya Czentral'naya Kreshcheno-tatarskaya shkola, 1887; Ilminsky, 1890; 1892; 1901; 1904; 1913, etc.; Ostroumov, 1872; Iznoskov, 1893; 1901; 1904; 1909; Mashanov, 1892; Bobrovnikov, 1899; 1900; Prokopiev, 1905, etc.]. The authors placed great focus on the implementation of the Christianisation policy for christened Tatars through elementary religious [Orthodox] education, and studied the influence of educational institutions upon their confessional identity. One special group of publications devoted to the educational and school affairs of Tatar Muslims are the works of the officials of local and central bodies of the executive branch of the Imperial Russian government [Anastasiev, 1893; 1904; Cherevansky, 1901; Miropiev, 1901; Krasnodubovskiy, 1903; Zorin, 1914; Lyubimov, 1914]. Due to the specific nature of their activity, they looked over the arrangement of classes and the educational programme in Tatar confessional schools, and supported qualitative changes that took place in the educational system of the Tatar Muslims at the end of the 19–beginning of the 20th century, which were caused by improvements in their socio-cultural life under the influence of jadidism.

Works of folklore and oral folk traditions [Zhyen, 1884; Törek, 1991; Tatar Folk Arts, 1977–1978; Tatar Folk Arts, 1981; 1980; 1988; 1983; 1984; 1987, etc.] also contain

valuable information on spiritual culture and social relations. These include sayings and proverbs, tales about folk holidays and wars the Tatars were involved in, the hard life of recruits, soldiers, captives and prisoners, as well as historic, toponymic traditions, legends, myths, etc.

Architectural landmarks are likewise among the material sources of great interest. The stone and wooden public and private buildings of the Tatars preserved mostly in cities are an example of the architectural styles that dominated during that period of time, and are a reflection of the Tatar people's everyday lives.

The everyday culture of Tatars in the 19th century is featured in exhibits in central, republican, urban and rural museums of local history (household items, clothing, jewellery, printed media, etc.).

Among pictorial sources, one should make note of an increased focus on photographs, which are often used as illustrative material, moreover, they, as well as the written sources, capture past events. Photographs objectively reflect the facts and may be used as additional material to reconstruct the complete picture of historical events. The only photo-publication of mosques in the European part of Russia and Siberia during the imperial era was an album published in 1911. Photographs in the album are accompanied by brief summaries with information about the philanthropist, the time of construction and reconstruction of places of worship [Yubilej, 1911].

Photo albums issued in the post-Soviet period are of informative value, since they show mainly historic mosques [Mecheti, 2001; Mecheti, 2001a; Kابدulvahidov, 2006].

Photo-funds of central [The Institute of History of Material Culture of the Russian Academy of Sciences, Russian State Historical Archive], regional archives [National Archive of the Republic of Tatarstan, etc.], Museum of Anthropology and Ethnography of the Russian Academy of Sciences [Kunstkamera], Russian Ethnographic Museum and regional museums [National Museum of the Republic of Bashkortostan, National Museum of the Republic of Tatarstan, Museum of the Millennium of Kazan at the National Cultural Centre 'Kazan',

etc.] store photographs depicting Muslim places of worship, townspeople and villager types, the celebration of folk and religious holidays, the daily life of Tatar peasants, etc.

Another set of graphic materials that captured everyday culture of the Tatars are paintings, reproductions, engravings and other works of art [Tatarskij, 2009; Kazan', 2005 and others]. In particular, the pictures from the 'Collection of Costumes' by E. Korneev [Sobranie, 1808] and paintings by K. Hun [Eglit, 1955] make it possible to reconstruct the appearance, clothing and costumes of the Tatars at the time. The works by E. Turnerelli [Turnerelli, 1839] and V. Turin [Turin, 1834] captured picturesque views of pre-reform Kazan, including its Tatar part, presented the lost beauties of pre-revolutionary architecture and building art of the Tatars.

Graphic sources (maps, plans, drawings) allow us to determine the location, exterior and interior of the residential buildings and liturgical buildings of the Tatars, the construction of which, by law, had to be agreed with the Ministry of Internal Affairs. These documents provide an idea of the buildings lost in the present, land planning and where the construction was supposed to start⁸.

A large bulk of sources is presented in the fundamental collections of documents and materials of the 1930s [Materialy', 1936; Istoriya, 1937], which were the first to provide a systematic publication of the sources on different aspects of national history in the period under review.

Anti-government protests of the Tatar peasants as part of the Russian peasant movement against the autocracy were recorded in the collections of documents on the peasant movement in Russia in the second half of the

⁸ Maps, drawings, and plans of Muslim Tatar places of worship and residential buildings can be found in the following collections: Russian State Historical Archive Collection 821, 1293, 1488, 1399; Russian State Archive of Ancient Acts: Collection 248, List 160; State Archive of the Orenburg Region: Collection 41, National Archive of the Republic of Tatarstan: Collection 2, 98, 408, 409; Central Historical Archive of the Republic of Bashkortostan: Collection I-144, I-428.

19th—the early 20th century [Krestyanskoe Dvizhenie, 1959; 1960; 1968; 1998].

The tradition has been set to prepare and publish collections of documents and materials on specific problems, including on Muslim topics [Imperatorskaya, 2006; Osoboe Soveshhanie, 2011; Xristianskoe Prosveshchenie, 2012], on educational institutions [Kazanskaya, 2005; Medrese, 2007; 2012], the history of Kazan

of the 19th century [Istoriya Kazani, Book 1; Book 2; Book 3], etc.

Thus, the study of the history of the Tatar people in the 19th—the early 20th century is based on a broad source basis, which, nevertheless, should be treated differently, since each source has a different degree of reliability due to the conditions of its creation.

II. LITERATURE REVIEW

Russian Historiography

Ildus Zagidullin, Liliya Baibulatova, Lyudmila Sverdlova

Currently a large amount of Russian historiography has been accumulated on the history and culture of the Tatars of the 19– early 20th century. Due to the significant amount of historical literature on this subject, the review is conducted under the problem-chronological principle, which, in our opinion, can more accurately determine research priorities on certain stages, and trace the evolution of scientific views on historical events and phenomena.

The legal and socio-economic situation of different groups of the Tatar population. Basic research in this area began in the Soviet period, as pre-revolutionary works are often treated as source material, since they are mostly presented by statistical data or ethnographic descriptions.

Merchants and entrepreneurs. Although the works on the history of the Tatar people which appeared in the early years of the given period carried the background of the new socialist interpretation of the role of the Tatar merchants and entrepreneurs in the history of the Tatar people of the second half of the 19–early 20th century, they still preserved a positive evaluation of their role in transforming the life of Tatar society. This aspect is clearly manifested in the work by G. Ibragimov ‘Tatars in the Revolution of 1905’ [Ibragimov, 1926]. G. Gubaydullin was close to these evaluations, who, above all, considered the effort of the Tatar bourgeoisie to raise the national-religious consciousness of Muslim Tatars in Russia as a

desire to ensure the modernisation of almost all sectors of life of the Tatar people [Gubaydullin, 1925].

The essay by G. Gubaydullin became a significant contribution to the study of Tatar merchants. The author emphasised that ‘the Tatars of the Kazan guberniya came into the 19th century with a deep class differentiation’ [Gubaydullin, 1925, p. 99], the cause of which he had seen in the growth of capitalism. He singled out the ‘Tatar bourgeois class’ [Gubaydullin, 1925, p. 105], but did not define its basic constituent elements. And with respect to the end of the 17–the beginning of the 19th century, he emphasises the flight of the Tatar murzas and serving men to the merchant class. He considered the merchant class to be the bourgeoisie. His work reflects the specific feature of publications of the 1920s, when, in considering this issue, the authors were forced to solve not so much scientific as political problems, and their conclusions were openly politicised. The work by F. Saifi enhanced the conclusions of G. Gubaydullin concerning the class differentiation of the Tatars, and concerning the formation of special classes of large-scale manufacturers, large-scale merchants, landowners, small farmers, workers and rural labourers [Saifi, 1930, p. 3]. Unlike his predecessor, he described the situation as merchant capitalism [Saifi, 1930, p. 17].

J. Validi, arguing about the nature of the Tatar enlightenment and Jadidism, also posi-

tively evaluated the role of Tatar merchants and defined the significant cultural development of the Tatar people in the second half of the 19–early 20th century as a result of their successful charitable activities. Moreover, being a graduate and later a teacher at the madrasah ‘Husainia’, J. Validi paid special attention to the Khusainov brothers, briefly covering their life and personal qualities, and he highly appreciated the importance of the charitable and educational activities of each of them [Validi, 1923].

But the positive reviews had no long-term perspective within the specified period. Soon, the analysis of the Tatar merchants and entrepreneurs gradually established very different tendencies. Therefore, the work by A. Arsharuni and K. Gabidullin attributes such qualities as political indecision and uncertainty to the Tatar bourgeoisie, although it does not deny its merits in the fight against conservatism in Tatar society [Arsharuni, 1931].

Most historians of the 1920–1930s did not touch upon the subject of class group history. Peasant and worker issues became dominant research subjects for many decades. Later scientific and popular-scientific and journalistic works still examined this issue while relying on class ideology.

The first major work devoted to the Tatar bourgeoisie was the monograph by Kh. Khasanov ‘Formation of a Tatar Bourgeois Nation’. The author identifies three stages in the formation of the Tatar bourgeois nation: 1) The late 17–the late 18th century: the appearance of commodity production, creation of manufacturing industry, trade expansion, the emergence of new economic centres, an increase in commercial capital 2) The early 19th century—industrial revolution: a shift from manufacturing to machine industry 3) the late 19th century—the abolition of serfdom in the Kazan-Volga region resulted in the final establishment of capitalist relations, formation of the main classes of the Tatar capitalist society [Khasanov, 1977, p. 19–20].

In his works, K. Faseev is quite categorical about the Tatar national bourgeoisie, whose members ‘pursued their narrow-class, mercenary goals’, ‘developed a fight for seizing the eastern markets, seeking to keep Muslim na-

tions under their economic and political domination’ [Faseev, 1955; 1971]. R. Nafigov explained the main reasons for the weakness of the Tatar national bourgeoisie [Nafigov, 1964; 1989] with economic, political, industrial, and ideological characteristics. However, at the same time, he made attempts to define the constructive role of entrepreneurship as well, which brought him closer to those works by Ya. Abdullin and Kh. Khasanov. Thus, Ya. Abdullin [Abdullin, 1976], on the one hand, having positively described enlightenment in the history of the Tatar people, afforded a special place in its distribution exactly to the national bourgeoisie. But, on the other hand, he defined merchants and entrepreneurs exclusively as an exploitative class.

In the 1980s, later editions of collections of works by G. Ibragimov were published. However, they included only those works of his which contained explicit criticism of the Tatar national bourgeoisie. However, these years saw the appearance of works, in which authors show a slight deviation from the rigid framework of the socialist ideology. For example, the works by G. Gazizullin, A. Makhmutova, M. Gaynullin, A. Karimullin, R. Amirkhanov [Gazizullin, 1979; Makhmutova, 1982; Gaynullin, 1983; Karimullin, 1983; 1984; Amirkhanov, 1988] show a clear recognition of the positive role of the Tatar bourgeoisie in providing the material basis for the development of the Tatar culture, periodical press and book-printing and public education system.

The post-Soviet period becomes a qualitatively new stage in the examination of the socio-economic history of Russia. On the one hand, the scientific community increasingly recognises the need to revise the estimates and opinions that prevailed in the Soviet period, on the other, it begins to develop those issues that were almost untouched upon earlier [Sverdlova, 1991; 1998; 2011; 2008a, p. 151–159; Galeev, 1997, p. 6–9; Nigamedzinov, 2003; 2004; Salihov, 2006].

The history of the Tatar merchants is understood in many different ways, as there is no single view of the socio-economic roots of the merchant class formation. For example, the article of the ‘Tatar Encyclopaedic Diction-

ary' titled 'Tatar merchants' justifies the belief that 'the origins of the formation of the Tatar merchants date back to the trading traditions of Volga Bulgaria and the Golden Horde' [Tatarskij, 1999, p. 309]. Authors who consider the 'Tatar merchantry', the social layer of merchants, to be a merchant class, believed that 'in the 15–16th centuries, the favourable economic position of Kazan on the caravan tracks and waterways contributed to the rapid formation of the merchant class' [Tatarskij, 1999, p. 309]. They identify three stages in the formation of the 'Tatar merchantry': 1) 15–16th centuries 2) the late 18th century: trade liberalisation under Catherine II, when the 'Tatar merchantry' was officially entitled to be enrolled in the guild 3) the late 19th century: in the post-reform period, the 'Tatar merchantry' became one of the sources of the formation of the 'Tatar bourgeoisie' [Tatarskij, 1999, p. 309].

As you can see, the periodisation of the history of the formation of the merchant class is connected mainly to the ethnic history of the Tatars: from the point of view of ethnic history, the authors of the 'Tatar Encyclopaedic Dictionary' identify the common genealogy of the formation of the Tatar merchant class rooted in the trading traditions of Volga Bulgaria and the Golden Horde. The interpretation of history affects the understanding of the social nature of the Tatar merchant class—there is no differentiation of the merchant class—the interpretation of the history of the formation of the merchant class points to the domination of the traditional approach to defining the social image of the Tatar merchants: the social stratum of the Arab traders is represented as a collective image—the 'Tatar merchantry.'

At the present stage scientific literature is actively studying and covering the merchant dynasties known for their major trading, entrepreneurial, industrial, and charitable activities [Tairov, 2002; 2003; Esieva, 2004; Mukhamadeeva, 2008]. Particular attention is being paid by researchers to the history of the Tatar bourgeoisie, such as participation in the development of charitable activities by Muslim Tatars in Russia, specific features, main areas of focus, and results of some of its representatives in this area [Khayrullina, 1993; Gos-

manov, 2002; Minnullin, 2002; 2007; Milyukov, 2006; Akhmet, 1997; Gani, 1998].

The publication of the multivolume edition of the 'Tatar Encyclopaedia' was an important event in the scientific life of Tatarstan. This work includes articles on the large industrialists, traders, cultural figures, artists, and scientists of all nationalities who lived and worked in and beyond the Kazan Guberniya and the Republic of Tatarstan.

The work 'Golden Pages of merchants, industrialists, and entrepreneurs of Tatarstan,' which is dedicated to the Russian and Tatar merchant class from ancient times to the late 19th century, has recently become a historiographical landmark. This two-volume work is a kind of encyclopaedia and information and reference guide, which presents the biography and genealogy of the major merchant families—the merchant dynasties—on the basis of archival documents. Illustrated by archival photographic documents, this edition was the first major contribution to the historiography of the topic under research [Zoloty'e, 2001].

So today the main focus of the research of the Tatar merchants and entrepreneurs is the study of the charitable and social activities of the merchant class, family histories, and social portraits of individuals. Beyond the coverage of historians are topics such as the accumulation of national capital, the determination of the proportion, and contribution of the Tatar merchants and entrepreneurs to the development of the regional economy, the study of the merchant class as a social phenomenon, not limited by a certain governorate, and as an integral part of the Russian entrepreneurship; an analysis of their cooperation with entrepreneurs of the neighbouring regions, including with Russian merchants, the daily life of the merchant class.

Peasants. Great importance in the study of the social and legal status of the rural population of the Tatar and non-Russian peoples in the Volga-Ural Region, mostly village residents of the state, is attached to the works of agricultural historians. The seminal work in this area of historical knowledge is represented by the two-volume monograph by N. Druzhinin 'State Peasants and the Reform of P. Kiselev' (Moscow—Leningrad, 1948; Moscow, 1965),

which analysed the socio-economic, legal, and other aspects of the life of state peasants. The main provisions of the thesis of N. Druzhinin on the leading role of the state in determining the social position of the peasantry were clarified and confirmed in the following decades by the regional studies of the reforms held in governorates and the impact of the supreme power on the socio-economic situation at the farms of the village ploughmen of the state, on the social and legal position of peasants in the Middle Volga Guberniyas [Sofronov, 1952; Gritsenko, 1959; Kleyankin, 1978; Tereshkina, 1978; Kazimov, 1980, etc.].

I. Morozov was the first to thoroughly research into the Tatar post-reform village in terms of socio-economic matters. He managed to identify a number of specific features of the national village. Based on the study of zemsky publications of Kazan, Vyatka, and Samara guberniyas of the 1880s, the author found that the Tatar ploughmen had the lowest level of 'economic prosperity' among the former peasants of the state—they had the smallest number of allotments, work animals, and cattle but the highest proportion of horseless households. I. Morozov also noted that the rich Tatar peasants were engaged mainly in trade, combining agricultural and hunting activities, with the former prevailing over the latter. At the same time, due to the low proportion of ploughmen leasing out and renting land plots, as compared to Russian ploughmen, and the low percentage of Tatars working their land plots, as compared to the Russians, the author came to the conclusion that the Tatar village in the Middle Volga Region was comparatively backward in terms of capitalist development. 'Specific features of class differentiation' of national peasantry were determined in view of the relative backwardness of the capitalist development of the Tatar village [Morozov, 1936 p. XLV]. The author did not cover all aspect of economic activity of the Tatar peasants. His article was written as an introduction to the collection of documents.

In the following periods of Soviet historiography, studies of Tatar peasant history were 'merged' with the agrarian history of the post-reform Kazan governorate or the Middle Volga

Region, and the Tatar ploughmen were considered only within the study of multi-ethnic peasants in the area.

The research carried out by Yu. Smykov [Smykov, 1965; 1984] involved a comprehensive analysis and integrated approach to the study of the socio-economic history of the Middle Volga peasantry. He analysed the results of the agrarian reforms of the 1860s in a multi-ethnic village, revealed the evolution of land ownership and land relations, studied important components of peasant economy, such as agricultural machinery, grain production, and livestock. In particular, the scientist demonstrated the property stratification of the Tatar community, the proportion of Tatars in the peasant economy, and the social division of labour among the Tatar population of the Kazan governorate.

Yu. Smykov provided a comparative analysis of paramount importance, contrasting the level of development and depth of penetration of capitalist relations in the multi-ethnic peasant environment of the area. However, the historian studied the socio-economic situation of the peasantry as a whole and did not set the goal to carry out a specialised study of the post-reform Tatar village.

The 1950–1980s saw the dominance of studies on the socio-economic development of various peasant categories from the perspective of the development of capitalist relations and economic development in the agricultural sector [Daishev, 1955; Usmanov, 1981; Clein, 1981; Kabytov, 1982; Smykov, 1984; Goncharenko 1984, et al.]. It should be noted that these works were written on the basis of Lenin's legacy on agrarian history and confirmed Lenin's conclusions of the significant influence of capitalism on agriculture in the late 19th century.

At the present stage, the subject of study is the social and legal status of state peasants and ploughmen of the Volga-Ural Region in the post-reform period [Shaykhislamov, 1998; 2006; Khayrutdinov, 2002; Mariskin, 2004, et al.]. New studies, based on local materials, provide a clear understanding of the important role of the state in regulating the social and legal status of the village residents of the state as a whole.

V. Khaziakhmetova attempted to identify the specifics of land tenure and peasant farm ownership in the Volga-Kama Region before the abolition of serfdom [Khaziakhmetova, 1978].

At the present stage, it is important to set broader and more important issues in the study of the economic structure of the Tatar village, the socio-economic situation of the farmers and ploughmen; however, most researchers are limited to the territory of the Kazan Guberniya [Zagidullin, 1992; Zaynullina, 2008], which undoubtedly is due to the fact that this guberniya is the historic homeland of the Tatars, where they lived most densely.

The monographs on various aspects of the history of the Bashkortostan and Orenburg areas are of great help when studying the socio-economic processes of the peoples inhabiting the Ural Region [Rodnov, 2002; Asfandiyarov, 2005; 2006; Denisov, 2006a].

In works on the Tatar peasantry there are no historical anthropology studies, and they poorly cover the specifics of social life, manufacturing and peasant agriculture of peasants of the state in terms of ethnicity. In this regard it is important to study the implementation of differential fiscal policy of local authorities on the distribution of taxes and duties among the various ethnic groups of the rural population and during land audits in a multi-ethnic village.

Cossacks, Meshcheryaks, Teptyars, and landless peasants. The first Soviet historian to study the number, settlement, and legal status of the Meshcheryak, Bashkir, and Teptyar classes in the Ural Region in the late 18–beginning of the 19th centuries was F. Tukhvatullin, who described the history of the area in the form of a chronicle [Tukhvatullin, 1928]. Later Meshcheryak history was covered mainly in the context of the study of the canton system. A certain consistency to the study of the class and ethnic groups of the Tatar population in the region was provided by the publication of 'Essays on the History of the Bashkir Autonomous Soviet Socialist Republic' (1959) [Ocherki po istorii, Vol. 1, Part 2], which gave a negative assessment of the canton era for many years. In the 1960s A. Asfandiyarov studied in detail the reasons for the introduction of the canton

system, the impact of that era on the socio-economic development of the Bashkir and Meshcheryak societies, described the duties of the Bashkirs and the Meshcheryaks, their participation in the military campaigns of the early 19th century, the causes and abolition of the militarised administrative system [Asfandiyarov, 1969]. Ufa historians also prioritised the participation of Muslim irregulars troops in the Russian-French war of 1812–1814 and in other military campaigns and expeditions [Raimov, 1943; Matvievsky, 1912; Usmanov, 1964; Rakhimov, 2008, et al.].

In general, the focus was on issues of socio-economic development and land policy of the government in the Ural Region. In the context of covering domestic autocratic policy against the Bashkirs and the assignment of land plots to various groups of the population, the socio-economic situation of class and ethnic groups was considered. A. Chuloshnikov identified the main signs of the division of pripushchenniks into Teptyars and landless peasants: the former drew up leases with the Bashkirs on the basis of written agreements, the latter confined, themselves to oral agreements [Chuloshnikov 1936, pp. 15–40]. In subsequent years significant attention was paid to the economic structure, land use issues [Usmanov, 1973; Davletbayev, 1986], the socio-economic status of Teptyars [Rakhimov, 1993], and their impact on inter-ethnic processes with the Bashkirs [Vasilyev, 1950; Rakhmatullin, 1974, pp. 4–13]. At the present stage, the tone in the study of this class and ethnic group has been set by the Ufa [Yakupov, 2001] and Kazan [Iskhakov, 1980; Priural'skie, 1990] ethnographers. A tradition of the 'parallel' study of Teptyars by historians, ethnographers, and linguists [Yuldashev, 1949; Ramazanova, 1984] has been set. However, historians do not take into account the findings of the representatives of related humanitarian subjects to the right degree, and there is no comprehensive approach. Multi-authored monographs on the history of Bashkortostan are a kind of generalisation of the accumulated material, they present a consideration of the number and location of cantons, the conditions of military service and duties of Meshcheryaks, the social status of other social groups, etc. [Is-

toriya Bashkortostana, 1996; Istoriya Bashkortostana, 2004, Vols. 1, 2].

As a rule, analyses of socio-economic aspects of the Bashkir activities identified various aspects of the economic life, socio-legal status of other class and ethnic groups, and ethno-demographic processes in the Ural Region [Nigmatullin, 1959, pp. 169–193; Kuzeev, 1968, 1968a; Shaykhislamov, 1994; Tagirova, 2011, et al.]. The study of state agricultural policy in the region also allowed new materials to be introduced on the subject [Akmanov, 2000; 2007; Kulsharipov, 2004, et al.].

We are inclined to explain the absence of historical studies on the Tatar-Cossacks, Meshcheryaks, and state Tatar-peasants by the fact that in Tatarstan a new concept of study of the modern history Tatars is currently being formed. Traditionally, the study of the peoples of the Ural Region has been the prerogative of Ufa historians and ethnographers, who focus on the history and culture of the Bashkir people.

Nobility. In recent years the previously forbidden topic of the Tatar nobility and murzas has become quite popular. Representatives of Tatar noble families have started to study the history of their families [Tatarskie, 2010], professional historians joined in on the study of the role and place of the Tatar murzas and noble people as part of the Russian nobility. However, the historiography of this topic is limited to a few works [Enikeev, 1999; Gabdullin, 2006; Azamatova, 2008], which cover the formation of the Tatar nobility and its socio-economic state. The monographs by S. Enikeev and I. Gabdullin examine the history of the Tatar princes, murzas, and the serving Tatars from the period of the Golden Horde up to the present time: settlement, land ownership, service, deprivation, and reinstatement of the nobility. They also present the history of individual noble families. In her work G. Azamatova discloses the social, economic, and political foundations of the Tatar nobility on the example of a comprehensive study of the Tevkelev family.

Working class. The topic of the Tatar working class, relevant in Soviet times [Gritsenko, 1950; Rabochy, 1981; Kruglikov, 1981] has somewhat lost its scientific value today, which, in our view, is not due to ideological reasons

but primarily because of the concentration of the national proletariat outside the area traditionally inhabited by the Tatars—in Baku, Donbass, in the Lena goldmines, etc. Currently the Tatar diaspora has only been outlined in studies.

As you can see, the history of the class and social groups of the Tatar population has been developed rather irregularly. In Soviet historiography the study of the socio-economic and legal status of the Tatars was practically dissolved in general works, and only from the 1960s onwards did ethnographic studies of individual Tatars groups begin to appear, which to some extent make up for this gap. Despite the new opportunities open to the researchers, in the post-Soviet period many issues on the subject were not studied comprehensively. Today the most studied topic is the history of the Tatar peasantry in the Kazan Guberniya. Also significant steps have been made in the study of merchantry. Until now the Tatar nobility, urban inhabitants, Muslim clergy, and working class have been poorly studied: their settlement, employment, psychological profiles, and their role in nation building, their daily life, the micro-history of representatives of various Tatar social groups.

The collective works of the 'History of the Tatar ASSR' [Istoriya, 1955; 1968; 1973; 1980] of the 1950–1980s defined the basic principles of writing national history in the Soviet Autonomous Republic. They replaced the study of the social history of the Tatars with a description of the sociocultural processes and economic development of the Kazan Guberniya, not taking into account regional and ethnic or religious aspects, or the class-social groups of the Tatar population in rural areas. As a result, 2/3 of the Tatar population settled in the Ural Region, in other guberniyas of the Volga-Kama Region, the Lower Volga Region, and in Western Siberia remained unstudied. The role of the nobility, merchantry, and the Muslim clergy in the social development of the Tatar people was assessed from class and atheistic perspectives.

Unfortunately, the multifaceted problem of the Tatar self-government remains understudied; this issue is often merged with more encompassing topics, where it is not paid enough

attention. At the present stage, the Soviet research traditions on the history of zemstvos have received a new meaning due to the new research topics [Azamatova, 2005; Salnikov, 2005; Starostin, 2002; Subbotina, 2010; Vladimirova, 2011, et al.]. However, the study of the interaction of zemstvos with ethno-religious groups of ploughmen and rural communities in the Volga-Ural Region and the determination of the degree of Tatar participation in the activities of zemstvos are still at the initial stage. The first steps are now being taken to study the history of the Tatar community of the Middle Volga Region and Western Siberia [Bakiyev, 2003; Mulla-galiev, 2011] and of the common law provisions that existed there [Bakiyev, 2011a], in the study of meshchanin societies [Kaplunovsky, 1998]. The most studied urban community is the ethno-religious community of Kazan due to the works on the activities of the Tatar City Hall [Izmaylov, 2009] and the Tatar members in the duma [Salikhov, 2005].

Life and customs of the Tatars. In Soviet times national culture, everyday and economic life were covered mainly in the works of ethnographers. The works of ethnographers, who due to their specific methodological approaches paid more attention to very specific features of the way of life of the Tatars from different regions, dominated the historical studies on the history of modern day Tatars, thereby blurring the general trends of sociocultural life of the Tatars and not taking into account the consolidation processes in nation building of the 19th century.

A great scientific achievement of the Tatarstani ethnographers is the collective historical-ethnographic study 'The Tatars of the Volga and Ural Regions' [Tatary', 1967], in which much attention is paid to the traditional culture of the Tatars in the 19–beginning of the 20th centuries. This important work has to a large extent made up for the gaps of Soviet historiography in the study of settlements and population, communities and dwellings, clothes and jewellery, eating habits, everyday life, and the festivities of the Tatars. It should be noted that the sections of this work devoted to social and kinship relations are of scientific significance to this day.

An achievement of the 1970–1980s was the new historical-ethnographic works on the family life of the Tatar peasants of the Kazan Guberniya [Zagidullin, 1966], social and family holidays of the Kazan Tatars [Kashafutdinov 1969], women's jewellery of the Kazan Tatars in the middle of the 19–beginning of the 20th centuries [Suslova, 1980], demographic development of the Tatars in the 18–19th centuries [Iskhakov, 1980], traditional dwelling [Mukhametshin, 1985], etc. A significant contribution to the study of the economic life of Tatar peasants in the Volga-Ural Region was made by the works by N. Khalikov [Khalikov, 1981], who managed to reconstruct the picture of the economic structure and way of life of the Tatar ploughmen.

Another equally important area of research and expeditionary work by Kazan ethnographers was the study of the major ethnographic groups of the ethnicity: The Mishar Tatars [Mukhamedova, 1972] and the Kryashen Tatars [Mukhametshin, 1977].

In the 1970–1980s, during the process of drawing up the historical-cultural atlas, some expeditions were held to perform a comprehensive study of ethnographic Tatar groups, and new research on weaving [Safina, 1996], national costume [Suslov, 2000], the rites and holidays of the Tatars of the Volga-Ural Region [Urazmanova, 2001] were prepared.

In the 1980s there has been a new phenomenon—that is, more fractional historical-ethnographic studies of the Tatars in specific regions: the Perm Tatars [Permskie, 1983]; the Kasimov Tatars [Sharifullina, 1991], etc.

A comprehensive historical-ethnographic study of the Turkic population in Western Siberia in the period under review was performed by N. Tomilov, which resulted in the development of the ethnographic classification of the Turkic peoples, the drawing up of the ethnic history of the Siberian Tatars, the identification of ethnic processes and interethnic contacts of the population of Western Siberia [Tomilov, 1980; 1981; 1983; 1992].

The current development stage of historical ethnography has been marked by the publication of the collective works 'Tatars' [Tatary', 2001] and 'Tartarika. Ethnography' [Tartarika, 2008],

new historical-ethnographic works on the history of the Tatars in separate regions: Molkeev Kryashens [Molkeyevskiye, 1993], the Lower Volga Tatars [Arslanov, 1995; Azizova, 2009], on the ethnocultural zoning of the Middle Volga Tatars [E'tnokul'turnoe, 1991].

New monographs by N. Khalikov were focused on agricultural production methods in the Tatar peasant farms of the Volga-Ural Region and the main areas of seasonal work of ploughmen [Khalikov, 1995; 1998].

Historical research on sabantuy by D. Sharafutdinov has enabled it to be identified not as a ploughmen festivity but as a nomadic holiday transformed by the settled life over the course of centuries [Sharafutdinov, 2004].

Today ethnography actively studies specific aspects of the ethnocultural life of the Tatars: the religious syncretism of the Mishar Tatars of the Siberian Volga Region [Idiatullov, 2010]. One of the little known issues is the problem of ethnocultural ties and interaction of the Tatars with other peoples of the region. The first steps have been taken in this direction, [Yagafova, 2009; Nikolaev, 2010; Sadikov, 2010a; Istoricheskie, 2011].

Within this historiographical review we would like to draw attention to two issues directly related to historical-ethnographic research.

National historiography developed two main approaches on the issue of the ethnic background of the Muslim rural population in the Ural Region, which had a complex class structure. Having analysed ethnic and demographic processes among the Tatars and Bashkirs based on census documents, D. Iskhakov focused on the need for a clear delineation of concepts, such as ethnic Bashkirs and the Bashkir estate, which, like the Teptyars, was a multi-ethnic social formation [Iskhakov, 1980; 1993a, et al.]. The need to separate these concepts is indicated by the Ufa scientists R. Kuzeev, A. Asfandiyarov, who paid attention to the high rate of quantitative growth of the Bashkir population in the early 19th century and connected it not only with natural growth but also with the transition of persons of non-Bashkir descent (including Tatars) to the 'Bashkir estate' [Istoriya, 2011, p. 17].

Another important issue based on the results of scientific research by ethnographers is associated with the number of Tatar sub-ethnicities. Kazan ethnographers determined features such as class-religious affiliation, the remoteness of the Tatar settlement region from Kazan, dialect features, and the economic, commercial, and domestic way of life of the local population to be the dominant idea of defining independent ethno-territorial groups and sub-ethnicities of the Tatars. In the absence of generalising works on the national history of the Middle Ages and modern times, the poor knowledge of the sociocultural processes in the Tatar community in the 18–beginning of the 20th centuries from a historical point of view, the lack of a conceptual view of the identified processes, summing-up the collected ethnographic material led to an 'imbalance' in evaluating ethnic processes. The ethnic and cultural differentiation of the Tatars of the Volga-Ural Region by N. Vorobyev was grounded on linguistic and cultural and community differences, having existed within the Tatar population of the region; he defined two sub-ethnicities among the Tatars—the Kazan Tatars and the Mishar Tatars [Tatary', 1967, pp. 9, 39]. Despite the claims of Yu. Mukhametshin that baptised Tatars are 'one of the territorial groups of the Kazan Tatars' [Mukhametshin, 1977, p. 154], of R. Mukhamedova that the Mishar Tatars of the right bank of the Volga are an 'ethnographic group' of the Tatars of the Middle Volga and Ural Region [Mukhamedova, 1972, p. 5], of F. Sharifullina that the Kasimov Tatars are a 'group of the Tatars of the Volga Region' [Sharifullina 1991, p. 106], in the final volume of the series 'Historical-ethnographic atlas of the Tatar people' the Kazan and Kasimov Tatars and the Mishar Tatars were identified as sub-ethnicities, and the 'Kryashens,' as a sub-religious community [E'tnoterritorial'ny'e, 2002, pp. 55–60, 151], which is not confirmed by the historical sources of the 19th century. During this time a fundamental aspect of the ethnic identification

⁹ According to Yu. Bromley, sub-ethnoses identify themselves as a group. Their ethnic features are less pronounced as compared to ethnoses [E'tnoterritorial'ny'e, 2002, p. 53].

of the Tatars was their religious identity (the Muslim Tatars). In the Ural Region ethnic identity was also influenced by class characteristics and the form of land ownership related thereto (Bashkirs, Meshcheryaks, Teptyars). With the development of the missionary system of N. Ilminsky, from the late 1860s, Christianisation among the old-baptised Tatars and their opposition to the ecclesiastical authority of the Muslim Tatars began to grow. However, the term 'Kryashen Tatars'—'keräšen tatarları' (such as, for instance, 'mukşı keräşene' ('baptised Mordovian') [Säyaxätnämälär, 2011, b.10]) still meant nothing more but the baptised Tatars.

In our view, the fundamental problems of modern Tatar ethnography are: the limitation of the lower chronological framework of the 19th century, which does not allow the connection between ethnocultural processes in the Middle Ages and early modern times to be seen; the poor knowledge of published and unpublished sources on the historical periods under study and the traditional emphasis on the materials of ethnographic expeditions of the 1970–1980s, giving at best a picture of household life in the early 20th century or at the turn of the century; the limitation of research on the Volga-Ural Region, the inadequate record of the ethnocultural state of the Tatar diaspora in Russian border regions (in the former Soviet Republics of the USSR) and in central Russia.

History of the culture of the Tatar people.

The historiography of the culture of the Tatar people is considered in terms of the following: education (schools, school policies), enlightenment and educators, Tatar literature, book publishing.

Tatar school and education. In Soviet historiography the topic of education is one of the most well-studied. The history of Tatar schools and secular education is reflected in the numerous publications of Russian researchers, which cover the work of Tatar school [Khakimov, 1972], methods of teaching in pre-revolutionary schools [Berkutov, 1968; Baykueva, 1971], and female education issues [Rustyamova, 1958; 1967]. A great contribution to the study of the expansion of secular education among the Tatars was made by A. Makhmutova monograph [Makhmutova, 1982]. S. Mikhaylova

[Mikgaylova, 1979] looked at the Tatar component of secular education in the 19th century on the example of Kazan University by analysing projects to create European style Tatar schools, the training of public figures and secular intelligentsia [Enaliev, 1998a, p. 6].

In the post-Soviet period, with the formation of a secular society, the researchers started to pay more attention to the madrasah activities, including their centres to preserve education and religion of the Tatars and their mudarris-es—custodians of traditions [Rakhimov, 1991; Amirkhanov, 1992; Mädrlärdä, 1992; Farkhshatov, 1994; Gimazova, 2004; Role, 2006; Safiullina-Al Ansi, 2008; Madrasah, 2008; Makhmutova, 2009]. Female education was studied from a new perspective. For example, A. Makhmutova (in her monographs 'Serving only you, my nation! The history of the Tatar enlightenment through the destinies of the Nigmatullin-Bubi dynasty' and 'It is time for us to start the dawn of freedom (Jadidism and the feminist movement)' based on the extensive factual material) provided an analysis of the political and cultural processes, in which women's enlightenment developed, identified patterns and features of the Tatar female education development, and noted the most active representatives of this movement [Makhmutova, 2003; 2006]. Vivid portraits of the Tatar women on the path of enlightenment were also present in the work by T. Biktimirova [Biktimirova, 2002].

Soviet historiography did not leave unnoticed the role of Orthodox missionaries in educating the Tatars. At the same time missionaries and school policy was generally assessed in a positive way in terms of the Russification of non-Russian peoples and the positive impact of Russian teachers on the development of Tatar pedagogical thought [Efirov, 1948; Khanbikov, 1968]. Up to the 1980s the main study on the subject was the work by V. Gorokhov 'Reactionary school policy of tsarism against the Tatars in the Volga Region' [Gorokhov, 1941], which focuses mainly on the system of N. Ilminsky. The author analysed the importance of the work of missionary educational institutions for the baptised Tatars and traditional school education system of the Muslim Tatars. Hav-

ing highly rated the educational activities of N. Ilminsky, V. Gorokhov, however, believed that it was aimed primarily at the Russification and Christianisation of the indigenous population of the region. The works by N. Pruss [Pruss, 1979], T. Chekmeneva [Chekmeneva, 1985] continued this tradition. However, the authors referred to the missionary institutions without paying enough attention to their impact on the strengthening of the Orthodox religious traditions among the local population.

A new viewpoint on the development of Orthodox religious education in the Volga-Kama Region in the 19–beginning of the 20th centuries is seen in a number of works by contemporary authors. For example, in his thesis research devoted to the study of the history of the Kazan Theological Academy (KTA), A. Zhuravsky [Zhuravsky, 1999] touches on the issue of missionary personnel training, the scientific organisation of the Orthodox anti-Muslim mission. This work is of particular importance due to the fact that the KTA historical period under study (from the 1880s to the 1920s) remained unstudied by both pre-revolutionary and Soviet scientists due to a number of external reasons. The only modern work devoted to the Kazan Theological Seminary (KTS) is a monograph by Ye. Lipakov [Lipakov, 2007]. On the basis of new materials and documents, the author highlights the key milestones in the development of the KTS—one of the oldest Orthodox theological schools in Russia, which played an important role in the development of religious education in the Volga-Kama Region. The monograph by R. Iskhakova [Iskhakova, 2001] devoted to the pedagogical education in the Kazan Guberniya in the post-reform period considers the establishment of a network of educational institutions of Orthodox theological institutions and missionary 'brethren' schools, the formation and development of the missionary-pedagogical system of N. Ilminsky and evaluates its contribution to the development of the education of local people.

The development of Oriental and Islamic Studies at synodic educational institutions of Kazan was studied in depth. The first comprehensive study in this area was the work by R. Valeev [Valeev, 1999]. He stressed the impor-

tant role of the missionary school of Orientalism, formed within the KTA, in the development of scientific knowledge in the countries of the Arab East and the Islamic religion. A significant contribution to the objective analysis of the role of the Kazan missionary school of Islamic studies and to the definition of its place in the Russian tradition of Oriental studies was made by Ye. Kolesova [Kolesova, 2000], I. Alekseev [Alekseev, 2001, pp. 84–96], M. Khabibullin [Khabibullin, 2004].

Enlightenment and educators. In the Soviet times up to the 1930s there was a relatively objective evaluation of the activities of the Tatar pedagogues and educators, and later until the 1960s historiography was influenced by the policy line expressed in the negation of individuals and institutions that did not conform to the Stalinism ideology. In the 1920s Tatar enlightenment was seen from the class perspective, the work of educators from among the religious leaders underwent especially critical reinterpretation. Nevertheless, the works of scholars such as G. Ibragimov, G. Sägdı, J. Validi, G. Gubaydullin [Validov, 1923; Ibragimov, 1926; Sägdı, 1926; Gubaydullin, 1926] positively rated the contribution of Ş. Märcani, R. Fäxretdin, G. Barudi, Q. Nasırı, X. Fäezxanov, et al., in the development of the culture and sociopolitical thought of the Tatar people. It should be noted that G. Ibragimov paid special attention to the heritage of Q. Nasırı, due to which he published the collection 'Qayum Nasırı mäjmugası' in 1922. It included articles by Tatar literary scholars and historians, who laid the foundations for the scientific understanding of the educator's work [Zhestovskaya, 2004a, pp. 9, 10]. The study by J. Validi 'Essay on the history of education and literature of the Tatars' features an integrated approach to the study of the Tatar enlightenment: the author looked at the evolution of the traditional Tatar schools, the views of religious thinkers from different periods, and the formation of literature [Validi, 1923].

Starting from the 1930s, due to the subordination of history to the dominant political ideology, the study of Tatar enlightenment outlined other priorities. Ş. Märcani and R. Fäxretdin were classed as aristocratic and bour-

geois leaders, so their role in the development of the enlightenment was belittled; the work of Q. Nasri, which was not studied comprehensively, was highly rated: much attention was paid to his pedagogical and literary heritage [Faseev, 1955; Gaynullin, 1955].

The situation changed with the coming of the 'thaw' period of the 1960s. Researchers were gradually moving away from the existing moulds, and this subject was comprehensively studied [Nafigov, 1964; Mikhaylov, 1972; Abdullin, 1976; Usmanov, 1980; Yusupov, 1981, et al.]: researchers looked at the main features and nature of the Tatar enlightenment, its origins, the role of individual representatives in the development of the spiritual culture of the Tatars [Zhestovskaya, 2004a, p. 12]. For example, the monograph by Ya. Abdullin 'Tatar Educational Thought' analysed the religious and philosophical views of G. Qursawi, Ş. Märcani, and Sh. Kultasi and evaluated them, defining the role and place of religious reformation in the development of social thought. Interest remained in the personality of Q. Nasri as an outstanding representative of the enlightenment movement and teacher. The work of Q. Nasri was the most 'convenient' for research—it was quite consistent with the ideology of the Soviet times [Qayum, 1948; Gaynullin, 1955; 1975a].

Tatar literature. The study of certain issues related to 19th century Tatar literature history started after the democratic changes in 1905, when two simultaneously developing directions were determined. On the one hand, literary criticism started to assess the artistic heritage of the past and present. This was first done by F. Amirkhan in his article 'On Literature' (1908) [Ädäbiyatka, 1908], where he considered folkloric works and analysed the works of Z. Bigiev and the first Tatar playwrights G. Ilyasi and F. Khalidi. A historical approach to the national literature of the 19th century was presented in the studies by R. Fäxretdin [Fäxretdin, 1908a], F. Karimi [Kärimi, 1909] G. İsxayı [İsxayı, 1908] N. Gasrıy [Gasrıy, 1915] M. Akchurina [Akchurina, 1911], et al. But these publications were usually limited to a brief overview of historical and literary events.

On the other hand, starting from the 1910s, the history of Tatar literature was interpreted as an academic discipline, due to which a textbook for madrasahs 'Movement of the Tatar literature' [Validi, 1912] by J. Validi was published, which was the first independent study on the history of Tatar literature. Particular focus was given to the formation of new educational literature, separate sections were dedicated to the life and work of Q. Nasri, A. Kargaly, G. Kandaly, Aqmolla, and Sh. Zaki.

The understanding that the history of literature is a process occurred in the 1920s. In this respect, we should mention the studies by Gata İsxayı 'Ädäbiyat Yulları' ('Paths of Literature') [İsxayı, 1920], G. Rakhim and G. Gaziz 'Tatar ädäbiyatı tarikhı' ('The History of Tatar literature') [Gaziz, 1923; 1925], J. Validi 'Essays on the history of education and literature of the Tatars (until the revolution of 1917)' [Validi, 1923], G. Säğdi 'Tatar ädäbiyatı tarikhı' ('The History of Tatar literature') [Säğdi, 1926]. We should also mention the articles published in the periodical press by G. Ibragimov. Chronologically, the first researchers were considered to be G. Ibragimov, G. Raxim, G. Gaziz, and J. Validi, but the creator of an integrated system for studying the history of Tatar literature on a scientific basis was G. Säğdi.

'The History of Tatar literature' by G. Säğdi consists of two parts. The first (introductory) part provides a general description of Tatar society in the 17–second half of the 19th centuries in economic, social, and political terms. It provides an interpretation of the conditions and causes of the educational Jadidist movement of the Tatars. The second part covers the history of literature in the second half of the 19–beginning of the 20th centuries, before the October Revolution. The author called it a period of 'Jadidism' and divided it into two stages: 1) from the second half of the 19th century until the revolution of 1905, 2) from 1905 until 1917. In approaches to the history of literature, the author continues the tradition of J. Validi. The book is a history of cultural and historical factors that influenced the development of literature. He considers the literary process in conjunction with the evolution of social thought, language, science, education,

and religion as part of the general cultural movement.

It was in the 1920–1930s that the periodisation problem of the history of literature was put on the agenda. In his book 'Essays on the History of Education and Literature of the Tatars (until the revolution of 1917)' and in his articles published in the newspapers 'Vakıt' ('Time'), 'Yıldız' ('Star'), in the magazine 'Bezneñ yul' ('Our way'), J. Validi considered the history of culture as a determining force and distinguished two stages in the history of Tatar literature: until the second half of the 19th century and the subsequent period of time.

Since the mid-1960s there has been a resurgence of researcher interest in the history of 19th century Tatar literature with the most complete anthology editions being published [Tatar, 1956; Tatar ädäbiyatı, 1968; Gaynullin, 1978; Tatar, 1979; Khafizov, 1979; Minnegulov, 1982]. The authors summarised the results of the research, which began in the beginning of the 20th century [Gaynullin, 1975, et al.]. There was a revival of the heritage of certain representatives of 19th century Tatar literature: Z. Khadi [Khadi, 1957], Sh. Mukhammedov [Möhämmädev, 1957], G. Utyz Imyani [Gabderäxim, 1986], G. Kandaly [Kandaly, 1960; 1988], Z. Bigiev [Bigiev, 1960; 1991], F. Kärimi [Kärimi, 1996]. In the 1970–1980s some attempts were made to give a generalised assessment of 19th century Tatar literature [Isoriya, 2003; 2003a]. In 1985–1989 five volumes of 'The History of Tatar literature' were published, the second volume of which was dedicated to the 19th century [Tatar ädäbiyatı, 1985]. Since the 1990s books and anthologies compiled for pupils and students have appeared [Minnegulov, 1994; Yakhin, 1994; Karurmanny, 2001].

During this time researchers also paid attention to Tatar local literature of the 19–beginning of the 20th centuries. The monograph by R. Shaykhiev 'Tatar Local Folk Literature of the 19–20th centuries' reviewed samples of special local historical works as narrative sources providing information on village history, the ethnography of certain groups, language, and social psychology. According to the author, these works lie at the origin of the local history;

despite their authors being not professional historians, they can serve as a reliable additional sources on the local history and ethnography of the Tatar people [Shaykhiev, 1990, pp. 5–6].

Book printing. From the 1970s A. Karimullin began to study the emergence and development of Tatar printed books, the attempts by the Tatar intelligentsia to issue their own periodicals [Karimullin, 1971; 1974; 1983]. His three monographs—'At the Origins of Tatar Books: from Their Emergence up to the 1860s,' 'Tatar Books of the Early 20th century,' 'Tatar Books in Post-Reform Russia'—looked at the history of Tatar book publishing as a sociocultural phenomenon. His thorough study of the subject allowed him to identify the stages of formation of Tatar books, identify what its contents were focused on, and prove for the first time the connection between the development of Tatar literature and book publishing. The introduction of many materials for scientific use, such as the Tatar petition to allow the publication of national periodicals in the late 19–beginning of the 20th centuries, was further proof that Muslim Tatars wanted to take active part in the educational processes on a national scale. In this regard, we should note the emergence of bibliographic research, allowing the study of book interests of the Tatar population. For example, the work by R. Bulgakov revealed the composition and contents of the arabographic collection of rare books fund of the National Museum of the Republic of Bashkortostan [Bulgakov, 2001].

So the history of the cultural development of the Tatar people received relatively complete coverage in national historiography, with Tatar researchers undoubtedly playing a special role in that. However, the legacy of many Tatar educators, writers, and poets, who have made a significant contribution to the development of education, literature, and poetry and to the promotion of education, has not been studied. The work of the Tatar educators among related Turkic peoples is poorly studied.

Islamic traditions and religious institutions. Russian Islamic studies of the pre-revolutionary period are separated into two areas: the academic area represented by secular scholars and the missionary area represented

by Orthodox figures, acting in this area with a missionary purpose. Russian Oriental and Islamic Studies in many ways acted as part of the global Oriental studies, which featured eurocentric concepts when evaluating the East and Eastern culture in human history, and a Christian view of Islam as an uncivilised phenomenon. In modern times the countries of the East significantly fell behind Europe in socio-economic and sociopolitical terms, which seemed to offer irresistible proof of Christian superiority over the Islamic world. Along with the creation of works on Islam, as noted by the historian N. Smirnov, 'many significant Russian orientalists often limited themselves to processing and translating works of Eastern authors or Western European scholars instead of performing independent research in the area of Islam' [Smirnov, 1954, pp. 96–97]. Nevertheless, the study of Islam and translation of the works of Western scholars helped to acquaint the Russian public with the tenets of this global religion.

They shared a common Orthodox-Christian attitude to Islam, which was reflected in the interpretation of the cultural identity of Muslims. For academics, the focus of their studies was 'classical Islam,' characterised by a high level of tolerance towards Muslims. Another unifying factor seemed to be the civic position of the authors and their protection of state interests.

In his major article in celebration of the first publication of the scientific journal 'World of Islam' in 1912, the largest Russian orientalist V. Bartold, summing up the situation in Russian Oriental studies, stated that 'till this time the general character of these works and their achievements have not corresponded to the importance that the study of the Muslim world has for Russia' [Bartold, 1966, p. 366]. The scientist also noted the 'total backwardness' of Russian Oriental studies as compared to West European ones, having bitterly admitted that 'Islam as a religion is still not represented in any comprehensive work in the Russian language, which at one time would represent a step forward in science; in this respect, even Russian experts were forced to limit themselves to the popularisation of conclusions obtained by West European, mainly German, scientists' [Bartold,

1966, p. 366]. We should also note his remark about the works written 'in order to defend Islam, or to fight against it,' which prevailed in this area among editions in Russian [Bartold, 1966, p. 366].

The Soviet times brought its own changes to the study of Islam and Muslim institutions. Many works had a strong atheistic orientation, and so the role of Islam in the spiritual and everyday life of the Tatars was distorted. On the one hand, Soviet historiography sided with the Muslim Tatars, critically evaluating the Orthodox missionary activity [Lyudmilin, 1932], on the other hand, it denied the positive influence of religion, such as Islam, on the daily life of society and the development of its culture. Despite the political ideological bias, the works of the 1920–1930s, especially of certain Tatar writers [Arsharuni, 1931; Mozaffari, 1930; Ishemgulov, 1930], were rich in factual material, which was due to their close connection with the Muslim Tatar environment and the 'objectivist' position to Islam [Mukhametshin, 2003, p. 5]. During this time several studies were performed on the role of Islam in the life of the Tatar people. These include the study by L. Klimovich 'Islam in Tsarist Russia' [Klimovich, 1936], which identifies the main forms of the religious policy of the state in relation to Islam, and the historical essays by Z. Ishmukhametov [Ishmukhametov, 1979], written so as to denunciate the role of religion in society, though relevant in that they covered the social functions of Islamic institutions in the Middle Volga Region. In general, the study of Islam as a sociocultural phenomenon and the investigation of its role in the daily life of the Tatars were minimal; this issue was often considered as part of more significant topics.

Changes in the political situation in 1991 contributed to the emergence of a large number of studies with an approach to 'the Muslim question,' which differed from that of the Soviet times. One can agree with the words of R. Mukhametshin, who noted that despite the growing interest in the Russian Islam it was studied mainly by historians and political scientists; therefore, 'the determination of the nature of the Islamic factor in the sociopolitical life of a particular region or state as a whole

dominates...' [Mukhametshin, 2003, p. 6]. One of these publications was the monograph by R. Landa 'Islam in the History of Russia' [Landa, 1995], which recreated a coherent picture of the history of Islam, including its position in the Russian Empire, and stated the reasons and problems regarding confrontations among the Russian Muslims. The majority of works of Russian researchers, who studied Muslim issues, can be divided into two subjects: religious and philosophical, Islam and the state.

During this time the study of religious and philosophical works of Tatar theologians became a priority. For example, A. Yuzeev looked at the Tatar religious philosophical thought of modern times through the example of the Tatar theologians G. Utyz Imyani, G. Kursavi, Ş. Märcani, explored the origins and evolution of the Tatar religious reformation, noted its specific features [Yuzeev, 1998]. The history and problems of Tatar religious and philosophical thought in an all-Muslim context was the subject of a study by D. Shagaviev [Shagaviev, 2008], who paid special attention to the work by Ş. Märcani 'al-Hikmah al-baligha' and Kalam, as one of the stages of Islamic philosophy.

The fast growth of religious commitment in the Tatar environment and the need to develop a methodological approach to the study of Islam, which would allow the functioning mechanism of Islam as an ideological and religious system to be determined, increased the interest of researchers in various Muslim social structure forms; they began to study the functioning of traditional religious communities, the functions of the parish clergy and mosques, the sources of their existence [Azamatov, 2000; Salikhov, 2005; Islam, 2006; Tatar, 2006; Mosques, 2006; Sources, 2009; Orenburg Muslim Spiritual Assembly (OMSA), 2011], specifics of the application of Sharia law by the Tatars [Mukhametzaripov, 2010].

Works were completed on the history of traditional Islam, on the Tatar theologians and their heritage [Khayrutdinov, 2004; Adygamov, 2006; Shagaviyev, 2010], on certain religious figures, ishans [Farkhshatov, 2009], on the contacts of the Tatars and other Mus-

lim peoples of Russia and the Ottoman Empire [Sibgatullina, 2010].

A new phenomenon in Russian Islamic studies was the publication of the encyclopaedic dictionaries on the Islamic World [Islam, 2004; 2006a]. Currently the publishing house 'Medina' is undertaking a project to compile a multivolume encyclopaedic dictionary 'Islam in the Russian Federation' [Islam, 2007; Islam v Moskve, 2008; 2009; 2009a; 2009b] based on the regional natural history approach, which allows a detailed and comprehensive study and clarification of the sociocultural development of Muslims through the evolution and activity of mass religious and national institutions to be performed: mahallas, clergy, religious and community leaders, religious educational institutions, cultural and educational and charitable societies, periodicals, etc., for a long chronological period of time: in the Middle Ages, modern and contemporary times.

Numerous publications on the Muslim question in schools, which have appeared in the contemporary period, disclose relationships between the state and the national schools in a new way. These works, in contrast to the studies of the Soviet times, have brought under question the exclusively positive impact of state school policy in relation to the Muslim peoples of the Volga-Ural Region [Zagidullin, 1992a; Farkhshatov, 2000; Suleymanova, 2000; Samatova, 2010].

As part of the 'Muslim question,' works were completed on the social life of the Tatar community in a number of villages and whole regions [Aminov, 1994; Salikhov, 1995; Idrisov, 1997; Yunusova, 1999; Chernovskaya, 2000; Khayretdinov, 2002; Zagidullin, 2003; Batyrgarey, 2004; Tatars, 2004; Mukhametshin, 2005a; Kobzev, 2007a; Gibadullina, 2008; Senyutkina, 2006], unified by the recognition of the important role of the religious factor in the formation of an ethnic and religious identity [Shakirov, 2009, p. 13]. The authors of these studies pay attention to a wide range of issues: the geography of settlements, the coverage of the formation of the ethnic, social and professional make up of communities, the functioning of Islamic institutions. These works are of particular benefit in that they use unpublished

written and visual sources from local archives. Today the study of rural and urban Muslim communities contributes to research done on the Tatar diaspora.

Since the late 1990s studies on cooperation between the state and Islamic institutions were completed, which looked into their functioning in autocratic conditions. They covered the history of the OMSA, presented the results of a study of education, the structure, and main areas of concern of the OMSA, looked at the work of the muftis, parish clergy, and other religious institutions, religious management restructuring projects, etc. [Azamatov, 1996; Abdrashitova 2001; Khabutdinov, 2010].

State regulation of Islam is directly reviewed in the works by E. Vishlenkova [Vishlenkova, 1997], who drew attention to the relationship between the state and the representatives of different confessions during the reign of Alexander I, and D. Arapov, who determined the general and specific relations of the state and Islam in the regions [Arapov, 2004]. Careful attention was paid to relations between the imperial authorities and Islam both within individual provinces and the entire Volga-Ural Region. Researchers were interested, first of all, in the 'Muslim question' regarding the autocratic policy and the reaction of the local population to the domestic policy pursued by the state in this area [Muftakhutdinova, 1999; Vorobyeva, 1999; Garipov, 2002; Karpenkova, 2004; Golubkina, 2005; Gilmudinov, 2005; Iskhakov, 2008, et al.].

The provision of the conditions to meet the religious needs of Muslims in the army, civil institutions, educational institutions, trade fairs were covered in the works by I. Zagidullin and O. Senyutkina [Zagidullin, 2006; Senyutkina, 2006]. A comprehensive study of the role of the mosque and public prayers in the social and religious and ritual life in traditional Muslim communities of the OMSA district was also performed [Zagidullin, 2007].

In the imperial period issues related to the observance of religious rights of the Tatars were not studied. The lack of interest can be explained by the desire of the official ideology institutions to present the feats of the Russian army as a victory of the 'Russian army, Chris-

tian in spirit.' Servicemen of other ethno-religious groups, being 'outlanders,' did not fit into this concept. Special publications about Muslims in the regular army appeared as part of the history of individual national military units, mostly the Crimean and Lithuanian Tatars [Muftizade, 1899].

In the Soviet times the study of 'religious issues' in the Russian army lost its relevance due to the approval and cultivation of new principles related to the building of an atheistic society. During this time the only work on the subject was the book by N. Galushkin published in the USA [Galushkin, 1961].

In the post-Soviet period we can highlight two groups of works that look at various aspects of the religious life of Muslim servicemen. The first group includes works on the history of Muslim communities in individual settlements or regions. They fragmentarily set out facts about the Muslim servicemen, on the work of the Muslim clergy related to the military authorities [Grishin, 1995; Aminov, 1994; Zagidullin, 2003; Batyrgarey, 2004]. The second group of works is devoted to Muslim military service in the regular army and irregular troops [Arapov, 2000; Emelyanova, 2001; Nasyrov, 2005; Akhmetshin, 2006, et al.]. Currently, the most highly covered issues are issues on the legal status of the assigned military mul-lahs [Azamatov, 2002; Iskhakov, 2002; Arapov, 2003; Abdullin, 2007], the Teptyar, Bashkir regiments [Usmanov, 1964; Asfandiyarov, 1988; Rakhimov, 1992; 1996; 2002; 2003]. In terms of comparing and contrasting some parties to meet the religious needs of the Muslim and Jew servicemen, as non-Christians religious groups, the monograph of the American scientist Y. Petrovsky-Stern is of significant educational interest [Petrovsky-Stern, 2003].

It should be noted that the inclusion of segments about Muslims in the study of spiritual and religious education in the Russian army was a new phenomenon in Russian historiography [Fabrika, 1997; Kotkov, 1999; Kravchuk, 2005]. There was a tendency to comprehensively study national parts of religious minorities in the army [Lapin, 2001].

The sociopolitical, religious, cultural, and educational movement of the Tatars.

Russian historiography covered different types of social movements of the Tatars in several areas. One of them was the study of the anti-government protests of the peasants in the Middle Volga and Ural Regions against agrarian reforms, land audits, and fiscal measures [Tokarev, 1924; Ustyuzhanin 1948, et al.].

In the 1920–1930s the main area of study for historians was the movement of the Tatar peasants in the Kazan Guberniya in 1878–1879. In his book 'The Past of Tatarstan' N. Firsov gave a brief, outline of the course of these events [Firsov, 1926, pp. 39–40]. Earlier the Tatar historian G. Gobäydullin published a copy of the petition of the Tatars to the Ministry of Internal Affairs, in which they complained about the unlawful actions of the governor of the Kazan Guberniya in 1878 [Gubaydullin, 1925, pp. 38–40]. G. Rakhim introduced memoirs of a witness to this uprising for scientific use [Rakhim, 1928 pp. 144–151]. E. Chernyshev, having studied much of the source material, wrote voluminous article [Chernyshev, 1927], describing practically the entire course of the uprising in Kazan uyezd. N. Firsov and E. Chernyshev said that fear of the forthcoming baptism was the main cause of protests among the Tatar peasants.

One of the first studies on the Tatar Peasant Movement of the 1850–1870s was the work by L. Morozov [Morozov, 1936]. The main narratives of the multi-ethnic peasant movement in the Kazan Guberniya in the 1860s were reflected in the new works by Ye. Ustyuzhanin, E. Chernyshev [Ustyuzhanin, 1948; Chernyshev, 1948]. We should also note the change in the point of view of the latter on the causes of the Tatar peasant movement in 1878–1879. E. Chernyshev put forward the weakening of their socio-economic position as the main cause of social protest [Istoriya, 1955, pp. 358–360].

The works by S. Daishev [Daishev, 1955; 1957] for the first time discussed certain moments of the Tatar peasant protests against the law on educational requirements for the Muslim clergy, against the population census in 1897 and noted a direct connection between the peasant protests with religious oppression and their difficult economic situation.

Yu. Smykov [Smykov, 1973] conducted a large and effective study on the forms of social protest of the multi-ethnic peasant class of the Kazan, Samara and Simbirsk Guberniyas, including the Tatar peasants, and defined the dynamics and main stages of the peasant movement in the post-reform period. He created the most complete picture of the events in 1878–1879 in the Kazan Guberniya.

The post-Soviet period witnessed the expansion of the scope of scientific research in the area of the Tatar peasant movements. According to materials on the Kazan Guberniya, it was found that the majority of the protests by the Tatar peasants in the post-reform period was not due to economic reasons but due to the exacerbation of the 'Muslim question' in the Russian Empire as well as the involvement of the parish clergy and Tatar merchants in the peasant protests [Zagidullin, 1992]. Scientists began the systematic study of the Tatar peasant protests, caused by a variety of rumours about baptism [Zagidullin, 2000; Märdanov, 2007] and the movement, which saw baptised Tatars return to Islam [Kobzev, 2007a; Iskhaikov, 2011, et al.]. An important achievement of modern scientists was the refusal to be bound by simplified schemes and approaches in the analysis of these movements typical of Soviet historiography, their recognition as a Tatar protest against the policy of the imperial authorities, a protest aimed at the preservation of their cultural identity and ethno-religious identity.

Much attention of the researchers was attracted also to Jadidism. Still there is no consensus among scientists on the social nature of Jadidism. In Soviet historiography Jadidism was mostly characterised as part of the educational movement aimed first of all at reforming traditional schools of the Tatars and further rapprochement with the European culture and transformation of society in accordance with modern requirements [Validov, 1923; Sägdı, 1926; Ibrahimov, 1984; Nafigov 1964, et al.]. At the same time, Jadidism was also politically sensitive: It was considered in opposition to enlightenment as a national-bourgeois movement, the members of which were accused of Pan-Turkism, Pan-Islamism, and anti-revolutionary activities [Faseev, 1971; Khasanov,

1977; Abdullin, 1977]. If Soviet historiography considered Jadidism mainly as part of the enlightenment subjects or in general works on Tatar history, the present stage witnessed the appearance of studies dedicated directly to Jadidism as a sociocultural phenomenon: the study of the role of Qadimism and Jadidism in the process of nation building continued, the nature of Jadidism was defined, new approaches to this problem were identified [Iskhakov, 1997a; Abdullin, 1998; Mukhametshin, 2005; Khabutdinov, 2008].

Jadidism was also characterised in different ways, depending on the dominant ideology: both as a cultural and educational and socio-political movement. Recently the opinion has emerged that Jadidism should be considered in a broader sense covering the religious, educational, and political reformism in the life of the Tatar nation [Islam, 2001 pp. 127–132].

Out of the religious and political schools, the best covered was the Wäisi movement. In the pre-October historiography the Wäisi activities were evaluated somewhat ambiguously. A. Kildishev [Kildishev, 1908], who was formerly one of its followers, on the basis of his own observations and according to the head Ğaynan Vaisov, presented the work that revealed the activities of this movement. In contrast E. Molostvova [Molostvova, 1912], using materials of A. Kildishev and the new information received from the Wäisi, favourably outlined the history and essence of the Wäisi as a religious movement. In Soviet times the Wäisi movement was seen through the prism of social and class struggle. Nevertheless, one of the researchers M. Sagidullin [Sagidullin, 1930] managed to systematically set out its history: from the beginning until its termination [Usmanov, 2006, pp. 383–384]. At present the most complete history of the Wäisi movement is represented in the work by D. Usmanova 'Muslim "sectarianism" in the Russian Empire: "The Wäisi Holy Regiment of the Old Muslim Believers" in 1862–1916' [Usmanova, 2009]. In this study the Wäisi movement was represented as a religious association, which later transformed into a community with its own religious autonomy, social status, and political programme.

Russian historiography saw the completion of works, which considered various forms of Tatar protest as a struggle for national identity, characterising it as a national movement. Within this framework F. Sultanov conducted the study 'The Tatar national movement: Past and Present' [Sultanov, 2000], which considering the forms of the Tatar national movement in modern times (religious reformism, Jadidism) marked a gradual shift in national identity from the principles of Islamism to the patriotic principle of Tatarism caused by the specific climate created by the Russian government's policy and the Orthodox church and the negligent attitude towards non-Russian peoples.

In general, the historiography of different forms of the Tatar movement showed a tendency to define the religious and national aspect in all forms of protests, which lay at the core of the national identity.

Different aspects of the Tatar history in the 19–beginning of the 20th centuries were also the subject of thesis studies. These studies were mainly conducted in the post-Soviet period, after the removal of the unofficial restrictions on the selection of topics and research methods. Since the late 1990s the sociopolitical, socio-economic, and religious history of the Tatars, the development of national literature, education, enlightenment have been studied mainly by Tatarstani scientists, and such studies have often been limited by regional boundaries. This narrow approach was determined by the ideology of Soviet history as a science, as a result of which the history of non-Russian peoples was not considered as a part of Russian history, being only woven into the overall fabric.

At the present stage of development of the humanities some works have been published analysing the contribution of Tatar intelligent thinkers and religious leaders to the development of the enlightenment [Salakhova, 2003; Gimazova, 2004; Zayni, 2004; Sharafutdinov, 2004a; Minnulina, 2006; Khafizov, 2006; Khamitullina, 2007, et al.] as well as works by authors, who aim to define the place and role of the Tatar enlightenment in the development of sociopolitical thought [Enaliev, 1998; Sabirov,

2000; Salakhov, 2000; Zhestovskaya, 2004; Galimzyanova, 2006].

An overview of the Russian historiography of the Tatar people shows that the choice of research topics and evaluation of historical events and facts are to a large extent determined by the state of development of historical science and the influence of ideological

'clichés.' If Soviet historiography under pressure of the existing ideology is noted for its criticism of the main public, social, and cultural processes in the Tatar history, post-Soviet historiography, while raising the same problems, evaluates all events in another way, sometimes radically different from the previous ones.

Historiography in the Turkish language

Alper Alp

Historiography in the Turkish language includes works on various aspects of the history and culture of the Tatars in the Volga Region in the 19–beginning of the 20th centuries. The first such publication was a book by Shamsaddin Sami, who presented a summary of the Russian Muslims, population, education, and industry of Kazan [Sami, 1891, pp. 1605; 1899, p. 3656].

Interest in the Tatars in Turkey arose at the beginning of the 20th century, which was clearly manifested in the issue of the newspapers 'Sabah,' 'İkdam,' 'Tercüman-ı Hakikat.' In 1911, when the Tatar Yu. Akçura started issuing the magazine 'Türk Yurdu' ('Turkish House') in Istanbul, the amount of information on the Tatars in the Volga Region increased.

The authors of the first works on the Tatars in the Volga Region were Tatar intelligent thinkers, who had emigrated from Russia and founded the tradition of studying the history and culture of their former fellow countrymen. The benefit of their works was the reliable knowledge of the subject and personal contacts with prominent figures of the Tatar renaissance of the early 20th century. The book by Gabelbari Battal Taymas 'The Turks of Kazan' (1925) [Taymas, 1966; Taymas, 1996] described the history of the Tatars of the Volga Region from ancient times to the formation of the USSR. The author considered the period of reign of Catherine II as the time when relations between the autocracy and Muslims started to take shape, which to some extent was caused by the desire of the imperial authorities to peacefully extend their

influence on the Kazakh steppe and Central Asia. Taymas believed that the beginning of the 19th century was a time of economic and intellectual breakthrough for the Tatars. He noted their achievements in the commercial and industrial sector, considering production and trading centres to be cultural development centres, and highlighted the role of book printing in the Arabic script in Kazan, etc. Taymas called Q. Nasiri and Ş. Märcani the leaders of the modern times. He defined Jadidism as an education and cultural movement of the Russian Turks, emphasised that the Jadids took significant steps in modernising Tatar institutions without any state support in confrontation with the Qadims and did not lose their confidence. He called the madrasahs 'Muhammadiya,' 'Husainia,' 'Usmaniya,' 'Galiya' and Izh-Bubi the leaders of educational institutions and distinguished merchants who contributed to their successful operation.

In a series of works published under the title 'Kazanlı Türk Meşhurlarından' ('Famous Turks of Kazan'), Taymas for the first time in Turkey provided the most complete information about Jadids and educators such as R. Fäxretdin, G. Barudi, M. Bigiev [Taymas, 1958, 1958a, 1958b]. He also wrote an essay about the life of brothers Ahmet Hadi and Sadri Maksudi [Taymas, 1959].

Due to his works on the history of the Tatars in Kazan, Akdes Nimet Kurat, also of Tatar origin, became a renowned scholar in Turkey. In his article 'The Period of Civilisational Awakening of the Turks in Kazan' ('Kazan Türkleri'nin Medenî Uyanış Devresi') [Kurat,

1969, p. 100], which can be considered a book in terms of its size, he described the conditions that paved the way for Tatar modernisation and studied the activities of the Ulema and the rich Tatars and educators, who were trained in higher Russian and European educational institutions. Kurat emphasised G. Utyz Imyani's appeal on the need to deal with the practical problems of life instead of unnecessary religious issues, emphasised his reformative qualities, including support in learning the Russian language. Unlike Taymas, Kurat praised G. Kursavi, calling him the second most important figure in the awakening movement. He believed that his most important idea was the one of the right of every Islamic scholar to interpret and explain the Quran and Hadith to the best of their knowledge and to seek the truth and to the extent of the results obtained to work against scholastic thinking, which prevailed in Bukhara and Kazan. Out of the other leaders of the modernisation movement, Kurat considered that Ş. Märcani, Q. Nasiri, and X. Fäezxanov were Tatar entrepreneurs as the financial experts of the Tatar community. According to him, all ideas and efforts to modernise were taken from cultural experience and were under the influence of the ideological movement in Russia, Turkey, and Egypt. In particular, he pointed to the close ties of G. Ibragimov with famous Ottoman educators such as Namık Kemal, Ahmet Vefik, Muallim Naji, Ali Suavi, and Ahmet Midhat. The article also described in detail the political activity of Muslims in Russia in the early 20th century.

The works by Nadir Devlet 'Rusya Türkleri'nin Milli Mücadele Tarihi (1905–1917)' ('History of national struggle of the Russian Turks (1905–1917)') [Devlet, 1999] and '1917 Türk-Tatar Millet Meclisi' ('The Turkic-Tatar National Assembly of 1917') [Devlet, 1998] are complementary. In the context of the stated subject the first work covers the process of the development of the movement for modernisation in the Volga Region and other regions of the country until 1905 and analyses the views of Tatar intelligent thinkers in creating a single literary language among Turkic peoples of Russia: if R. Fäxretdin, M. Bigiev

lobbied for this idea, G. Barudi and Ğ. Tuqay held the opinion that the Tatar language should be a separate literary language. The second work by N. Devlet also provided information on the cultural and political history of the Tatars of the Volga Region in the late 19–beginning of the 20th centuries.

Significant contribution to the study of the work of G. Ibragimov [Türkoğlu, 1997], and R. Fäxretdin [Türkoğlu, 2000] was made by I. Türkoğlu. He traced the life journey of G. Ibragimov in Russia and Turkey, describing his educational, publishing, journalistic, and political work, his views on education and the Islamic world, and the attitude to his ideas of Muslims in Turkey.

The studies by I. Türkoğlu also provided a detailed description of the Tatar educational institutions and education system there, showed the role of Märcani, Afgani, and I. Gasprinskij in shaping the views of R. Fäxretdin, covered in detail the organisation and functioning of the OMSA, in which R. Fäxretdin was the Qadi and during the Soviet times, the mufti. The author highly rated the role of R. Fäxretdin in the development of the Jadidist movement.

Ahmet Kanlıdere provided a comprehensive study of the biography and works of the famous religious figure M. Bigiev and considered the impact of the views of the Tatar theologian on the Muslims of Russia and Turkey [Kanlıdere, 2005].

The Book of Ibrahim by Maraş 'Türk Dünyasında Dini Yenileşme' ('Religious reform in the Turkic world') [Maraş, 2002] can be called a narrative on the history of ideas of the Tatars in the Volga Region, based on the analysis of works by Utyz Imyani, Kursavi, Märcani, and Fäezxanov, the impact of the leaders of the new generation educators on the Jadidist movement: G. Barudi, M. Bigiev, R. Fäxretdin, G. Bubi, and Z. Rasuli. The author also examined issues such as the translation of the Quran, *ijtihād*, *khutbah* language, and the rights of women, who were often a subject of controversy between the Tatars in the early 20th century.

İlyas Topsakal studied the relationship between the Russian state and the Tatars of the Volga Region during the 19–beginning of the

20th centuries, the system of N. Ilminsky; based on the works by M. Mashanov, he distinguished the attitude of missionary organisations to the Muslim community in the region in the early 20th century [Topsakal, 2009].

The work by Saime Selengi Gökgöz 'Yevfimiy Aleksandroviç Malov İdil-Ural'da İslam Karşıtı Rus Misyon Siyaseti' ('Evfimij Aleksandrovich Malov. Anti-Islamic missionary policy of Russia in the Volga-Ural Region') tells the story of the state-Islamic relations, the movement to return the baptised Tatars to Islam and identifies the main areas of Malov's work on the missionary path [Gökgöz, 2007].

Alper Alp studied political movements and groups among the Tatars in the early 20th century. The first part of his work covers the participation of the Tatars in the political processes of Russia and among Muslims [Alp, 2010].

History books in Turkish on the history of the Tatars of the Volga-Ural Region in the period under review contain four issues: the movement of Jadidism and Islamic reformation (in most cases these topics are covered through the works and actions of specific individuals); the sociopolitical activities of the Tatars in the early 20th century; the Christianisation policy against the Tatars.

Western Historiography

Mustafa Tuna

Little information on the Muslim peoples of the Volga-Ural Region can be found in the Western literature of the 19th century. It is generally positive, though. In 1825 a special Russian issue of the tourist book 'The Modern Traveller,' published in London, quoted a 1715 traveller: 'They say Kazan Tatars are more civilised than their Russian masters.' According to the authors of the reference book, Tatars were outstandingly literate. They had a school at every mosque. Besides, Tatar merchants in Kazan were very rich [The Modern Traveller, 1825, p. 226, pp. 308–309]. German economist Baron von Haxthausen travelled to a number of Russian cities and regions and collated a large quantity of diverse materials. In 1856 the English version of his book 'The Russian Empire: Its People, Institutions, and Resources' was completed, in which von Haxthausen wrote: '...both mentally and physically, Kazan Tatars belong to a nobler human race. However, their Mohammedan faith only enables them to develop to a limited extent.' Emphasising the Tatars' superiority to the Russians, he also believed that 'if the intelligent and friendly race was converted to Christianity, it could not only become one of the most civilised nations but promote Christianity and civilisation all across Asia' [Baron von Haxthausen, 1856, pp. 323–328].

Such comparisons between the Tatars and the Russians became rarer in 19th century literature. However, authors still maintained that the Kazan Tatars were 'the most civilised people' in their family—that is, among the Turkic peoples of Russia [Latham, 1878, p. 226].

Ethnographic and philological research boomed in Western Europe in the late 19th century. As a result, Turkic studies as a branch of science appeared both in Russia and in Western Europe. One of its founders V. Radloff spent over ten years in the Altai Krai studying Turkic languages. His works on Siberian Tatars, written in German, aroused interest in Turkic languages on the part of European philologists [Radloff, 1884]. The ethnonym 'Tatars' had a vague meaning ranging from 'Mongols' and 'Middle Asian Muslims' in the West at that time. The term was mostly used to denote the Turkic-speaking descendants of the Golden Horde who were still inhabiting the Kipchak steppes. Authors used regional indicators to narrow the meaning to the 'Tatars' of a specific region. For instance, the term 'Kazan Tatars' was used to denote the dwellers of the Kazan Khanate and later the Kazan Guberniya. The term 'Turk,' or 'Turkic,' gradually acquired many connotations of 'Tatar.' As ethnographic data on the 'Tatars' of various regions accumulated, the names became ethnonyms. The term 'Kazan Tatars'

has been used in English since the early 18th century. However, it was in the late 19th century that it came to mean the Turkic-speaking peoples inhabiting the Volga and Kama Basin. This initially included the Tatars who had converted to Christianity under Russian power. Yet the term 'Kazan Tatars' was mostly used to denote the Muslim population of the region [see: Balint, 1875–1876, quoted by: Duka, 1889, p. 596; Cust, 1891, pp. 184–194; Vambery, 1892, pp. 1–18].

Another fact pertaining to the late 19th century is that, unlike secular ethnographers, Russian Orthodox missionaries became more active in studying and identifying the peoples of the Volga-Ural Region. They collated a lot of information. Even though all of their sources were in Russian, their findings affected the way in which Western scholars described the Kazan Tatars. The main topic of such missionary literature was the Kazan Tatars' indifference to Christian proselytism. The famous Hungarian Orientalist of Jewish descent Armin Vambery probably referred to this fact when he wrote in 1892: 'Despite three centuries of subordination to Russia, [the Muslim Tatars of Kazan] became only slightly less adherent to Islam and the Asian way of thinking. There is no evidence that the dominant element [that is, the Russians] has assimilated them [Vambery, 1892, p. 12]. By the beginning of the 20th century Russian missionaries had come to criticise Muslim Tatars because they were disappointed by their resistance to proselytism. In 1991 the debut issue of the American missionary magazine *The Moslem World* presented the article 'Muslims in Russia' by Sofia Bobrovnikova-Chicherina, an adherent of N. Ilminsky. The author informed the Western audience about the nascent Russian Islamic reformist movement known as Jadidism. She believed the reformists, among whom many were influential pan-Turkists and pan-Islamists, were close to their goal of 'uniting separate the Islamic ethnoses in Russia into a Muslim nation.' While earlier works, like the one by Baron von Haxthausen, viewed the Tatars as an ethnic minority to be sympathised with, S. Bobrovnikova-Chicherina depicted them as a threat to the Russian Empire and, consequently, to the

whole Christian world [Bobrovnikoff, 1911, pp. 5–31]. Back in 1906 Vambery claimed in his article that pan-Turkism, or pan-Islamism, had ceased to be practice-oriented [Vambery, 1906, pp. 348–353].

S. Bobrovnikova's concern about Turkic-Muslim activity in the conflict with the Russian regime continued to dominate West European and American literature until the dissolution of the Soviet Union. In 1918 the author of another article in the magazine *The Moslem World* suggested that the chaos that reigned in Russia at the end of World War I and the opening of the borders to Protestant missionaries could create an opportunity to fight against the Turkic-Muslim movement, which he termed 'pan-Turanism' [Camp, 1918, pp. 115–130]. Probably one of the last works to contain a pessimistic depiction of the interregional Turkic-Muslim movement that emerged at the turn of the 20th century was 'Pan-Turkism and Islam in Russia' by S. Zenkovsky, published in 1960. A. Zenkovsky was mostly interested in ancient Russian history, especially that of the Russian Orthodox Church, and did not speak any Turkic languages. This is why he referred predominantly to Orthodox Christian missionary literature on Russian Muslims and its interpretations by Soviet historiographers, which continued to denigrate the Muslim reformists of the late imperialist epoch, this time as representatives of the 'bourgeois' movement. Therefore, despite S. Zenkovsky's clear deviation from the scientific approach to his subject, the work is rather representative of the antagonistic tone of the literature in Russian that was available to him [Zenkovsky, 1960].

As the USSR's relations with the West decayed from the 1930s, Western scholars developed an alternative approach to the issue of the interregional Turkic-Muslim reformist movement, which was approving and even eulogic. This period is marked by frequent references to sources in Turkic languages in Western literature. Already in 1922 the authors of an article in *Encyclopaedia Britannica* wrote: '... the situation changed after the Russian revolution and the dissolution of Russia. The Pan-Turkists are very close to their irredentist goals now' [*Encyclopedia Britannica*, 1922]. Even though this

never happened, the memory of the Turkic-Muslim reformist movements of the late imperialist epoch and the political activities of Muslims in the early Soviet Russia continued to occupy the minds of West European and American scholars, especially after World War II, when differences between the Western Europe and the USSR had turned into outright antagonism. The Soviet Union deprived the Turkic and Muslim peoples of the former Russian Empire of liberty. However, the authors maintained that the peoples who had tasted freedom could fight for independence with support from the Ottoman Empire, provided that they received sufficient incentive and assistance from the West.

Research on the 'national issue' of the Soviet Union became popular in the 1950s [for example, Kolarz, 1952; Hostler, 1975]. Three French scholars, namely Alexandre Bennigsen, Chantal Lemerrier-Quelquejay, and Hélène Carrère d'Encausse, made important contributions. Their first published works, which appeared in the 1960s, led to great interest in the Turkic-Muslim peoples of the Soviet Union as a subversive element [Bennigsen, 1964; 1967; d'Encausse, 1966; *L'Empire Éclaté* 1978]. All the studies on the Volga-Tatar Region depict the Tatars as one of many Muslim peoples in the Soviet Union. They became widely known in literature on the modernist trends of the late imperialist epoch, where the Volga-Ural Region was always the focus, but were seldom mentioned by Soviet historiographers. As a sole exception, Mirsail Sultan-Galiev was extremely popular because he tried to combine Marxism with the idea of self-determination and Muslim nationalism, meaning that the revolution was not over for the Muslim peoples of the Soviet Union [Bennigsen, Lemerrier-Quelquejay, 1960; Galiev, 1986].

The bog in which the USSR got stuck in by invading Afghanistan in 1979 fueled the West's hope for a Muslim renaissance in the Soviet Union. 'The Islamic Threat to the Soviet State' by Alexandre Bennigsen and Marie Broxup, published in 1983, is extremely representative of the trend [Bennigsen, Broxup, 1983].

Works by Edward Lazzerini also deserve to be mentioned in this context. He mainly viewed the issue of Islam and the modern

works from the point of view of the subject of his thesis 'Islmail-Bey Gasprinsky: The Ideological Father of the Muslim Reformists of the 19–Beginning of the 20th Centuries in the Russian Empire' (1973). As the result and partly under the influence of representatives of the Tatar diaspora—historians such as A.Kurat and Battal-Tajmas, also adherents of Gasprinsky's ideas—Lazzerini took a secular approach to the concept of Islamic reforms in the Russian Empire. It was not the Tatars of the Middle Volga Region that he studied. Taking into account the key role that the Kazan Tatars and Kazan played in the cultural life of Muslims in Russia in the late 19–beginning of the 20th centuries, he paid special attention to reconstructing their national history in the works of Soviet Tatar historians. Lazzerini's focus on Islam as a cultural tradition and the reforms within the tradition continues to attract the interest of scholars even today. However, what was of significance to the Western academic community in the 1970s was the subversive potential of Muslims in the Soviet Union. Lazzerini's dissertation attracted the interest of many scholars due to its extensive sources. His dissertation was never published [Lazzerini, 1981, pp. 625–35; 1982; 1994, pp. 82–100].

Monographs in English on the history of several peoples in the USSR, mainly Muslim ones, appeared in the 1980s [Fisher, 1978 et al.]. They included the first historical overview dedicated to the Kazan Tatars, or the 'Volga Tatars,' as A.-A.Rorlich called them in her book of the same title published in 1986 [Rorlich, 1986].

Since the author could not access most libraries and archives in the Volga-Ural Region at that time, A.-A.Rorlich used printed materials from American, European, and Turkish libraries as well as those provided by people from the Tatar diasporas. As a result, her work reflects two stylistically different groups of 20th century sources on the history of Muslims in Russia, namely 1) sources from the Soviet period that emphasise the unique ethnic or national features of the Kazan Tatars; 2) Turkic or Western literature focused on the late imperialist reformist movement as a feature of

the national awakening period. Thus, a large part of A.-A.Rorlich's work is on the Turkic-Muslim transformation and the interaction between leading Muslim reformers, who were either imperialists or advocates for the Soviet regime, until Soviet power was established in the Volga-Ural Region. The last chapter dealt with the Kazan Tatars' 'cultural immunity' to the Soviet regime.

In the post-Soviet period European and American scholars lost their interest in the Muslim peoples of the USSR as a subversive element. While Islam had been the Western bloc's ally against their arch-enemy before the USSR fell, after the dissolution it became a new global threat. This way of thinking creates a negative bias in studies on Middle Asia and the Caucasus. However, the Muslims of the Volga-Ural Region were quite far from the key centres of military action and relatively peacefully integrated with the new Russia and so were able to avoid this negative reputation. Besides, experts in the history of the Volga and Cisural Regions emphasise that the Muslim population peacefully coexisted in a multilingual and multi-confessional environment in a non-Muslim empire.

Studying the history of the Russian Empire's expansion in the Volga-Ural Region, Andreas Kappeler reported this new trend back in the 1980s [Kappeler, 1982]. Especially his book 'Russland als Vielvölkerreich,' which first appeared in 1992 in German and was consequently translated into French and English, influenced the new generation of historians who began to study the history of the Russian Empire in the 1990s [Kappeler, 1992]. When the Soviet Union dissolved, and many peoples that had constituted the so-called union became more politically influential, these post-Soviet scholars started to view the Russian Empire as a multi-ethnic and multi-confessional entity. Works by Robert Geraci, Paul Werth, and Robert Crews that focused on the history of the Volga Tatars should be mentioned in this context. They studied the records of the newly opened local archives to trace the connection between the history of the Volga-Ural Region and such broad historiographic issues such as confessional policies, studies on bor-

der lands, and imperial and national identity. Geraci and Werth were guided to some extent by the unpublished dissertation of Isabel Kreindler [Kreindler, 1969] and focused mainly on politics and imperialistic identity in Russia. Muslims do not appear in their studies as a subject but as an object of Russian policies and a population group [Geraci, 2001; Werth, 2002]. Crews mostly dealt with the interaction between Russia's Muslim communities and the imperial state. However, his idea of the Muslim communities' point of view has been challenged. His arguments for the imperial government's role in the development of Islamic law and the Muslims' readiness to tolerate it interfering in their internal disputes has attracted the attention of historians and theologians [Crews, 2006].

The second type of source that became widely available to historians in the post-Soviet period is manuscripts by Volga-Ural Muslims in Turkic and Arabic. Allen Frank and Michael Kemper made especially broad use of these sources to describe the unique Muslim world of the Russian Empire, which was neither independent nor isolated, but still quite autonomous within the imperial state. Kemper and Frank referred to findings by Soviet historians, including Tatars, to connect the history of the Volga-Ural Region with existing works on Middle Asia and the Near East that had been trying to explain Islam and the Muslim community through text analysis for years. While Kemper analysed the discourse of 18th- and especially 19th-century Islamic scholars [Kemper, 1998; Kemper, 2008], Frank initially focused on the debates by Tatar scholars and intelligentsia on the identity of the Volga-Ural Muslims in the 19th century [Frank, 1998, pp. 39–49]. He then presented a detailed description of the religious institutions and lifestyle of the region's Muslim communities in the same period [Frank, 2001; Frank, 2008]. The works give an idea of the high cultural achievements of the Muslims of the Volga and Cisural Regions in the 19th century, which had a close connection with other Muslims both within the region and far beyond it, while only indirectly demonstrating the features of an imperial state.

A third group of scholars tried to bridge the gap between the two approaches in post-Soviet historiography by using archival data as well as Islamic sources. However, they did not accept the way in which the Muslim reformist movement was characterised in early Western historiography and tried to describe the key imperialism-related issues of Muslims while studying the interaction between the Volga-Ural reformists, interregional Muslim organisations, the imperial state, and particular aspects of the Muslims' lives. For instance, Christian Noack paid special attention to the socio-economic development of the Volga-Ural Muslims in the late 19–beginning of the 20th centuries, which he viewed as the root cause of the reformist and nationalist movements [Noack, 2000]. Agnes Keefeli-Clay wrote that Islam was becoming more popular in all Muslim and Christian Tatar communities, while the imperial state and the reformists had changed their attitude to the interaction [Keefeli-Clay, 2001]. James Meyer viewed the reformist activities of Russian Muslims, in particular the Kazan Tatars, as an attempt by new community leaders to create an inter-empire organisation. The author maintained that these leaders moved between the Russian and Ottoman empires, searching for a new identity that could unite the Muslims of these distant territories [Meyer,

2007]. Besides, it should be noted that possibly we can understand the social and cultural transformations that took place in the late imperialist Muslim communities of the Volga-Ural Region as the outcome of an interaction—sometimes even a conflict—of intrerregional, imperial, and global influences [Tuna, 2009; 2011].

In general, Western studies on the history of the Kazan Tatars in the 18–19th centuries were greatly influenced by the approach that West European and American authors took to wider cultural and political issues, such as colonialism, Christian proselytism, decaying relations between the USSR and the West, and the Cold War. After the immense political pressure was relieved, the number of new trends in the development of these studies increased significantly in the 1990s. It is hard to think of a more serious political problem. Yet the relatively successful integration of the Republic of Tatarstan into the political and cultural structure of the Russian Federation and the peaceful coexistence of Muslims and Christians in the Volga-Ural Region have been attracting the attention of many scholars. This is why most scholars studying the pre-Soviet history of the Kazan Tatars became interested in how a Muslim people can exist in a multi-confessional and multi-lingual environment.

Section I

The Socio-demographic Development of the Tatars

CHAPTER 1

Tatars in the Volga and Ural Regions

§ 1. Tatar Population Size Dynamics and Distribution in the Volga and Ural Regions

Damir Iskhakov

The size and territorial distribution of ethnic groups have a major impact on ethnic [Kozlov, 1969] and social processes. However, the study of the distribution and current population size of people is clearly insufficient for a proper understanding of the ethnic situation in this or another period: these processes require a historical approach, which fully applies to the Volga-Ural Tatars. However, while studying the changes in Tatar distribution at the end of the 18–19th century, it is necessary to take into account administrative and territorial transformations, which were sufficiently large in scale during the period under analysis.

Taking this into account, for our statistical calculations, we used the uyezd and governorate divisions that existed in the 60s and 90s of the 19th century and all the demographic data from 1795 to 1897 for it. Another important factor that needs to be taken into account when analysing statistics on the demographic development of the Tatars over the period in question is the assessment of the results of the ethnic processes that occurred in the Volga-Ural Region. It was namely then that the ethnic processes involving the Tatars, Bashkirs, Chuvash as well as Besermyans developed intensively in the Middle Volga and Ural Regions. This primarily influenced the latter half of the 19th century, both as a dynamic in change of population size and the unique patterns of distribution of the Volga-Ural Tatars.

The most intense interaction between the Tatars and Bashkirs in the Ural Region occurred in the 18–19th centuries. The issue of mutual relations between Tatars and Bashkirs was taken into consideration by us in an article where we noted that the Teptyars 'who, due to

language were largely recorded as being Bashkirs in 1897, but were actually a Tatar ethnographic group' [Iskhakov, 1979, p. 42]. The opinion expressed in literature that a portion of the Mishar Tatars (according to language) living in the Ural Region were recorded as being part of the Bashkirs in 1897 has been confirmed [Kuzeev, 1978, p. 238]. In all our calculations of population groups at the end of the 19th century were referred to as Tatars. However, there is another aspect of Tatar-Bashkir ethnic relations, namely whether it was correct to record as Bashkirs the population of the westernmost areas of the Ural Region (the territory of Bugulma Uyezd, Samara guberniya, Sarapul and Yelabuga Uyezds, Vyatka Guberniya, and Menzelinsk Uyezd, Ufa guberniya), who, according to the 1897 census were recorded as 'Bashkirs'. R. Kuzeev, who studied the demographic development of the Bashkirs, has no clear opinion on this: on the one hand, he rightfully noted the 1897 census to have recorded 'about 300–350 thousand Teptyars and Mishars as Bashkirs' [Kuzeev, 1978, p. 241]. On the other hand, contrary to his statement that 'we cannot but take into account the closeness of the Bashkir and Tatar languages, and the absence of significant differences in the spoken languages of the Teptyars and Bashkirs in the north-western regions' [Kuzeev, 1978, p. 245], he nonetheless considers that the entire Bashkir-speaking population in the aforementioned uyezds to be completely Bashkir [Kuzeev, 1978, p. 250].

We suggest a different, more clear solution to this problem. According to the 1926 census that took into account not only language but the ethnic affiliation of the population within

the Tatar Autonomous Soviet Socialist Republic, which included all the aforementioned uyezds, only 1.5 thousand Bashkirs were recorded [Shibaev, 1930, p. 261]. And that is where the 1897 census recorded 166,209 Bashkirs (according to language) [Shibaev, 1930, p. 37, 89, 107]. Where had they disappeared to? The answer is rather simple: They had assimilated with the Tatars. However, apart from stating the fact, it is necessary to shed some light on the causes of such a rapid ethnic transformation. It should be immediately noted that not everyone among these 166.2 thousand people were Bashkirs in the narrow, ethnic sense. A comparison of the 1897 census records with those of the district Inspection (1856) allows us to make the following conclusion: at least 42,000 people of the aforementioned population to have been 'Bashkir'-speaking Teptyars. That is, the remaining 124,000 Bashkirs proper, during the 29 years between the censuses of 1897 and 1926 completely changed their ethnic affiliation, which we find hard to believe. If we proceed from the fact that, the Bashkir population at the end of the 19th century, still continued to preserve its ethnic self-awareness, then we would have to attribute its rapid change to mistakes in the 1926 census. However, doubts about the correctness of the census have not been expressed.

In fact, representatives of the group specified by us as 'Bashkirs' by the end of the 19th century could not have had a Bashkir ethnic self-awareness. Here are the reasons why. An analysis of records on Tatar and Bashkir co-residence (within one locality) in the late 18th to the first third of the 19th century, reveals 88% Bashkirs in Menzelinsk Uyezd, 58% in Yelabuga Uyezd, and 45% in Sarapulsk Uyezd to have co-resided with Tatars. The Tatar population of Tatar-Bashkir localities was twice as large as the Bashkir one in Bugulma Uyezd and 1.5 times larger than the Bashkir one in Yelabuga and Sarapul Uyezds. The ratio was 1:1 in Menzelinsk Uyezd. It should be noted that, in the latter uyezd by the end of the 18th century, 43% of all marriages were mixed, Teptyar-Bashkir. There is no basis to think that, by the end of the 18th to the early 19th century, the situation was

different in the remaining uyezds. Besides, in these uyezds, the Tatar population already by the end of the 18th century was 5.6 times larger than the Bashkir population. Under such circumstances could this most north-westerly group of Bashkirs preserve their own ethnic uniqueness? Apparently, not. This is why every attempt of the zemstvo statisticians in the 1860–1870s 19th to distinguish between the Bashkirs and Tatars of the north-west frontiers of the Ural Region ended in failure. Taking all this into account as well as the fact that no direct link between native language and ethnic self-awareness exists by the end of the 19th century, we think that the 'Bashkirs' of the four north-west uyezds belong to the Tatar ethnic group. The Bashkir ethnic affiliation of representatives of this group at an earlier stage is also dubious. Most likely it is about their inclusion in a class community. U. Rakhmatullin proved the groups to have often descended ethnically from the Tatars and other peoples in the Volga Region [Rakhmatullin, 1988]. Thus, this population group can probably be defined as transitional between the Tatar and Bashkir ethnic groups.

Finally, the 1897 census reported a large number of Bashkirs (according to language) in Cis-Ural cities. Knowledge of the ethno-language situation and comparison of the 1897 data with that of further censuses have convinced us that the actual number of Bashkir urban dwellers by the end of the 19th century was significantly smaller. Based on this, we exposed the corrected data of the 1897 census for Cis-Ural cities and obtained, in our view, more reliable data about the size of the Tatar urban population.

We should now dwell on the ethnic processes that were taking place in the Tatar-Chuvash environment. The idea about the existence of earlier intense ethnic contacts between the Tatars and Chuvash being based on inaccurate statistical information has already been expressed in literature. [Dimitriev, 1969]. We support this opinion. However, two regions where the ethnic processes led to the assimilation of a significant portion of the Chuvash population should be mentioned. This primarily applies to the Simbirsk guberniya (especial-

ly the Buinsk and Simbirsk Uyezds) and the adjacent territory of the Samara guberniya (in particular, the Samara and Stavropol Uyezds), where by the middle of the 18th century, about 4000 Chuvash co-resided with Tatars in these areas [Russian State Archive of Ancient Acts, f. 16, inv. 1, file 931]. The majority of them were subsequently assimilated by the Tatars (the process was completed by the end of the 19th century). The second area where Tatar-Chuvash ethnic contacts were intense was the territory of the Tsvil'sk and Tetyushi Uyezds, Kazan guberniya, where a group of 'Molkeevo Kryashens' resided. Pre-revolutionary scholars sometimes referred to them as Chuvash [Komissarov, 1912, p. 6]. According to the material for the first half of the 18th century, 60% were really made up of baptised Chuvash [Russian State Archive of Ancient Acts, f. 350, inv. 2, file 2977, 2988, 3005], who until the 1830s preserved their own ethnonym. We only refer to them as Tatars for the period from the late 1850s, (who by this time were recorded as 2.6 thousand people), when they were first reported to have been fully assimilated by the Tatars [Rittikh, 1870, p. 140]. By the end of the 19th century, the total number of Molkeevo Kryashens was 5,300 people.

With regard to the Vyatka Guberniya, it is necessary to take into account the ethnic interactions between the Tatars and Besermians which had been occurring since the Middle Ages in the Vyatka territory. We have found that in the first half of the 18th century, that as a consequence of these ethnic processes, a portion of the Besermians (a group ethnically related to the Tatars) were added to the Tatars of Glazov and Slobodskoy uyezds in Vyatka guberniya. By 1744 they had already adopted Islam [Russian State Archive of Ancient Acts, f. 248, file 803, s. 181]. At least one third of the Tatar population in the aforementioned uyezds were former Besermians, whose assimilation was completed in the late 19– or early 20th century. They had reached as many as 4,300 people then.

These are the preliminary remarks required to study the distribution and population size of the Volga-Ural Tatars over the period from the late 18th to the 19th century. It should also be noted that references for this study have been analysed before [Iskhakov, 1980; 1993]. Therefore, this issue is not addressed here. The dynamics in the changes of the total Tatar population size of the Volga-Ural region over the period are presented in Table 1.

Table 1

The dynamics in the changes of the total Tatar population size of the Volga-Ural region in the 18–19th centuries

Urban and rural population (pers.)	Population			
	1795	1833	1857	1897
Total in region,	617297	1019514	1416051	2249539
including:	10851	23471	29733	110914
urban population,	1,8	2,3	2,0	4,9
%	606446	996043	1386318	2138625
rural population,	98,2	97,7	98,0	95,1
%				

As Table 1 shows, the size of the Tatar population over a century (1795 to 1897) increased from 617,300 thousand to 2,249,500 people, that is 3.6 times, which is closer to Russia-wide indicators [Vodarsky, 1973, p. 151]. From the end of the 18th century to the middle of the 19th century, the average Tatar population in-

crease rate in the region was 1.6%, which is also close to Russia-wide indicators [Kabuzan, 1971, p. 5, 52–57 etc.; Rashin, 1956]. In the latter half of 19th century, the value remained as high (1.5%). If the high rates of increase in the Volga-Ural Tatar population in the first half of the 19th century, being chiefly attribut-

able to a gradual acceleration of the local economic development, then the post-reform situation was also influenced by the assimilation taking place while the Volga-Ural Tatars were consolidating into the core of the Tatar nation. The Tatars were numerous enough to form a nation-type community already by the cusp of the 18–19th centuries. By the end of the 19th century, the larger portion of their population, living in the Volga-Ural region, became one of the largest ethno-national communities in the Russian Empire.

The socio-economic transformations of the 18–19th centuries, especially the latter half of the 19th century, led to the gradual increase of Tatar urbanisation (Table 1). By the end of the 19th century, about 160 thousand out of 240 thousand Tatar urban dwellers living in different cities across Russia (8.8% of the total Tatar population), or more than 60% of them were Volga-Ural Tatars. The majority of Tatar urban dwellers (about 111 thousand) resided in cities of the Volga-Ural Region (Kazan, Ufa, Orenburg, Samara, Simbirsk, Saratov, Nizhny Novgorod, Kostroma, Penza, Yekaterinburg, Perm, Chelyabinsk, Troitsk, etc.). Besides, citizens from the Middle Volga Region and the Cis-Ural Region migrated to a number of cities in the European Russia (Moscow, Saint Petersburg, etc), Transcaucasia (Baku), Central Asia, Western Siberia (their total number by the end of the 19th century had reached 50,000 people).

However, the level of urbanisation of the Volga-Ural Tatars, even at the end of the 19th century was extremely low (4.9%), the vast majority of them continued to be part of the rural population. Nonetheless, the increase in the share of the Tatar urban population in the 19th century, led to a gradual change in their social structure.

The Tatar urbanisation rate was slow in Western Siberia. Already by the end of the 19th century, over 2/3 of the Western Siberian Tatar urban population were migrants from the Volga-Ural Region. The percentage of urban dwellers was large among the Astrakhan Tatars already by the 18th century, which is attributable to the fact that a number of their localities lay in the suburbs of Astra-

khan. They were later included in the city. At the turn of the 19th to the beginning of the 20th century, the vast majority of Astrakhan Tatars consisted of Middle Volga Tatars. The Lithuanian-Polish Tatars were highly urbanised: in the 1830s, 19th from 8 to 33–42% resided in cities (depending on the governorate), but by the late 19th century, which was almost half of the Lithuanian Tatars. The dispersion of Tatar urban population was high (Minsk, Navahrudak, Igumen, Slomin, Vilno, Grodno, Kowno, Warsaw). The percentage of urban dwellers among the Crimean Tatars was already significant by the 18th century (about 20% as of 1783). In all likelihood the size of the urban Crimean Tatar population decreased after the annexation by Russia. Nonetheless, the Crimean Tatars in the 19th century were one of the most urbanised Tatar groups in Russia, right up to the end of the 19th century. In spite of migration to Turkey (including Tatar urban residents), the percentage of urban dwellers among the Crimean Tatars grew rather rapidly. The largest Crimean Tatar groups of the beginning of the 20th century resided in Bakhchysaray (10 thousand people), Simferopol (7.9 thousand), Yevpatoria (6.2 thousand), Karasubazar (6.2 thousand), Feodosia (2.6 thousand), and Kerch (2 thousand).

As is well known, after the dissolution of the Tatar Khanates in the Volga Region an intense migration among Tatars followed. For a number of reasons, (like increased socio-economic oppression, cruel religious persecution, etc.), it peaked in the first half of the 18th century, the main direction being from the Middle Volga Region to the Cis-Ural Region. As a result of the mass migrations of the Tatars from the Middle Volga Region eastward, the size of the Tatar population in the Cis-Ural Region had reached, by the end of the 18th century, 219.2 thousand (a third of the Tatars in the Volga and Cis-Ural Regions). Further on the Tatar migration rate in the Cis-Ural Region decreased, but nonetheless by the end of the 19th century, more than one million people lived in its north-west part. The result is partly reflective of the ethnic processes taking place between the Tatars and the Bashkirs. A large part of Tatar migrants from the Middle Volga Re-

gion and the Cis Ural Region moved through the Northern and North-Eastern Kazakhstan to the Western Siberia and Central Asia following the reforms (by the end of the 19th century, their total number consisted of 94.3 thousand

people of whom 40.3 thousand lived in Siberia). A more detailed picture of Tatar distribution in the Volga-Ural Region from the 18th century to the first quarter of the 20th century, is presented in Table 2.

* Incomplete data.

** Data not fully reliable.

Another direction of Tatar migration from the area of question was to industrial areas in the European Russia and Transcaucasia (by the end of the 19th century—28,000 people).

The Volga-Ural Tatars in the 18–beginning of the 20th century, became a significant part of the Tatar population of the Astrakhan Region and the Western Siberia. Their percentage in the Astrakhan Region in the late 18th century was 13.2%, in the 1830s 19th it was 17.4%, and at the beginning of the 20th century exceeded a third of the total Tatar population of the Lower Volga Region. A similar situation was observed in Western Siberia: by the end of the 19th century, Tatar migrants made up 17% of all Tatars in Western Siberia. Lithuanian Tatars by the middle of the 19th century, had settled in the Vilna, Minsk, Smolensk, Grodno, Kowno, Podolia, Volhynia, Augustów, and Lublin Governorates (the two latter ones belonged to the Kingdom of Poland. After 1783 and almost until the establishment of the Crimean Autonomous Soviet Socialist Republic, the Crimean Tatars were included in the Taurida guberniya (Simferopol, Yevpatoria, Feodosia, Perekop, Dnepr, and Melitopol Uyezds). The latter three uyezds were dominated by Nogais, who had by that time become a sub-ethnic group of the Crimean Tatars.

Practically, already by the end of the 18th century, the basic ethnic Volga-Ural Tatar territories had already formed and further on in the 19th century, their general configuration remained the same, any changes being confined to its inner 'compaction'. As data in Table 2 shows, in the 19th century, the largest Tatar groups were concentrated in the Kazan and Ufa guberniyas. While the former governorate showed a trend towards a gradual reduction, the latter witnessed an increase in the Tatar population. Nonetheless, the Kazan guberniya with the adjacent uyezds of the nearest governorates (Malmyzh, Yelabuga, Sarapul Uyezds, Vyatka Governorate; Buinsk Uyezd, Simbirsk guberniya; Bugulma Uyezd, Samara guberniya; Menzelinsk Uyezd, Ufa guberniya) represented the centre of the ethnic territory for the region's Tatars. If by the end of the 18th century, the local Tatar population being 335.7 thousand people (that is, 54.3% of the total Tatars

in the Volga-Ural Region), then by the middle of the 19th century, the figure was 734.5 thousand (52% of the total Tatar population of the region), and by the end of the 19th century, it was 1.24 million people (50.4%).

In the governorates occupying the westernmost regions (the ethnic territories of the Mishar and Kasimov Tatars), a tendency in the reduction of the percentage of Tatars living in this region was observed: if by the end of the 18th century, 132 thousand Tatars resided there (1/5 of the Tatars in the region), then by the middle of the 19th century, their percentage had dropped to 17.3% (245.5 thousand people), and by the end of the 19th century, it dropped to 14.3% (350.6 thousand people).

The vast majority of Tatar nations forming in the 18th century and in the 19th century, was largely concentrated in the Volga-Ural Region. At the same time due to ethnic processes taking place between the Tatars and Bashkirs, a gradual increase in the share of the Ural group of Tatars was noted, while the decline in the share of the Tatars, who lived in the western provinces of the region, continued. Beyond the borders of the Volga-Ural Region by the end of the 19th century, lived no more than 5% of the Volga-Ural Tatars. The two key migration directions were westward, to industrial areas in the European Russia and the Northern Caucasus, and eastwards, as well as south-eastward (to Kazakhstan, Central Asia, and Siberia). The largest percentage of post-reform migrants (94.3 thousand, or 77.3%) chose the latter direction. The movement can be viewed as a continuation of the Tatar migration to the Cis-Ural Region. The westward migration mostly targeted cities in industrial areas. As for the flow east- and south-eastward, the majority of the Tatars moved through northern and north-eastern Kazakhstan and further to Siberia. Most of the Tatar migrants to Central Asia and Kazakhstan settled in Kazakhstan in the post-reform period. Apart from migration to the Ural Region, the flow was not connected with agricultural colonisation as the majority of the migrants took up residence in cities. Only the Tatar migration to western and Eastern Siberia was connected with agricultural colonisation.

§ 2. Tatar Social Structure in the Volga-Ural Region at the End of the 19th Century

Damir Iskhakov

German scholar K. Noack mentioned the socio-historical background of the development of the Tatar nation to be under-studied over ten years ago [Noack, 1998, pp. 147–158], for which he referred to an analysis of 1897 census data. Since then, his work is the only relevant study dedicated to this topic. Yet, in spite of obvious advantages, it has a number of limitations: firstly, the author failed to account for the results of the ethnic processes that took place between the Tatars and the Bashkirs in the Cis-Ural Region in the 19th century, confining himself to an insipid mention of 'Tatar' and 'Bashkir' scholarly opinions on the issue [Noack, 1998, p. 157]. Secondly, he referred to the vague meaning of the word 'Tatars', which he attributed to the fact that ethnic differentiation had not been completed in the Turkic population by the end of the 19th century in several areas of Russia, he excluded data from Western Siberia from consideration.

However, such an approach can cause rather significant corruption of the findings, primarily those for the Cis-Ural Region. And this is not only our conclusion. The well-known scholar R. Kuzeev from Bashkortostan also mentioned the 1897 Cis-Ural census to have recorded about 300–350 thousand Teptyars and Mishars as Bashkirs, that is significantly more than those recorded as Tatars [Kuzeev, 1978, p. 241]. Furthermore, it is utterly illogical to include data for the Turkic-Tatar population from the Lower Volga Region, where ethnic processes took place among the Yurt, Nogai, and Volga Tatars, while excluding Tatars in Western Siberia, whose ethnic contacts were no less intensive than those in the Volga-Ural Region.

Taking this into account, we could have attempted to adjust K. Noack's data for four Cis-Ural governorates, namely those of Vyatka, Perm, Samara, and Ufa. However, the results do not yield any radical revision of K. Noack's findings but merely confirm them. Besides, in a number of cases re-calculation can cause the

corruption of the data for certain social and occupational categories because the number of their representatives is too small for some groups. As a result, we left the scholar's calculations unchanged, which eventually means that we were using data for the Cis-Ural region that are not completely accurate. We added our own calculations to those of K. Noack, which we obtained as a result of reprocessing the 1897 census data for the Tobolsk and Tomsk guberniyas, i.e. according to the ethnic territory of the Siberian Tatars. On the whole, our analysis largely relies on K. Noack's publications, but with some additions.

To start with, we should analyse the distribution of Tatars among the key class groups of the Russian Empire in the 19th century (see Table 3). As the data suggests, by the late 19th century, the vast majority of the Tatar population belonged to the peasant class ('Cossacks' and 'indigenous dwellers' included). Except for the Steppe Area (Kazakhstan), 9/10 of the Tatars led a peasant life or were recorded to belong to this largest class of Russia. At the end of the 19th century, this indicator was approaching the rural percentage of the Tatar population. The percentage of merchants and burghers differed significantly depending on the Tatar residence area—from 1–2% in Central Russia, the Middle Volga Region, and Urals to 5–8% in the Central Black Earth Region, Lower Volga Region as well as the Southern Ural. The major reason behind the higher value in the Lower Volga Region was the inclusion in Astrakhan of a number of Astrakhan Tatar localities situated close to the city. Probably the slight increase in merchant and burgher percentage in the Southern Ural, as compared to the Middle Volga Region, is representative of part of the local rural Tatars being registered as 'Bashkirs' and not the actual situation. The value for the group in question was the highest in the Steppe Area (Kazakhstan) at 35.23%, which is attributable to the non-farming nature of the Tatar

south-eastern migration from the Volga-Ural Region. The low merchant and burgher percentage in the Tatar population of Western Siberia (0.87%) is attributable to the delayed

urbanisation of Siberian Tatars, who at the end of the 19th century, made up over 88% of the region's Tatar population.

Table 3

Population at large	0.51	0.13	0.11	5.52	87.23	6.5

* The data for Western Siberia (the Tobolsk and Tomsk guberniyas) has been added to those provided by K. Noack.

** Part of the Tatars were recorded as 'indigenous dwellers'.

*** The 1897 reported the following figures for Western Siberia: 133,024 indigenous Tatars, that is, Siberian Tatars proper; 17,385 Volga-Ural peasant Tatars, and 20 Cossacks. We united them into one single group of peasants.

In general, the data primarily suggests that even at the end of the 19th century, the Tatars remained a predominantly peasant nation. In fact, this also applies to other peoples in the Russian Empire, including the Russians themselves. Nonetheless, the social and occupational structure of the Tatar population (see Table 4) showed a clear trend towards development and becoming more complex because a large group of urban dwellers formed against the backdrop of capitalist development in Russia. Besides, the structure differed depending on the region of Russia.

Let us dwell on the differentiation of Tatars among social and occupational groups, taking into account the territorially determined distribution among the branches of the economy.

It should be noted that the Tatars were poorly represented in a number of privileged fields, such as administration, science, medicine, arts, and public education, where as few as 0.5% employees were Tatars. Rentiers and military personnel made up 1–2%. The percentage of Islamic clergy and religious school teachers (often these were one and the same people). The group 'servants and day-labourers' accounted for about 3–5% or more in certain cases. Commerce and financial activities (banking, crediting) were widespread among Tatars (see Table 4). The number of Tatars engaged in processing field (industry, handicrafts, and domestic production) was large but differed materially depending on the territory: according to the general pattern, the

Table 4

Distribution of Tatar Labour Population by Sector (%)

Governorate/region	Agriculture	Process industry	Trade	Services sector	Servants and day-labourers	Others
Saint.-Petersburg	1.32	7.86	26.52	16.10	21.77	26.43
Moscow	1.11	10.86	37.34	5.99	30.44	14.26

Ural/ Turgay	35.76	11.49	20.86	5.09	20.97	5.83
Akmola	12.62	19.41	28.97	2.63	15.34	21.03
Semipalatinsk	22.66	16.86	27.95	5.47	11.05	16.01
Semirechye	26.43	16.32	26.72	4.97	8.49	17.07
Tobolsk	72.78	4.87	2.89	1.66	10.33	6.47
Tomsk	82.59	6.06	1.49	0.80	5.82	3.24

percentage increased eastwards, though it was not without exceptions. For instance, over one tenth of the Tatar population of the Moscow Governorate, that is, mainly the inhabitants of Moscow, were engaged in the sphere. In the cities Tatars demonstrated a high engagement in services (including inns, hotels, overnight homestays, communications, transport, etc.). If in Moscow Tatars were predominantly engaged in commerce, then in Saint Petersburg the key occupations were service and military personnel (up to 20%). The social and occupational structure of the Tatar population of the Steppe Area (Kazakhstan) was rather peculiar: those engaged in agriculture formed a minority (1/10 to under 1/3). Tatar urban dwellers were largely employees in commerce (26–28%) and processing (16–19%), day-labourers and servants (8–15%). It should be noted that such an employment structure for Tatars in this zone differed significantly from similar structures

of the Tatar population in the European Russia. While there it was also sometimes very peculiar. In particular, only 46% of the small group of Kasimov Tatars were engaged in agriculture, while the ratio for other spheres differed from that in the rest of governorates: 9.32% in commerce, 3.56% in services, 8% in the military, and 7% employed in the processing field and as day-labourers/servants. Special studies note their high engagement in non-farming activities [Ahmetzyanov, Sharifullina, 2010, pp. 241–259].

However, agriculture (farming, animal husbandry, beekeeping, forestry, hunting, fishing, woodworking) was the dominant sphere among Tatars. Engagement in services remained relatively low but territorially determined. In particular, a higher number of employees in the sphere was reported for Saint Petersburg, Astrakhan, cities of the Steppe Area, etc.). The third most important group

Tatar family.
Photo, late 19th–early 20th centuries

in the Tatar social and occupational structure was that of day-labourers/servants, who were rather a deprived class.

The Tatar social and occupational structure was quite homogeneous in the areas of the fundamental ethnic territory. Besides, Tatar com-

munities in Western Siberia were highly similar to those in the Volga-Ural Region. However, the former had lower percentages engaged in commerce and services. However, Mishar Tatars in a number of western governorates showed similar figures for the latter fields. K. Noack noted that the Tatar merchant percentage to have exceeded that of Russian merchants only in the Central Black Earth Region and Steppe Area, while in the Lower Volga Region the two ethnic groups showed similar values for the parameter. The Russian merchant percentage was higher than that of Tatar merchants in the rest of governorates. A similar situation with burghers was noted.

Noteworthy, remnants of the old aristocracy, the descendants of noble princes and murzas, survived in Tatar communities. This made the Tatars very different from other indigenous peoples in the Volga-Ural Region. The other part of the former elite, which was much larger, lost its property and titles and merged with the peasants, merchants, and entrepreneurs.

In conclusions, we note that by the end of the 19th century, the Tatars enjoyed social prerequisites that ensured a successful adjustment to the new economic and political conditions in the Russian Empire from the second half of the 19–the beginning of the 20th century.

§ 3. Urban population

3.1. Specific Development Patterns of Urban Tatar Communities

Ildus Zagidullin

The emergence in the second latter half of the district— district century, in the Volga-Ural region and Western Siberia of Russian urban settlements was largely due to military and political factors, as well as the administrative functions of these settlements. They were founded as fortresses, military facilities, to which locals had limited access. Founded in the district II century, Russian settlements in south-eastern Russian were also initially meant to host irregular and regular troops.

An important role in the sharp increase in the number of Russian cities was played by

the administrative reform of Catherine of Russia which divided the county into 50 governorates (in which each had 200 to 300 thousand male dwellers), and consisted of 10–12 uyezds, each having 20 to 30 thousand male dwellers.¹ [Shkvarikov, 1939, p. 64]. It should be noted

¹ In the period of provincial reforms from 1775–1785, the status of "city" was bestowed upon such fortresses, villages, slobodas and ostrogs of the Volga-Urals and Siberia as Belebey, Biysk, Bugulma, Buguruslan, Buzuluk, Semipalatinsk, Troitsk, Yalutovsk, Buinsk, Verkhneuralsk, Volsk, Glazov, Yelabuga, Irbit, Ishim, Spassk, Malmyzh, Mamadysh, Nizhneudinsk,

that the number of newly formed cities of the period from the 19th to the early 20th century was significantly inferior than the 18th century.

According to the famous geographer V. Semyonov-Tyan-Shansky, the main feature of the majority of governorates and regional centres to up to the middle of the 19th century, were the appearance of local authorities in settlements. They also had weekly markets, regular local fairs, and occasional elements of plant and factory industry [Semyonov-Tyan-Shansky, 1910, pp. 39, 43, 45]. As industrialisation gained momentum in Russia, industrial and commercial cities began to develop. They were characterised by a mixed economy up to the fall of the autocracy.

In the post-reform period city classification was characterised by instability. In the late 19th century, statistics showed a trend towards narrowing the circle of urban localities: the published records of the First General Census of 1897 excluded towns and posads, while all the non-urban administrative (uyezd) centres were recorded as cities [Tikhonov, 1978, p. 50]. This yielded 932 cities with 16.8 million inhabitants, which made up 13.4% of the total Russian population. Large industrial localities, as well as settlements and towns having elements of plant and factory production and well-developed trade were not recognised as cities, while a large number of localities 'with a significantly small number of dwellers engaged in agriculture' were included in the category [Ivanov, 1971, pp. 312–340]. In spite of the industrialisation tendencies, the majority of Russian uyezd centres continued to serve as home stations for police and administrative authorities and had more in common with a village than with a city.

According to V. Semyonov-Tyan-Shansky, 'only two reliable signs' of urban population existed in the country: the percentage of the population not engaged in agriculture and trade turnover per capita of urban population. The number of 'economic cities' at the turn of the century was 1,237, that is, 1.6 times as many as formal cities (761). At the same time, 227 cit-

ies, or 30% of them, did not meet 'the economic criteria for a city' [Semyonov-Tyan-Shansky, 1910, pp. 56, 76]. Some Russian scholars tend to include in the city category, localities that were commercial and industrial centres of the nearest territory and were formally recognized as cities. [Vodarsky, 1979, p. 141]. Since more accurate statistics on the ethno-confessional composition of Russian urban populations, their occupational structures and literacy is not available, we will be following the domestic historiographic tradition of referring to the First General Census of 1897.

If it was wealthy peasants who wanted to raise their social status and extend their activities who moved to cities before the reforms, then in the post-reform period it was largely poor villagers who had lost any hope of improving their economic standing. We agree with L. Goncharenko that 'such a large number of city dwellers having a tight connection to the country through their class and economic status, routine and labour traditions dating back to the patriarchal peasant community, is essential to the social structure of the post-reform city' [Goncharenko, 1994, p. 154]. Urbanisation brought about increased migration, social stratification, new population groups 'undergoing adaptation to the new local conditions,' intensification and the breakdown of old, traditional activities, the weakening of the 'traditional territorial neighbourly connections and social contact forms' [Gorod, 1982, p. 92].

In 1897, Russian cities were predominantly Russian-speaking, the percentage being 60.9% (compared to 67.7% in the country). In terms of religion, the majority were Orthodox Christian—60.5% in cities and 70.7% in uyezds. The Muslim (6.5% in cities as compared to 11.8% in the country) and Old Believers (1.3% as compared to 1.8% in settlements) percentages were small. The urban Jewish percentage was 17.4% (as compared to 2.4% in settlements); Catholics made up 9.4% (as compared to 9.1%); Lutherans, 4.5% (2.6%); Gregorian Armenians, 1.6% (0.8%) [Rossiya, 2002, p. 122].

The development of Tatar urban communities was influenced by a number of factors. The emergence of Tatar expatriate communities in fortress cities in the country's south-east was, to

Omsk, Osa, Perm, Sarapul, Sergach, Sengiley, Sterlitamak, Tetyushi, Khvalynsk, Chistopol and others.

Tatar Menial Workers. Ufa.
Photo from the early 20th century.

some extent, determined by the 'governmental protection', which consisted of in engaging Tatars as mediators for establishing commercial and economic contacts with the Central Asian Khanates and Kazakh zhuzes. Thanks to the establishment of fortress trading centres, Tatar communities in the last third of the 18th century, appeared in Petropavlovsk, Troitsk, and Semipalatinsk. In Western Siberia, the Bukhara and Tatar people, mostly entrepreneurs, resided in Tatar slobodas in Tobolsk, Tara, and Tyumen.

The 1795 inspection reports present the following number of people from the census list residing in Tatar communities in 15 cities of the Volga-Ural Region: Kazan—2,760, Chistopol—793, Kasimov (Ryazan guberniya.)—444, Nizhny Novgorod—118, Buinsk (Simbirsk guberniya.)—36, Khvalynsk (Saratov guberniya.)—59, Kuznetsk (Saratov guberniya.)—17, Seitov Posad—6,481, Troitsk—40, Verkhneuralsk—16, Chelyabinsk—14, Orenburg—10, Ufa—30, Belebey—4, Bugulma—26 (Governorate-General of Orenburg) [Iskhakov, 1993, pp. 73–75].

Tatar military service also contributed to the establishment of Muslim communities. Many cities had Muslim cemeteries even be-

fore a Muslim mahallah was established and registered. Long recruit service and permanent basing brought about marital relationships and the birth of children. It was not uncommon for retired soldiers integrated in the Russian cultural environment to take residence at their home stations (Saint Petersburg, etc.).

While doing this, the Tatars wanted to secure the traditional way of living and religious practice, and the only way of doing so was through a mahallah. Where a new Islamic parish with a mosque was registered, it was an unmistakable sign of a fledging ethno-confessional community. In the first half of the 19th century, the Orenburg guberniya still witnessed intense development of urban Muslim communities. In particular, Muslims built mosques in Sterlitamak (1800), Ufa (1830) [Azamatov, 2000, pp. 59, 70], Sol-Iletsk (1833) [Kraj, 2007, p. 63], Troitsk (1828, 1838) [Denisov, 2009, pp. 123–127], Uralsk (2 mosques by 1861) [Karimov, 2009, p. 158], Samara [Gibadullina, 2008, p. 170], and Khvalynsk (Saratov guberniya). The communities of Seitov Posad (the 4th mosque built in 1802, the 5th and 6th ones in 1816) [Kraj, 2007, p. 60], Semipalatinsk (7 mosques by 1864) [Zagidullin, 2007a, [pp. 36–37], and Petropavlovsk (4 mosques by the late 1850s) developed intensely [Russian State Historical Archive, f. 1265, inv. 4, year 1855, file 40, s. 1–4]. In Western Siberia, mahallahs were registered in Tomsk and Omsk. Importantly, ethno-confessional processes in the cities involved not only Tatars but Bukhara and Central Asian entrepreneurs.

In the Middle Volga Region, pre-reform Tatar mahallahs were established in Simbirsk and such uyezd centres as Volsk, Yelabuga, Chistopol, and Tetyushi.

In the latter half of 19th century, the registration of city mahallahs, primarily in areas of compact Tatar settlements occurred².

² Makhalli emerged in provincial cities (Perm, Penza, Saratov, Irkutsk) and district administrative centres, including Mamadysh (Kazan guberniya), Bugulma, Buguruslan, Buzuluk, Novouzensk (Samara guberniya), Sarapul (Vyatka Guberniya), Kuznetsk, Tsaritsyn (Saratov guberniya), Tsarev, Krasny Yar (Astrakhan guberniya), Chelyabinsk (Orenburg guberniya) and Ekaterinburg (Perm guberniya).

Characteristically, as Muslim city communities in the Orenburg and Astrakhan guberniyas as well as the Western Siberian Governorate-General developed, the percentage of Kazakhs in their population increased. However, Tatars continued to dominate the communities' economy and culture.

The establishment of a railroad network and the development of new industrial areas in the late 19–early 20th century determined the key areas of non-farming seasonal work, migration flows, and the development of urban communities. In the western governorates, it was Muslim military service that favoured the establishment of city communities, which role was played by the governmental migrant policy and railroad construction in Siberia and Kazakhstan.

At the beginning of the 20th century, city parishes were registered in the western governorates (Warsaw, Kiev, Łódź, Minsk, Kharkov, etc.) and Odessa, in central and north-western governorate centres (Tver, Vyatka, Arkhangelsk, etc.), and industrial cities (Ivanovo-Voznesensk, Yaroslavl, etc.) [Zagidullin, 2006b, p. 71–100]. In the Volga-Ural Region, Muslim parishes appeared in a number of large cities (Vyatka, Nizhny Novgorod) and uyezd centres.³ In the Perm guberniya, Tatars tended to take residence in workers' settlements.

The fact that a number of cities in the Volga-Ural Region had two mahallahs in the early 20th century⁴ indicates intensified urbanisation. In spite of the further increase in the number of Muslims, the construction of new mosques was suspended in large Tatar communities in 1905. A Europeanisation trend was clear in the national culture. In that period, the Tatars began to pay more attention to social issues, establishing cultural, educational, and charity institutions, publishing newspapers and magazines.

The establishment of new Muslim communities in Siberian cities was representative of

the economic development of new territories in the east of Russia⁵.

Thus, the modernisation and industrialisation of the empire determined the extension of the Tatar habitat and the establishment of new urban Tatar communities. A multi-cultural environment caused the Tatars to gradually integrate with the Russian socio-cultural space, bringing about intensified Europeanisation. Jadidist ideas were primarily promoted in urban communities.

Rural migrants had to face an alien urban culture, that created social and psychological discomfort. The only way of preserving the familiar cultural habitat under the circumstances was to form compact 'Tatar colonies'. Since such a possibility existed within the pale of settlement, it was there that 'Tatar streets' emerged. Muslims aimed to organise communications among one another along rural territorial, 'neighbourly' lines. By forming compact settlements and preserving the kind of habitat they were used to, Tatars aimed to create a 'safe environment' for their authentic cultural traditions.

The transformation of 'Tatar streets' into a 'Tatar neighbourhood', a Muslim enclave, was primarily delayed because there were too few Muslim migrants and because they could not afford real estate. Such a territory would contain Tatar mosques, educational establishments, shops, and industrial plants. They led an autonomous life and succeeded at addressing the burning issues of maintaining religious traditions, succession in training and education, and adherence to their religious custom.

In large cities, class differences during resettlement were determined by one's financial standing. The poor lived in the suburbs, while the wealthiest representatives of all strata resided in the city centre. Many cities had Tatar slobodas (neighbourhoods) in unprivileged

³ Spassk (Kazan guberniya), Malmyzh, Stavropol, Menzelinsk, Zlatoust, Osa, Irbit, Krasnoufmsk, Alapayevsk, Verkhoturys and others.

⁴ Two makhallies functioned in such district cities as Chistopol, Buinsk, Nikolaev, Buguruslan, Buzuluk, Volsk, Tsaritsyn, Belebey, as well as in the provincial centre of Samara.

⁵ Tatars also made their homes in Novo-Nikolaevsk (Novosibirsk), Mariinsk, Barnaul, Kurgan (Tobolsk guberniya), and near the railway stations of the Siberian Railway in Chita, Verkhneudinsk (Trans-Baikal Oblast), Krasnoyarsk, Yeniseisk, Kansk (Yeniseisk Guberniya), Olekminsk, Yakutsk (Yakutsk region), Blagoveshchensk, Khabarovsk, Nikolaevsk and Zeya-Pristan (Amur Oblast).

Tatar Street and the First Cathedral Mosque in Chistopol. Photo from the early 20th century.

districts. The location of a mosque was usually confined to the sloboda or a compact Muslim neighbourhood.

'Resettlement based on ethnic affiliation brought about no zoning in terms of building quality... The ethno-confessional plan zoning was inferior to the social zoning system' [Zorin, 2001, pp. 320]. The fact that social zoning was poor in Muslim localities is largely attributable to the Muslim population being relatively small or containing no privileged urban groups like wealthy factory owners or merchants.

If a wealthy Tatar joined a small community, he usually became its leader and trustee. For instance, only two Tatars in Yekaterinburg in the 1880s owned real estate, the brothers Kamaletdin and Zaynetdin Agafurov [Gorod Ekaterinburg, 1889, pp. 60–61, 79]. It was in their house that a Muslim prayer room was opened (1884) [Russian State Historical Archive, f. 821, inv. 8, file 675, s. 118–119 reverse]. 'Their real estate was refuge to the imam's and muezzin's families' [Vesnovsky, 1903, p. 227].

In the early 20th century, cultural processes intensified in Muslim communities that completed their integration in the all-Tatar 'high culture'. A major role was played by reinforced cultural connections to co-religionists from other regions of compact Tatar settlement,

primarily Kazan, to which they viewed themselves as peripheral.

What made the expansion of the city network in the south-east of Russia peculiar is its lying remote from industrial centres, communication with which was poor until the railroad branch was built, along with low population density, of which Russians made only a small percentage and which was largely dominated by Turkic nomadic Kazakhs, who professed the so-called 'Steppe Islam.' Of special importance were the reinforced commercial and economic connections to Central Asia, which was the Tatar ideal of Islamic learnedness and righteousness. This is why marginal urbanisation did not cause any major transformation among Muslims like they did in the cities of the central Russian governorates. Tatar urbanisation was characterised by a large number of new urban communities emerging out of historically Tatar regions, on the Russian periphery, in the latter half of the 18th century. Migrants from the Middle Volga and Cis-Ural Regions became major contributors to trade activities under the new geopolitical and economic circumstances.

To sum up, the development of Tatar urban communities was more intense in Kazakhstan, the Cis-Ural Region, and the Volga Region in the pre-reform period. The post-reform period saw the formation of new communities, mainly

in regions of compact Tatar settlement. In the early 20th century, migration flows targeted Russian industrial areas and Siberia. At the same time, existing urban communities expanded.

A new phenomenon in the social and cultural life of a number of ethnic and religious communities at the end of the 19th century, were dedicated public institutions were founded to address social issues of poor co-religionist groups. Muslim charity associations were active in Saint Petersburg-the first: (1867–not later than 1882) and the second (1898–1917), Semipalatinsk (1898), Ufa (1898), Astrakhan (1896), Kazan (1897), Troitsk (1901), and Kasimov (1897). In the early 20th century, especially after 1905, a large number of cultural and educational organisations appeared to meet Muslims' socio-cultural needs and address their issues.

The establishment of new social organisations indicated that a new approach to social issues, namely based on private initiative, had been adopted.

The spread of the Western European charity model, necessitated radical changes to the scheme of using zakat, which wealthy Tatars allocated for their poor co-religionists. Namely, it was transferred to charity associations to provide targeted aid to those who needed it most of all and meet social needs, such as maintenance of schools, elderly homes, orphanages, and other social institutions. Many public organizations failed to cope with the challenges. The most pressing issues that charity associations had to face were poor funding, low social activity of the board and the community in general, failure to efficiently use the funds raised, a bad lack of active and reliable board members, Jadid-Kadim controversies, etc. [Ibrahimov, 1900, pp. 5–29; No. 17, 1903, pp. 13–16; 1908, pp. 7–11, 11–12].

The multi-cultural environment of Russian cities facilitated the transformation and secularisation of traditional religious communities, which had been previously represented by rural parishes only. The urban conditions enabled Muslims to compare their situations and study the cultural survival experience of other ethno-confessional communities under similar conditions.

The concentration of the Tatar bourgeoisie, which identified itself as the national elite responsible for the nation's future, in cities, and the need for social changes in Tatar communities favoured secularisation and Europeanisation. These processes, which began precisely in urban communities, depended on many factors, the main ones were: whether the community had wealthy Muslims prepared to make donations to meet their co-religionists' needs, modernist merchants and religious leaders, etc. The clergy and other Islamic institutions clearly failed to meet all the needs of their communities. The lack of ethnic urban class institutions, which was determined by the small size of Tatar populations, raised the question of establishing organisations to address social issues. City charity, cultural and educational organisations were established as institutions of a developing civil society. A unique model of social institutions was formed. In fact, such institutions tended to deal with both religious, and social, and cultural issues of the local communities, thus consolidating around it the most active parish members. It was in urban Muslim communities in the western and central governorates and steppe areas that Tatars first contacted representatives of Turkic peoples and other ethnic groups of the population and established friendly relations with Shia communities.

Being concentrated in urban communities in the early 20th century, the intellectual force at the first opportunity began to publish newspapers and magazines, through which they influenced social processes in the Muslim community of the Volga-Ural Region.

Merchant and city community leaders invited the most learned and authoritative spiritual clergymen to their parishes at their cost. In turn, such clergymen founded educational establishments attracting not only local children but those from across the entire region. It was common for Kazan merchants to rely on rural parish mullahs to reinforce the urban clergy [Ibrahimov, 1900, pp. 5–29]. On the one hand, such 'intellectual inflow' (ensured through financial encouragement of imams) secured traditional cultural values and protected them against the assimilating influence of the foreign cultural environment. On the other hand, it escalated

the conflict between the modernist bourgeoisie and the younger generation of Tatar intellectuals, Jadids and rural Kadim mullahs, 'written off' by wealthy Tatars from the rural hinterland.

The high social activity of the Tatar bourgeoisie, who funded reforms, printing estab-

lishments supplying the entire Russian Ummah with sought-after printed matter, and Tatar intellectuals' contacts with Russian scholars and social activists turned the Kazan Tatar community into an informal cultural centre of the Volga-Ural and Siberian Muslims.

3.2. Social and Class Composition and Social Division Labour in City Tatar Communities in the Volga and Ural Region in the Late 19th Century

Nayla Khamitbaeva

Governorate Centres. In the the, 19th century, the urban population mostly grew due to migrants. Cities connected with water arteries and those in which the main railroad lines passed developed especially rapidly, which caused not only quantitative but qualitative changes, in particular in terms of ethnic composition. The majority of Russian cities had become multi-ethnic by the end of the century.

By the mid-19th century, medium-sized cities had a population of 5 to 25 thousand people, while small cities had under 5 thousand inhab-

itants [Mironov, 1990, p. 22]. In the early 20th century, localities having a population of 5 to 20 thousand people were termed small cities; those having 20 to 100 thousand inhabitants, medium-sized cities; and those—with over 100 thousand inhabitants, large cities [Rossiya, 2002, p. 115].

The 1897 census records on the existing population are representative of the general social division of labour, employment, dispersal, and class composition of the urban Tatar population.

Table 5

Tatar Percentage in Governorate Centres in the Volga and Ural Regions in 1897

[Pervaya vseobshhaya, Vol. 2, 10, 14, 28, 30, 31, 35, 36, 38, 39, 45 (Table 13)]

Cities	The entire population including both sexes	The Tatar population including both sexes	The share of the Tatar population, %
Astrakhan	112880	15355	13.6
Vyatka	25008	141	0.6
Kazan	129959	28520	21.9
Orenburg	72425	11306	15.6
Penza	59981	387	0.6
Perm	45205	1263	2.8
Samara	89999	2301	2.6
Saratov	137147	1711	1.2
Simbirsk	41684	2191	5.3
Ufa	49275	2524	5.1
Total:	763563	65,699	8.6

The total population of the region's governorate centres was 763,563 people, of whom 65,699 were Tatars. The percentage of the Tatar population was 8.6%. That is, Tatars had become an 'important constituent' of the popu-

lations of a number of cities in the Volga Ural Region by the late 19th century. Large Tatar communities (over 10,000 people) existed in Kazan, Astrakhan, and Orenburg. Vyatka and Penza had the smallest Tatar percentage

of 0.6% each. The remaining governorate centres had a Tatar percentage from 1.2% to 5.3%. Confessionally, an absolute majority of the Tatar population in the above cities were Muslims.

The Governorate centres had a predominantly male population (51.3%). The percentage of male Tatars was 57.6%, and that of female Tatars 43.4%.

Tatars made up 9.6% of the male city population and 7.5% of the female city population. The prevalence of men can be viewed as indicating the key directions of non-farming seasonal activities and migration flows.

At the end of the century, urban class status was rather 'vague', primarily in terms of property. Nonetheless, an analysis of traditional class parameters yields curious findings.

Dividing the population into urban classes yields a relatively accurate estimate of its 'indigenous' percentage. As is evident from Table 6, the percentage of Tatars was low in privileged urban classes in governorate centres. That of noblemen by birth was only 0.7%. They were the most numerous in Orenburg (138 people) and Ufa (206 people), other cities having 1 (Vyatka) to 89 Kazan. None were recorded for Perm and Samara. Kazan (68 people) and Orenburg (37 people) had the most personal noblemen, while the rest had 1 (Samara, Saratov) to 25 (Ufa). The census reported no Tatar personal noblemen in Vyatka and Penza.

The Muslim clergy was a small but very influential urban population group⁶. According to statistics, the largest amount of clergymen lived in Ufa (16 people), the number ranging from 1 (Perm) to 9 (Kazan) in other cities⁷.

The number of Tatar honorary citizens was also insignificant: 154 people in Kazan and from 2 (Penza) to 37 (Astrakhan) in other cities. No representatives of the given class group were reported for Vyatka, Perm, and Simbirsk.

Merchants made up 0.9% of the total urban Tatar population. They were the most numerous in Kazan (346 people) and Orenburg (130 people), the number ranging from 4 (Simbirsk) to 28 (Astrakhan) in other cities. The census reported no Tatar merchants in Vyatka and Penza.

The majority of Tatars (23%) were burghers. Those were low-ranking public officials, small entrepreneurs, craftsmen, employees, etc. The countryside was the main source of additional burghers.

Peasants (73%) made up a significant group of the region's urban Tatar population. The cities mainly attracted peasants who engaged in seasonal work as labour force markets. Some of them settled in large villages as well as at plants and factories outside of the cities [Goncharenko, 1994, pp. 150–151]. At this time a group of rural population that resided in cities for a long time and ran businesses while preserving the peasant status formed.

The data in Table 7 indicates the non-productive population accounted for only 12.9% of the total number of Tatars. The percentage was 4.9% in Astrakhan, 17.0% in Vyatka, 15.6% in Kazan, 8.6% in Orenburg, 30.0% in Penza, 14.6% in Perm, 14.0% in Samara, 15.5% in Saratov, 45.0% in Simbirsk, and 14.2% in Ufa. Thus, the non-productive percentage was the highest in Penza and Simbirsk. This group included officials, military personnel, clergymen, and people engaged in medical, cultural, and educational activities. 'Rentiers and pensioners', who received income from their real estate or other property, were the largest representatives in the group. Tatar rentiers were most numerous in Vyatka (8.5%), Simbirsk (8.4%), Kazan (7.7%), Samara (6.5%), Perm and Ufa (5.7% each). The percentage ranged from 1.9% (Astrakhan) to 5% (Penza).

Community representation in governmental institutions, such as administration, judiciary bodies, and the police is an important social indicator. Noblemen, as a rule, tended to occupy all important administrative positions and enjoyed promotion opportunities, which were, however, were practically closed to Tatars. For instance, the number of Tatar administrative, judiciary, and police officials

⁶ The Muslim clergy, unlike its Orthodox counterpart, was not a separate class in the district of the Orenburg Muslim Spiritual Assembly.

⁷ Furthermore, Tatar clergy were not recorded in Vyatka, Orenburg, Penza, Samara and Saratov, which does not correspond to the facts.

Table 6

Distribution of Tatars in ten large cities of the Volga Region and the Urals Region in 1897, divided by social classes [Pervaya vseobshchaya, Vol. 2, 10, 14, 28, 30, 31, 35, 36, 38, 39, 45 (Table 24)]

Social classes	The Tatar population including both sexes	% of the total
Hereditary nobility	473	0.7
Lifetime nobility, bureaucrats from non-noble class	151	0.2
Clergy, persons of liberal professions	37	0.05
Hereditary and lifetime honorary citizens	250	0.4
Merchants	548	0.9
Bourgeois	15,083	23.0
Peasants	47,977	73.0
Army cossacks	158	0.2
Foreign-born	206	0.3
Finland natives	—	—
Persons not belonging to these classes	484	0.7
Persons who did not indicate their class	32	0.05
Foreign subjects	300	0.5
Total:	65,699	100

Table 7

Employment of the Tatar population in ten large cities of the Volga Region and the Urals Region in 1897 [Pervaya vseobshchaya, Vol. 2, 10, 14, 28, 30, 31, 35, 36, 38, 39, 45 (Table 22)]

Population groups	The Tatar population including both sexes	% of the total
a) Officials and army	1,848	2.8
b) Clergy and professionals	1,512	2.3
c) Rentiers and pensioners	3,531	5.4
d) Prison and unclassified population	1,554	2.4
Total unproductive population	8,445	12.9
e) Trade	18,627	28.3
f) Communications	786,5	11.9
g) Private employees, servants, day-labourers	13,475	20.5
Total semi-productive population	39,967	60.8
h) Agriculture	355,3	5.4
i) Industry	13,734	20.9
Total productive population	17,287	26.3
Total:	65,699	100

in Kazan in 1897 was 172, including one woman, the total Kazan official staff consisted of 1,683 people. That is, the Tatar percentage in administrative bodies was 10.2% [Sverdlova, 2008, p. 77]. This group of Tatars was the largest in Penza (17.3%), while in the rest of cities the percentage ranged from 0.7% (Astrakhan) to 9.1% (Saratov). In general, it was

a small group accounting for 2.8% of the total Tatar population of large cities in the Volga-Ural Region.

Tatar clergymen and representatives of the ethnic intelligentsia were the smallest group of the non-productive urban population (2.3%). Their percentage was 24.5% in Simbirsk, ranging from 1.1% (Astrakhan, Oren-

burg, and Samara) to 2.0% (Kazan) and 2.3% in other cities.

The semi-productive population made up the largest group with 60.8%. Significant groups resided in Astrakhan (75.9%), Samara (72.1%), Saratov (71.9%), and Ufa (71.0%). They were not insignificant in other cities, their percentage ranging from 44.8% (Simbirsk) to 68.0% (Perm). The semi-productive group included merchants (28.3%). A large number of merchants were recorded in Vyatka (47.5%) and Perm (40.7%). Their percentage was relatively high in Ufa (24.3%), Samara (24.5%), Kazan (25.4%), Simbirsk (27.2%), Astrakhan (30.1%), Saratov (31.8%), Orenburg (33.0%), and Penza (35.1%). Tatar merchants preferred grocery, clothing and footwear, and fabric trade. The vast majority of their trade enterprises were classified as small and medium-sized.

It was almost impossible for workers coming from the country, who had poor, if any, knowledge of Russian, to find a skilled job. Immigrants tended to get jobs that required no special knowledge and training. This is why a large portion of Tatars were presented as 'private employees, servants, day-labourers'. They prevailed in Samara (38.5%), Saratov (36.5%), and Ufa (36.3%), the percentage ranging from 0.9% (Simbirsk) to 25.2% (Perm) in the rest of the governorate centres.

Tatars engaged in communications made up 11.9%. Tatars made the largest percentage of carriage drivers as well as river and railway employees in Astrakhan (24.9%), which percentage generally ranged from 2.1% (Perm) to 16.7% (Simbirsk).

An interesting picture of the Tatars in the employment of the provincial cities of the region is represented in the group of productive population, which was 26.3%. Tatars were mostly engaged in industry (20.9%), and in agriculture only 5.4%. The largest productive population group of 34.8% was represented by Kazan Tatars, of whom 27.4% were engaged in industry. A significant group of them was concentrated in Orenburg (26.3%, including 21.4% in industry), where Tatars ran slaughter and tallow houses, meat processing plants, city wool-scouring plants, hat and

sheepskin plants. The productive population was somewhat smaller in Astrakhan (19.2%, including 16.3% in industry). Astrakhan attracted a large number of workers in fishing, salt production, and load handling in water transport. In other cities, the percentage of Tatars engaged in industry ranged from 7.1% (Vyatka) to 11.7% (Ufa).

It should be noted that in large cities, except for Vyatka, the number⁸ of Tatars engaged in industry exceeded those in agriculture. Being a large social stratum, the peasantry supplied new urban workers as barge haulers and loaders, servants, cheap labourers—mostly unskilled—at industrial plants, carriage-drivers, and day-labourers.

To sum up, Tatars representation in privileged spheres, such as administrative activities, science, medicine, arts, and public education, was poor in large administrative centres. The largest sub-group of the Tatar non-productive population was rentiers. Merchants made up the majority of the semi-productive population. The percentage of Tatars working as private employees, day-labourers, and servants was considerably high. Most of the productive Tatars were engaged in industry.

Muslims in medium-sized and small cities. Muslims were quite numerous in the uyezds centres and non-uezds cities.

An extract from the records of the First General Census of the Russian Empire of 1897 revealed the Tatar communities in medium-sized and small cities in the Volga and Ural Regions of at least 100 people.⁹

As is shown in Table 8, the region's 39 small and medium-sized cities hosted 39,511 Tatars, of whom 54.2% were male and 45.8% female. That is, male population was prevalent here, as it was in large cities. In general, Tatars made up 7.4% of the total population of 39 cities.

Data on cities with a Tatar percentage of over 10% from Table 8 were summarized in Table 9. There were 11 such cities.

⁸ There were 10 Tatars included in the census in 1897 who worked in industry, and 32 Tatars engaged in agriculture.

⁹ The table does not include Irbit where 1,334 Tatars lived. In January, the Irbit Fair was held.

A rich Tatar family. Astrakhan guberniya. Photo from the early 20th century.

According to Table 9, the percentage of Tatars in the 11 small and medium-sized cities was 23.4% of the total urban population. Buinsk, Iletskaya Zashchita, Orsk, Sterlitamak, Troitsk, and Chistopol had the largest¹⁰ Tatar percentage of over 20%.

Most of the Tatars in uyezd centres were burghers (61.1%). The remaining inhabitants formed the following local groups: peasants (33.2%), merchants (2.03%), and Cossacks (1.62%).

The social composition of the Tatar population was diverse. Tatar noblemen, both by birth and personal, and honorary citizens were few in number¹¹.

¹⁰ In the post-reform period, when the development of capitalist relations was now the determining factor in social relations, regional socio-economic factors began to influence the emergence of new cities. Thus, three Ural industrial centres were recognised in 1865 as cities: Orsk, Zlatoust and Sol-Iletsk (Iletsk zashita) [Lappo, 1994, p. 24].

¹¹ Nobles by birth lived in Iletsk zashita (20 persons), Orsk (10), Sterlitamak (61), Troitsk (24) and Belebey (36 persons), while individual nobles lived in Chistopol (10 persons), Orsk (2), Troitsk (2) and Sterlitamak (13 persons). There were no personal or hereditary Tatar nobility in Arsk, Buinsk, Malmyzh, Nikolaevsk or Tetyushi. Honorary citizens lived only in Iletsk zashita (5 pers.), Omsk (3) and Troitsk (3 pers.).

Merchant distribution among urban centres was non-uniform. Their percentage in the population could be as high as 2.03% instead of 0.9%, as in the governorate centres. An especially high concentration of individuals from this group was found in Troitsk, 264 people. Other uyezd centres had 2 (Tetyshi) to 87 (Sterlitamak) residents registered as merchants. The census reports no Tatar merchants in the citites of Arsk, Malmyzh, and Nikolayevsk.

Merchants were the most numerous in Troitsk (4,299 people) and Sterlitamak (3,054 people). 7 (Arsk) to 1,956 (Chistopol) Tatar merchants resided in the rest of uyezd centres. They were engaged in temporary production, agriculture, petty trade, and handicraft production.

The number of military Cossacks in Orsk was 348 people. Insignificant numbers of them resided in Troitsk (82 people), Iletskaya Zashchita (6 people), and Sterlitamak (5 people).

Peasants made up a significant part of Tatar communities. Tatar peasants were prevalent in Chistopol and Troitsk (2,908 and 2,479 people respectively), the number ranging from 37 (Nikolayevsk) to 772 (Iletskaya Zashchita). Thus, the uyezd centres also attracted peasants looking for seasonal jobs, though less than the governorate centres did.

Table 8

Tatar population of small and middle-sized towns of the Volga Region and the Urals Region in 1897 [Pervaya vseobshhaya, Vol. 2, 10, 14, 28, 30, 31, 35, 36, 38, 39, 45 (Table 13)]

Cities	The whole population including both sexes	Tatar population			% of Tatars out of the entire population

Chelyabinsk	19,998	272	173	445	2.2
Chistopol	20,104	2724	2199	4923	24.5
Total:	534,551	21,418	18,093	39,511	7.4

As shown in Table 11, a small part of the Tatar population was represented in the non-productive group (9.3%). The productive population made up a relatively large percentage (34.8%). The semi-productive population was the prevalent group (55.9%). However, small cities had a larger percentage of productive population when compared to larger cities, where non-productive (12.9%) and semi-productive (60.8%) percentages were higher.

The non-productive population was the largest in Arsk (50.3%) and Malmyzh (32.8%), while in other cities the percentage ranged from 3.1% (Iletskaya Zashchita) to 19.0% (Buinsk).

The largest public official percentages were reported for Malmyzh (4.4%) and Arsk (3.1%), the value ranging from 0.1% (Iletskaya Zashchita) to 2.2% (Buinsk).

Tatar rentiers made up a large percentage of the non-productive population of small cities, at 4.7%. They were most numerous in Buinsk (14%) and Malmyzh (11.2%), ranging from 0.4% (Nikolayevsk) to 6.9% (Belebey) in other cities.

The absence of Tatar noblemen and merchants in a number of uyezd centres (Arsk, Malmyzh, Nikolayevsk) indicates that the Tatar urban community had a low social, class, economic, and educational status determining its passive role in the city's social life.

The Muslim clergy and Tatar intelligentsia made up a total of 1.8%.

Tatars engaged in commercial activities made up the largest percentage in the semi-productive population of small cities (32.3%). They were largely registered as 'private employees, servants, and day-labourers' (19.2%).

The semi-productive population group was prevalent in nearly all cities, except for Nikolayevsk (1.4%) and Arsk (5.6%). Large semi-productive groups were found in Tetyushi (71.2%), Sterlitamak (69.7%), Troitsk (63.2%), Orsk (62.1%), Chistopol (61.1%), Buinsk (59.6%), Belebey (44.6%), and Iletskaya Zashchita (37.2%).

The Tatars engaged in trade made up most of the semi-productive population of nearly all uyezd centres. They were especially numerous in Orsk (44.3%), Buinsk (42.6%), and Sterlitamak (43%), while in other uyezd centres the

percentage ranged from 1.4% (Nikolayevsk) to 37.1% (Troitsk). In the uyezd centres, most of Tatars did delivery, door-to-door, and petty trade, while some were engaged in stationary trade and had their own shops [Gibadullina, 2008, p. 144].

Speaking of the productive population, in contrast to the governorate centres, where a significant portion of the Tatar population was engaged in industry, a significant portion of the Tatar population was engaged in agriculture in small towns (18.4%).

As a whole, the productive Tatar population made up 34.8% of the population in small and medium-sized cities. The percentage was the largest in Nikolayevsk (95.1%), mainly due to Tatars engaged in agriculture (94.0%)¹². A large group of Tatars employed in agriculture resided in Iletskaya Zashchita (48.2%) and Arsk (36.6%). The percentage ranged from 3.9% (Troitsk) to 17.8% (Orsk) in other cities.

Individuals employed as farmers, beekeepers, animal breeders, wood growers, forest industry workers, fishers, and hunters, which the 1897 census recorded can be viewed as agricultural urban population proper. The agricultural urban populations were much larger in uyezd cities than they were in large governorate centres.

In Belebey (27.4%), Troitsk (23.8%), and Chistopol (20.3%), Tatar industrial employees were somewhat more numerous than those in agriculture. In other uyezd cities, the percentage of Tatars engaged in industry ranged from 1.1% (Nikolayevsk) to 13.7% (Buinsk). Tatars made up a total of 16.4% of all industry employees of the eleven cities specified. They worked at small brick, tanning, cereal, grain draining, rendering, malt, bag weaving, rope, and potash plants.

As a whole, the 1897 statistics suggests the following sources of income for the Tatar populations of medium-sized and small cities in the Volga and Ural Regions: commerce

¹² The important factor here is that the district town of Nikolaevsk was founded next to the Tatar Mechet Sloboda in 1836 [Gibadullina, 2008, p. 136]. Despite the shifting of local farmers to the bourgeois class, their occupations did not change in any significant way, although

Table 9

**Share of the Tatar population in eleven medium-sized and small towns
of the Volga and Urals Regions in 1897**

Medium-sized and small towns	The whole population including both sexes	The Tatar population including both sexes	Share of Tatars, %
Arsk	1228	161	13.1
Belebey	5835	788	13.5
Buinsk	4213	1583	37.6
Iletskaya Zashchita	11768	2747	23.3
Malmyzh	3165	409	12.9
Nikolayevsk	12,504	1759	14.1
Orsk	14,016	3035	21.7

Tetyushi	4754	789	16.6
Troitsk	23,299	7283	31.3
Chistopol	20,104	4923	24.5
Total:	116,436	27,256	23.4

Table 10

**Distribution of the Tatar population in eleven medium-sized and small towns in 1897,
broken into classes [Pervaya vseobshhaya, Vol. 10, 14, 28, 36, 39, 45 (Table 14)]**

Social classes	The Tatar population including both sexes	% of the total
Hereditary nobility	151	0.55
Lifetime nobility, bureaucrats from non-noble class	27	0.09
Clergy, persons of liberal professions	6	0.02
Hereditary and lifetime honorary citizens	11	0.04
Merchants	553	2.03
Bourgeois	16,649	61.1
Peasants	9049	33.2
Army cossacks	441	1.62
Foreign-born	109	0.4
Finland natives	—	—
Persons not belonging to these classes	90	0.33
Persons who did not indicate their class	30	0.11
Foreign subjects	140	0.51
Total:	27,256	100

(32.3%), salaried and day labour (19.2%), agriculture (18.4%), industry and handicraft production (16.4%).

It should be noted that most of uyezd centres remained 'the same villages as they used to be, most of their burghers and merchants still doing arable farming', though industrialisation trends were clear [Shchepkin, 1882, p. 7]. The population of such uyezd cities

mostly engaged in agricultural and petty handicraft production.

The modernisation processes taking place in Russia in the second half of 19th century, determined the expansion of the territory across which urban Tatar communities lived and developed not only in large administrative centres but in small uyezd cities, though the processes were less rapid in the latter.

Table 11

Employment of the Tatar population in eleven medium-sized and small towns of the Volga and Urals Regions in 1897 [Pervaya vseobshhaya, Vol. 10, 14, 28, 36, 39, 45 (Table 22)].

Population groups	The Tatar population including both sexes	% of the total
a) Officials and army	211	0,8

h) Agriculture	5019	18,4
i) Industry	4472	16,4
Total productive population	9491	34.8
Total:	27,256	100

3.3. Tatars in workers' settlements in the late 19-early 20th century

Ildus Zagidullin

The economic and industrial development of peripheral areas and industrialisation brought about new industrial centres and areas in the empire. Along with the development and technical upgrade of old enterprises in the Urals (2/3 of all the Ural plants were concentrated in the Perm and Ufa Governorates—the Zlatoust Uyezd and the eastern parts of the Ufa and Birsks Uyezds of the latter belonged to the Ural Region) [Vvedenie, 1960, p. 3], in the 1880s, in the Central and North-Western industrial districts 19th new industrial areas quickly developed: Those included the Donets Coal Basin, the Krivorozhky Minery, and the Baku Oil Fields [Tikhonov, 1988, pp. 46–47]. Over 3/4 of all the plants in the Southern Region had advanced equipment and were established in the last decade of the 19th century.

Each industrial plant had a workers' settlement. According to economists this caused

production to concentrate in several locations, forming large plants with a huge work force. Industrial production was part and parcel of Russian city formation. A network of 'economic' cities, towns, and workers' settlements having no municipal government, which the effective law did not recognize as urban localities, were characteristic of industrial areas [Vodarsky, 1972, p. 201].

The population of workers' settlements was highly mobile and predominantly male. Most of the peasant workers had temporary passports while formally remaining residents of their native villages. Since a number of socio-economic factors determined employment and the general situation at the new place of residence, many preferred to leave their families at home to maintain their households. In the post-reform period, some large and medium-sized businesses began to turn into sustainable industrial institutions that tried to form their own

permanent work force of skilled personnel to ensure year-round production and improved performance.

The Tatars worked at three governmental military plants in the Volga-Kama Region nearly from the time they were founded in the 18th century. Those were the Kazan Gunpowder Plant, the Izhevsk Weapons Plant, and the Votkinsk Iron Plant.

The Tatar community of the Izhevsk Weapon Plant was formed by workmen and disabled soldiers in 1807. It consisted of 450 individuals of both sexes in February 1839 [Zaitseva, 1996, No. 3–4, pp. 240–243].

A group of Tatar peasants from the Kazan and Orenburg guberniyas was assigned to the Votkinsk Plant (established in 1758) in the 1760s. It had a mahallah at the beginning of 19th century. However, the worker community (129 individuals of both sexes) was not granted the right to build a mosque until 1900.

In the early 20th century, more than 30 thousand Tatar workers (68,626 individuals of both sexes, including families, out of the 150 thousand plant and factory workers) lived in the territory where the Tatar nation was forming (the Volga-Ural Region and the Western Siberia) [Khasanov, 1977, p. 232; Nafigov, 1964, pp. 20–21]. The metallurgical plants in the Urals employed over 4,000 workers, while 1/5 of the total industry employees worked at cloth factories in the Simbirsk guberniya.

In the early 20th century, the settlements of the following plants in the Volga-Ural Region had large Tatar communities (about 1 thousand): the Ushkov Chemical plant (Vyatka guberniya), the Motovilikha, Nadezhdinskoye (Perm guberniya), Miass (Orenburg guberniya), and Satka (Ufa guberniya) Plants. Workers' settlements in the region had a total

Tatar stevedores in the Kazan river port.
Photo from the late 19–beginning of the 20th century.

of about twenty mahallahs [Zagidullin, 2006b, pp. 71–100].

A significant part of seasonal workers left the historical Tatar-inhabited territory. In the late 19th century, Tatars settled at Siberian gold mines to make up to 13% of the proletariat at the beginning of the 20th century and began to work on the Siberian railroads (1%) [Tagirov, 1995, p. 389]. Shortly before World War I, Tatars made up a large national proletariat group ranking fourth after Russians, Ukrainians, and Latvians. Most of the labour force lived outside the regions of the traditional Tatar habitat [Ocherki, 1973, p. 17]. In 1917, Donbass mines, which were developing rapidly, employed 90 thousand Tatars; the Baku oil fields, 3.5 thousand (18.5% of all workers); factories in Orekhovo-Zuyevo, 5 thousand workers [Khasanov, 1977, p. 232; Nafigov, 1964, pp. 20–21].

Tatar workers wanted to form autonomous workers' associations, artels. They often hired cooks, had joint expenditures, and settled together in barracks. Characteristically, most of members of Tatar workers' communities owned no real estate. Such communities were highly mobile in terms of migration, consisted predominantly of men, and were to some extent integrated into the Russian labour environment.

3.4. Muslim (Tatar) 'Community Cities'

Ildus Zagidullin

The Key Features of Muslim (Tatar) 'Community Cities'. According to the organisation of social and cultural life of the ethnic and religious communities of Russian cities N. Yukhneva identified three types of settlements: 1) two ethnic cities within one locality, where most of its functions are duplicated. Each city lived according to its own customs, while some mutual influence was observed, it was minimal. Central Asian cities in Russia belonged to the classical type. Such suburbs arise where a city 'joins' another one; 2) a city having a single centre and margins, extremely coherent with compact ethnic groups forming enclaves (neighbourhoods, slobodas) in a foreign cultural environment within it. Such enclaves can emerge for the following reasons: single migrations of large groups, migration to join one's friends and family, ethnic discrimination in accommodation, certain ethnic groups being the same as disadvantaged social groups; 3) the dispersed settlement of ethno-confessional groups with an uneven percentage of residents in different areas of the city. The social factor is essential here as accommodation depends on the occupation and social status of the inhabitant [Yukhneva, 1984, pp. 13–14].

In our opinion, a number of Russian cities in the 19th century, had economically powerful ethno-confessional communities qualifying as the second dispersal type, while their socio-cultural development made them Muslim (Tatar) 'community cities', which term can be defined through the following features:

- 1) the existence of one or several territories with specific economy and culture, compact settlement neighbourhoods, where streets are partly or completely built according to city planning principles;
- 2) real estate—private and public institutions, such as religious, educational, commercial and/or industrial organisations;
- 3) social institutions: two or more mahallahs with clergy, schools providing ethnic education to nearly the whole younger generation

of the religious groups, and, in the early 20th century, cultural, educational, or charity organisations;

4) a large resident contingent (merchants, burgers);

5) a stratum of entrepreneurs and merchants as primary funders of religious and ethnic institutions;

6) economic self-reliance of the community for key social issues of its members;

7) involvement in addressing issues related to the locality's economic, commercial, and cultural development, representing the community's interests to the government and municipal authorities.

In the first half of the 19th century, 'Muslim (Tatar) community cities' were active in Kazan, Seitov Posad (Kargala), Semipalatinsk, and Petropavlovsk. In the late 19th century, the list also included the ethno-confessional communities of Troitsk, Orsk, and Orenburg in the south-east of the country. The Tatar community of Ufa became one of them at the beginning of the 20th century.

Among the aforementioned cities, Kazan, Astrakhan, Orenburg, and Semipalatinsk were governorate centres. Petropavlovsk, Troitsk, and Orsk were uyezd centres. Kargala, where the Tatar City Authority was liquidated in 1828, had a stripped-down municipal administration.

Kazan qualified as a large Tatar community (28,520 people). Medium-sized 'Muslim (Tatar) community cities' existed in Astrakhan (16,959 people), Semipalatinsk (14,660 people), Orenburg (13,257 people), Troitsk (8,430 people), and Petropavlovsk (6,087 people). Only in Semipalatinsk did the Tatars account for less than a half of the Muslim population while definitely dominating the community's socio-economic and cultural life. The rest of the Muslim 'community cities' were ethnically Tatar. It was Tatars who determined the dynamic patterns and content of their socio-cultural processes.

The percentage of Muslims played a major part in the forming of a uniform cultural and

religious space and city economy. Muslims made up 1/3 to 1/4 of such medium-size cities as Troitsk (36.2%) and Petropavlovsk (30.9%). In other cities, Muslims accounted for less than 1/5 of the total population: 15% in Astrakhan and 18.6% in Orenburg. Muslims made up over a half of the urban population of Semipalatinsk and 21.8% of that of Kazan.

Kazan

*Lyudmila Sverdlova,
Ildus Zagidullin*

In the late 18th century, the city counted 5 thousand Tatars [Istoriya Kazani, Vol. 1, p. 120]. In the 19th century, the Old and New Tatar Slobodas had all the essential elements of urban infrastructure: the Eastern Hay Market, the Yunus Square, hotels, inns, industrial plants, workshops, places of worship, educational institutions, and commercial organisations. When forming prestigious streets, the Tatar commercial and industrial elite built their estates according to contemporary city planning standards. Some wealthy Tatars resided and carried out their activities in the Russian part of Kazan [Märcani, 1989, pp. 366–380].

The city had several areas of Islamic confessional education. Madrasahs operated in Tatar slobodas. The Yagodnaya (Berry) and Admiralteyskaya (Admiralty) Slobodas, as well as the Porokhovaya (Gunpowder) Sloboda in the suburbs, had maktabas.

In Kazan (1781–1855) an autonomous municipality was in place, the Tatar City Hall, which recorded merchants and burghers, issued commercial licenses, collected taxes, and dealt with other economic and administrative issues of native inhabitants. It represented executive power, which the Empire's administration entrusted to it, and was accountable to the state authorities.

According to sociologists it was cities with a population of over 20–30 thousand people who offered opportunities of radical development of personal relations like transition from primary to secondary contacts, from community relations to society relations [Zimmel, 1905, pp. 117–136; Mironov, 1990, p. 25]. The process was controlled by the Tatar bourgeoisie.

At the end of the century, noblemen, both personal and by birth, 'non-noble officials', and honorary citizens made up 1.1% (311 people) of the city's Tatar community (28.5 thousand people of both sexes). The merchants were somewhat more numerous, with 346 people, or 1.2%. Tatar burghers were the largest urban class. There were as many as 5,598 of them (19.6%). They were largely engaged in domestic industries and petty trade. Peasants (77%) were the main labour force for seasonal work and day labour. They worked as servants for wealthy families, workers at plants, factories, craft shops, and pier loaders [Pervaya vseobshchaya, Vol. 14, pp. 26–261]. Some of them did petty trade and went to confessional schools.

According to the 1897 census data, 15.66% of Kazan's Muslim population were engaged in commerce. The processing industries employed 24.51%. 'Professional' percentage was 0.9%. 1.58% were administrative officials. The clergy accounted for 0.36% of the population [Noack, 1993, Table. IIa].

In 1857, 127 plants in 24 industries employed 2.8 thousand workers. 1/3 of the plants were owned by Tatars, who made up 1/7 of the population [Laptev, 1861, p. 348]. In 1898, Tatars owned 10 industrial plants with an annual output value of over 1,000 rubles. They produced a total output that amounted to 405,000 rubles and employed 144 workers [Istoriya Kazani, Book 1, pp. 121–122].

Even though the municipal and class autonomous authorities were liquidated, the Tatar part of Kazan preserved its authentic ethnic urban culture within 14 economically self-reliant parishes with mosques and educational institutions, clergy, and waqf property, where Sharia largely controlled everyday and family issues. The ethnic bourgeoisie funded and controlled its coreligionists' social and cultural development by building mosques, maktabas, and madrasahs, establishing orphanages and shelters for economically disadvantaged children (1844, 1904), a Muslim poor-house (1900), etc. In the latter half of 19th to the early 20th century (before 1906), the 2nd, 3rd, 4th, 7th, 9th, 10th, Kazakov, and Usmanov Mosques acquired waqf property. The madrasahs at the

premises of the 1st, 2nd, and 4th Mosques and the 'Muhammadiya' Madrasah were built [Azamatov, 2000, pp. 30–34; Waqf Property, pp. 48–49, 57–58].

Having established a charitable society in 1897, the elite cooperated to address issues related to maintaining an orphanage, an obstetrical medical institution, and an outpatient hospital, fire victim and needy aid as well as others. The elite's charity was of great importance for the community because the government, autonomous municipality, and *zemstvo* provided little support [Salikhov, 2001, pp. 243–248].

In 1899, the Kazan Tatar community was denied a 'Muslim consumer society' because the city had a 'consumer society' (since 1893) and in order to prevent 'Muslims, who are reluctant to assimilate with the Russian population, from establishing any autonomous social organisations' [Zagidullin, 2004, pp. 240–241].

Thanks to the presence of a university, a large number of madrasahs, and a well-developed printing infrastructure, Kazan was able to become a major Islamic and Tatar printing centre to meet the needs of Muslim peoples in Russia in the latter half of the 19th century.

Astrakhan

Andrey Syzranov

The primary population of the new Russian fortress of Astrakhan, which was founded on the left Volga bank in 1558, consisted of Russian *Streltsy* and Cossacks. However, as the city grew in the late 16–first third of the 17th century and its new parts, *Bely* (White) and *Zemlyanoy* (Ground) 'cities' emerged, the population of Astrakhan became multi-ethnic. It consisted of service class people, merchants, and craftsmen. They were ethnic: Russians, Yurt Tatars, Armenians, Persians, Indians, 'Bukharans', 'Khivians', etc.

The key groups of Astrakhan Tatar population from the latter half of the district –the beginning of the 20th century, were: Astrakhan (or Yurt) 'Nogai Tatars', Middle Volga (or Volga-Ural) Tatar migrants, 'Agrizhan Tatars', 'Burkharan Tatars', and 'Gilan Tatars'.

In the district century, Astrakhan included Tatar Sloboda, which was inhabited by

the Yurt Tatars. It remained essentially separate and was fenced off [Kidirniyazov, 1999, p. 297]. The inhabitants of the sloboda were craftsmen, merchants, or labourers [Golikova, 1982, p. 171].

In the district century, Astrakhan became a major Russian-Eastern trade centre. The so-called 'eastern colonies' gradually developed in the city. In 1673, the authorities established new Agrizhan, Bukhara, and Gilan trade courts, or slobodas, in *Zemlyanoy Gorod*. The government permitted Indians, Persians, Bukharans, and others to take residence in Astrakhan in 1681 [Golikova, 1982, pp. 163, 165].

The offspring of mixed families—Indian fathers and Tatar mothers—known as 'Agrizhans' or 'Agrizhan Tatars' lived in Agrizhan Sloboda [Gmelin, 1777, p. 145; Nebolsin, 1852, p. 113; Oldekop, 1870, p. 331]. Gilan Sloboda was inhabited by Persians and 'Gilan court Tatars' (the descendants of Persian men and Tatar women). 'Bukharian court Tatars' settled in the Bukhara Sloboda, who had 'came from Bukhara in ancient times', also known as 'Bukharans'. Bukharian court people came not only from Bukhara but from Khiva ('Khivians') [Oldekop, 1870, pp. 331, 332; Dalinger, 1887, pp. 4, 5; Golikova, 1982, p. 162].

Unlike their 'fathers' (Hindu Indians and Shia Muslim Persians),¹³ representatives of the Agrizhan and Gilan Tatar sub-ethnic groups were Sunni Muslims [Gmelin, 1777, p. 197; Nebolsin, 1852, p. 113].

P. Nebolsin wrote: 'Until 1836, the community of the Bukhara, Gilan, and Agrizhan Court Tatars was a privileged class that enjoyed the right of free trade without paying any guild duties... A special tax of 5 thousand rubles in notes per capita and recruitment duty were imposed on all Tatars of the community in 1836 until they were declared fully equal to native Russians in terms of all taxes and duties...' [Nebolsin, 1852, p. 114].

The Tatars of the three courts had assimilated with the Yurt Tatars and probably Middle Volga Tatars by the middle of the 19th century [Iskhakov, 1992, p. 14; Oldekop, 1870, p. 331; Dalinger, 1887, p. 4; Nebolsin, 1852, p. 113].

¹³ there were also Muslims among the Indians.

20th century.

From the end of the district—the beginning of the 18th century, Astrakhan received the first wave of immigrants from Kazan [Arslanov, 1995, pp. 4, 24; Viktorin, 2003, p. 76]. They resided in Kazan and Tatar (near the Yurt Tatars) Slobodas, Zemlyanoy City [Gmelin, 1777, pp. 150, 196; Georgi, Part 2, p. 33]. Already by this time, the urban Tatar populations included Tatars from the Kazan, Simbirsk, Penza, Saratov, and Ryazan guberniyas [Arslanov, 1995, p. 24]. 'The urban Tatar population was regularly refilled with new migrants' from 18—the beginning of the 20th century [Viktorin, 1994, p. 5].

The urban Yurt Tatars were engaged in crafts, commerce, or worked as labourers [Golikova, 1982, p. 171]. Aul Yurt Tatars also carried out commercial activities in Astrakhan. Even though they were formally prohibited from it, many traded 'disguised as Armenians, Indians, and urban Tatars' [Georgi, Part 2, p. 35; Gmelin, 1777, p. 175]. I. Ravinsky reported the Yurt Tatars to have traded in Kizlyar [Ravinsky, 1809, p. 340].

According to S. Gmelin, urban Kazan Tatars were mostly merchants, while some 'were servants,... labourers or agents for Indians, for whom they sometimes work as... commissaries' [Gmelin, 1777, p. 197].

The annual Islamic calendar holidays, the Prophet Muhammad's birthday, and adherence to Islamic food regulations were essential features of the Astrakhan Tatar lifestyle. Some Tatars completed the Hajj—the pilgrimage to Mecca [Rezvan, 2006, p. 406]. 'Life cycle rites' were performed according to Sharia norms.

Astrakhan Islamic clergymen mainly received religious education in Orenburg, Kazan, Bukhara, and Astrakhan [Oldekop, 1870, p. 404; Dalinger, 1887, p. 18].

Mosques were central to the religious and social life of the Astrakhan Tatars [Syzranov et al., 2006; Syzranov et al., 2007]. Already by 1586, a mosque existed not far from the city. In 1666 seven mosques were active in the 'posad', or in the 'lower city' (Zemlyanoy) [Evliya, 1979, p. 132]. After a hundred years, four mosques were active in the Agrizhan, Bukhara, and Gilan slobodas in Zemlyanoy City [Gmelin, 177, pp. 146, 163]. In 1910, Astrakhan had 18 mosques [Dremkov, 1912, p. 4].

As a rule, mosques tended to run the Islamic matkab schools, sometimes madrasahs (advanced schools). At the beginning of the 20th century, the city had 19 maktabas and 6 madrasahs: on the premises of Ak-Mosque, Kara-Mosque, Gilan Court Mosque, and Mosques

No. 3, 6, and 7, Tsarevskaya Sloboda [Dremkov, 1912, p. 14].

Jadidism began to spread in the Astrakhan Muslim community in the late 19th century. In 1892 [Mamleyeva, 2007, p. 15] or 1895 [Abdurakhman Umerov, 2003, p. 303] Mullah Abdurakhman Umerov¹⁴ founded a Jadidist madrasah, named Nizamiyah, in Tsarevskaya Sloboda. It became one of the leading Islamic research and education centres in the south of Russia,¹⁵ attracting Tatars, Kazakhs, Nogais, Turkmens, Nakh, Lezgians, Avars, etc. In 1907, Abdurakhman Umerov founded 'Umerov i Ko.' (Umerov and Co.) Publishing Partnership (1907–1913) and published the newspaper 'Idel' (Volga),¹⁶ the main local Jadidist mouthpiece [Kurmanseitova, 2004]¹⁷.

In 1896, the first Muslim public organisation 'Jamaat Hayriya', or 'Society for the Protection of Poor Tatars' was registered in Astrakhan, and presided over by honorary citizen by birth I. Iskenderov. The society used its fund, consisting of membership fees and donations by merchants and mosque goers, to buy textbooks for the maktab and madrasah students, firewood, warm clothing, medicines for the poor, issue funeral allowances, etc. [Otchet pravleniya, 1900; State Archive of Astrakhan Oblast, f. 286, inv. 2, file 514, s. 13].

¹⁴ Abdurakhman Izmaylovich Umerov, or Gabdrakhman Gumarov, Abd ar-Rahman ibn Ismail ibn Umar al-Hadji-Tarkhani (1867–1933) was an educator, theologian, historian, ethnographer and Arabist, publisher, public figure and teacher. He was born on 18 January 1867 to an Astrakhan bourgeois family, Nogai-Karagash Ismail Umerov. After finishing his primary education in a mektebe, in 1881–1889 A. Umerov studied in the Kazan madrasah of Sh. Marjani (1818–1889), after which he returned to Astrakhan.

¹⁵ Among the graduates of the madrasah were the Nogai philologist, folklorist and educator A. Dzhanibekov (1879–1955), the Turkmen philologist and theologian A. Niyazi (Niyazov) (1880–1932), the Uzbek historian B. Saliev (1882–1942) and others.

¹⁶ Initially, the newspaper's publisher and editor was Z. Sharifullin. When A. Umerov became the publisher, Z. Sharifullin stayed on as an editor, and in 1910 he declined the position in favour of Umerov.

¹⁷ In addition to 'Idel', at the beginning of the 20th the Tatar newspapers 'Borhane tärkkiy' ('Reason/Argument for Progress'), 'Mizan' ('Scales'), 'Halik' ('People'), the magazine 'Mägarif' ('Enlightenment'), 'Tup' ('Cannon') and others were published in Astrakhan.

In 1905, the society Mäclise Şurai Islam ('Muslim Assembly House') was founded. It ran a maktab offering education to both boys and girls. The society also published the newspaper 'Borhane täraqıy' ('Evidence of Progress'). The founder of the society, the principal of the school, and the editor of the newspaper was 'Şamaxı Tatar,' that is, a migrant from Northern Azerbaijan Mustafa Izmaylov (Lütfi) [State Archive of Astrakhan Oblast, f. 1, inv. 12, file 722; f. 286, inv. 2, file 297; f. 1, inv. 2, file 1730, s. 8].

In 1907, a more 'moderate' society known as 'Cämägate islamiya' ('Islamic Society') was founded in Astrakhan, primarily by city mullahs. It funded the newspaper 'Idel'. Its president was Mullah of Mosque No. 8 A. Umerov [State Archive of Astrakhan Oblast, f. 286, inv. 2, file 297; f. 290, inv. 3, file 521, s. 65].

By the early 20th century, Astrakhan along with Kazan, Ufa, and Orenburg had become important centres of Tatar culture [Iskhakov, 1992, pp. 24–25]. Tatar commercial capital developed rapidly here. The city had ethnic printing houses that published periodicals as well as a Tatar theatre. New mosques were built and Islamic educational institutions founded.

Orenburg

Denis Denisov

Orenburg was founded in 1743 as the administrative and military centre of the border territory as well as the centre of the Russian Empire's commercial and diplomatic relations with the peoples of Kazakhstan and Central Asia. The Tatars dominated the border trade from the very beginning in Orenburg due to their linguistic skills, cultural and religious affinity. For instance, already by 1761 there were 81 Tatars (65.1%) among 109 Russian traders in the Orenburg trading house. In 1799, the ratio was 162 out of 248 (65.3%) [Dorofeev, 1988, p. 53; State Archive of Orenburg Region, f. 6, inv. 1, file 160, s. 1–19 reverse]. At first, Muslim entrepreneurs showed a preference for seasonal operations and it was only in the late 18–early 19th century that they had begun to take residence in Orenburg, forming separate

neighbourhoods around the first city mosque. Muslim percentage in the city's resident population remained small until the mid-19th century. In 1826, only 146 male Muslims resided here, which number had increased to 457 people of both sexes (2.5%) by 1847. However, a massive inflow of Tatar migrants to Orenburg began in the 1860–1870s. The city was enjoying an economic boom due to developing commodity production of crops, processing and food industries, railway network, and the annexation of Central Asia by Russia. In 1875, The Tatar population of Orenburg was as large as 5,336 people (14.3%). The 1890 value was 14,966 (30.7%), and in 1904 22,576 (26%). Tatars (11,321 people (15.6%) in 1897) were the core of the city's Muslim community [Belavin, 1891, pp. 59–60; *Pervaya vseobshchaya*, Vol. 28, pp. 1, 64–65]. Migrants settled in all neighbourhoods but tended to live west of the historical centre of Orenburg, in a craft and industrial district, and north of it, in Novaya (New) Slobodka and in the so-called Novye Mesta (New Places).

Border trade, the volume of which continued to increase until the mid-19th century, remained crucial to the city's economy. However, the Trans-Caspian Railroad, built in 1880–1900, ensured quick delivery of goods from Central Asia directly to Central Russia, thus undermining the traditional caravan trade. As a result, the annual trade volume of the trading house first sharply fell then stabilised at 4–4.5 million rubles [Obzor za 1890 god, p. 11; Obzor za 1895 god, p. 20; *Statisticheskij obzor za 1900 god*, p. 16]. The trading house activities did not move to a new level until the Orenburg–Tashkent Railroad was commissioned in 1904. In 1912, a historical maximum sales volume of 15,609,018 rubles 50 kopecks was recorded [Statisticheskij obzor za 1912 god, pp. 20–21].

Tatar ethnic capital was represented by small and, occasionally, medium-sized businesses, primarily in animal produce processing. According to the 1895 statistics, 6 out of 12 slaughter and rendering houses, producing an output amounting to 371,983 rubles, were Tatar-owned (56.4% of the industry). It was Tatars who founded the city's soap industry. In 1895, Tatars owned 5 out of 9 wool-scour-

ing plant producing a total output amounting to 338,670 rubles (55.8%) [Perechen' fabrik, 1897, pp. 88–89, 530–533].

As commercial crop production developed in the Southern Ural in the 1870–1890s, flour and cereal production boomed as an autonomous and essential urban industry [Istoriya Bashkortostana, 2004, p. 419]. Over 20 Tatar bakeries played a major role in supplying baked goods to city inhabitants.

At the turn of the century, large commercial and industrial capital developed in Orenburg. Its most outstanding representatives were the 1st Guild Orenburg Merchants Ahmed (1838–1906), Gabdulgani (1839–1902), and Mahmud (1845–1910) Khusainov. They ran a number of plants for primary processing of animal raw materials: a slaughter and rendering house (since 1875), a gut washing plant (since 1885), and a wool-scouring plant [Perechen' fabrik, 1897, pp. 530–533; Perechen' fabrik, 1910, p. 52]. In 1888, the brothers built a large steam millet hulling mill, which had an annual output of around 85,000 poods of millet with a value of 100,896 rubles in 1895. As their business expanded, the brothers Khusainov bought 3 more slaughter houses in Kargala, gut washing 'plants' in Samarkand and Tashkent, and a leather drying plant in Kazalinsk¹⁸ [State Archive of Orenburg Region, f. 56, inv. 1, file 3743]. In 1898, Ahmed was recorded as a 1st guild merchant of Kazan, Gabdulgani, from Kazalinsk, and Mahmud remained an Orenburg merchant. Yet, they cooperated within their 'Brothers Khusainov Trading House' with an authorized capital of 100,000 rubles.

At the turn of the 20th century, large Orsk merchants, the brothers Ramiyev, moved to Orenburg to control their industrial and commercial enterprises: Zakir came in 1890, and Shakir in 1900.

¹⁸ A significant portion of the raw material came from the Nizhny-Novgorod Fair, where A. Khusainov purchased large commercial and residential buildings with warehouses and shops, such as the 'Khusainovskoye' and 'Laishevskoye' town houses. Commerce and procurement operations were provided by affiliates of their firm in Aulie-Ata (Taraz), Verny (Almaty), Irgiz, Perovsk (Kyzylorda), Samarkand, Tashkent, Tokmak, Turkestan and Chimkent.

The empty cathedral mosque in Orenburg. Photo from the early 20th century.

According to the 1897 statistics, 29.2% of the independent Tatar population of Orenburg were labourers and employees (with a total city percentage of 21.6%); 27.1% did trade (10.9%); 21.4%, industry and handicrafts (17.1%); 7.1% worked in transport (4.6%); 4.9% received income from the treasury, public institutions, and private individuals (8.8%); 3.3% were prisoners (1.4%); 2.3%, military personnel (8.6%); 2.3% did agriculture (5.4%); 2.2% worked in catering and services (3%); 1.6%, in construction (4.1%); 1.4% received income from capitals and real estate (4.8%); 0.4% were public officials (3.8%); 0.2% were clergymen (1.4%); 0.2%, teachers (1.4%); 1.8, others (3.1%). In terms of classes, peasants were prevalent (49.4%). Burghers made up 43.9%; foreign subjects, 1.75%; Cossacks, 1.3%; noblemen by birth, 1.2%; merchants, 1.15%; unidentified individuals, 0.7; personal noblemen and public officials, 0.3%; honorary citizens, 0.2%; 'indigenous dwellers', 0.1% [Pervaya vseobshhaya, Vol. 28, pp. 132–133, 160–161].

The Tatars played an important role in the socio-economic life of the city: by being actively involved in addressing issues of municipal services, amenities, construction and transport, local funding, education development, and control over industrial and commercial enterprises. While in 1871–1879 there were no Tatars in the Orenburg City Duma, in 1879–1883 there

was 1 out of 72; in 1883–1892, 4; in 1892–1893, 8; in 1893–1897, 6 out of 50; in 1897–1901, 3 out of 58; in 1901–1905, 5 out of 59; in 1905–1909, 7 out of 60 [Orenburgskie gubernskie vedomosti, 1879, June 23; 1883, June 11, July 9; Orenburgsky Listok, 1887, May 3, 10, 17; 1892, March 1; Orenburgskie gubernskie vedomosti, 1909, April 11].

Characteristically, Islamic institutions in Orenburg initially enjoyed active and formative governmental support in advance of the local community's

growth and demand. A mosque was built at the government's cost near the trading house—in 1783–1785 in order to satisfy the spiritual needs of Muslim merchants. In 1802–1804, the government funded the construction of the city's first cathedral mosque. In 1834–1846, a second cathedral mosque (Caravanserai Mosque) of the Bashkir Meshcheryak army was built on the government's initiative. In the following decades mosques were opened in new districts: Mosques 3 and 4 in 1885, Mosque 5 in 1887, Mosque 6 in 1893, and Mosque 7 in 1910 [Denisov, 2006, pp. 53–72].

The influence of Central Asian immigrants and the development of an ethnic bourgeoisie brought about the restoration of the waqf institute in the Tatar community. In 1848, merchant T. Markibaev donated a plot of land for a Muslim school to Mosque 1. In 1860, a shop was built there according to the will of Prince A. Chingis. In 1871, F. Mukminzhanov donated a yard plot for a madrasah and the imam's house. In 1885, Ch. Akilbekov donated another plot of land for an educational institution. In 1875, B.-K.M. Gubaydullina gave a land plot with residential buildings and outbuildings to Mosque 2 for a madrasah building. In 1881, the congregation built waqf granaries nearby [State Archive of Orenburg Region, f. 11, inv. 3, file 4143, s. 389–391 reverse; f. 41, inv. 1, file 690, s. 5 reverse–6]. In 1903, After his

death, A. Abdulvaliyev left Mosque 3 a stone outbuilding. Finally, in 1906, the Russian's Empire largest waqf of 500,000 rubles was established according to the will of the deceased merchant Khusainov. The income from it was used to maintain Mosque 6 and the Khusainiya Madrasah, issue allowances to the teachers of 60 innovative maktab in the Orenburg, Kazan, Vyatka, Simbirsk, and Penza guberniyas and Ural Region, 26 scholarship for government-owned educational establishments, and religious and moral books as well as training literature [Azamatov, 2000, pp. 42–48].

Muslim primary schools (maktab) in every parish ensured the transmission of religious and cultural traditions, while secondary educational establishments (madrasahs) at the premises of Mosques 1, 2, 5, and 6 (the former two were Kadimist, and the latter two were innovative). In 1891, the 'Khusainiya' Mosque was founded at the Khusainovs' expense on the premises of Mosque 6 to train a new generation of ethnic intelligentsia. From 1893 to 1902, around 100 men's schools were reformed and over 20 women's schools established in the Orenburg guberniya on the initiative and with financial support of G. Khusainov.

In the early 20th century Orenburg became a major centre of the synthesis of the western and eastern civilisation and their experience, revised, brought about a modernisation, secularisation of Tatar culture as well as new ethnic arts. Here were 3 out of the 13 Tatar printing houses in the Russian Empire (Vakit, Din v mägışät, and Karimov, Khusainov and Co.) that published 11 periodicals,¹⁹ which had a major influence on the development of Tatar literature, journalism, and political consciousness.

Kargala

Denis Denisov

Under the Senate's Decree of 13 March 1744, the Orenburg Administration was per-

mitted to 'accept for residence in a separate sloboda near the city of Orenburg' up to 200 Tatar families from the Kazan guberniya to foster the development of trade with the peoples of Kazakhstan and Central Asia. It was named Seitova Sloboda (Sayyid Sloboda) after the name of its first resident Sayyid Khayalin and Kargalinskaya after the river Kargala (now the village of Tatarskaya Kargala). The settlers were relieved of recruitment duty but could be subjected to irregular conscriptions when necessary. They were permitted to build a mosque [Complete Code of Laws of the Russian Empire–1, Vol. 12, No. 8893]. The residents' privileges were extended greatly under the Tsar's Edict of 8 August 1745. Favourable economic conditions attracted a large inflow of Tatar migrants to Kargala, primarily from the Trans-Kazan, causing it to rapidly transform to not only an important trade and craft but a major religious, cultural, and educational Muslim centre in the Ural Region. Its population size was 2,174 male individuals in 1762, 6,409 individuals of both sexes in 1870, 7,625 in 1889, and 11,077 in 1910 [Russian State Archive of Ancient Acts, f. 350, inv. 2, file 2450, s. 10, 24–89 reverse; Odnodnevnyaya perepis' 1870 goda; Odnodnevnyaya perepis' 1889 goda, unbound; State Archive of Orenburg Region, f. 164, inv. 1, file 209, s. 21 reverse, 24]. By 1870, Kargala consisted of 1288 houses, including 1191 wooden, 29 mixed, and 68 stone ones. Under the Decree of 7 November 1784, the posad administration was introduced in Kargala to be replaced by simplified city administration in 1870.

As an urban settlement, Sayyid Posad had a complex multi-branch economy dominated by domestic and foreign trade with the peoples of Kazakhstan and Central Asia [Dorofeev, 1988, p. 53; State Archive of Orenburg Region, f. 6, inv. 1, file 160, s. 1–19 reverse]. Residents of the city competed with Russian merchants in textile, tanned leather, paint, small ware, metalware, grain, and fur trade. Tatars were actively involved in the caravan trade. They visited Bukhara, Khiva, Tashkent, Urgench, and other Central Asian cities.

The Gostiniy Dvor building—that held 28 stone and 17 wooden shops was built in Kar-

¹⁹ The newspapers 'Vakit' ('Time') and 'Ural', magazines 'Din v mägışät' ('Religion and Life'), 'Karmack' ('Fishing-rod'), 'Karchiga' ('Hawk'), 'Mägarif' ('Enlightenment'), 'Mägälim' ('Teacher'), 'Chikertkä' ('Grasshopper'), 'Chykech' ('Hammer'), 'Şura' ('Advice'), 'Yaz' ('Spring').

gala in 1811–1814. The total number of shops in the posad had increased to 260 (15 stone and 245 wooden ones) by 1889 [Odnodnevna-ya perepis' 1889]. Many shops were traditionally located on the ground floors of residential buildings.

From the day it was founded, Kargala was nearly the only major Tatar handicraft centre in the Orenburg Region. Weavers, tailors, gold embroiderers, lace makers, shoemakers, sheepskin makers, sheepskin coat makers, felt boot makers, masons, stove setters, sawyers, carpenters, bakers, barrel makers, bag makers, cart makers, harness makers, blacksmiths, copper- and silversmiths, jewelers, etc. worked in the settlement.

Local industry developed over time. Already by the late 18–early 19th century, the Kargala Tatars had established potash and soap factories on land that they leased from the Bashkirs. By 1882, Sayyid Posad had 18 slaughter- and rendering houses (54 workers, an annual output amounting to 84,000 rubles), 1 candle plant (1 worker, 3,200 rubles) [State Archive of Orenburg Region, f. 164, inv. 1, file 85, s. 40].

A vast majority of Kargala citizens were engaged in agriculture. By the 1760s, the sloboda had turned into the centre of an agricultural region that produced and processed high-quality wheat. Its dwellers also cultivated oats, barley, millet, hulled wheat, buckwheat, and peas. In the late 19th century, Sayyid Posad had as many as 7 water mills (2 stone and 5 water ones). Melon-growing became wide-spread. Melons and watermelons, pumpkins, and cucumbers were cultivated.

According to the statistics for 1870, the total occupation percentages for the Sayyid Posad population (minus dependents) were as follows: agriculture—50.3%, private employment and labour (20.3%), commerce (17.2%), fishing, hunting, etc. and handicrafts (11.9%), income generation from capitals and real estate (0.3%). The data on the class structure of the posad's Tatar population indicate similar patterns. Peasants (47%) were predominant, followed by burghers (34.9%), merchants and honourary citizens (14.4%), retired soldiers with families (1.7%), personal noblemen and noblemen by birth, including tarkhans (0.9%),

clergymen (0.7%), Cossacks (0.2%), and Kazan Tatars (0.2%) [Odnodnevna-ya perepis' 1870, unbound].

From the moment Kargala was founded, it favoured free Islamic practices, the preservation and development of Islamic culture. Local merchants funded the construction of 10 mosques in the city. Before the Orenburg Mohammedan Spiritual Assembly was founded, the Kargala chief akhunds were informal leaders of the Southern Ural Muslims. They greatly influenced the social life of Muslims in a large part of the Cis-Ural Region and the Kazakh Steppes.

In the mid-18th century, the largest complex of Central Asian type Muslim educational establishments in the Southern Ural began to form in Kargala. In 1810, local madrasahs hosted a total of 359 shakirs; in 1842, to 519; in 1872, to 496; in 1901, to around 700 [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 386, s. 14–22 reverse; State Archive of Orenburg Region, f. 6, inv. 6, file 11811, Sheet 8; f. 10, inv. 2, file 114, s. 72; Central Historical Archives of the Republic of Bashkortostan, f. I-295, inv. 8, file 8036, s. 20 reverse–21]. Those included not only Tatar residents of the Orenburg Region but migrants from the Kazan, Ufa, Samara, Vyatka, Tobolsk, and other governorates, as well as Kazakhs from the Turgay and Ural Oblasts.

In 1895, Islamic education was reformed on the initiative and with material support of merchant G. Khusainov by introducing the listening training method and more secular subjects to the curriculum. All primary schools switched to listening. The madrasahs of Cathedral Mosques 1, 2, 5, and 9 were reformed according to new principles. However, the rest of madrasahs continued to be guided by old religious scholastic principles until they were shut down by the Soviet regime.

Orsk

Denis Denisov

Unlike other cities in the Orenburg guberniyas, Orsk attracted its first Tatar residents as soon as the fortress was founded. By 1735 Cossacks were accommodated in a separate

Tatar Sloboda north-east of the new fortification. The first mosque was built to meet their spiritual needs in 1738 [Materialy' po istorii, 2002, p. 536]. In 1834, its Tatar Cossack population consisted of 337 people [State Archive of Orenburg Region, f. 98, inv. 2, file 58, s. 518–560]. In 1865, Orsk officially became an uyezd centre. The removal of military settlement restrictions, intensified business activities, and increased trade volume resulting from Russia's annexation of Central Asia caused a massive inflow of Tatars from the Central Volga Region to Orsk. In 1870, the city resided as many as 1,995 Muslims (35.9% of the city's total population); in 1905, 4,184 (29.3%); in 1910, 7,719 (35.4%), the Tatars were prevalent among them. They tended to reside in the Old and New Slobodas west of the Old Vorstadt Sloboda south-west of the historical centre of Orsk. Their key occupations were commerce and handicrafts [Ignatyev, 1870, unbound; Pervaya vseobshchaya, Vol. 28, pp. 56–57, 68–69]. As the city's Muslim community grew, a lot of religious buildings were built. In 1872, Mosque 2 was constructed. Mosque 3 followed in 1884; Mosque 4, in 1885; Mosque 5, in 1910 [Denisov, 2008, pp. 109–166].

All mosques ran Muslim educational institutions, which began to introduce new advanced training methods and increased the number of secular subjects on the curriculum in the late 19th century.

The economic situation in Orsk depended on trade with nomadic Kazakhs, who sold livestock and imported grains and timber to the Steppe. Already by 1738, a trading house had been founded in Orsk. However, local trade volumes were always smaller than they were in Orenburg and Troitsk, because it was through the latter two cities that two main caravan roads to Central Asia led. When the Samara–Orenburg Railroad was commissioned in 1878, it undermined the exchange trade in Orsk because it lacked modern communications. Its volume decreased until it ceased to exist in 1885. Two fairs were opened in 1887.

Tatar entrepreneurs dominated the local border trade from the day Orsk was founded. They had largely preserved their leadership by the early 19th century and were engaged in

all key spheres of the city's trade. Outstanding Orsk entrepreneurs included M. Ashirov (textile), brothers A.-S. and M. Burnaev (textile, livestock), Kh. Dolotkazin (flour), G. Kinikeev (livestock, raw materials, wool), B. Mangutov (flour), F. Mukmenev (grocery, livestock), Kh. Mukminev (timber), A. Nigmatullin (textile, bread), A. Rakhmatullin (textile, raw materials, wool), K. Rakhmatullin (livestock, raw materials, bread), and others.

The proximity of a stable animal breeding raw material source favoured the development of processing industries in Orsk. In 1869, 6 out of 9 slaughter-and-rendering houses in the city, producing an annual output amounting to 8,675 rubles (35.8% of the total output) were Tatar-owned [State Archive of Orenburg Region, f. 164, inv. 1, file 5, s. 400–401 reverse]. G. Kinikeev and A. Rakhmatullin leased a plot of land on the Ural River from the city to build wool-scouring plants supplying raw materials to weaving factories [State Archive of Orenburg Region, f. 364, inv. 1, file 32, s. 8].

The following were the key Tatar occupations in Orsk in the late 19th century: commerce—34.9% (with a total city percentage of 15%); day-labour—24.5% (15%); agriculture—15.7% (28.9%); industry and handicrafts—13.8% (11.9%); income from the treasury, public institutions, and private individuals—2.8%(5.9%); income from capitals and real estate—2.2% (3%); catering and hospitality—1.1% (1.7%); carriage driving—0.7% (0.7%); other occupations—4.3% (17.9%). While Cossacks used to dominate the Tatar class structure before, in the latter half of the 19th century burghers became the prevalent group (63.4%), followed by peasants (19.4%), troop Cossacks (11.5%), foreign subjects (3.5%), merchants (0.9%), 'indigenous' dwellers (0.6%), noblemen by birth and personal noblemen, public officials, honorary citizens (0.5%), unidentified individuals (0.2%) [Pervaya vseobshchaya, Vol. 28, pp. 140–143, 164–165].

Tatar entrepreneurs were actively engaged in developing the city's economy and education, in particular as officials in local self-government authorities. In 1876–1880, Tatars had 10 out of 66 seats in the Orsk City Duma; in

The house of Merchant Burnaev in Orsk, Orenburg guberniya, second half of the 19th century. Photo from 1972.

1880–1884, 7 out of 72; in 1893–1897, 5 out of 26 [Orenburgskie gubernskie vedomosti, 1876, May 29; 1880, July 5; 1884, June 30; 1889, March 11; 1894, January 29]..

Troitsk

Denis Denisov

Troitsk was founded in 1743 as a fortress on the Orenburg frontier line. In 1750, a local trading house was built.

Muslims' executed an important role as the mediators of exchange trade with their co-religionists, on which the city relied economically, determined their high percentage in the population of Troitsk. In 1861, its Muslim population numbered 4,320 (38.4%), which value had increased to 8,013 (42.7%) by 1894. Tatars made up the vast majority of the local Muslim community.

The borderline fair that took place at the local trading house from July 1 to October 1 was crucial to the economy of Troitsk. A total of 108 caravans consisting of 12,902 baggage animals arrived there in 1860 [Pamyatnaya knizhka, 1865, pp. 12–14]. From the latter half of the 18th century, Tatar merchants sent caravans to Bukhara, Tashkent, Khiva, Kokand, Turkestan, Khujand, Kashgar, and other cities annually [State Archive of Orenburg Region, f. 3, inv. 1, file 194; f. 5, inv. 1, file 17]. In 1845, Troitsk merchant A.-V. Abubakirov led the first caravan to Qoqek and back, carrying Chinese tea,

thus founding a new tea route. The Exchange trade volume—peaked in the 1870–1880s. The total value of goods sold there in 1884 was 5,830,000 rubles [Obzor za 1885 god, p. 13].

Apart from border and caravan trade, stationary trade developed intensely in Troitsk to meet the demand of not only migrants but the city's and uyezd's constantly growing population. While in 1862 the city's trade network consisted of 129 shops, there were 254 of them (40 stone and 214 wooden ones) in 1891 and

545 (56 stone and 489 wooden ones) in 1907 [Pamyatnaya knizhka, 1865, pp. 10–12; State Archive of Orenburg Region, f. 164, inv. 1, file 142, s. 14 reverse–15; Vedomost' o chisle zdaniy, 1908, unbound]. Large wholesale and retail businesses, such as the: Yakushev Brothers' Gallery, K. Abdrashitov's Fashion and Textile Shops and those of L. Yaushev's Descendants, Bakirov's Small Trade Gallery on the Lower Market, M. Valeev's Fashion and Textile Shop, which used innovative promotion techniques (advertising, discounts, sales) and services, including optional ordering and reworking, were founded in the late 19–early 20th century.

In the late 19–early 20th century, Tatar representation was high in the grocery network. Tatars dominated the city's wool, tallow, leather, bread, textile, and small ware trade, controlling the whole fur and fruit trade.

Troitsk was one of the key channels through which Kazakh livestock was supplied to Russia, which determined the early development of the animal produce processing industry in the city. In 1871, Tatar merchants owned 7 out of 15 rendering houses producing a total output amounting to 30,870 rubles (19.6% of the total output); in 1895, 10 out of 13 slaughter houses yielding 202,307 rubles (69.6%) [State Archive of Orenburg Region, f. 164, inv. 1, file 21, s. 1–2; Perechen' fabrik, 1897, pp. 532–533]. The soap industry gradually separated from rendering. 3 out of 5 soap plants were Tatar-owned in the early 20th

century [Gorod Troitsk, 1912, p. 112]. The percentage of Tatar entrepreneurs in the city's leather industry increased from 25.8% in 1871 to 86% in 1917 [State Archive of Orenburg Region, f. 164, inv. 1, file 21, s. 2 reverse-3; f. 364, inv. 1, file 32, s. 5].

The annexation of Central Asia by Russia and new railroads caused the trade volume of the Troitsk trading house to decrease gradually in the late 19–early 20th century. To remain competitive under these changed conditions, Tatar entrepreneurs had to re-equip their plants, move their commercial and procurement activities as well as industrial production closer to the raw material sources, and develop a trade network in the Urals, Kazakhstan, and Central Asia.

The brothers Gabdulvali (1840–1906), Muhammadsadyk (1845–1899), Muhammadsharif (?–1906), and Mullagali (1864–1926) Yaush-ev founded the House of Commerce with its head office in Troitsk, offices in Moscow and Warsaw, branch offices in Chelyabinsk and Kochkarsky Settlement, Orenburg guberniya, Kostanai, Turgay Olbast, Tashkent, Chimkent, and Aulie-ata (Taraz), Syr Darya Oblast, Tokmak, Semirechye Oblast, Qulja, China, and at the Nizhny Novgorod, Irbit, Zverinogolovskoye, Zlatoust, Karachelskoye, Kundravy, Tukmak, Turgay, Ust-Uyskoye, and Chumlyak Fairs. There was an extensive network of wholesale and retail shops to sell textile, small ware, leather, iron and hardware, tobacco, paint, grocery, colonial goods, fur, tea, sugar, bread, etc. The Yaushevs made part of their goods at their industrial plants in Troitsk: a tanning and soap factory (the 1895 yearly output amounted to 216,019 rubles), a slaughter and rendering house (the 1908 yearly output amounted to 2,737 rubles), a tea packing plant (the 1905 yearly output amounted to—160,000 rubles), a steam mill (the 1895 yearly output amounted to 115,737 rubles). Entrepreneurs developed agricultural produce processing in Central Asia²⁰.

²⁰ They founded a wool-scouring plant in Tokmak and cotton plantations around Tashkent, and in 1888 they built a clay brick treatment plant in Alimkent in the Tashkent district of the Syrdarya region (in 1895 products worth 25,203 roubles were manufactured).

The data of the First General Census of the Russian Empire of 1897 revealed a high Tatar concentration in commerce and production in Troitsk. Key Tatar occupations included day-labour—26.8% (with a total city percentage of 25.3%); commerce—25.1% (12.4%); industry and handicrafts—19.3% (17.5%); receiving income from the treasury, public institutions, and private individuals—7.6% (7.3%); catering and services—4.4% (2.6%); agriculture—3.4% (9.7%); construction—3.4% (4.7%); cab driving—2.7% (1.6%); receiving income from capital and real estate—2.3% (2.7%); teaching—1.2% (1.2%); worship services—0.8% (2.7%); military service—26% (8.9%), other activities—2% (7.6%). In terms of classes, 58.6% of Troitsk Tatars were burghers; 34.6%, peasants; 3.6%, merchants; 1.1%, Cossacks; 0.9%, 'indigenous dwellers'; 0.6%, unidentified individuals; 0.3%, noblemen by birth; 0.1%, foreign subjects; 0.1%, personal noblemen and public officials [Pervaya vseobshhaya, Vol. 28, pp. 144–147, 166–167].

Troitsk became one of the largest Islamic religious and cultural centers in the Southern Ural. The city's 1st mosque was built in 1828, followed by a second one in 1835–1838, a third one in 1863, a fourth one in 1878, a fifth one in 1879, a sixth one in 1894–1895, and a seventh one in 1912.

All mosques ran madrasahs, which initially had a small number of students. In the 1890s, the system of Islamic education was reformed completely in Troitsk with the financial support of the local bourgeoisie. The listening training method and secular subjects were introduced. New curricula were developed. Other innovations included the class-and-lesson system and examinations. Like the Prenburg-Kargala centre, Troitsk became a major city offering training to teachers.

Mosques and confessional schools were built and maintained at the cost of the bour-

Nearby, in the town of Kinsay at the Keles Yausheva railway station, a second factory was also founded (in 1908 products worth 126,400 roubles were manufactured) [Perechen' fabrik, (List of plants), 1897, p. 42–43, 530–531, 800–801; List of factories 1910, p. 5; List of factories 1912, p. 30].

An inn in Troitsk. 1868–1870. Photo from the early 20th century.
Modern-day S. Razina Str. 9.

geoisie, whose donations gradually formed the local waqf property²¹.

A high Tatar percentage in the population, a large stratum of house owners and commercial and industrial bourgeoisie ensured their active involvement in local issues, the city's economic and social development through elected self-government bodies. The Tatar percentage in the Troitsk City Duma increased gradually over the last quarter of the 19th century. While in 1872–1876 it was 19.4%, the value increased to 27.1% for the period of 1888–1892. However, Alexander III's counter-reform of 1892 limited their quota to 20%, which could not ensure their representation in the municipal authorities that would be adequate to the Tatar percentage.

In order to ensure social protection for the population, the development of education and culture, Troitsk Tatars founded the first Muslim public organisation in the Orenburg Governorate. The Troitsk Muslim Charity Society was incorporated in 1898. It provided aid to starving people in famine-stricken areas and targeted aid to the needy, funded city Mus-

lim schools, founded an orphanage, contributed to cemetery maintenance, etc. [Denisov, 2009c, p. 360].

Ufa

Ildus Zagidullin

In the late 16th to district century, the composition of the Ufa Fortress, inhabited by Tatar 'interpreters', 'New Christians', and 'Sloboda Tatars', was determined by the administrative functions that the military settlement

was expected to perform [Davletshina, 2001, p. 28]. Ufa was promoted to administrative centre of the re-established Orenburg guberniya in 1744. In 1796, when the Vicegerency of Ufa was transformed into the Orenburg guberniya, Ufa became an uyezd centre. It was promoted to governorate centre following the establishment of the Ufa guberniya in 1865.

In 1835–1865, the city hosted the chancellery of the commander of the Bashkir Meshcheryak army [Öfö tarixı, 1983, p. 77].

Characteristically, it was in that city with a small Tatar population where the Orenburg Mohammedan Spiritual Assembly²² was located. Mufti G. Gabdrakhimov was able to obtain a 'vacant neighbourhood' for the religious administration, in the centre of which a stone mosque was built at the cost of 2nd Guild Merchant from Tsarevokokshaysk Mukmin Khazyaseitov in 1830 (reconstructed at the end of the century) [Azamatov, 1996, p. 51]. Besides, donations were used to build a house for clergyman candidates coming for examinations. The mufti's house was built at the government's expense. In 1865, the marriage tax, imposed in 1834, enabled the community to complete the two-story administrative building of the Orenburg Mohammedan Spiritual Assembly with an apartment for the mufti in it.

Mufti S. Tevkelev made a major contribution to the development of the city's Islamic

²¹ Thus, in 1895 the merchant M. Bakirov donated a stone bench costing 2,000 roubles to the first mosque. In 1901 G.-V. Yaushev donated land with numerous buildings worth more than 2,500 roubles to the 6th community, and in 1906 under the will of M.-Sh. Yausheva a waqf fund worth 35 thousands roubles was established to fund the second mosque and community madrasah 'Muhammadiya' [Azamatov, 2000, p. 49–52].

²² In 1797–1802 it was (temporarily) located in Orenburg [Azamatov, 1996, pp. 25].

infrastructure. In 1877, he founded a Muslim orphanage and poor-house at his cost, to which he donated two out buildings in the eastern part of the OMSA neighbourhood. A large house with an outbuilding and a garden was bought for the Muslim orphanage of the 1st cathedral mosque to celebrate the 100th OMSA anniversary [Shirgazin, 2007, pp. 314–315].

The fact that the OMSA had its office in Ufa largely determined the establishment of the Tatar Teachers' School in the city in 1872, which was transferred to Orenburg following an inspection (1876) by the Minister of Public Education D. Tolstoy.

In 1870 the establishment of regular steamboat communication on the Balaya River and, most importantly, the construction of the Samara–Zlatoust Railroad favoured the growth of Ufa's population, in particular Tatar. The railroad reached Ufa in 1888, thus turning it into a major Southern Ural transport hub and intensifying its economic activities [Istoriya Ufy', 1981, pp. 96, 97]. The population numbered 49.3 thousand people in 1897, 68.2 thousand in 1904, and 100 thousand in 1916 [Valeev, 2007, p. 25].

Muslims are known to have made up 8% of the total population of Ufa in 1886 [Ufimskij, 1887, pp. 143, 144]. In 1897, it was home to 2,524 Tatars (5.1%), 3,151 Bashkirs (6.39%), 84 Meshcheryak (0.17%), and 72 Teptyars (0.15%). Ufa had the largest percentage of noblemen of all Tatar city communities in Russia—8.1% (with the total city percentage of 4.5%). Speaking of other population groups, the class composition of the Tatar population was as follows: personal noblemen and public officials—1% (total city percentage—4.6%); honorary citizens—0.4% (1.2%); merchants—0.4% (1.4%), burghers—28.6% (37.9%), peasants—59.2% (46.4%) [Pervaya vseobshhaya, Vol. 45, pp. 174–175]. In the early 20th century, the dynamics of the Muslim population size significantly exceeded total city values. Muslims made up 1/3 of the Ufa population in 1910 (32.8%, or 31,897 people) [Goroda Rossii, 1914]. At the end of the century, literacy rate was 40% among Russians, 25% among Tatars, and 24% among Bashkirs [Istoriya Ufy', 1981, p. 123].

The increasing size and power of the Muslim community influenced their representation in the city дума in a positive way. In 1915, they made up 11—out of 61 дума members [Spravochnik, 1915, pp. 6–9].

Social division of labour in the Ufa Tatar community was hardly different from that in other urban ethno-confessional communities of the Volga-Ural Region. In the early 20th century, the Karimovs' Trading House monopolised the city's textile trade and carried out commercial operations in food stores [Kabanova, 2004, pp. 68–69].

Most of the Muslim population lived in the city's outskirts, primarily in Nizhegorodskaya Sloboda, where a second (wooden) mosque was built in 1873 to be followed by a third, stone, one in 1903. Merchant Abdulatif Khakimov built a fourth mosque, a two-story building of stone with two minarets, in the Russian part of the city, near his house. The Muslim community began to build a 5th mosque in 1914. However, the outbreak of war, and its opening was delayed for four years.

The first madrasah in Ufa was founded in 1887 by the imam of the First Cathedral Mosque Hayrullah Usmanov (1847–1907). It offered education to the children of Ufa residents and Muslims from across the Ufa Uyezd. In 1891–1892, it moved to the OMSA neighbourhood. The brick building of the 'Usmaniya' Madrasah appeared here in 1905 [Shirgazin, 2007, pp. 314–315]. The second madrasah, 'Khusainiya', appeared in 1903 [Ütäbay-Kärimi, 1997, p. 101]. The third madrasah, 'Galiya', was founded in 1906 by Zuya Kamali, (a graduate Usmaniya) who studied at the University of Cairo at the expense of the local Muslim charity organization [Ütäbay-Kärimi, 1996, p. 191]. In 1910, the city had 9 active Tatar schools—4 madrasahs and 5 maktabas.

The Orenburg mufti, OMSA members, and Tatar noblemen played a significant role in the community's socio-cultural life. Merchants cooperated with noblemen to protect their poor coreligionists and the education of the younger generation in the Ufa Poor Muslim Protection Organisation (1898, first chairman akhund: Kh. Usmanov) [Otchet pravleniya, 1901], the Ufa Muslim Charity Association (1915, chairman,

In the bazaar square of Ufa. Photo from the early 20th century.

merchant Muhammadnazip Khakimov) [Otchet, 1916], and the Ufa Muslim Consumer Society (1915) [Ustav, 1916].

The Ufa Muslim Ladies' Society (1907, president: Mariam Sultanova) founded a girls' orphanage and ensured training for 'several hundred of Muslims' daughters at ethnic women's schools,' for which purpose it raised funds from the zemstvo, the city administration, and other donors [Otchet, 1912a].

In the early 20th century, Ufa was a major Tatar urban cultural centre. In 1906–1907, the newspaper 'äl-Galämel-islami' ('Islamic World', first editor: D. Abylgildin) was published there. 'Tormış' ('Life') appeared in 1913–1918. Such magazines as the 'Mäğlumate mäxkämäi şärgıyayı Orenborgıya' (Proceedings of the Orenburg Muslim Spiritual Assembly, had found their niche in the Tatar informational expanse, it was published from 1908–1911, 1916–1917),²³ the weekly 'Mäğlumate cädidä' ('New Information', 1911–1912), and 'Ufanıñ avıl könküreşe jurnalı' ('Ufa Journal of Country Life', 1914–1917) [Tatar wakıtlı, 1999].

The first Tatar printing house 'Şarık matbası' ('Oriental press'), 1908, was a branch of the Partnership of Karimov, Khusainov, and

Co., Orenburg. It published about 200 books, mostly authored by local artistic intelligentsia [Karimullin, 1974, pp. 165–168]. The second private printing house, owned by Usmanov, was founded in 1911 and remained active for 2 years [Khayrullina, 2004, p. 207].

To sum up, in the early 20th century Ufa was the Muslim center of Southern Ural. It had

madrasahs, adequate, newspapers, magazines, and publishing facilities. The cooperation of the city's bourgeoisie and Tatar intelligentsia accelerated the modernisation of the ethnic culture.

In conclusion it should be noted that the development of Russian cities in the late 18th century, in particular the Tatar urban communities in the south-east of Russian resulted from the policy of the government. The key frameworks within Tatar urban communities developed from the end of the 19th to the beginning of the 20th century were largely determined by how rapidly capitalist relations developed, how rapid the progress of Russian modernisation was, and what socio-economic processes took place far from the country's centre.

In most Volga-Ural and Siberian cities, Tatars were the second largest ethnic population group after Russians.

Cities were centres where close contacts of various confessional population groups took place and a new intelligentsia, represented by Tatar elites with European education, formed. They concentrated the ethnic capital and merchantry as the regional elite, whose modernisation efforts brought about social innovations in the Tatar communities.

²³ The first editor (1908) was the imam of the 3rd mosque M. Khasanov, after whom it was the heads of the OMSA Khasangat Gabyashi, Nurmukhamed Mamleev and the honorary citizen by birth Giniyatulla Kapkaev.

CHAPTER 2

Provincial Tatars

§ 1. Western Siberia

Svetlana Korusenko, Nikolay Tomilov

By the beginning of the 20th century, the following three groups constituted the core of the contemporary Tatar population of Siberia: the local Turkic-speaking population, Bukharans, and the Volga-Ural Tatars.

By the end of the 18th century, the territories of the following native Turkic-speaking ethnic units had formed:

- the Tobol-Irtysh Tatars, including the Tyumen-Turinsk, Tobolsk, Yaskolba, Kurdak-Sargat, and Tatar Tatars;
- the Baraba Tatars;
- the Tomsk-Ob Turkic-speaking group, which included the Eushta Tatars, the Chats, the Ob Tatars, and the Kalmaks.

As a result of the changes in the settlement of Siberian Tatars that took place from the late 16th to the middle of the 18th century and were caused by the colonisation of Siberia, striped settlement patterns of population groups coming from the European Russia, and the volatile situation in a number of regions brought about the discontinuity of territories between the Tyumen, Kurdak-Sargat, and Tara Tatars on the one hand and the Tyumen and Turinsk Tatars on the other hand: the Chats' migration to the Cis-Ob region broke the ethnic Baraba and Turkic territory in the Middle Cis-Ob region into separate fragments. The territory of the Tobolsk, Tyumen, and Yaskolba Tatars was coherent. The Tobolsk Tatars lived next to the Kurdak-Sargat Tatars. The latter group's territory was adjacent to that of the Tara and Baraba Tatars. The two groups also shared a border area. In the east, the Kalmaks, the Ob Tatars, the Chats, and the Eushta Tatars were within a coherent territory, where individual representatives and small groups of Tobol-Irtysh and Baraba Tatars also lived. Such a geographical

arrangement of different Siberian Tatar groups in principle remained unchanged from the 19th to the beginning of the 20th century. Administratively, the territory inhabited by Siberian Tatars consisted of southern areas of the Tobolsk (the Tara, Tobolsk, Tyumen, and Yalutorovsk districts) and Tomsk (the Kainsk and Tomsk districts) guberniyas.

In the 19th century, each group lost some old settlements and developed new ones; some of the existing localities expanded. Major shifts in the dispersal of Siberian Tatar groups were attributable to the Russians' reclamation of the region for the purpose of farming. This primarily led to a striped pattern in the arrangement of their settlements and agricultural lands. In the Turinsk and Ob Tatar groups, Russians settled directly in their villages. It was not uncommon for Ob Tatars to live in Russian villages. Other Tatar groups had no practice of the kind. Only in the late 19th century, the Russian percentage began to grow in a number of Tatar settlements. It was the highest in the Ob Tatar localities. In the 18th century, the Russian concentration was relatively high in certain Tomsk Tatar villages, which was largely determined by the presence of baptised Tatar groups within them. In the Tobol-Irtysh Tatar groups, the percentage of baptised Tatars was so small that they tended to move to Russian localities. Even though the government supported the Tatar population in terms of protecting the integrity of their land, the re-allocation of land between Tatars and Russians through sale and lease became common. Russians came to greatly outnumber the indigenous population of Western Siberia back in the 17th century, and over the course of the 18th century their number increased 2.4 times [Kabuzan, Troitsky, 1962, p. 146]. ber of places, an inflow of Russians narrowed down the Siberian Tatar habitat and aggravated the territorial disunity of certain groups.

As Russian cities emerged and developed in Siberia, part of the Siberian Tatars became their residents. For instance, the Tatar Sloboda was founded during the construction of Tobolsk. In 1816, the Tatar population 'consisted of 23 yasak people of both sexes and 134 Tatars (men) from the Tatar Cossack team' [Russian State Historical Archive, f. 1264, inv. 1, file 4, s. 155]. 185 indigenous dwellers resided in Tobolsk in the 1880s [Golodnikov, 1882, p. 29]. 23 Serving Tatars resided in Tyumen in 1816. The Tatar population of Turinsk numbered 12 in 1835 [Russian State Historical Archive, f. 1264, inv. 1, file 71, s. 49]. 72 people resided in Tara in 1816 [Government Institution of Tyumen Region State Archive in Tobolsk, f. 154, inv. 8, file 354]. A Tatar Sloboda was also founded in Tomsk, where Serving Tatars resided together with the Bukharans. In the early 1820s, the Tomsk Tatar team numbered 54 people (about 100 people including wives and female children) living directly in the city [Russian State Historical Archive, f. 1264, inv. 1, file 4, s. 148 reverse–149, 156 reverse; inv. 546, s. 18]. It is entirely possible that some Siberian Tatars (mainly coming from the Tobolsk guberniya)

in the 18th to 19th century took residence in Petropavlovsk, where Volga Tatars, Bukharans, and Kazakhs also resided [Russian State Historical Archive, f. 1265, inv. 9, file 226, s. 2–7; Slovtsov, 1881, p. 9]. By the end of the 19th century, the total urban Siberian Tatar population numbered 653. However, they were clearly a minority as compared to the non-indigenous Volga Tatars in terms of percentage.

The population dynamics of the three key Siberian Tatar groups—the Tobol-Irtysh, Baraba, and Tomsk Tatars—over the 19th century is presented in Table 12. The table largely refers to consolidated and primary records of the 5th (1795), 8th (1834), and 10th (1858) censuses, as well as those of the First All-Russian Census of 1897, which S. Patkanov processed to single out data on certain peoples and ethnic population groups.

The data in Table 12 indicates that the Baraba Tatar population decreased. It has been argued that the decrease in the Baraba Tatar population is attributable to a deterioration in living conditions (in particular, heavy murrains) and the spread of epidemic diseases. The Baraba Tatars remained semi-nomads in the 19th century. Livestock breeding was their primary occupation. In the 19th century, the Tomsk Tatar population increased insignificantly. It is at-

Table 12

Dynamics of the number of Siberian Tatars in the late 18–19th centuries

Groups of the Tatars	1795	1834	1858	1897
Tobolsk-Irtysh	21,482	28,195	30,325	37,648
Barabinsk	(5060)*	4876	4411	4433
Tomsk	2723 (as of 1805)**	2764	(1770)***	4016
Total:	29,265	35,835	36,506	46,097

* The total number of the Baraba Tatars was calculated based on the number of males. ** The number of the Chats and Eushins given is from 1795 (materials of the 5th revision of population), the number of the Ob Tatars and Kalmaks was taken from the Bulletin of the Tomsk District on the Population from 1805 [State Archive of Tomsk Oblast, f. 144, inv. 1, file 1]. *** The number was stated without the Ob Tatar group and was calculated based on the number of males.

tributable to the partial Christianisation of the Tomsk Tatars. Those baptised eventually assimilated with the Russians. Population growth was the highest in the Tobol-Irtysh Tatar group, though there were periods when some of the local groups dwindled. The Tobol-Irtysh Tatars were less inclined to convert to Christianity because Islam was strongly entrenched in their communities. This is especially true with the Tara and Tobolsk Tatars.

The Bukharans, who had begun to move to Siberia before the Muscovite State annexed it, also lived within the Siberian Tatar habitat. Their inflow was the largest in the latter half of the 17–18th century. The following four territorial groups of Siberian Bukharans were formed: 1) Tyumen; 2) Tobolsk; 3) Tara; 4) Tomsk. The Tomsk Bukharans were largely an isolated group. The remaining three groups often consolidated, which happened in the early 19th century, when new duties were imposed on the Bukharans. To quote an address to Governor-General of Siberia I. Pestel: 'Most humble request by the Tobol, Tyumen, and Tara Bukharans and Tashkent people's attorneys Mament Shikhov and Magomet Shikhov' [State Historical Archive of the Omsk Oblast, f. 2, inv. 1, file 158, s. 1a]. This indicates the Bukharans living in the territory of the Tobol-Irtysh Siberian Tatar groups to have been closely interconnected. These groups can be singled out because the Bukharans tended to form groups around large cities as their primary occupation was initially commerce. They lived in the Siberian Tatar territory. Part of the land was in hereditary use of large Bukharan family

groups (such as the Imyaminovs', Shikhovs', and Aytykins' land in the Tara uyezd, the rights on which were confirmed by 'excerpts' from patrol books dating back to the end of the 17th to the first half of 18th century and shajara genealogies). The Bukharans originally had close contacts with the Siberian Tatars, including marital relationships. The Bukharan population included small groups of indigenous Siberian Tatars, migrants from the Kazan guberniya, Kalmyks, and Kazakhs (for instance, in Petropavlovsk, where the Bukharans were controlled by the head of Tobolsk). This is attributable to the privileges that Russian rulers granted to the Bukharans from time to time. The Bukharan population of the Western Siberia was divided into administrative districts, each controlled by an elder. For instance, at the end of 18th century, the Bukhara volost was established in the Tara district, while the Bukharan population of the Tobolsk and Tyumen districts were administered by the Bukharan elder. By the middle of the 19th century, the Bukhara volosts of the Tobolsk and Tyumen districts had been established. There also was a Bukhara volost in the Tomsk district.

As is indicated in Table 13, the Siberian Bukharan population grew constantly; a significant level of growth occurred in the first half of the 19th century. The first half of the 19th century was a period of a focused eastern governmental policy and the Empire's expansion into the Central Asian region, which favoured further migration from Central Asia to Siberia, which primarily attracted farmers. However, at that time newcomers were no longer enti-

Table 13

**Dynamics of the population of the Siberian Bukhara Tatars
in the last quarter of the 18–19th centuries**

Territorial groups of the Siberian Bukhara Tatars	1782	1834	1858	1897
Tyumen guberniya	1547	(2548)*	3147	3412
Tobolsk	1888	3156	3422	3308
Tara	1243	2424	3339	4515

Total:	4678	8395	10,215	11,517

* The total number was calculated based on the number of males.

tled to land. Most of the migrant Bukharans resided in indigenous territories and those of the Bukharans to whom land was assigned in the 17–18th century. This is why mid–19th century land management documents provide information on the land owned by this or that Bukharan clan (like the Shikhovs, the Imyaminovs, the Burgutovs, and others in Tara) and report a lack of land, limiting ownership opportunities to livestock plots. In the late 18th century, the Tobolsk group of Siberian Bukharans was prevalent, while in the late 19th century the Tara group became the largest because a branch of lake settlements in the forest-steppe zone was founded by Bukharans in the late 18–early 19th century [Korusenko, 2006, pp. 47–51]. While in the early 18th century Bukharans tended to live around cities, such as Tyumen, Tobolsk, and Tara, in the 19th century remote territories of the Tara district also had a very compact population; the Tyumen and Tobolsk Bukharan groups scattered among the local Tatars. For instance, the journal of the Tobolsk District Office for Peasant Issues (Record No. 91, dated 1 July 1895) reads as follows: 'Tatar volosts have the following features: Bukharans live in nearly all Tatar yurts; it is a most peculiar group of Tatar-populated volosts "consisting in the fact that nearly in each Tatar settlement its dwellers belong not to a single indigenous volost but to very nearly all of them'... The population of the Bukhara volost, which also has its indigenous population in the city of Tobolsk, while the most remote yurts of the volost lie within the Tyumen and Tara districts, is even more scattered' [Government Institution of Tyumen

Region State Archive in Tobolsk, f. 479, inv. 2, file 51, s. 37, 38].

The fact that the 1926 census reported nearly all Bukharans residing in the Tara district—11,517 people (of whom 497 were Tara residents)—is attributable to the changing size of various Bukharan groups and their dispersal. The census recorded 3 Bukharan residents of the Tobolsk district and 81 in the Tyumen district [Vsesoyuznaya perepis' naseleniya 1926 goda]. Therefore, the process of Bukharan Tatarisation had already begun by the early 20th to be completed by the mid–20th century.

The Volga Tatars had begun to move to Siberia even before it became part of Russia. Following the annexation of Siberia, Volga and Ural Tatars tended to migrate to Tobolsk and Tyumen Tatar territories. However, 'Kazan people' were occasionally in other Turkic-speaking groups. For instance, the 1701 Patrol Book of the Tara uyezd mentions, apart from yasak, service class, and zakhrebetnik Tatars and Bukharans, representatives of the non-indigenous Turkic-speaking population, namely people from Kazan—10 adults and one child (1.0% of the uyezd's Turkic-speaking population). They resided both in villages around Tara and in Tara itself and in remote localities, primarily small ostrogs. Most of them owned no land; some did not even have livestock.

It is assumed that in the 18th century a group of Tatar migrants from the European Russia settled among the Tobolsk Tatars in the Tobolsk district to be later known as 'obrok Chuvalshhiks' (non-Russians) [Patkanov, 1912, p. 120; Tumasheva, 1977, p. 15]. Most of them were Tatars from the Kazan, Samara, and other

guberniyas who had moved to Tobolsk. They gradually took residence in local Tobolsk Tatar yurts. The city's population was as small as 24 people in 1782 [Government Institution of Tyumen Region State Archive in Tobolsk, f. 154, inv. 8, file 4, s. 1218]. The first Chuvalshhiks came to Siberia in the latter half of the 17th century. Unlike yasak Tatars, Chuvalshhiks paid obrok and not yasak. This is why they formed a special obrok Chuvalshhiks volost. However, administrative documents sometimes referred to obrok Chuvalshhiks as yasak Tatars. Part of the yasak and zakhrebetnik indigenous Siberian Tatars must have been included in the obrok Chuvalshhik group. Therefore, we believe this Tatar category to be a mixed Siberian and Kazan population group. Unlike 'pure' Volga-Ural Tatar migrants, who remained peasants, they became sedentary indigenous dwellers within the framework of M. Speransky's reforms. At the same time, the indigenous obrok Chuvalshhik volost existed until the 20th century. It was dissolved in 1910 [Bakieva, 2003, p. 59].

It was not until the latter half of the 19th century that a mass migration of Volga-Ural Tatars to Siberia took place, which affected the culture and ethnic development of the Siberian Tatars. Most of the Tatar newcomers belonged to the Kazan Tatar groups. However, some of them were Ufa Tatars, Mishars, etc. Many of them continued to take residence in indigenous Siberian Tatar villages or found new localities near them.

The number of Tatar migrants in Siberia grew slowly and remained generally insignificant until the 1860s. Speaking of the Tomsk Kazan Tatar group in the last quarter of the 18th century, J. Falk (1771) reported the Tomsk Tatar and Bukharan population to number 200 people of both sexes [Falk, 1824, p. 54]. In 1816, the Tatar population of the Kazan volost, Tomsk district numbered 107 people, namely 59 men and 48 women [State Archive of the Tomsk Region, f. 321, inv. 1, file 10, s. 5–13].

Documents report 91 Kazan Tatars to have lived in three districts of the Tobolsk guberniya—Tara, Tobolsk, Tyumen—in 1782; this number had decreased to 27 by 1816. In fact, there were more of them in the districts, especially in that of Tobolsk, because they were not

recorded by ethnic affiliation within the yasak, zakhrebetnik, house-serf, and service groups. Part of the Kazan Tatar population was included in the obrok Chuvalshhik group. However, it is impossible to single them out because they assimilated with the Siberian Tatars. According to different statistics, the number of obrok Chuvalshhiks in the Tobolsk guberniya in 1782 was 254 male individuals [Russians State Archive of Ancient Acts, f. 248, inv. 53, file 4342, s. 466 reverse; Russian State Historical Archive, f. 1341, inv. 1, file 295, s. 146 reverse] or 249 people [Russian State Historical Archive, f. 1341, inv. 1, file 295, s. 92–92 reverse]; in 1812, 325 people on the census list; in 1816, 376 male individuals, or 622 people; in 1858, 920 individuals of both sexes [Government Institution of Tyumen Region State Archive in Tobolsk, f. 154, inv. 8, file 427, s. 1–57; file 804, s. 1–185]. If we assumed that the Kazan Tatars account for half of the total obrok Chuvalshhiks, this would yield their approximate number, data on migrants included. This would be 340 individuals of both sexes for 1782; 500 for 1834; and 600 for 1858.

Records report the Tatar migration from Europe to Siberia to have not become mass-scale until the last third of the 19th century. Even in 1858, non-indigenous Tatars in the Western Siberian Plain were only 700 people (or a little more). Their number grown rapidly to 14.4 thousand people by 1897 (Table 14).

Volga and Ural Tatars tended to co-reside with local Tatars. They came to prevail in some localities. For instance, the 1897 census revealed a non-indigenous Tatar percentage of about 55% in a number of villages in the Tara uyezd, Tobolsk guberniya (Bayby, Tashetkany, etc.). They came in family clans. It was common for families from the same uyezd to live together. In Tashetkany, most non-indigenous people came from the Bugulma uyezd, Samara guberniya. New villages were founded from time to time. For instance, the villages of Molodtsovo and Malye Murly were founded in the same uyezd in the last quarter of the 19th century. Kazanka was founded in the early 20th century.

Thus, mass Volga and Ural Tatar migration brought about major changes to the dispersion

Table 14

Number of Volga and Ural Region Tatars in the West Siberian Plain in 1897

(calculated based on [Patkanov, 1911, pp. 2–3, 130–131])*

Group of Tatars, district	Urban population	Rural population	Urban and rural population
<i>Tobolsk guberniya</i>			
Tobolsk, Tura, Tyumen, Yalutorovsk and Tara (lived with the Siberian Tatars)	745	5452	6197
Beryozovsky, Ishim, Kurgan, Surgut, Tyukalinsk (lived without the Siberian Tatars)	110	1767	1877
Total:	855	7219	8074
<i>Baraba Governorate</i>			
Kainsk	113	1251	1364
<i>Tomsk guberniya</i>			
Tomsk	1335	2237	3572
Mariinsk	113	1251	1364
Total:	1448	3488	4936
Total:	2416	11958	14374

* The data of the 1897 census offers us information on the ratio of native and immigrant groups (Volga-Ural Tatars and Bukhara Tatars) as of the late 19th century.

of indigenous Tatar groups by the end of the 19th century. Already in that period, Tatar migrants made up over one third of the Tomsk Tatars and almost one fourth of the Baraba Tatar population. However, the groups remained small as compared to the Tobol-Irtysh Tatars. Non-indigenous Tatars made up a little more than 14% of them in the late 19th century. Table 15 indicates Tatars from the Volga and Ural Regions to have accounted for most of the urban Tatar population, namely 52.2% in the Tobol-Irtysh group, 99.1% in the Baraba group, and 82.1% in the Tomsk group. In general, the Tatar population expanded greatly over the last third of the 19th century, primarily due to migration.

Tatar population growth rate was even higher in the first 15 years of the 20th century due to more intense migration from the Volga and Ural regions. For instance, 1911 statistics report the Tomsk guberniya alone to host over 36,000 Muslims, most of whom were non-indigenous

Volga-Ural Tatars [Pamyatnaya knizhka Tomskoj gubernii za 1912 god, p. 184]. In the Tobolsk guberniya, an increase in the number of non-indigenous Tatars in the early 20th also caused a rapid growth of the Tatar (both indigenous and non-indigenous) population. It numbered over 66,000 people in the governorate in 1907 [Dunin-Gorkavich, 1909, p. 6].

To limit our analysis of Tatar population size in the late 19th century to the territory inhabited by certain groups would yield incomplete results. Tatar migrants from the European Russia formed their localities and even founded enclaves in the Tomsk guberniya (Altai regions), the Irkutsk guberniya, and further to the east. The number of Volga-Ural Tatar migrants to Siberia and the Far East by the late 19th century is provided in Table 16. According to S. Patkanov, 1,515 Tatars were found on Sakhalin, who were not included in the table.

Table 16 suggests a high percentage of urban dwellers among non-indigenous Tatars—

Table 15

The number of Siberian Tatars, Bukhara residents and Tatars transplanted from the Volga and Urals Regions in the late 19th century (according to the 1897 census data)
(calculated based on [Patkanov, 1911, pp. 2–3, 130–131])

from 10 to 40%. However, it did not exceed half in any region.

By the end of the 19th century, the Russian to indigenous ratio in the population of Siberia changed. According to the 5th census, in the late 18th century, Russians accounted for about 70% of the Siberian population [Kabu-

zan, Troitsky, 1962, p. 146]. The 1897 census revealed a Russian percentage of 80.7% in Siberia (including the Far East). However, the Russian to indigenous ratio in the Western and Eastern Siberia was different: 91.4% in the Western Siberia and 65.8% in the Eastern Siberia (including the Far East); indigenous

and non-indigenous Tatars in Eastern Siberia numbered 63,583 (1.9% of the total population), which value was 17,215 people (0.7%) for the rest of the Asian part of Russia. That is, over 80,000 Tatars resided in Asian Russia in the late 19th century.

The multicomponent structure of the Siberian Turkic-speaking population determined its social complexity dating back to the period when the Russians began to develop the territory of Siberia (late 16–17th century) and first local and then indigenous groups

were integrated in the administrative system through newly-established volosts representative of social changes (like the Podgorodnaya volost for former Serving Tatars transferred to the yasak class). Most social unification took place in the latter half of the 19th century, when the three groups belonged to different census categories: indigenous dwellers (indigenous Tatars), state peasants (non-indigenous Tatars), and Bukharans. Yet, representatives of this or that group could cross social borders.

§ 2. Kazakhstan

Marat Sdykov, Nayla Khamitbaeva

The Tatars began to come to Kazakhstan and take residence there in the 18th century, within the framework of the formation of the multinational population following the Russian colonisation of the Kazakh land.

In the 18th century, the population of Kazakhstan was divided into three clan units, namely the Junior Zhuz, which covered the western part, the territory between the Ural and the Emba; the Middle Zhuz in the central part; and the Senior Zhuz around Lake Balkhash. The Junior Zhuz Khan Abulhair's request to Empress Anna Ioannovna to accept him as a Russian subject was enshrined in a decree of 1731. The administrative reforms of 1822–1824 abolished khan government in the Junior and Middle Zhuzes. The rest of the Kazakh land was annexed by Russia by the mid-19th century following the military colonisation of the Central and Southern Kazakhstan. The process was over when the Regulations on Steppe Area Administration were adopted to complete the introduction of the Russian administrative system in Kazakhstan. In the middle of the 1850s, when Russian task groups entered the Syr Darya region, the territory of Kazakhstan was fully included in the Russian Empire. The annexed regions of Kazakhstan formed the Steppe Governorate-General, consisting of the Ural, Turgay, Akmola, and Semipalatinsk oblasts. In 1882, the Semirechye oblast was included in the Steppe Governorate-General.

The following key migration flows from Russia to Kazakhstan can be singled out. The most important one consisted of state-controlled migration waves. Here the parent country established a system of measures to encourage the necessary social and ethnic population group to move eastward. The Orenburg, Siberian, and Semirechye Cossack Armies were established under the emperor's decree in the territory of Kazakhstan and the adjacent land as a military and police force in the steppe areas. In the first half of the 19th century, the second migration flow consisted of migrants looking for shelter and relief of their burdens. The second component of migration to Kazakhstan was the voluntary migration by entrepreneurs, merchants, peasants, and burghers, who tended to reside in urban settlements or near them, founding slobodas and populating the outskirts, which stimulated the local economy and culture. Thus, the colonisation of Kazakhstan and Russia's policy of encouraging central area dwellers to migrate to the newly annexed land caused a multinational population to form by the end of the 19th century.

The governmental migration policy for Kazakhstan focused on ensuring settling for Tatars as a people having a culture, language, and religion similar to those of the Kazakhs. Back in the 18th century, Tatars had been engaged in the 'acculturation' of the nomads of the Kazakh Steppes, which were undergoing a transi-

tion to the Russian Empire. The Volga Tatars were encouraged to carry out commercial activities among the nomads of Kazakhstan. The governmental treasury funded mosque and confessional school building, sent Kazan Tatars to the steppe as mullahs, teachers, etc. The Tatar language became the official language in which tsarist authorities communicated with the nomadic population of Kazakhstan in that period. Religious and linguistic affinity determined close contacts between Tatars and the indigenous steppe people [Zagidullin, 2006, pp. 162–197].

A new flow of migrants during intense colonization of the Kazakh land resulted from the need for political, administrative, and military arrangements in the new colonies. Key new migrant groups included military personnel, service people, public officials, and Cossacks. Suffering a lack of experienced translators, boundary authorities engaged Serving Tatars in the translation of written correspondence in Turkic languages, diplomatic negotiations, and collection of information on events in the Steppe. Tatars served as interpreters and public officials to communicate with the indigenous population.

Tatar mullahs also played an important role because they contributed to the establishment of new mosques and madrasahs, especially where new migrants lived.

Uralsk was the administrative centre of the Ural Cossack Army, which affected the social composition of the Tatar community. It had a high percentage of Cossacks with 10.9% (with a city value of 31.2%) [Pervaya vseobshhaya, Vol. 88, pp. 26–27].

The first reports of a mass Tatar migration to the region date back to the middle of the 18th century. The Tatars initially resided in Uralsk in the second half of the 18th century. In 1760, the government permitted them to inhabit the Irtysh Pale, and groups of Tatars came to the Petropavlovsk and Semipalatinsk fortresses there. The Tatars were attracted to the region to transport cargo between Siberian cities along the Irtysh River. In 1836, the Tatar population of Petropavlovsk numbered 459 people; Semipalatinsk, 1,451; and Ust-Kamenogorsk, 210 [State Archive of Orenburg Region, f. 3, inv. 1,

file 1630, s. 49–53]. Already by the end of the following century, the cities had a wide network of Tatar neighbourhoods, mosques, madrasahs, and maktab schools.

In 1832, the first Tatar settlement in Central Kazakhstan was founded in the territory of Ak-molinsk. The settlement became a large locality where in 1864 130 Tatars, 245 Kazakhs, and 1,319 Central Asian merchants resided. It had a mosque and a Tatar school providing education to 40 children of various ethnic affiliations on its premises [Kosymbaev, 1998, pp. 58–59]. The total Tatar population of Kazakhstan numbered 3.9 thousand people, or 0.23% of the region's total population, by the middle of the 19th century [Vostrov, 1980, p. 18].

Until the mid-19th century, the Tatars tended to reside in Tatar slobodas, which suggests them to have been somewhat isolated from the local population. This is attributable to not only religious differences from other citizens but their occupations, because commerce and mediation were not traditional in the steppe at that time. Therefore, the Tatar population grew mostly due to an influx of migrants. The main reasons that caused Tatars to move to the East were recruitment, forced Christianisation, and dramatic deterioration of living conditions, famine. The government sent part of the Tatar population to Kazakhstan when fortresses and outposts were being built there.

Starting in the middle of the 19th century, the Tatar-inhabited territory began to expand toward southern Kazakhstan because the Russians had occupied the Syr Darya and Semirechye Regions. That is how the settlements of Kokpekty and Zaysan arose. After the Alatau External District was founded in Semirechye in 1856, Tatar and Chala-Kazakh migrants, that is, representatives of the Turkic-speaking sedentary population of the region, descendants of mixed Kazakh and Tatar, Kalmyk, and other families headed there. They founded a commercial sloboda specialising in leather production near the Verny fortification. A madrasah and a mosque opened soon [Asfandiyarov, 1998, pp. 329–330, 333].

However, the largest migration flows in the 19th century moved from the Volga region and Central Russian to Western Kazakhstan. Some

Tatars lived in Uralsk, which had one of the largest Tatar communities in Kazakhstan.

The key Tatar migration destinations in the post-reform period were the city of Aktyuba, founded in 1869—the city's upper part is known as Tatar—and the Kostanay uyezd, Turgay oblast, where a large local Tatar community of 1,725 people formed within a short time [Troynitsky, 1905, Ed. 7, p. 37].

Tatar migration to Kazakhstan and Kirghizia from the Middle Volga and Northern Ural regions, as well as Western Siberia, was more intense in the post-reform period.

The statistics indicates the Tatars became the most influential population group in Kazakhstan by the end of the 19th century.

In the late 19th century, the Tatar population of Kazakhstan numbered 50,114 people, or 1.45% of the region's total population. Tatars were the most numerous in the Ural and Ak-mola regions. Large communities also existed in the Semirechye and Semipalatinsk oblasts. Tatars were the fewest in the Turgay oblast. The 1897 census records for the Turgay oblast reported that 'Tatars, Mordvins, Cheremis, and Bashkirs, belonging to the sedentary part of the population, tend to reside, as Russians do, in northern uyezds, that is, those of Kostanay and, partly, Aktyubinsk' [Pervaya vseobshhaya, Vol. 87, p. LXXXVII]. The largest uyezds,

those of Turgay and Irgiz, in the southern area of the region, were very hard to live in as they largely consisted of salt marshes and sandy soil, which would greatly challenge arable farming.

In terms of total population size, the Tatars were the third largest expatriate community of Kazakhstan after Russians and Ukrainians. They lived in nearly all areas of Kazakhstan.

The Tatars had become a large group of the urban population of Kazakhstan by the late 19th century. The urban population of Kazakhstan at the end of the 19th century numbered 28,875 people, or 57.6% of the region's total Tatar population. The Tatar population of Petropavlovsk numbered 6,129; Semipalatinsk, 5,678; Uralsk, 3,461; Kostanay, 1,411; Iletsk, 1,341; Verny, 1,211. Tatar populations were smaller in such cities as Kopal (961), Lepsinsk (900), Omsk (789), Guryevsk (655), Przhevalsk (539), and Pavlodar (561). Atbasar, Kokchetav, Kokpekty, Kargaly, and Ust-Kamenogorsk were home to less than 500 Tatars each. Other cities in the region had Tatar populations of 100 to 300 people.

Socially, most of the migrants were burghers (18,773 people, or 37.5%), who tended to reside in cities. The second largest Tatar population group consisted of peasants (18,156 people, or 36.2%) and Cossacks (7,637 people, or 15.2%), most of whom lived in uyezds. There were few Tatars that belonged to the

Table 17

Population size in the regions of Kazakhstan in 1897 [Pervaya vseobshhaya, Vol. 81, 84, 85, 87, 88]

Regions	Entire current population of both sexes	% of the total	Tatar population of both sexes	% of the total
Akmola	682,608	19.8	10,819	21.6
Semipalatinsk	684,590	19.8	9940	19.8
Urals	645,121	18.7	17,805	35.5
Turgay	453,416	13.1	3197	6.4
Semirechensk	987,863	28.6	8353	16.7
Total:	3,453,598	100	50,114	100

higher levels of society: only 207 noblemen by birth, 52 personal noblemen, 4 clergymen, and 30 honorary citizens resided in the region. Just as the Tatar merchants (1,225 people, or 2.4%), they tended to live in cities.

Tatar public officials and military servants were only 892 people, or 1.8%. Tatar clergymen and professionals numbered 1,205 (2.4%). A large portion of the Tatar population was engaged in commerce—14,875 people, or 29.7%. Private employees, servants, and day-labourers made up a considerable group of 5,137 people, or 10.2%. The majority of them lived in cities. A small part of the Tatar population worked in city, water, and railroad transport. Most of Tatars engaged in transport were cab drivers (1,710 people). As few as 41 Tatars worked in water and railroad transport. A large part of the region's Tatar population—24,420 people, or 48.7%—was employed in agriculture and industry. Agricultural workers numbered 16,840, or 33.6% of the Tatar population, while industry employed 7,580 people, or 15.1%.

The major economic and social transformation in Kazakhstan that were caused by the entrance of Russian capital to the Steppe and the beginning decay of the traditional Kazakh economy changed the ethno-social structure. Entrepreneurial opportunities attracted to Kazakhstan representatives of new social groups: merchants, industrialists, etc. The urban population had become predominantly 'nonresident' by the late 19th century. At that time, Kazakhstan had 34 cities: 6 oblast centres, 26 uyezd centres, and 2 non-uyezd cities. Tatars formed a new population group in Kazakhstan, primarily in cities.

The Tatar population continued to grow rapidly in the early 20th century. While in 1897 Kazakhstan had 50.1 thousand Tatar residents, in 1917 there were as many as 97.4 thousand. Tatar percentage increased from 1.45% to 1.82% [Bekmakhanova, 1986, Table 35, p. 172; Table 36, p. 173; Table 37, pp. 175–176]. This is attributable to both natural change and migration. However, migration remained the main reason for population growth in the early 20th century.

As industry, especially small businesses and the railroad network, developed in Kazakhstan, the population of oblast and uyezd cities, which were becoming not only administrative and commercial but industrial and cultural centres, began to grow at a higher rate. Having a population of 31,000 people, Semipalatinsk became a commercial and industrial centre of Eastern Kazakhstan in 1900. Petropavlovsk in the north of Kazakhstan had 21,000 residents and 66 agricultural produce processing plants with a capital of over 1 million roubles. The plants employed 1,375 workers of various ethnic affiliations, including Tatars. The population of Kostanay, which was founded in 1879, grew by a factor of 2.5, to 14.3 thousand people over 18 years. That of Akmola, which became a commercial centre, increased at a similar scale. Uralsk was the commercial and industrial centre of Western Kazakhstan. In 1900, its population numbered 39 thousand people. The construction of the Uralsk-Pokrovskoe Railroad in 1895–1896 favoured the city's growth. The population of Pavlodar, Guryev, Ust-Kamenogorsk, Karkaraly, Kokshetau, and other cities grew rapidly.

Table 18

The number and relative share of the Tatars in Kazakhstan in 1897–1917

[Pervaya vseobshhaya, Vol. 81, 84, 85, 87, 88]

Regions	Number, '000 people		Share, %		Increase, % (+, –)
	1897	1917	1897	1917	
Akmola	10.8	24.0	1.59	1.55	– 0.04
Semipalatinsk	9.9	38.3	1.45	1.45	0
Urals	17.8	14.5	2.76	1.81	– 0.95
Turgay	3.2	7.6	0.70	2.01	+ 1.31
Semirechensk	8.4	13.0	0.84	0.98	+ 0.14
Total:	50.1	97.4	1.45	1.82	+ 0.37

The urban population largely consisted of craftsmen, industrial workers, and low-rank employees. At the same time, a lot of public officials and merchants lived in cities that were economic and administrative centres. An intelligentsia stratum developed. The Tatars continued to populate the Semipalatinsk oblast. They concentrated in the Semipalatinsk (growth by 8.46%) and Trans-Caspian (growth by 3.43%) uyezds. The percentage of Tatars was high in the Uralsk oblast, though it decreased somewhat from 1897 to 1917. Part of the Tatar population served in the Ural Cossack Army. Those were Christians who gradually became russified. Migrants continued to arrive in the Semirechye and Akmola oblasts, where Tatar population grew from 19.2 to 37 thousand people.

Before the revolution, Tatars were engaged in various spheres of urban economy, including petty handicrafts, furriery, and urgent domestic services. As Tatars grew involved in the social life of the new territories, expatriate group leaders, usually wealthy migrants, became distinct. They initiated the founding of Muslim communities and, later, ethnic centres for religious, cultural, and educational issues. Madrasahs at the premises of mosques, secular schools, clubs, beneficiary and charity partnerships were established. In the most advanced centres of that time—Uralsk, Petropavlovsk, and Semipalatinsk—newspapers and books were published and an ethnic intelligentsia developed.

Tatars were also important for Kazakhstan's economy. The merchants Khusainovs, Yaush-

evs, Abdrashitovs, and others opened rendering houses, soap plants, slaughter houses, and houses of commerce in Kostanay, Aktyube, Irigiz, and Karabutak. Outstanding entrepreneurs from Kazakhstan include Birushev, Muratov, the Akchurins, the Tyumenevs, the Shamsutdinovs, the Davletkildeevs, the Brothers Tabeev, Valit Yanguzarov (Petropavlovsk), Iskhak Gabdelvaliev, and father and son Kaipovs (Verny). However, the most famous merchant and industrialist dynasty was that of the Musins from Semipalatinsk, who were on the list of the Russian Empire's 150 richest families in the early 20th century.

A Tatar subculture developed in the Kazakh land. Its most outstanding representative is Ğabdulla Tuqay, who lived in Uralsk when aged 9–21, which had formidable influence on his personality and poetic oeuvre. Ğ. Tuqay was brought up in merchant Galiaskar Usmanov's family. Born in the village of Kaybitsy, Kazan guberniya, Mutygulla Tukhvatullin became Ğ. Tuqay's spiritual advisor. The poet studied and worked at his madrasah 'Mutygilya' for 11 years, at the same time attending Russian classes. His academic performance suggested high aptitude. Tuqay's first works partly appeared in the handwritten magazine 'Āl-Gasrel-cādid' ('New Century'), 1904.

In 1906, the Statute of the Uralsk Muslim Charity Society, presided over by M. Tukhvatullin's son Kamil, was registered [Ustav, 1908].

Kamil Tukhvatullin, along with Ğ. Tuqay, actively participated in the revolutionary events of 1905. They jointly edited the Tatar

The house where G. Tukay used to live in Uralsk.
Photo from the late 19th century

newspaper 'Fiker' ('Thought') and magazines 'äl-Gasrel-cädid' ('New Century') and 'Uklar' ('Arrows'), which were published in Uralsk at that time. After the revolution and the closure of newspaper, both went to Kazan in 1907 to continue their activities.

Thus, the development of the Tatar diaspora had several stages and was a component

of complex socio-political, economic, cultural, and demographic processes resulting from Russia's colonisation of Kazakhstan. Radical changes in every aspect of the traditional society and the emergence of new structures caused large masses of population to move to new territories. The first representatives of the Tatar diaspora arrived in Kazakhstan in the late district century. In the 18th century, a mass Tatar migration, in particular to the Kazakh steppes, began. After the Russian government permitted Tatars to trade, the merchant stratum of the Tatar popula-

tion increased, and their inflow in Kazakhstan became more intense. From the 19th to the early 20th century, Tatars volunteered to move to boundary lines. Tatars were widely sent to such areas under orders and contracts. Adaptation enabled the Tatars to find a niche and play a major role in the economic and spiritual life of Kazakhstan.

§ 3. The Lower Volga Region

Viktor Viktorin, Leonid Arslanov

Tatars enjoyed broad settlement opportunities in Russia. They were able to gradually populate the country's southern frontier, its forest-steppe, steppe, and semi-desert territories up to the Caspian Sea. They do so both on their own initiative, sometimes without obtaining a permission, and within public service (in particular, in the military, navy, etc.).

The lower reaches of the Volga witnessed a rapprochement between various ethnic elements, both Tatar proper and Tatar-influenced, adhering to different economic and cultural traditions. Those included crop and vegetable farming, semi-nomadic livestock breeding,

sometimes fishing, etc. Various Turkic-speaking groups began to interact at a large scale. Tatar migrant farmers from the Middle Volga Region established close contacts with those who had been semi-nomadic livestock breeders until recently, resulting in numerous mixed families and a very curious combination of traditions.

While it was the Tatar peasants (from the Northern Trans-Kazan Region and the Tetyushi-Buinsk Region in the south of the right Volga bank) who dominated the migrant community south of Tsaritsyn until the early 19th century, the territory between Penza and Sara-

to be dominated by Serving Tatars. The Nogai ethnic group that had been living in the territory for some time presented the substrate for all rural and urban migrants in the Lower Volga Region [Arslanov, 1995, pp. 1–12, 16, 23, 36, 48, 122, etc].

Various Tatar ethnic groups moved towards the south of Russia in a number of ways. At first, there was hardly any contact between them. By the middle of the 19th century, the migration waves met between Tsaritsyn and the Caspian Sea (often in the same or neighbouring localities).

The service class, other serving, simply initiative and authorised, or unauthorised (run-aways, sometimes persecuted) Tatar migrant waves merged in the lower reaches of the Volga and then in the Cis-Caucasian Region, yielding various ratios. According to M. Poluboyarov, the new Tsaritsyn Zasechnaya Cherta (Abatis Line) was to be established in the steppe between the Don and the Volga under Peter I's decree dated 3 March 1718. The guardians of the previous Penza Abatis Line, including Tatars and Mordvins, were eventually sent there [Poluboyarov, 1995, pp. 180–181].

No detail of the decree is available. However, the tendency seems highly possible, and there is some evidence confirming this assumption. After the Astrakhan guberniya was established in late 1717, a defense line was built in the interfluvium (20–30 km). However, when the direct external, military threat was eliminated, migration patterns soon changed.

In particular, those were connected with laying, populating, and maintaining the state's main roads: strategic, cart, post, commercial, and military routes. Two Moscow roads can be singled out as being formed in the 18th century, from Ryazan via Tambov and via Penza; and the Kizlyar, or Linear, Road, which was primarily built for military purposes. A road from Tsaritsyn to the Caucasus, that is, leading to the newly annexed Azov Sea Region, primarily occupied by Cossacks, and further to the foothills, was to be laid by the end of the century. This is why reports on formal establishment of large Tatar settlements mentioned this to be done under the tsar's edicts in order to populate the steppe from Tsaritsyn to the Caucasian Road.

This is why Tatar localities emerged along the roads with new settlements around them thus forming a far-reaching network of local roads.

For instance, lower class Mishar Tatar migrants followed the road from Penza via Petrovsk to Saratov and further via Tsaritsyn to Astrakhan. Under the new conditions, the 'service' status of its participants was soon replaced by that of peasants according to census records (1811, 1833, 1835, etc.). Near Tsaritsyn, the flow merged with the Middle Volga–Kazan one (partly represented by temporarily Orthodox Christian Kryashen Tatars). Together they moved far to the south, also to the Kizlyar ('Linear') Road, which became especially important during the large-scale Caucasian Wars, by the end of the 18th to the early 19th century.

Both external political processes and domestic transformations affected the migration of various Tatar ethnic groups. After the Penza–Sura Abatis Line was established, the border became an area of inter-Turkic ethnic contacts, where migration flows moving in opposite directions met. In the early 18th century, Crimean Tatar raiders gave way to Kuban Nogais. Nogai groups in the Russian army participated in the colonisation of the territories in question [Viktorin, 2006, p. 160].

Under Peter I's decree of 18 December 1708, the Kazan guberniya was established. That of Nizhny Novgorod followed in 1714. The Astrakhan guberniya was formed of territories within these governorates in November 1717.²⁴ The purpose was always to extend Russian influence south- and eastward, to the Caucasus, West and Central Asia. It is no coincidence that Peter I led his Persian Campaign of 1722–1723, which played a major part in populating the region, through Astrakhan. A large group of Kazan Tatar, state peasants—or, more specifically, *laschmanns*, recently assigned to the Admiralty, woodcutters and carpenters, sailors and landing soldiers, and ship maintenance staff—was

²⁴ In the 18th century, Astrakhan guberniya included large areas, 'From Zhiguli to Terek', from Kizlyar to Guryev on the River Yaik, and to Petrovsk, Saratov, Simbirsk and Samara with Syzran. From 1769–1780, Saratov and Penza guberniyas were gradually allocated some of these territories. In 1797 Penza guberniya was renamed to Saratov.

moved southwards, up to Astrakhan and the so-called ridges, that is, foothills of Dagestan and Chechnya.

The Kazan Trade Sloboda developed in Astrakhan. Major changes took place in the life of the nearby Yurt and the Jetisan Nogai Tatars, who settled near Astrakhan in the mid-18-beginning of the 17th century. They began to establish contacts with migrants from the Middle Volga Region.

In a 1877 questionnaire, the elder of the Zatsarevo volost Iskhak Mukhammedov wrote, 'The first settlers were Yurt-Nogai people from Asia, who were not sedentary and roamed in tents...; however, the (Yurt.—V. V., L. A.) Tatars went separate ways, chose special places for themselves, and founded sedentary settlements, in which they built houses for themselves, following Tsar Peter I's visit to Astrakhan [Astrakhan State Record Archive, f. 32, inv. 1, file 382, s. 155–156]. About ten sedentary Yurt Tatar locations had been established by the 1750–1770s. Those included Zatsarevo (Tiyak-aul), Moshai (Kazy-aul), Staraya Kucherganovka (Kanga-aul), Solyanka (Sulänkä), Kargali, Yaksatovo (Maylegul), Tatarskaya Bashmakovka (Kizan), and others. The Jetisan people continued to lead a semi-nomadic life (until the very end of the 18th century), also roaming in the Volga delta, near Astrakhan [Vaskin, 1973, p. 33].

Then the majority of Kalmyks (Turguts) fled back to China. The migration of (the Dörbets) previously staying on the left bank began in January 1771, creating very unusual conditions in the lower reaches of the Volga River. At that stage, a small semi-nomadic group of livestock breeders and fishers, Tatars from Kalmykia (0.6–0.8 thousand people) living on the Caspian Sea shore, 'the Utars of the Alabuga village', was formed. It was a Yurt Tatar group preserving the nomadic lifestyle but with multiple ethnic additions. Essentially Nogai (the Jemboiluk and Beshogul clans), it was joined by the 'Kyrgyz/Burut people' who came along with the Kalmyks, the right-bank Cossack Horde ('Tomud, Tomut/Togmut'), largely kalmykized, partly Buddhist Turkmen from Stavropol, Tatar migrants, Kalmyk foster children, and by the middle of the 19th century, also Bukharan mer-

chants—'Sarts' from Astrakhan, who wanted to merge with the semi-nomads. The group was first mentioned in the 1782 census book as '401 families', a mixed ulus controlled personally by Captain Mullah Abdullah Zhangurshin [State Archive of Astrakhan Oblast, f. 394, inv. 1, Vol. 1, file 5521, s. 226–229].

The 'Alabuga Utars' had their administrative centre, Ish-Tube (Öş-tübä), not far away on the right bank, near Astrakhan, at the beginning of the Kizlyar ('Linear') Road, at the healing lake ('Ta'arat-kül') and the holy Sufi tombs 'Öräk/Ürdäk-aje', 100 km south-east of their basic territory, on the 'Mochagi' coastland.

The following sedentary settlements of the Utars became well-known from the end of the 19th to the early 1930s: Alabuga (1876–1929) and Ish-Tube (1878–1929). The dwellers of the former moved to Lagan and to the Ulan Khol railroad station, Kalmykia.

Russia's annexation of the Crimea and Kuban in 1783 dramatically changed the ethno-cultural situation in the region. The Nogais and Muslim Kalmyks ('Kazlar', 'Shered/Sheret') became Russian subjects. Turkic subjects of the former Kalmyk Khanate, more Nogais and a small group of Kazakhs ('Tomud, Tomut/Togmut'), became a detached group. Nearly all of them met Middle Volga Tatar migrants on their way and established ethnic contacts with them.

The Tatars then moved to the steppe and semi-desert area of the Lower Volga Region. They often served as guards at the boundaries of the Kazakh steppes. But in the Steppe Trans-Volga Region, along the rivers Irgiz and Kameilik, the western Bashkirs, to be later known as 'Samara-Saratov Bashkirs', led a semi-nomadic life [Viktorin, 1988, pp. 10–11]. New Kazakh subjects were unstable, which motivated Catherine II to issue the decree of 21 August 1788, under which fortresses were to be built 'between the Uzens'.

In 1786, the Tatar village Malye Chapurniki (Kechе Chapurin) was founded south of Tsaritsyn, Astrakhan guberniya, 'under Her Majesty's edicts in order to populate the steppe... of the Kazan and Sviyazhsk vicegerencies with serving,... newly baptised, and, from the Penza vicegerency, yasak Tatars...'

It supplied the grass-root Moscow to Astrakhan Road and its branches to Kalmykia and the Northern Caucasus. A 1811 document reported '30 households of non-Christian Tatars and 49 households of Christian Tatars in the settlement of Malye Chapurniki' [State Archive of Astrakhan Oblast, f. 687, item 522, s. 289–292]. The number of Muslim Serving Tatars increased rapidly at that time.

The attempts at supplying Mokry Karasal near Manych Lake and the Don River, on the way from Tsaritsyn to the Rostov Fortress and further to the Caucasus, by founding there three settlements—Mordvin, Chuvash, and Tatar—also failed. The settlers demanded that they should move to the Volga for lack of drinking water. In 1787–1788, the village Kamenny Yar (Tashly Yar) 'with settlements of the three ethnic groups' was founded [State Archive of Astrakhan Oblast, f. 498, inv. 1, file 327, s. 2]. By the early 19th century, the Mordvins and the Chuvash had moved to the left bank of the Volga. The Tatars from the right bank of the Middle Volga stayed in the settlement and founded 2–3 khutors. Tatar poet Gaziza Samitova (1862–1929) was born here.

However, the large group of Tatars that returned from Karasal (almost 600 house-owners as compared to the 177 remaining) was moved to the Linear (Kizlyar) Road, to steppe ilmens near Astrakhan, at once. The village of Lineynoe (Kämenni aul) was founded there in 1788. In 1864, the village of Turkmenka (Tölke aul), situated along the main road, stemmed from it.

Some Kryashen Tatars from Malye Chapurniki did the same without asking for permission. Over 300 migrant Tatars rafted downstream the Volga river for as long as 270 km until they reached merchant Kurochkin's land and the locality of Kurchenko (Kartuzan aul) [State Archive of Astrakhan Oblast, f. 476, inv. 1, file 113, s. 2], where the newly baptised migrants converted back to Islam straightaway. The Orthodox Christians from Malye Chapurniki did not follow their example until 1905–1911 [Arslanov, 1995, pp. 76–77].

Another, multi-ethnic village, Zenzeli (Ci-däle) emerged in 1771 as a Cossack cordon at the very border with the Kalmyk camping grounds, following their tribesmen's escape.

However, it did not have any residents until 1791 when several Tatar families from Kurchenko moved there.

Apart from the Tatar settlement, a Russian locality and a Kalmyk one emerged there. Kazan Tatars, Chembar Mishars—'Kara-Kalpaks' from the settlements Bishtyubinka and Novaya Kucherganovka—several families of the neighbouring 'Utars' and Nogais from Dagestan, who had also adopted the Tatar traditions (referred to as 'Kyzylbash'), joined the former. Those representatives of the diverse Tatar rural group who had emigrated moved westward, to the steppes of Stavropol.

The Tatars of Astrakhan and other localities in the governorate coined an umbrella term for all their tribesmen from the 'Linear' (Kizlyar) Road and the 'steppe ilmens': 'kändi, kändilär', referring to certain features of their household utensils.

On the whole, the 19th century Tatar migrant flow went down the Volga River, from which part of it went westward to found new localities in the steppe (primarily the Stavropol guberniya) and bring another migration flow to the existing ones (Kamysh Burun, Kulikovy Kopani, Maly Barkhanchak, etc.).

Kazan Tatar migrants did not make multiple 'transfers'. The migration route of Serving Tatars was more complex as they moved along the road southward from Penza. At the very beginning of the large road, service class people from Mordovia founded three large villages about 1700. Those were Verkhny Yelyuzan (Äläzän), Srednyaya Yelyuzan, and Nizhnyaya Yelyuzan. After about 50 years, migrants from Yelyuzan founded the village Yakovlevka (Änkä aul) 120 km south-east of it, then the settlements Novaya Yelyuzan (1829), Verkhazovka (1848), and others in the Trans-Volga steppe, near the Bashkir and Kazakh land.

From the end of the 17th century, a Temnikov Serving Tatar group undertook multiple attempts at moving to the village Ust-Uza between Penza and Petrovsk. However, Crimean-Kuban invaders damaged it heavily. Migrants from Ust-Uza founded the village Novaya Ust-Uza (1789) near Petrovsk and Altata (derived from 'alty at', the legendary 'six founding fathers'), in the Trans-Volga steppe (1840).

The village Stary Vershaut emerged in around 1708. Captive Kuban Nogais (which seem to have been initially converted to Christianity) were among the legendary 'seven families' of its first settlers. Representatives of other Turk-Kipchaks (both 'Kazakhs' and 'Kyrgyz' people in legends on the origin of the local 'Tukums') joined them later [Polevy'e materialy' V. Viktorina, 1998], followed by numerous Serving Tatars, probably from Kuznetsk.

After fifty years, even closer to Petrovsk, the village Tatarskaya Pokaevka was established, followed by Novy Vershaut at the very beginning of the 19th century. At the same time, the inter-Turkic group continued its migration far to the south [Viktorin, 2008, p. 3].

In the Trans-Volga steppe near Kazakhstan, Serving Tatars from the Kvalynsk and Kuznetsk uyezds took residence in the Osinov Gay (Iske Uzin) fortress in the early 19th century. They founded the Mechetnaya Sloboda, later known as part of the city of Nikolayev (now the city of Pugachyov) in the late 1830s and the village Safarovka (1842) [Viktorin, 1988, p. 8].

From the 1830s, large groups of Chembar Mishars inhabiting six settlements (Kikino, Kochkarovka, Kobylino, Mochaleyka, Reshetovo, Telyatino) began to migrate southward.

In the steppe ilmens of the right bank of the Volga, near Astrakhan, Chembar Mishar deserters secretly founded the settlement Yango-Asker (Soldat Avıl); they took residence near a healing lake, where the Nogai Tatars, or 'Utars', also had a winter camp, and began to form mixed families by marrying representatives of the latter.

Near Tsaritsyn, the Chembar Mishars of the six settlements inhabited the villages Malyayevka (1834) and Bakhtiyarovka (1836). A third Mishar settlement, Lyatoshinka,²⁵ had been founded by 1840 (probably due to the population's migration along both Volga banks), between Tsaritsyn-Saratov and the very border of the Kazakh steppe. Its founders were Temnikov Mishars (in particular migrants from Yakovlevka—Änkä aul) and those from four to five settlements near Kuznetsk and Khvalynsk. However, part of its population escaped to Bu-

keev Dzhangir Khan as 'Kara-Karpak Mishars' straightaway. They spent there 2–3 years (until 1842). Two large uyezds, both containing Mishar Tatar and Bashkir settlements, namely those of Nikolayevsk and Novouzensk, were transferred from the Saratov guberniya to the new Governorate of Samara in 1850.

In 1843, those Tatars who had left Zhan-gir Khan crossed the Volga and founded their settlements Bishtyubinsk (Bish tübä) and Novaya Kucherganovka (Keldermesh, or Kara-kalpak aul) 250–260 km south of the territory, on the right bank, near Astrakhan and not far from the village Yango-Asker [Viktorin, 2003, pp. 74–81].

By the middle of the 19th century, a community consisting of representatives of all the aforementioned Mishar Tatar groups had developed in Saratov ('Glebuchev Ovrag'). At approximately that time, Mishar Tatars made up to one third of the Tatar population of Astrakhan (that is, about 3 thousand people). They founded several villages on the Volga banks, near the governorate centre.

Large-scale migration of Kazakhs across the Ural River from the so-called Bukey Horde in the early 19th century changed the ethnic composition of the Lower Volga Region dramatically.

The population of the Lower Volga Region grew as a result of the addition of other ethnic groups such as the Nogai (the so-called Nogai Cossacks) and adjacent Tatars (the so-called Kalpaks, Kara-Kalpaks) to it. Groups descended from the Tatars, such as the Kazanchi, were well-known in the Junior Zhuz from the late 1790s [Arslanov, 1995, pp. 93–110; Arslanov, 1998, pp. 116–121]. They were descendants of soldiers who had deserted from near Bugulma, Belebey, and Buguruslan to the steppe. While part of Sultan Bukey's Horde, they became semi-nomads, crossed the Ural River together, and adopted the name Kalpak, or Kara-Kalpak, as a kind of 'disguise'. In 1817 they were accepted as full-fledged residents of the Horde. However, in 1827–1842 they argued with Bukey's son, Zhan-gir Khan, which resulted in their exile to the Russian border, where they spent several years as semi-nomads [State Archive of Astrakhan Oblast, f. 2, inv. 1, file 238 (1836–1849), s. 459].

²⁵ Changed to Nikolaev district.

In the area around Segir Kuduk and Sarbasta, a small Mishar Tatar group from the village of Lyatoshinka that had remained in the steppe joined the Kazan 'Kara-Kalpaks', who, by the end of the 19th century, were comprised of native Kazakh and Karagash Nogai clans under the name 'Karakalpaks'²⁶. This partly forgotten group, which emerged in the 19th century and had a very wide network of ethnic contacts, still exists, undoubtedly, within the Tatar ethnos.

At the very beginning of the 19th century, semi-nomadic Jetisan Nogai tribes, who had joined the Yurt Tatars, became sedentary. There appeared settlements such as Kilinchi (Kiläçe), which belonged to the Murzas (Princes) Urusov, and Semikovka, which belonged to Batyr Semek Arslanov, as well as several villages inhabited by the yemek-jemek, who were of mixed descent, that is, mostly offspring of prisoners of war from the Northern Caucasus. These included Tri Potoka (Cämäli, Yamele-aul), Kulakovka (Kolakau), and Osypnoy Bugor (Yarlı Tübä) [Vaskin, 1973, p. 33]. In this manner the Yurt ethnic group (the 'Tatar', 'Nogai', 'Nogai Tatar' people), who shared the tradition of celebrating the Amel/Amil spring holiday sometime between 1st and 10th March O.S., depending upon the respective village, was formed.

By the middle of the 19th century the Alabuga Utar, who had appeared in 1771 and whose descendants were the same Yurt Tatars that remained semi-nomadic until 1929, became an established group. Their ranks grew as Uzbeks from the Bukhara Merchant Court and traders from Astrakhan known as 'Sarts' joined them [see Idrisov, 2011, pp. 315–316].

Differences between the lifestyles of the Yurt Tatars and the Utars versus urban and rural migrant Tatars offset one another with time. Migrant Tatars in Yurt settlements easily switched to the local dialect. In the late 19th

century, it became more common for young Yurt men to marry girls from Kazan and Mishar families (the dowry was replaced by a gift) [Sharifullina, 1992, pp. 109–110].

Another group of Kazan migrants settled in the Bukey Horde, but remained subjects of the Astrakhan guberniya. They resided at a guard settlement that had been liberated by Ural Cossacks and from where the villages of Novaya Kazanka and Jangala (Zhankala), now a district center in the West Kazakhstan region, emerged in 1871.

Finally, at the end of the 19–beginning of the 20th century, a large group of migrants from Kazan's poorest suburbs came to Astrakhan for work. While keeping in contact with each other, they worked as day-labourers in ten Yurt Nogai (and former Jetisan Nogai) settlements around Astrakhan. They remained on a permanent basis and united during the Revolution to found a new Tatar village on an island between two affluent branches of the Volga River known, after 1918, as Novye Bulgary (Yaña Bolgar).

Thus, occupation of the Lower Volga region by the Tatars was completed by the end of the 19th century. The nature of the ties between various ethnic Tatar groups became stronger, independently of whether they sprang from their previous localities or were acquired in their new home.

According to statistics for the 1880–1890s, there resided in the Astrakhan and Saratov guberniyas, apart from the nearly 600 thousand city and fortress dwellers, over 1.5 million rural Russians (including over 50 thousand Cossacks), 300 thousand of which lived in the bottom-lands and in the delta between Tsaritsyn and the Caspian Sea. The population also included up to 170 thousand Germans, over 150 thousand Ukrainians (primarily peasants hauling salt, that is, the so-called Chumaks), approximately 120 thousand Erzi Mordvins, and others.

Approximately 150 thousand Tatars representing various ethnic groups lived in this region. These include those who resided along the Saratov-Penza Border, around 90 thousand people. In the Trans-Volga steppe, in two uyezds (Nikolayevsk and Novouzensk), which became part of the Samara guberniya in 1850s, there were 16–17 thousand Tatars; in Astrakhan

²⁶ In the Ural District of the Kazakh SSR in 1926, there were 845 male 'Karakalpaks' as the heads of households, i.e. only 3–4 thousand people with their families. A little less might have lived from the turn of the 19–20th centuries near the Alexandrov Gay (after its construction in 1895), Pallasovka and Kaysatsk railway stations (both in 1909) in the Russian governorates. Some were not taken into account, as (even in the same family) they were recorded as 'Karakalpak' and 'Kazakh' and 'Tatar' and 'Bashkir' [Arslanov, 1998, p. 116–120].

An Astrakhan Tatar man.
Photo from the early 20th century.

and the 'lower' uyezds, at least 35 thousand; in the 'substeppe ilmens' and the adjacent Kalmyk steppe, up to 5 thousand; and in the 'upper' uyezds and the Tsaritsyn area, over 6 thousand. There were approximately 8 thousand Tatars among the Kazakhs of the Bukey Horde (including, of course, the 'Kara-Kalpaks').²⁷ Other Turks inhabited neighbouring territories in the Lower Volga region, in particular a number of Anatri Yenchi Chuvash in its upper regions.

About 200 thousand nomadic Bukey Kazakhs lived in the lower reaches of the river. A small Bashkir group inhabited the eastern part of the area; 10–11 thousand semi-nomadic Nogai Karagash and 2.5 thousand Turkmen lived even closer to the delta.

The Mongolian-speaking Oirat-Kalmyks (more specifically, those located in the Cis-Volga area, namely the Torghuts, Khoshuts, and 'Lesser' Dörbets), who were both nomadic and 'lake people', that is, Cis-Caspian fishermen, comprised a separate group of at least 100 thousand people. [compare with Vaskin, 1973, pp. 11–20, 27–34, 41–46, and others]. Ethnic contacts with their neighbours were quite diverse.

Thus, the Tatar population of the Lower Volga Region played an integral part in the multi-ethnic composition of the region. But the 19th century was key to its development in both rural and urban localities. Each of the 50 Tatar settlements discussed previously possesses unique features that might serve as the basis for further historical, regional, and ethnographic studies.

The history of the Lower Volga Tatars can be regarded as an integral part of the history of the Russian State and its southern expanses. This concerns both 'voluntary' Tatar migration, as well as the governmental practice of settling people 'along roads', which played a special role in the military and administrative management of the newly populated territories. It is also a notion essential to this section of our text.

§ 4. Turkestan

Western Turkestan

Nayla Khamitbaeva

Tatars came to Turkestan long before it was settled by the Russians. Even in the 17–18th centuries, Tatars were of great use to their Russian counterparts in their dealings with Near

Eastern and even East Asian states. Thanks to Tatars in service to the Russian government, the Russians had trained interpreters. And the Tatar language was used, for a while, in diplomatic relations between Russia and Persia.

In the early 19th century, the tsarist government encouraged Tatar merchants to trade in Central Asia. In fact, there existed a dis-

²⁷ The calculations were made according to data released earlier, as well as very detailed statistical information from the 'polls' in 1901, which are stored in the AAGOIAmz.

tinct group known as the 'Bukhar Yurtuchi' or Bukharan traders. Tatar merchants had connections, however, not only with Bukhara, but 'some of the wealthiest Tatars also traded in Bukhara, Khiva, Persia, and Turkestan' [Rybushkin, 1848–1849, p. 87].

A new wave of Tatar migration to Central Asia began during the Crimean War. Apart from Tatar recruits who were reluctant to fight against Turkey and fled to Central Asia, Tatars condemned for various crimes went there to avoid repression by the tsarist government. A large number of Tatars came to Central Asia as madrasah students studying in Bukhara and Samarkand, which had long been famous as Islamic centres for theological education. According to V. Bartold, the Tatar population of Turkestan numbered approximately 5,000 at the time of the Russian conquest [Bartold, 1927, p. 158].

In the middle of the 19th century, Russia began to attack Central Asia in order to obtain cheap raw materials and market outlets, and to extend its sphere of influence. In 1853, the Ak Mechet Fortress fell, followed by Chimkent in 1854; Tashkent on 17 May 1865; in 1866, Khodzhent, Ura-Tube, and Jizakh in the Khanate of Bukhara; and Samarkand was captured on 2 May 1868. Thus, from 1864 to 1868 two Khanates were overrun by the Russians, namely, those of Kokand and Bukhara, although they remained formally independent. The newly conquered areas in Central Asia formed the Governorate-General of Turkestan with its centre in Tashkent. The Governorate-General of Turkestan was divided into the following five oblasts: Syr Darya, Fergana, Samarkand, Semirechye,²⁸ and Trans-Caspian. In 1886, it was officially named Turkestan²⁹.

Many Tatars arrived in Turkestan along with the Russian troops: some came as soldiers and officers, others as interpreters and provisioners [Gubayeva, 1991, p. 111]. Following its annexation by the Russian Empire, a new wave of Tatar migrants flowed into Turkestan from Russia's inner governorates. Thus, in the

late 19th century, the population of Turkestan reached 5,280,983. The Tatar population numbered 18,432, or 0.35% of the region's total. A large part of the region's Tatar population lived in cities (11,609 people, or almost 63% of the population of Turkestan). Only three cities had a Tatar population of over 1,000 people. These were Tashkent, Verny, and Ashgabat. It should be noted that the Tatar population of other cities in the region grew rapidly. For instance, that of Kopal numbered 961; Lepsinsk, 900. The cities of Kazalinsk, Przhevalsk, and Turkestan had over 500 Tatar residents [Pervaya vseobshchaya, 1897, Table 1, 13].

The tsarist administration's colonial policy, which aimed to populate newly annexed territories with Russians, influenced Tatar migration significantly. The government resolved that 'only native Russians of the Orthodox Christian Faith' could move to Turkestan [Central State Archive of the Republic of Uzbekistan, f. 1, inv. 31, item 123, s. 37]. This is why there were more Russians than Tatars in Turkestan in the late 19th century. For instance, 3% of the population in Syr Darya oblast were Russian, as compared to only 0.3% Tatar. Figures for Samarkand oblast are similar: 10.4% and 0.3% respectively.

Following the colonization of the region, the Russian administration began to receive demands from across the Empire that runaway recruits should be found and extradited. In a report dated 3 May 1868, Assistant Governor General Gomzin of the Turkestan Region wrote that State Counsitor Rossitsky, in order to appease the indigenous population, requested 'permission to ignore prosecution of all those from Russia who had come to reside in Tashkent before the city swore an oath to Russia' [Central State Archive of the Republic of Kazakhstan, f. 1, inv. 19, file 3, s. 1–1 reverse]. Later, on 6 June 1871, Governor General Kaufman of the Turkestan Region wrote to the head of the military that most of the runaways were Tatars who had emigrated from Russia before the region was colonized. 'now that the new order has been introduced in the region,' he noted, 'these people are not only harmless but, taking into account their knowledge of Russian trades, by remaining they also pass on this knowledge to the native population with whom they have become

²⁸ The Semirechensk region from 1882 to 1899 was a part of the Stepnoy general governorate.

²⁹ Until 1917, this territory was nominally referred to as Russian or Western Turkestan in terms of its administrative conditions

Kallahon Mosque built in Tashkent on funds provided by Tatar merchants.

closely acquainted'. He continued, '...I ask Your Excellency to request' from the Tsar 'permission to relieve from prosecution all those from Russia who have come to reside in Tashkent before the city swore an oath to Russia, based upon the skills and qualities possessed by these emigrants'. This permission was granted on 29 July 1871 [Central State Archive of the Republic of Uzbekistan, f. 1, inv. 19, file 3, s. 6–9]. Like other emigrants, Tatars were granted the same rights as local residents and relieved from conscription in the army; they could own property, hold some elected offices, attain higher social class, etc.

Tatars were actively involved in nearly all spheres of the region's economic life: they worked as translators for Russian administrators, as tax collectors and volost officials, and managed and led survey parties. They were some of the first workers at the region's new plants, oil fields, and mines.

Tatars played an important part in reinforcing commercial contacts. In 1872 in Bukhara, according to V. Bartold, one noticed a lot of Russian goods, but no Russian merchants: 'all trade in Russian goods in Bukhara was conducted by either local inhabitants or Tatars' [Bartold, 1927, p. 252].

In Semirechye oblast, the main items exported were sheep and goat skins, which sold

well not only in Russia but also abroad. Tea was an essential import item. One of the main suppliers of tea was the Tatar merchant Chanyshhev. In 1899, for example, his representatives purchased 50 thousand roubles worth of tea in Hankou. In 1900, his purchase amounted to 98,766 roubles. The total value of tea on the market in 1899 was 54,450 roubles; in 1900, 175,612 roubles [Pamyatnay knizhka, 1901, pp. 3–16].

Tatar merchants in the Syr Darya oblast also supplied wool to cloth mills in the Volga River area. From

Chimkent they exported not only wool but also lambskin to Moscow, leather for foreign factories, entrails for sausage and toolmakers, and a drug named Santonin to European and other countries. To quote I. Geyer, 'Kazan Tatars control all of the aforementioned branches of trade' [Geyer, 1909, p. 308].

By the latter half of the 19th century, most trade was concentrated in the commercial centres of Kazan, Orenburg, and Ufa. Delivering goods to Central Asia became the main occupation in some villages, such as Mengeri and Atnya in the Kazan guberniya. For instance, the Yaushevs from Troitsk, the Khusainovs from Orenburg, and the merchants Salimzyanov and Karimov from Kazan all traded in Kazakhstan and Central Asia.

A large part of Turkestan's Tatar population, namely 5,446 people (or 31.0%), was engaged in commerce [Pervaya vseobshchaya, 1897, Table 22]. Among them there were 1st-guild merchants Muhammad Bakirov, Abdulvali Yaushev, Murtaza Ibragimov, Gazetulla Bayazitov, as well as female merchants Shirinbana Khusainova, Saida Khusainova, and others from Tashkent, and 2nd-guild merchants. According to archive documents, over 30 Tatar 2nd-guild merchants resided in Tashkent alone in 1895 [Central State Archive of the Republic of Uzbekistan, f. 87, inv. 1, file 25077, s. 7–32].

A total of 2,832 people, or 16.1% of the region's total population, were employed in industry in the Turkestan Region in the late 19th century [Pervaya vseobshchaya, 1897, Table 22]. Some Tatars in Turkestan were large factory owners. For instance, in Yu. Fuzailov's House of Trade there was a cotton-cleaning plant with a water engine, a manual press, and three gins (Peyshambe Kishlak, Kata Kurgan uyezd, Samarkand oblast). Salikhov owned a cotton-cleaning plant, in which there was a kerosene engine, two screw presses, and four gins (Chardor Kishlak, Mitn volost) [Geyer, 1909, p. 242]. The Yaushev brothers ran a cotton-cleaning plant in their 'Yaushev Brothers House of Trade', one of the few large facilities in the Turkestan Region. While in the 1890s the Yaushevs owned only one ginning plant with 20 workers, by the early 20th century they also ran the Keles Cotton Factory and two shops, managing over 300 employees and workers [Central State Archive of the Republic of Uzbekistan, f. 98, inv. 1, file 15, s. 7–28].

In the late 19th century, 4,987 people, or 28.4% of the region's total population were employed in agriculture in the Turkestan Region [Pervaya vseobshchaya, 1897, Table 22] Fatikh Suleymanov, who won numerous awards at horse exhibitions, ran a horse farm in Semirechye oblast. He leased the land from Cosacks in the rural village of Nikolayesk, where they grew 187 desyatins of wheat, oats, and barley [Central State Archive of the Republic of Uzbekistan, f. 1, inv. 17, item 1021, s. 6–10].

Tatars were one of the first groups to cultivate potatoes in Central Asia before the arrival of the Russians there. According to V. Bartold, potato cultivation was an essential indicator of European cultural influence. He mentions the settlement of Nogai-Kurgan, south of Tashkent, on the road to Chinaz, which was founded by Nogais—the term used by Tatars in Turkestan to designate Volga Tatars. According to his contemporaries, in 1866 it was the only village in the area where potatoes were cultivated. This proves, according to V. Bartold, 'that Tatars began to play a part in imposing European culture on their Turkish tribesmen and co-religionists even before their conquest by the Russians' [Bartold, 1927, pp. 105–106].

Tatars taught beekeeping to the inhabitants of the Turkestan region. I. Geyer noted that it was mostly Tatars and Tajiks who practiced beekeeping in Tashkent uyezd, especially in its mountainous regions. According to Geyer, a Tatar from the settlement of Brich-Mulla became a beekeeper back in the 1860s upon the order of Governor General K. Kaufman. From there, beekeeping spread along the tributaries of the Chatkal River [Geyer, 1909, p. 93].

I. Geyer drew from the textile industry to illustrate the influence Tatars had on the local economy. For example, women sewed hand-made robes that were then cut and sold by men. To quote I. Geyer, 'This was the situation in Tashkent approximately 25 years ago when a certain Tatar appeared and proceeded to revolutionize the entire textile industry'. This Tatar brought with him a sewing machine and used it to make robes. 'After a while... other Tatars began to follow his example'. When the local population learned machine sewing, the composition of the working staff changed: 'with the introduction of the sewing machine, women began to play a lesser role in robe production, while men came to dominate the trade' [Geyer, 1909, pp. 108–109].

Establishing themselves in various economic fields, Tatars and their Russian rivals became serious competitors.

Already in the 1880s, the Russian administration became concerned about the widespread role Tatars had begun to play in the region's economy: because they had become serious competitors, they were treated as an 'unwelcome element' in Turkestan.

In 1901, the Military Governor of the Syr Darya oblast wrote in his secret report to the Police Department of the Ministry of Internal Affairs that this region had long been favoured by Tatar traders from eastern governorates in European Russia. Tatar merchants bought various raw materials from the local population, while selling textile and factory-made goods. According to the governor, the trade 'ensures high profit, especially for those individuals whom indigenous dwellers view as not only tribesmen but co-confessionalists who can be trade mediators and religious leaders.' In his opinion, the Tatars' influence on the local population increased after

the region was colonized, so they soon not only came to economically dominate the steppe but became the carriers of certain external forms of the Tatar culture. Thus, he reported the local administration 'has taken every measure to restrict the Tatars' freedom' [Central State Archive of the Republic of Uzbekistan, f. 1, inv. 31, item 123, s. 37–37 reverse].

First of all, the registration of Tatar residents in the Turkestan region was heavily restricted. A Tatar could be assigned to an urban or rural community provided that the police issued a 'certificate' of political reliability. The only way to avoid the restriction was through a bribe. Public officials in Turkestan often impeded registration in order to get large amounts of money. It was essentially impossible to get registered without a bribe.

Article 262 of the Regulation on Administration of the Turkestan Region, dated 1886, read, 'Non-Russian subjects and all non-Christians, except for indigenous inhabitants, cannot acquire land and any real estate in the Turkestan Region' [Tärceman, 1886, No.48]. The article thus applied mainly to the Tatars, Bashkirs, and other 'non-Christian' and 'non-Russian' migrants. Article 207 of the Regulation prohibited real estate deals and notarial residential lease contracts for yearly periods. Therefore, Tatars coming to Turkestan after the Russians occupied it were not entitled to buy land or any real estate in the region. Even those Tatars who had taken residence there before the Russians came were affected by the restrictions after some time. They had to confirm their attachment to the local population.

The Military Minister of Russia received numerous petitions. While occasional requests by private individuals were granted, those raising the question of relieving all Tatars of restrictions always met with flat denial.

Tatar residents of the Turkestan region had to buy real estate with the help of straw persons, which was often challenged.

In the late 19–early 20th century, new ideas connected with the development of capitalism came to the wakening Muslim world of Russia. This raised the question of ethnic personnel and secular intelligentsia members capable of managing trade, not to mention industry.

The need for ethnic personnel necessitated improved education.

V. Bartold believes that 'only Tatars who had come from Russia's internal provinces' founded innovative schools in the Turkestan region [Bartold, 1927, p. 136]. He wrote that the tsarist administration believed Islamic culture to be doomed. However, 'life soon invalidated this opinion as Volga Tatars brought to Turkestan the idea of reforming the Muslim school to meet modern requirements while preserving the ethnic and religious principles, which was received well' [Bartold, 1925, p. 252].

It did not take long for innovative schools to become popular among the local population. Famous missionary N. Bobrovnikov wrote that such schools founded by Kazan Tatars 'were very successful and had more students that they could host' [Bobrovnikov, 1913, p. 80]. Their exact number in the Turkestan region is unknown. They opened in nearly every more or less important locality and were both for men and women [Tatar women taught at the latter].

At the end of the 19–the beginning of the 20th century, 'Tatars competed with Russians in introducing European educational techniques and European culture in general to Muslims. The competition grew tougher with time. However, the Russians ignored it until it had grown especially large-scale' [Bartold, 1927, p. 136].

Various measures were suggested to eliminate the influence of the enlightenment movement. One of the suggestions was that Tatars should be prohibited from teaching in the Turkestan Region.

In 1911, rules were issued in the Turkestan region, under which maktab teachers were to belong to the same ethnic groups as their students: 'a Sart cannot teach Kyrgyz people, and a Tatar cannot teach Sarts' [Bobrovnikov, 1913, p. 77]. 'Propagators of Pan-Islamism' were ostracized heavily. The Russian administration suppressed the Tatar maktab. Tatar teachers could work only in Tatar schools because they were prohibited from teaching in public ones.

The Russian administration was concerned not only with how rapidly innovative schools were spreading across the country. The Governor-General of Turkestan reported to the Ministry of Internal Affairs that, apart from

the innovative schools, 'the new Tatar movement is only manifested in their willingness to found Tatar charity societies, public reading rooms, and literary evenings in various cities...' [Central State Archive of the Republic of Uzbekistan, f. 1, inv. 31, item 123, s. 12 reverse].

In 1908, the Tashkent Tatar intelligentsia decided to arrange a European-style theatre to perform in Tatar in order to break the ice of Muslim superstition and prejudice against European theatre in particular and European culture in general. However, they were unable to stage the first play until 1909. It was the Tatar comedy 'Berençe teatr' ['The First Theatre Performance'] in the theatre hall of the commercial assembly of Tashkent [Tatarskij, 1909, p. 172].

In the second half of the 19th century, a puppet theatre was active in Turkestan. Doctor Batyrshin, a Tatar city doctor, was one of the public's favourite theatre characters in the 1890s. 'Puppet and human performances usually took place on evenings during Ramadan when the month was in winter,' wrote V. Bartold, 'and attracted many Russians.' In the 1870–80s, 'even Russian governors and uyezd administrators appeared on stage, which later ended, probably on the authorities' demand' [Bartold, 1927, p. 174].

Tatar periodicals also contributed to the awakening of the Muslim population of the Turkestan region. 'Progressive daily periodicals, which only existed in Turkestan for two years [1906–1908], were wholly controlled by the Volga Tatars' [Bartold, 1927, p. 138].

The Military Governor of the Syr Darya oblast reported innovative literature to be extremely sought-after on the local book market [Central State Archive of the Republic of Uzbekistan, f. 1, inv. 31, item 123, s. 38]. Apart from the newspaper 'Tärceman', such Tatar periodicals as 'Yoldız' [Star], 'Vakıt' [Time], 'Ölfät' [Unity], 'İdel', and others were popular.

The Tatar portion of Semipalatinsk. Lithograph from the late 19th century

The autocratic government had good reason to feel concerned. Public officials admitted that if Russians did not publish books and leaflets for the local population, 'the Tatar printing industry, whose goals and objectives are far from being consistent with the all-Russian state interests, will do so' [Bartold, 1927, p. 135].

Thus, the autocratic regime viewed the Tatars of Turkestan as 'conductors of Russian influence'. In spite of the government's vision, Tatar activities were largely aimed at ensuring the region's economic development, cultural awakening, and enlightenment of peoples living in Turkestan.

The Tatars' active involvement in the economic and cultural life of Turkestan was viewed both as competition, which was unwelcome, and as reinforcement of the Muslim world of Russia, which was even more unwelcome. The legal restrictions, which to some extent decreased the Tatars' competitiveness, decelerated the economic and cultural development of the Turkestan region. At the same time, they created conditions under which the Tatars of Turkestan had to seek greater ethnic, religious, and cultural unity to protect their ethnos from assimilation. The unification, solidification, and interaction enabled the Tatar community of Turkestan to preserve their place in the region's social and economic life in spite of legal restrictions.

*East Turkestan**Liliya Baibulatova*

East Turkestan [Kashgaria, Malaya Bukharia and the Six Cities, the Seven Cities; now the Xinjiang Uyghur Autonomous Region of the Republic of China] is a hollow nearly surrounded by the Tien Shan, Kun-Lun, and Karakorum mountain ranges [Kornilov, 1903, p. 67]. The landscape protects the territory from wet wind, making the air so dry that most of Turkestan is a desert. Only the peripheral foothills are suited for life and arable farming, of which the Ili Valley is of special importance [Pevtsov, 1949, p. 52].

Some travellers mentioned Tatars among the population of Western China. For instance, V. Radlov used the term to refer to the Taranchi and Qulja people [Radlov, 1989, pp. 515, 522], who are ethnically Uighurs. Iakinf Bichurin reported Tatars [Turks] to live in various provinces as a tax-paying class [Bichurin, 1842, p. 53].

The coming of Muslim Tatars to East Turkestan is primarily attributable to the development of Russian-Chinese commercial relations. In the late 18th century, Russian merchants had to turn to the Tatars to have their goods carried to East Turkestan, because Russian merchants could not enter Qulja and Qoqek. Tatars hardly faced any robbing, which enabled them to monopolize this trade situation [Shkunov, 2007, p. 199]. Apart from the caravan routes from Semipalatinsk and Petropavlovsk, Tatars discovered an easier and quicker way to bring tea from Troitsk to Qoqek [1844]. The Troitsk Tatars founded a company and did not need any support from the Russian and Chinese governments. They turned this operation of foreign trade into their private undertaking [Korsak, 1857, p. 427].

The Russian Tatars began residing in East Turkestan in the 1830s. The first Tatar migrants who wanted to avoid service in the Russian army came to the Altai oblast through their marriages to Kazakh women. They founded a small settlement in Balbagai, which later expanded with new migrants [تاتارلارنىڭ، 1988، س. 13، 17]. The local Cossacks later named their village Nogayskaya [Gosmanov, 1996, p. 26].

The second wave of Tatar migrants to East Turkestan was connected with the further development of commercial relations between China and Russia [تاتارلارنىڭ، 1988، 25]. On 13 July 1850, the two states signed a treaty establishing the legal framework for bilateral trade. From that date on, Russian merchants were to receive special tickets in Semipalatinsk, Petropavlovsk, Troitsk, Ust-Kamenogorsk, and Kopal, to trade in two cities, Qoqek and Qulja, where Russian consulates were established³⁰ [Moiseev, 2003, pp. 23–24]. This ensured many opportunities for Tatar merchants. Not a single caravan went to Qulja after 1865, essentially because the Taranchi were reluctant to let in Russian merchants, while the local authorities denied any responsibility for securing their caravans and prohibited Russian ships from navigating the Ili River. Only a few Tatar merchants, who connected Semirechye with Qulja, carried out some minor commercial activities [Kaulbars, 1874, pp. 142–143].

The inflow of Tatar merchants to East Turkestan increased after the Treaty of Petersburg was signed on 12 February 1881, under which Russian merchants trading there were entitled to enter and leave the territory freely and carry out duty-free trade [Moiseyev, 2003, p. 199; Chanyshchev, 2007, p. 6]. However, Tatars tended to trade in the frontier cities. The central city of the Xinjiang Province, Ürümqi, hosted 50 Semipalatinsk Tatars, Sarts, and ³¹ Taranchis in 1890.

A new wave of Tatar migration followed in 1905–1917. This involved representatives of the Tatar intellectual elite. At the same time, Tatar periodicals and books entered East

³⁰ On 21 July 1863, the Russian consulate in Kulja was forced to withdraw from Kulja factories, fearing an attack from the local population [Aristov, 1873, p. 170].

³¹ During M. Pevtsov's trip, the settled population of Turkestan was referred to as sarts, regardless of their nationality. Russian settlers in Turkestan called all of its settled and non-nomadic population 'sarts' [Pevtsov, 1949, p. 307, 308].

Turkestan. Due to Tatar intellectuals, the opposition of Jadidism and Kadimism began there [Gosmanov, 1996, p. 36].

In general, Russian Tatars were unevenly dispersed across East Turkestan. At the early stage of the migration, Tatars tended to take up residence in Qulja and Qoqek, and after 1905, in other cities, namely Ürümqi, Dörbiljin, Turpan, and Kashgar. In that period, Tatar emigrants also became rural residents, in particular near Qulja and in the Altai Region [Gosmanov, 1996, p. 36]. However, they were most numerous in Ili (over 1,900 individuals of both sexes in 1892) and Tarbagatay oblasts [Chanyshiev, 2007, p. 6]³². The customs and religion that they shared with the local Uighurs, as well as their linguistic affinity, made possible the peaceful co-existence and development of the commercial and cultural relations between the two peoples [Chanyshiev, 2007, p. 7].

Developing commercial relations brought about Tatar mahallah type communities in cities with a compact Tatar population, such as Qulja and Qoqek [Gosmanov, 1996, p. 35].

The majority of Russian Tatars living in East Turkestan were engaged in commerce. V. Radlov noted in the 1850s that Tatar merchants felt freer and happier there than they did in Russia because they were on friendly terms with the representatives of other ethnic groups [Chanyshiev, 2007, p. 7]. Trade, primarily the petty kind, was initially the source of subsistence for the Tatars. The most successful of them opened shops and resold livestock. Some were able to establish commercial relations with Russia [Gosmanov, 1996, p. 45]. One of these merchants was Ramazan Chanyshiev, who started his career as a representative of a Russian merchant who ran a tea company. Having raised capital, R. Chanyshiev cooperated with Nasyr Burnashev to establish a company in Ürümqi and became engaged in the tea trade with Russia. The Trade House of the Brothers Iskhak, Ibray, and Garif, which primarily exported leather and wool to Russia, and the Altai Company, founded by Fatikh Aldagarif and

Fazyljan Yunuchi, which sold everyday goods imported from Russia, were also very famous. However, few Tatar merchants traded at the international level. Most re-sold goods at small shops in the city or among farmers and livestock breeders, to whom they supplied everyday goods [تاتارلارنىڭ، 1988، س.19، 20، 21].

According to Ch. Valikhanov's memoirs, Tatars raised great profit from trade with the Kazakhs, to whom they brought cheap and low-quality fabrics and cast iron and iron household items, which were sought-after, in order to obtain small cattle, leather, and fur. The Kyrgyz people also turned to the Tatars in order to sell their own goods in China [Valikhanov, 1985, pp. 34–35].

Tatars primarily sold textile and paint, metal items, sugar, stearine candles, and in the autumn and early spring, Kyrgyz sheep. They used the money made from such trade to purchase large amounts of cotton and raisins in the Turpan District [Pevtsov, 1949, p. 268]³³. Tatar merchants brought fruit, rawhide, fur, and livestock from Qulja, where they sold cheap fabrics, metal items, and tanned leather [Kaulbars, 1874, p. 143].

The Tatar population was also engaged in trade crafts. There were Tatar blacksmiths, tailors, leather and shoe makers, mahogany workers, goldsmiths, ethnic cooks, etc. [تاتارلارنىڭ، 1988، س.21].

Furthermore, livestock breeding and arable farming were popular among Tatars. Most of the Tatar small cattle breeders lived in Qulja, Ürümqi, Guchung, Jimisar, Altai, Kobuksar counties, as well as in other areas. Arable farming was popular with wealthy merchants, who bought or took on lease land and hired workers. They used more advanced tools and thus gained more profit. Horticulture was also popular with the Tatar residents of Qulja and Qoqek [تاتارلارنىڭ، 1988، س.23].

³² For comparison, in the 1880s there were 130,000 people in the Iliysk territory, and in the Tarbagatay district there were 64,000 people [Kostenko, 1887, p. 113].

³³ M. Pevtsov also noted the presence of Fergan Sarts in other oases: in Aksuysk—200 people, Uch-turfansk—100 people, Yarkendsk—100 people, and in Khotansk—80 people who traded Russian goods (cotton, metal products) in Turkestan and exported to Russia paper material (matu), goat wool, sheepskin, carpets, thick felt (from Yarkend) and raw silk (from Khotan) [Pevtsov, 1949, p. 47, 70, 94, 95].

Young Tatars came to East Turkestan as labourers to work for rich merchants or tea-house keepers [Gosmanov, 1996, p. 46]. Wealthy merchants from various ethnic groups employed educated Tatars for trade business management as clerks, bookkeepers, inspectors, and technicians [تاتارلارنىڭ، 1988، س.22].

Islamic clergymen and enlighteners were of special importance among the Tatars because they held major influence over the development of education among the local Uighurs and Kazakhs. In the late 19–early 20th century, the Uighur school system was in principle Kadimist. There was no uniform curriculum. Education consisted of reading and memorizing religious books and the like [Chanyshhev, 2007, pp. 83–84]. Several alumni of the Russian-Tatar Teachers' School in Kazan were invited to Xinjiang to develop primary education in the 1870s. They also developed a special curriculum for local schools [Chanyshhev, 2007, p. 85].

It was common practice to offer clerical positions to famous religious leaders. For instance, Kurbangali Khalidi (1846–1913), a famous enlightener and scholar, who came to East Turkestan from Ayagoz (Kazakhstan) as a teacher and local history expert, was invited to Qoqek as an imam in 1874 [Gosmanov, 1996, p. 62]. In 1899, Kashfelasrar Vagapov (1858–1957), who had studied in Kazan, Astrakhan, and Bukhara, was invited to Qulja as the imam khatib of the local mahallah. When he arrived, the construction of the local mosque began. Education was ensured for Tatar boys and girls. The teaching methods were mixed

Jadidist and Kadimist. In 1913, Wagapov's schools became absolutely Jadidist and moved to the premises of the mosque. Apart from teaching, K. Wagapov worked as a qadi and became famous as a fair judge [Gosmanov, 1996, pp. 63–64].

Wealthy Tatars made contributions to the Islamic infrastructure too. For instance, in 1880 the Tatar beys Elkybaevs built a mosque in Qulja and founded a two-year madrasah at its premises. Later, when the number of Tatar children had grown, Sharafutdin Gabitov built a four-year madrasah (the Qashfiya School) that offered boarding for 10 students near the mosque [Chanyshhev, 2007, pp. 60–61].

To sum up, the history of Russian Tatars in East Turkestan suggests that the main reasons why they emigrated from Russia were of a socio-economic and religious nature. While in the late 18th century Tatars only appeared there as traders, as soon as in the first third of the 19th century gradual economic development and population settlement began, encouraged by the friendly local Uighurs and Kazakhs. The growth of the Tatar population brought about the Tatar communities of such large cities as Qulja, Ürümqi, and Qoqek in the early 20th century. The Tatars of East Turkestan were very influential in the development of the local Turkic people, primarily concerning education. In the late 19–early 20th century, Tatar schools became enlightenment centres not only for Tatar emigrants but for Kazakhs and Uighurs as well. Merchants also were able to find an economic niche. Part of them reinforced Russian-Chinese commercial relations.

§ 5. Central Russia

Farida Sharifullina, Damir Khayretdinov, Dmitry Makarov

Modern times were a distinct stage in the history of the development of central Russian Tatar communities. Many earlier communities that existed in present-day Kaluga, Vladimir, Ivanovo, Yaroslavl, and Tver oblasts ceased to be in the 17–and 18th centuries. This occurred even earlier in the Voronezh, Belgorod, and Kursk oblasts. Most of the local Tatar

groups in the Ryazan oblast, most of the Tatar population of the Moscow and Tambov, probably also Tula, oblasts had dwindled by the beginning of the 19th century. Full-fledged Tatar communities existed in Kasimov uyezd, Moscow and Kostroma only. Yet, central Russian Tatar communities grew more active following the reforms, which is chiefly attribut-

able to the intense migration of Volga Region Tatars to the area. Military service was often a major factor (such as in Voronezh, Kaluga, Kursk, Tver). Tatar communities of the 19–the beginning of the 20th century in all central Russian regions, except for Kasimov, were characterized by high urban dispersion. Tatar migrants formed compact enclaves with social (mosques, schools, cemeteries) and partly economic (halal meat sales points) infrastructure of their own within the ethnically foreign environment. Infrastructure establishment was determined by both religious requirements and an ambition to preserve an authentic linguistic and cultural environment. Many scholars reported Tatars to be concentrated at certain institutions (glove plants in Moscow, services on the Moscow–Saint Petersburg Railroad) or in certain spheres (factory security in Ivanovo-Voznesensk). An especially high percentage of Tatars were involved in private business (cab drivers, petty traders, craftsmen).

Characteristically, the establishment of new Tatar communities in Central Russia was connected with urbanization. Such communities were dominated by migrants from certain areas. For instance, in the Vladimir Governorate, including today's Ivanovo oblast, Tatars came from the Nizhny Novgorod region and the Buinsk Uyezd, Simbirsk guberniya; in Tula guberniya, from the Khvalynsk uyezd, Saratov guberniya; in Kursk, from the Nizhny Novgorod region and the Kasimov area. Where Tatars from different regions co-resided, a differentiation by occupation and financial status was clear. Kasimov and Temnikov Tatars were the wealthiest and most socially privileged. They were the most socially active group as well.

Moscow. The Muslim population of Moscow surged during the period in question. While several years before, in 1866, records reported 223 males and 116 females [Central Historical Archive of Moscow, f. 199, inv. 2, file 39, s. 2–4], by 1871 the number had grown to 1.2 thousand people; by 1897, to 4.2 thousand; and by 1912, to 9.7 thousand [Vydro, 1976, p. 30].

The small Tatar community, which had been stable for centuries, could feel the winds

Kurbangali Khalidi. Fig. of 1880.

of change. This determined both its abrupt growth and the nature of socio-economic relations both within and beyond the community.

In the late 19th century, the number of Tatars in trade, merchants, mediators, and members of commercial institutions, increased greatly. Outstanding Moscow merchants included the 1st and 2nd guild merchants S. Erzin, M.-R. Isakov, I. Akhun-Janov, Kh. Kashtrov, M. Devishev, A. Nigmatulla, and others. They and other representatives of the community owned many residential buildings, shopping galleries and shops, warehouses, and hotels in Moscow.

At the turn of the century, the commercial and industrial class of Tatar society specified its ethnic and political interests, which were especially intense in the early 20th century. In Moscow this took the form of interaction between outstanding merchants and ethnic and religious leaders of the Muslim community.

The community's ethnic local composition remained unchanged as compared to previous epochs, with Tatars from the Middle Volga and the Kasimov uyezd constituting its core. Apart from them, Crimean and Lithuanian-Polish Tatars were also influential [Sadur, 1987, pp. 30, 35, 37].

'Relations between the ethnic groups known under the umbrella term "Tatars" and other Muslim groups were closer in Moscow than in their traditional homelands, and...opposition to Orthodox Christianity as the official religion played no small part in this...

Moscow Tatar coachman. Photo from the early 20th century.

Thus, the presence of a mosque and a separate cemetery was of special importance for the population of Moscow' [Sadur, 1987, p. 37]. It should be noted that it was not only the mosque itself that acted as a unifying factor but rather the presence of a specific neighbourhood hosting a group of old residents adherent to a set of well-established everyday traditions.

As it was in previous centuries, the most obvious and stable centre of Tatar concentration in the latter half of the 19th century to the early 20th century was Zamoskvorechye, previously known as the Tatar Sloboda. Already in the 1880s, compact Tatar communities began to expand considerably. However, the expansion is beyond comparison with the situation that took place in the early 20th century, when Tatars came to own nearly the entire Tatar Sloboda and the territories to the far north and south of it [Khayretdinov, 2002, pp. 149, 204–209]. No lucrative trade was carried out there. Any merchant had to own warehouses and points of sale in busy places in the centre of Moscow. In the late 1870s, such activities as inn, restaurant, hotel, and meat shop keeping became common for Tatar merchants, along with the traditional practice of trading miscellaneous goods.

The secular and the religious were intertwined so tightly among Tatar public figures that the wealthiest merchants not only funded the community's religious activities but literally directed it as active mosque go-

ers. In the 1880s, the Zamoskvorechye mosque was reconstructed, which failed to solve the problem of excess mosque goers. A document reports it to host 'as few as up to 1,500 people' [Central Historical Archive of Moscow, f. 16, inv. 84, file 179, s. 24, 36]. Likewise, the wooden madrasah building was too small to host everybody hoping to attend it. The new, stone madrasah building did not open until

September 1915. It closed after the Revolution.

In 1913, a large house was built using the funds of oil well owner Aga Shamsi Asadullayev from Baku on Maly Tatarsky Lane to become a cultural centre for Moscow Muslims. The school in the Asadullayev house remained private and community-funded until the Revolution. It also hosted Muslim youth evenings and provided free lunches to students. The printing house in the same building published newspapers in Tatar, 'Il' ('Country') and 'Süz' ('Word').

Tatar newcomers in Moscow began to populate the city actively. Many of them lived in Myasnitskaya Chast [Sadur, 1987, p. 30].

By describing the Muslim community as a 'group discriminated against', we refer to the 'cultural environment of pre-reform Moscow, which did not favour non-Russians' [Sadur, 1987, p. 28]. This was not the only issue. In the latter half of the 19th century, the government began to exert greater administrative and financial pressure on Tatar entrepreneurs. The church continued to view Muslims as a population category that should be subjected to missionary work [Central Historical Archive of Moscow, f. 203, inv. 377, file 85, s. 19, 29, 82, 95, 165; file 86, s. 120, 214].

In spite of the above trends, social liberalization in Russia had a major influence on the Tatar community of Moscow, which also affected the religious aspect. For instance, ten years after the second Muslim community of Moscow was founded, the municipal authori-

ties issued permission for the construction of a second mosque near Maryina Roshcha in 1904.

Tver. Tatar Muslims were first reported to be residing in Tver in 1846. According to 1869 census data, there were 58 of them. In 1878, the Muslim population of the Tver guberniya numbered 717; in 1897, 513 (196 in the provincial centre); most of them were Tatar (408). A little more than one third of them served in regiments garrisoned in Tver and the province, while the rest were seasonal peasant workers. In 1906, the Tver Cathedral Mosque was built on the funds of entrepreneur Fatikh Alyshev from Tver, who owned railroad station cafes in Saint Petersburg. The famous religious leader, military imam of the Moscow Military District (from 1905) Khusain Seid-Burkhan, who came from the Nizhny Novgorod region, was its imam khatib until the early 1930s. Apart from Tver, the city Bologoye had a Muslim community [Islam, 2009b, pp. 19–20, 203–204, 261].

Yaroslavl. By the beginning of the Modern Age, there were no Tatars loyal to either the Romanovs nor those having left Yaroslavl living in the city. In 1878, the number of Muslim (mostly Tatars) residents in the city hardly reached 20. However, they were already trying to register a religious society at that time. After 30 years, their population had grown to 2.6 thousand. 1,204 of them were residents. Some of them grew rich and started businesses like leather and fur processing workshops, and later leather and fur article shops. A horse slaughter house was founded with support from Kazan merchants. Tatar shops at its premises offered halal meat. In 1910, the Moscow company founded by the extremely wealthy oil well owner Aga Shamsi Asadullayev opened a branch office in Yaroslavl, which employed Tatar clerks and sales agents.

Moreover, as Tatar Muslim representation in the guard increased, the city administration allocated a land plot in the Leont'evskoye Cemetery (which was expanded in 1900) for Muslim burials in the early 20th century.

A mosque was built in 1906 on the initiative of Imam Ziyatdin Safarov, born in Tambov guberniya. At first the Tatars erected a wooden prayer house. The current stone building of the Yaroslavl Cathedral Mosque followed in 1914.

Imam Mahmud Yusupov came from Nizhny Novgorod guberniya [Chernovskaya, 2000].

The Moscow Guberniya. In the Middle Ages, there were not only separate Tatar settlements but the territories of Tatar khans' and princes' near Moscow. The only community to be traced back to these lands in the modern time was that of Zvenigorod.

In the rest of the cities near Moscow, shortly after the reforms, Tatar communities were made up of migrants (mostly from the Nizhny Novgorod and Simbirsk guberniyas). According to the Moscow provincial Statistical Committee, the largest Muslim (essentially Tatar) colony in the Moscow province, consisting of 314 people, was in the Bogorodsk Uyezd. Judging by the proportion of the sexes, families lived in Bogorodsk [Noginsk since 1930] and the neighbouring Pavlovsky Posad, while the populations of the nearby localities consisted mainly of seasonal workers. The total Tatar population of Podolsk and the uyezd at that time numbered 140 individuals of both sexes, whose number grew year by year. It was 177 in 1907. 95 Muslims (mostly with families) lived in Sergiyev Posad, while 88 lived in Kolomna and the Kolomna uyezd. The total Muslim population of the Moscow guberniya (Moscow excluded) had exceeded 1,300 by 1907 [Central Historical Archive of Moscow, f. 199, inv. 2, file 574, s. 2–46]. However, they were too scattered across uyezd and non-uyezd cities to establish any stable ethnic and religious infrastructure in any of the localities, except for 2–3 Muslim cemetery lots.

The low financial and social status of the Tatar communities also contributed to the situation. Tatar activities near Moscow were limited to cab driving, work at one of the then-few industrial plants (like the Kuznetsov China Plant in Dulevo), and minor works (for instance, at plants belonging to the Morozov textile empire in Orekhovo-Zuyevo). Only a few of them were able to practice petty trade [Islam in Moscow, 2008, pp. 162–163]. After the 1917 revolution, the micro-units grew into full-size Tatar communities, which were clearly Moscow-oriented.

Kasimov In the 19th century, the Tatar population of Kasimov continued to suffer

ethnic and confessional oppression. In spite of Christianization, Islam grew more influential among the old non-Christian Tatars. Clergymen (sayyids, akhunds, abyzes) were willing to reside in Kasimov. The city's clergy came from the Tambov, Penza, and Kazan guberniyas, as well as from the Crimea. Hereditary dynasties developed in the Kasimov uyezd. In the final quarter of the 19th century, the uyezd had 8 active mosques. Islam enabled the Tatars to preserve their ethnic identity without assimilating into the large Christian Russian population [Yuzeev, 2002b, p. 81]. It is thus natural that the Kasimov Anti-Muslim Mission, which was founded for the purpose of Muslim conversion to Christianity, failed in the last quarter of the 19th century [Alfeev, 1898, p. 759].

Kasimov Tatar agriculture was closely connected with raw animal material processing such as tanning and sheepskin making. There were many astrakhan factories owned by Tatar merchants in Kasimov. They carried out their commercial and business activities far beyond the Kasimov uyezd. Many southern Russian cities imported leather articles. Kasimov merchants actively participated in establishing commercial contacts between Russia and Kazakhstan/Central Asia. They were active in the Makaryev, Troitsk, Irbit, Krestovskoye fairs as well as other such events. This favoured permanent market and cultural connections between Volga-Ural Tatar groups.

The Tatar population of Kasimov and the Kasimov uyezd had reduced considerably by the late 19–early 20th century. While in the 18th century there were as many as 6 thousand people, in the late 19th century there were only 5 thousand. The number of Tatar villages decreased from 62 to 38 in the latter half of the 19th century. The key Kasimov Tatar migration directions (eastward, across the Volga, and to the Trans-Ural Region) mostly followed the same routes as other Middle Volga Tatar groups [Sharifullina, 2004, p. 24]. Some (about 15%) took residence in the cities. Migration to Moscow (the Tatar Sloboda) continued. They had been included in its population since the 14–16th centuries. Their inflow to Petersburg was recorded in the early 20th century. They

merged with the homogeneous Tatar migrant mass in the new area, 'losing their authentic culture and custom' [Iskhakov, 1993b, p. 63]. Small population groups, probably craftsmen and merchants, are known to have moved to the Kazan, Simbirsk, Nizhny Novgorod, Vyatka, Saratov, and Orenburg guberniyas, as well as to Kazakhstan and Central Asia. On the one hand, the migration caused the drain of the Tatar population from its ethnic homeland. On the other hand, it favoured Volga-Ural population growth and consolidation [Ahmetzyanov, Sharifullina, 2010, p. 242].

The Tatars of the Kasimov uyezd were actively engaged in forming an economic Tatar community. The rapid development of certain industries as well as the establishment of stable and strong economic connections to extend and reinforce the domestic market across ethnic Tatar territory were favourable influences. At the same time, synchronous ethnocultural information acquired a higher growth rate. Kazan was the principal supplier of teaching staff and books. The Tatar literacy rate was relatively high. 57% of the total adult population could read and write in their mother tongue [Pervaya vseobshchaya, Vol. 35, pp. 190–193]. In the late 19th century, the language of instruction at educational institutions (maktab and madrasahs) was Standard Tatar [Sharifullina, 2004, p. 25].

Kasimov Tatars contributed greatly to the spread of enlightenment among the Turkic-speaking peoples of the Crimea, Kazakhstan, and Central Asia. Outstanding Tatar teachers in the Crimea included Abdul and Shamil Tyncherov, Arif Mamatkazin, and others [Ahmetzyanov, Sharifullina, 2010, p. 243].

In the latter half of the 19–early 20th century, the Kasimov Tatar economy included a number of trades. In the late 19th century, trade households made up 23% of the economy, and in the early 20th century, 37.1% [Russian State Historical Archive, f. 1290, inv. 6, item 76, s. 48; Sbornik, 1892, p. 23].

Both local and seasonal trades were popular. Local trades included shoe, brick making, jewellery, raw animal materials and fiber processing (leather, sheepskin, and wool making), which accounted for a high percentage

Qasim Khan mosque in the town of Kasimov of the Ryazan guberniya. Photo from the early 20th century.

as compared to other trades. Finished products were meant to be sold at the market, which was characteristic of small peasant home industries. In the post-reform years, home industries developed into capitalist plants of small rural industry, while such craftsmen became employees who produced articles at the plant owner's workshops or at home. The development of trades favoured simple capitalistic cooperation and manufacturing production, which turned into plant and factory industry.

In the mid-19th century, Kasimov Tatars owned a number of tanneries. Goat hair and astrakhan processing was popular. Down hair, which mostly came from the Nizhny Novgorod fair, was generally processed by women at home.

In the latter half of the 19th century, astrakhan processing plants were operating in Kasimov and the adjacent settlements [Koverskoye, Temgenevo, Podlipki, etc.]. The largest of them belonged to Shakulov, Musaev, Bostanov, Ishimbaev, Taneev, and Davletkildeev. They yielded 17,400 to 50,000 roubles per year. The network of their industrial and trade capital spread beyond the province. There was a small group of male shoemakers. Moreover, some Kasimov Tatars worked in soap, silver jewellery, spindle, clothing, and beverage production [Svedeniya, 1915, p. 284; Russian State Historical Archive, f. 1290, inv. 6, item 76, s. 319]. Home industries like spinning, weaving, and embroidery became less impor-

tant in the latter half of the 19th century. A total of 24.8% of the Tatar population of the Kasimov Uyezd (Kasimov excluded) were engaged in the trades [Sharifullina, 2004, p. 373].

Among them, seasonal trades were widespread. In the 1880s, more than a half [58.3%] of the total male working-age population performed seasonal work, which was largely aided by peasants' relatively loose connections with the rural community. The percentage of seasonal workers was about the same in rural Tatar communities in the governorates lying in the Oka and Sura interfluvium (57.4%) and full proprietary Russian peasants from the Kasimov Uyezd (52%) [Sbornik, 1887, p. 496].

Unlike other Tatar groups and other peoples in the Volga-Ural Region, Tatars in the Kasimov Uyezd were widely engaged in non-farming, long-distance seasonal work in various, predominantly central, cities of Russia. Seasonal labour was connected with the provision of services to urban dwellers and institution keeping. 4.7% of the total Tatar population in trades performed seasonal service labour. They worked as waiters, lackeys, coachmen, grooms, street cleaners, etc. A system of territorial seasonal worker differentiation had developed by the end of the 19th century. Well-paid jobs, waiters, clerks, lackeys, were usually occupied by migrants from Bely Aymak. Seasonal workers from Chorny Aymak and the right Oka bank received low salaries as cab drivers, grooms, and street cleaners, which

undoubtedly affected the financial standing of the sub-groups. Another part of the Tatar population (9.3%), the wealthiest one, owned inns, refreshment rooms, restaurants, clubs and furnished accommodations. They performed seasonal work when there was no farming to do. Some seasonal workers (15%) had given up agriculture and become city residents by the late 19th century [Sbornik, 1892, p. 51].

In the late 19th century, part of the Kasimov Tatar population of Kasimov and the uyezd (10.7%) was engaged in commerce [Pervaya vseobshchaya, Vol. 35, p. 190–193]. The bourgeoisie, who invested in not only industrial but commercial enterprises, dominated the sphere. Leather, fur, and leather and fur articles were the key commodities. They accounted for 64% of the total commodity turnover. The high activity of the Tatar bourgeoisie and its trade capital had a positive influence on ethnic relations, while favouring the establishment and operation of an all-Russian market. The Tatar bourgeoisie did not limit its business contacts to Russian markets but operated far beyond the country. For instance, the capitalists Tanev, Kastrov, Akbulatov sold leather and fur articles to Germany and America.

Traditionally, the urban and rural Tatar percentage in non-farming activities differed. Popular seasonal activities in the country included institution keeping (10.3% of the total uyezd Tatar population) and commerce (2.9%). City dwellers preferred commerce (34.1%), seasonal work in services (13.3%), and fibre and animal produce processing (12.7%) [Pervaya vseobshchaya, Vol. 35, p. 190–193]. To sum up, popular activities of the Kasimov Tatars in the late 19th century included seasonal work, involving 14% of the Tatar population, or 58.3% of the total adult male population, trade (10.7%), and fibre and animal produce processing (4.7%). The other activities only accounted for small percentages [Ahmetzyanov, Sharifullina, 2010, p. 262].

At the same time, arable farming was an important economic activity for the Kasimov Tatars.

Kostroma. The Kostroma Tatar community was one of the few communities dating back to the post–Horde period. By the begin-

ning of the 19th century it had developed into an autonomous rural community within the Gridino Volost of the Kostroma Uyezd, living in the Tatar Sloboda in the suburbs. The Tatar population grew rapidly. In 1762, 128 Tatars resided in Kostroma. In 1811, there were 204; in 1857, 325; in 1874, 365; in 1902, 525 [Semenov, 1865, p. 741]. An inflow of Tatars from Kazan, Kasimov, Penza and Nizhny Novgorod, from which cities it was common to invite brides, clergymen, and teachers, was a contributing factor. A clerical school teaching Standard Tatar opened in the Tatar Sloboda in 1866. However, contemporaries report that 'the language of the Kostroma Tatars was usually Russian rather than Tatar' [Pirogov, 1881, p. 67]. At the same time, the Tatar population of Kostroma preserved a number of authentic features, which made them a distinct ethnic local group, with the Romanov and Yaroslavl Tatars at the core. In the 19th to early 20th century, the most wide-spread occupation among the Kostroma Tatars was arable farming. They also practiced such trades as cab driving and fishing. Some of them were steamboat workers, pilots and captains or kept inns in the city. Some of the Tatars were engaged in commerce, primarily trading horses in Kostroma markets, and kumis making. Tatar women sold threads. Kostroma Tatars were generally wealthy. Since men outnumbered women, it was common to bring brides from Kazan, Ryazan (mostly Kasimov), and other governorates.

Long-term and close contacts with the Russians, especially at the stage when capitalistic relations were developing, affected their traditional culture significantly. Russian cultural influences brought about changes to the clothing, headwear, wedding ceremony elements, and everyday objects and traditions [Sharifullina, 2008, p. 66].

Kursk guberniya. Only a few exiled convicts from the Caucasus lived in Kursk until 1860. The first time Muslim military personnel were recorded to reside in the city was in 1865.

A stable Muslim community formed in Kursk in the 1890s. Its members were permanent residents of the city. Moreover, it was necessary for them to formalise their religious

activities. The 1897 census records report 413 male and 28 female Muslims (0.02% of the governorate's population) to be residing in the Kursk guberniya). They formed compact settlements in 4–5 areas of the town. Those were, most importantly, the Yamskaya Sloboda (evidently inhabited by Kasimov Tatar refreshment room employees, petty traders), and Semenovskaya, Kondyrevskaya, Pochtovaya and Zolotaya Streets.

The social status of Kursk Tatars varied. The most financially independent migrant from the Kasimov Uyezd, Abbas Khanbekov, who owned the Petrogradskaya Hotel, was the community's locomotive. His house attracted people for group namaz. Even though Muslims of other ethnic groups were present in the Kursk community, Tatars clearly dominated it at that time, both numerically and in terms of organisation. There were permanent mullahs in that period.

Ivanovo. The history of the Ivanovo Tatar community consists of several stages with long gaps between them. Even though large groups of Tatars with high social status (Mugreyevo and Yurt Tatars) were reported to have been residing in the region in the 16–17th century, no information on their direct descendants in the 19th century is available.

The next stage in the history of Ivanovo Oblast is connected with the territory's rapid industrial development in the 19th century. The region's textile industry involved, in particular, the Muslim population, namely Tatars from governorates in the Volga Region. It is noteworthy that the first Tatar migrants mostly worked as watchmen and in guardhouses. This is indicative of the employers' high confidence in them. In 1883, the city hosted 11 Muslims; in 1895, 283; in 1909, 342 [State Archive of Ivanovo Oblast, f. 2, inv. 1, file 369, s. 4; file 1090, s. 136; f. 4, inv. 1, file 1606, s. 48–49; Russian State Historical Archive, f. 821, inv. 8, file 720, s. 18 reverse]. In the 1870s, a Muslim cemetery was arranged in Ivanovo-Voznesensk. The community received permission to build a mosque in 1909. The construction project was not implemented because of the community's financial difficulties. In spite of the lack of a mosque, the

Muslims of Ivanovo and other cities of the oblast were religiously active [State Archive of Ivanovo Oblast, f. 2, inv. 1, file 4736, s. 1–2, *Islam v czentral'no-evropejskoj chasti*, 2009, p. 213, 220].

Voronezh. In the 19th century, the Tatar community of Voronezh was predominantly military and had a connection to the city garrison and the Prince Mikhail Cadet Corps, which prepared military personnel for further education in military educational establishments in the capitals (in particular, representatives of the Muslim peoples of the Caucasus and the Crimea within the empire). One of the first Muslims to study there was I. Gasprinsky (1863–1865). The majority of Muslim students of the Corps came from the Northern and South Caucasus. However, Khivians and Crimean Tatars were also represented. The number of Muslim cadets in the Prince Mikhail Corps significantly increased in the early 20th century.

Kaluga. The fact that already in the late 18th century a Muslim cemetery was arranged in Kaluga indicates that the city had Muslim residents. The last Crimean khan Shahin Giray 'with his harem and servants' lived there as an honorary prisoner in the year 1786 [*Islam v czentral'no-evropejskoj chasti*, 2009, p. 17–18, 103–104; *Kaluga City Plan. Outline*. Kaluga, 1912].

Starting in the 19th century, Kaluga became an exile location for captive Cossacks, Caucasians and people from Turkestan. The 1897 census revealed the total Muslim population of the Kaluga guberniya to have numbered 144 men and 28 women. Tatar imams were reported to have lived there beginning at that time.

In the early 20th century, the Muslim community of Kaluga consisted predominantly of Tatars [77 families]. Other peoples, mostly Caucasian captives, were widely represented. The Kaluga Muslim community acquired a prayer house of their own at that time.

In sum, the central Russian Tatar communities of the 19th to the beginning of the 20th century were a precursor of their further development in the Soviet and post-Soviet period. In fact, it was in the post-reform time that the

core of most of the central Russian Tatar communities of today came to be.

Intra- and inter-regional Tatar migration routes were determined. Representatives of the elite, mostly from the Kasimov and Yelatma Uyezds, were connected with the migration to large Central Russian cities. The latter led both migrant workers from the neighbouring uyezds in the Volga Region governorates (primarily the Sergach, Kurmysh, Buinsk, and Temnikov Uyezds) to central Russian industrial centres and those leaving the Kasimov, Yelatma, and Tambov Uyezds for other regions.

The rapid development of Tatar communities brought about a number of new mosques and madrasahs, which became central to the Tatar ethnic and religious renaissance for a short period until the 1920–1930s. It was the

period when Muslim cemetery plots appeared in central Russian cities, marking the first stage of the communities' institutionalisation. Tatar-Muslim communities in many regions were funded by wealthy entrepreneurs, primarily Kasimov Tatars and migrants from the village Azeyevo, in today's Ryazan Oblast.

Kasimov Tatar merchants and industrialists controlled whole branches of trade and industry. However, a large number of common people from around Kasimov along with migrants from rural communities in the Volga Region had to do seasonal work, which caused them to settle in a number of large cities in central Russia. This pre-determined Tatar depopulation in Kasimov and the nearby area, while Tatar communities in all the industrially important centres of the region continued to grow.

§ 6. The Crimean Tatars

Viktor Gankevich

In 1783, Russia annexed the territory of the Crimean Khanate. Crimean Tatar murzas swore allegiance to the new regime. Murzas, Islamic clergymen, public officials, and common people swore an oath later. However, the new territory was not seamlessly incorporated.

On 2 February 1784, the Taurida Oblast of seven uyezds was established by a decree by Catherine II. In 1796, the Taurida Oblast was liquidated and its territory included in the Novorossiia guberniya. Finally, the Taurida guberniya within the territorial borders of the former Taurida Oblast, consisting of the Simferopol, Yevpatoria, Feodosia, Perekop, Dnepr, Melitopol and Tmutarakan Uyezds, the latter was consequently transferred to the Caucasian administration, under the Decree by Alexander I of 8 October 1802 [Administrativno, 1999, pp. 7–8].

The first nobility election took place in 1787. Representatives of the local elite, Tatar murzas, became uyezd judges and uyezd police officers [Muftizade, 2000, p. 234].

In 1803, governorate, uyezd, and class institutions typical for all administrative units in the Russian Empire began to operate in the

Taurida guberniya [Administrativno, 1999, pp. 7–8]. Police and military service became a major issue for the Crimea Tatars of the³⁴ empire.

When the war against France broke out, in 1807, four Cossack type Tatar cavalry regiments, each consisting of 500 people, were formed. They participated in the Patriotic War of 1812 and the Foreign Campaigns of 1813–1814. In October 1814, the Tatar cavalry regiments received leave to be finally dissolved in 1817 [Muftizade, 2000, p. 235–238].

In 1827, the Crimean Tatar Life-Guards Squadron was formed within the Mixed Cossack Life-Guards Regiment. During another Russo-Turkish war (1828–1829), the Crimean Tatar guardsmen fought their way to the Kös-tence Mangalia Fortress via that of Iskaci and

³⁴ Starting in 1784, volunteers began forming five divisions of Tauride Beshleysk troops (in 1790–six divisions), which performed mainly police functions for the protection of dignitaries, the state border, salt industries, forests, patrolling of the Peninsula, searching for and escorting criminals, etc. Ultimately, the Tauride Tatar divisions of Beshleysk troops were disbanded in 1796 [Muftizade, 2000, p. 232–234].

participated in the action near Varna. During the Crimean War (1853–1856), part of the squadron, headed by Colonel Batyr Celebi Muftizade (later promoted to Major General) remained in Kronstadt and guarded the Baltic shore. The rest of the guardsmen, headed by Rittmeister Omer Bey Bolatukov participated in the defence of Sevastopol and the Battle of the Chernaya River.

In 1864, the Life-Guards Squadron was dissolved into a team of Crimean Tatar Life Guard of His Imperial Majesty. During the Russo-Turkish War of 1877–1878, two privileged Crimean Tatar Life-Guards teams were at the headquarters of Alexander II and distinguished themselves in action during the occupation of Gorny, Dubnyak, Lovich and Plevna. The unit existed until 1890 [Muftizade, 2000, p. 240–243].

Crimean Tatars continued to serve in the Russian army on the usual terms after universal military service was introduced. For instance, in 1874, the Crimean Squadron was formed under the command of Colonel V. Poltoratsky (later Major General) near Bakhchysaray. In 1875, a second squadron was formed near Simferopol. An infantry crew [the Crimean Infantry Company] followed. In 1897, the Crimean Division was awarded with a colour [Muftizade, 2000, p. 243–245]. Thus, Crimean Tatars were generally involved in universal military service. At first, they went to army units in the Crimea, later across Russia. What remained of the special Crimean Tatar tax for guard maintenance was used according to the intended purpose until the last Life-Guards unit was dissolved.

Religion was crucial to the Crimean Tatars' spiritual life. After the Russian Empire annexed the Crimea, the government wanted to preserve the well-established administrative confessional division system and the Muslim religious administration system of the region. At the moment of the Russian annexation of the Crimea, the region had 1531 active mosques in respective parishes and 21 tekiyes, centres of spiritual asceticism. Mosques fell into two categories, the five-time and parish type.

Speaking of religious administration, it is a common fact that Catherine II signed a decree

establishing the position of mufti on 21 January 1794. Moreover, the document specified the structure of Islamic religious administration. The qadi asker remained assistant mufti. Furthermore, five members of the suggested clerical administration were appointed 'efendis', whose position is somewhat vague, to assist them [Gankevich, 2009a, p. 122]. The situation remained unchanged until the 1830s. However, this proved to be disadvantageous. The administration was outside of the state structure.

The Taurida Mohammedan Spiritual Administration (TMSA), accountable to the Ministry of Internal Affairs, was founded in 1832 to rectify the situation. The TMSA was traditionally headed by the Taurida Mufti, assisted by the Qadi Asker. The board included the Simferopol, Yevpatoria, Perekop, Feodosia and Yalta Uyezds qadis. The TMSA Chancellery was headed by a Secretary, who controlled the translator, desk heads, a 'journalist' (also record keeper), chancellery clerks, etc. [Gankevich, 2009a, p. 142].

The Muslim clergy fell into the following two categories: higher (mufti, qadi asker, uyezd qadis), and lower/parish (hatips, imams, mullahs, sheikhs, muezzins). Teachers at Islamic higher educational establishments, madrasahs (mudarrhises), or primary ones, maktabas (ojis), who had a parish title belonged to the clergy. Ferrashes (minor orders) belonged to mosque officers.

The TMSA was responsible for a set of issues related to the Muslim population of the Taurida guberniya, namely opening and closing mosques, Islamic educational establishments, controlling waqf real estate and movable property of mosques, madrasahs, and maktabas, appointing community clergymen, ensuring adherence to Sharia, etc. The sphere of TMSA spiritual control covered not only the Muslim community of the Taurida guberniya but those of the western governorates, namely those of Volhyn, Vilna, Grodno, Kowno, Minsk, and Podolsk.

The ethnic composition and demographic changes in the Crimea throughout the imperial period were significant and dynamic. While some ethnic groups gradually ceded ground,

others grew rapidly into a dominant component. Regional demographic patterns varied between the city and the country. It should be noted that the empire's government and the provincial administration developed the region to ensure polyethnicity for maximum population of the remote area.

For instance, the Crimean Tatar population of the regions ceased to be numerically dominant. Numerous migration waves that shook the Crimea every once in a while contributed to this. The migration was caused by a number of economic, social, religious and political reasons. It was sometimes determined by panic instilled by rumour and inaccurate information, like reports on the introduction of universal military service in the 1870s. In most cases, it was a national and ethnic tragedy. Such mistakes were often very hard to rectify. According to D. Zolotarev, Crimean Tatar migration changed the regional situation materially and had 'far-reaching effects on the region's economic, cultural and political life' [Zolotarev, 1999, p. 131].

The Russian government and the local provincial administration never took a clear stance on the diminishing demographic importance of the Crimean-Tatar people. For instance, it was not until the latter half of the 19th century that the governmental policy for Crimean Tatar re-settlement in the Ottoman Empire was reformed. It varied from supporting such processes in 1856 and 1859 to fully prohibiting and preventing any migration from 1862 to 1902, which was followed by removing the prohibition in 1910 [Zolotarev, 2016, p. 13]. In the last quarter of the 19–early 20th century, three large migrant flows rushed in from the Crimea. The waves date from 1873–1876, 1892–1894, and 1901–1904. D. Zolotarev estimated the total number of Crimean Tatar emigrants of that period at 25,000 [Zolotarev, 2001a, p. 173]. Some of the migrants and their descendants tried to return to their home land. Yet, it was difficult to convert back to Russian subjects from Turkish ones. The government and the local provincial administration did not always have a unified opinion on Crimean Tatar migration. The Taurida provincial administration often demonstrated flexibility, trying

to suspend and stabilise the regionally devastating processes.

Changes in the Crimean Tatar population's size over the period from the 19th to early 20th century demonstrate how critical the issue was. In the early 19th century, P. Sumarokov reported in his book that Muslim clergy consisted of 8,411 men and 7,530 women. There were 62,224 male and 59,011 female Tatar settlers. Moreover, the so-called Nogais, 7,398 men and 6,269 women, lived in the Crimea [Sumarokov, 1803, p. 159]. According to the 9th revision presented by Academician P. Keppen, the Crimean Tatar clergy numbered 7,887 and 'Tatar settlers', 138,875 [Keppen, 1857, p. 133]. In 1868, the Crimean Tatar (Muslim) population consisted of 13,783 men and 12,516 women, while in uyezds the numbers were 49,270 for men and 39,831 for women [Karmanny'j kalendar', p. 116–117]. In the mid 1870s, the Muslim population of the Taurida guberniya consisted of 86,019 men and 74,046 women [Verner, 1889, p. 33]. The Muslim population of the Taurida guberniya is known to have numbered 200,050 individuals of both sexes at the very end of the 19th century [Kalendar', p. 85].

The Crimean population has always been polyethnic. Records of the First General Census of 1897 report the following noteworthy ethnoses in the Crimea in the late 18–early 20th century, apart from the Crimean Tatars: the Ukrainians, the Russians, the Greeks, the Germans, the Karaites, the Krymchaks, the Gypsies, the Greeks and the Armenians. The guberniya's ethnic composition was extremely diverse. The East Slavic group accounted for 70.8% of the total population (in particular, 42.2% Ukrainians, 27.9% Russians, 0.7% Belarusians), or 1,025,310 people. Among the rest, Turkic-speaking peoples were the most numerous. In particular, the Crimean Tatars made up 13.0% (187,947 individuals of both sexes) in the late 19th century. Of Turkic-speaking populations, the census mentioned the Karaites 'and part of the Jews' (apparently the Krymchaks) as accounting for 0.6% (8,911 people). Turkic ethnoses were the last element in the '*Turkish*' (Turkic-Tatar.—V.G.) *population* of the guberniya as a 'predomi-

nantly non-indigenous and occasional element' [Pervaya vseobshchaya, Vol. 41, p. X]. However, its percentage was insignificant at 2,197 people.

The Crimean Tatars had an outstanding ethnic authenticity. The Russian writer E. Ivanova, who visited the Crimea in the latter half of the 1880s, presented a curious description of the Crimean Tatar communities on the southern coast. In particular, she noted, that 'Calmness and indifference are a Crimean Tatar trait. They are livestock breeders. The Crimean Tatars are Mohammedans, adherent to the law. They are honest, just, and respectful to the elderly, hospitable. They are handsome, slender, excellent horsemen' [Ivanova, 1889, p. 22, 23].

The public education was important to the Crimean Tatar social system. It could be traditionally religious or state-funded. Traditional schools were either primary (maktab) and high (madrasahs). The educational establishments employed the scholastic *usul-kadim* method and the innovative, listening-based practice, known as *usuljadid*, *usul sautiya* (the latter beginning in 1884).

Quite naturally, Muslims paid special attention to confessional educational establishments at the core of Islamic education and upbringing and thus were very popular with Crimean Tatar believers.

Faithful Muslims believed it to be their duty to send their children to maktab so that they learned to be adherents of Islam after, quoting I. Gasprinsky, 'a Muslim tribal training that any novice onlooker will find surprising and any advocate of Russification remarkable' [Gasprinsky, 1881, p. 26].

F. Andriyevsky, who had witnessed the ritual of sending a Muslim child to maktab, confirmed this. He described it as very sol-

Crimean Tatar females. Photo from the early 20th century.

emn. The student-to-be, usually aged 5 to 7, accompanied by his parents, friends, family, and maktab students was brought to the teacher, whether male or female. While on the road, the entourage performs relevant Islamic songs, hymns and recites poems. Having arrived at the maktab, the child's parents 'entrust' him to the teacher, bow to the latter, and give him/her a special gift such as coffee, tea, sugar, tobacco, a shawl, fabric, bread and sometimes money, depending on how wealthy and well-off the family is. Following the ritual, the parents hold a big festive ceremony. Guests perform a special *dua* prayer. In mountain villages in the Crimea with a religiously mixed population it was common practice to invite Christians to the semi-religious celebration. On the same evening, the village's well-respected inhabitants came to the new maktab student's home to have a cup of coffee and a 'laf' talk. Those included clergymen, highly respected *ajis* and *aksakals*. Women, clergymen's wives, rebukers, midwives, etc., gathered in the neighbour's house. 'The hero of the occasion, whether it's a boy or a girl, approaches the guests one by one in order of seniority in a shy and timid manner and performs a highly respectful *salam* greeting, which younger ones traditionally address to older people,' wrote F. Andriyevsky [Andriyevsky, 1908, p. 13–15].

Crimean Tatar ethno-confessional maktab fell into three basic categories, namely—mosque, public and privately funded. Quite naturally, mosque maktab were the most authoritative ones. Most of their teachers were local clergymen. They sometimes had assistants, who could fill in for them when necessary. Muslims also founded public (jemaat) and privately funded educational establishments that taught the Quran and foundations of Islam. Another maktab type popular with the Crimean Tatars was the confessional Quranic school.

Most maktab were funded by a Muslim community, sometimes using donations by wealthy community members. Any waqf money and property donated for the maktab was rarely sufficient to ensure proper maintenance. According to official statistics, the TMSA hardly ever spent a total of over 60 roubles per year for the maintenance of the average Crimean Tatar maktab [Verner, 1889, p. 77].

The salary of the average teacher, oji, ranged from 50 kopecks to 1 rouble. With a total of 60 students, the teacher would usually received a salary of 50 kopecks per student. This would equal 6 roubles per year. The whole maktab yielded 300 roubles. Moreover, the teacher was often given accommodation where it was also common to hold classes. He/she received firewood for the winter season and some other services to improve the oji's living standard and social status at the public's cost.

Most of the teachers were imams, mullahs, hatips, muezzins and ajis. Muslim clergymen's family members could also become maktab teachers. When a mullah taught boys at a mens' maktab, his wife or daughter would traditionally teach female students. Sometimes the mullah's son or another authoritative maktab graduated acted as his assistant. It was not uncommon for sokhts (students) of Islamic clerical schools and madrasahs to instruct maktab students.

The oji is a greatly respected, venerable, sometimes even mystical image in Islamic tradition. Maktab students accorded the greatest courtesies possible to their ojji. Sometimes

they went to extremes. For instance, students could not walk ahead of their ojji. Students dared not knock on the door upon arriving at the maktab. They were expected to squat respectfully with their arms crossed on their chest. Squatting in silence to express their respect, the students had to wait patiently 'for the oji to open the door because he/she needs to' [Andriyevsky, 1908, p. 26–27]. The Muslim greeting for the most authoritative maktab teachers was a kiss on their hand and on the flap of their clothes. Any Muslim was ready to receive them as honorary guests.

Already in the 1890s, the famous Crimean statistician K. Verner noted that most of the Tatar school buildings did not suit their purpose' [Verner, 1889, p. 63]. Quite naturally, classrooms were never ventilated. The lighting was extremely poor. The traditional window frame with the parmahlyh thick lattice adsorbed most of the daylight. Moreover, some ojjs covered them with newsprint to prevent passers-by from seeing what was going on inside.

F. Andriyevsky cited a Tatar teacher who expressed his opinion at the Yalta Public Teachers' Convention for Non-Russian Schools in 1905. Describing the existing maktab, the teacher mentioned them to 'have very poor buildings without any school furniture; children sit on the bare ground during classes; the classroom is always scantily lit and very cold' [Andriyevsky, 1908, p. 32]. He believed that even though children first went to the maktab 'at a very early age', they were prone to diseases that gradually became chronic. First of all, those included tuberculosis (consumption), which was wide-spread among Crimean Tatars. Several years at school turned students into anaemic, dwarfy people with underdeveloped chests and other signs of developmental disorders.

The liberal transformations that took place in Russia in the latter half of the 19th century raised a number of issues, including that of reforming the Crimean Tatar ethnic confessional education. The situation demanded improvements. The outstanding Crimean Tatar enlightener I. Gasprinsky raised the question of reforming the entire professional training

system of the Turkic-Muslim peoples of the Russian Empire in general and the Crimean Tatars in particular. He suggested a number of measures that ensured major benefits. Such famous Crimean Tatar social activists as I. Muftizade and A. Mediev also addresses the issue.

In the early 1880s, I. Gasprinsky noted that any 'Muslim community has a school and a mosque of its own' [Gasprinsky, 1881, p. 26], emphasizing Crimean Tatar traditions. The TMSA recorded 34 mosque and 116 privately funded maktab in 1876. They provided education to 2,610 boys and 1,112 girls, yielding 20 people per school [Dyakonov, 1882, p. 55–56]. The 1893 statistics report a total of 330 mosque maktab with 4,757 male and 3,428 female students. Privately funded maktab, which numbered as many as 138 in the Crimea, were training 1,911 boys and 1,615 girls [Dyakonov, 1894, p. 164–165].

When Russia annexed the Crimea, madrasahs remained traditionally under the influence of the Muslim clergy. Madrasah teachers fell into the following two categories: mudarrhis and gochis. The former had the same rights as community mullahs, while the latter were equal to muezzins [Complete Code of Laws of the Russian Empire–2, Vol. 23, No. 22297]. According to Russian law, mudarrhis and gochis were expected to have adequate knowledge, be decent people aged at least 25 (21 for gochis) [Complete Code of Laws of the Russian Empire–2, Vol. 30, No. 29040].

The following types of Crimean madrasahs can be singled out: Bakhchysaray, large urban and rural and plain rural (madrasah by name). The most authoritative, famous, and influential madrasahs were situated in the former capital, Bakhchysaray.—Those were the Khan's, Orta and Zinjerli Madrasahs [Pritsak, 1993, p. 18]. The second type included some urban and even rural madrasahs, among which the Karasubazar Tekye, the Kerch, Sary-Em-in Madrasahs, and the village madrasahs of Tashlydair, Uzub-Basha, and Akchur were of note. The rest of the madrasahs, mostly rural ones, more or less qualified as such [Gankevich, 2000b, p. 17].

Madrasahs were managed by the mudarrhis, who acted as the president of the educational establishment, an Islamic clergyman and a professor. The mudarrhis appointed a supervisor to maintain order. At the Zinjerly Madrasah, one of the supervisors managed the library and was expected to maintain the books on the catalog in proper condition. There was a waqf custodian and treasurer, known as the mutawalli. The imam and muezzin facilitated the religious training of the sokhts. The mudarrhis could invite an ojja or a mullah as a private teacher for junior sokhts to help them learn their mother tongue. A Calligraphy teacher, hattat, could also help. In the late 19th century, a number of large madrasahs established the position of Russian teacher.

The mudarrhis appointed a senior student, or buyuk, in each group. It was an honorary position. Apart from maintaining discipline, the buyuk was more importantly supposed to be a tutor to help the junior students study this or that subject [Tärceman, 1885, 7 October]. In the evening the buyuk usually read out the text to be studied without explaining its meaning. Arabic was the language of instruction, so nobody but the tutor understood what it meant. Some madrasahs had a buyuk hierarchy of torbuyuk, kiblebuyuk and sirabuyuk. Among them was the Davuljar Madrasah [Kırım'da medrese hayatı, p. 9].

Madrasah sokht groups were usually united in some kind of artels. They shared a room termed the oda. The mudarrhis assigned a buyuk to each of such groups. Members of each sokht artel shared meals and lived autonomously. The food was bearable. However, the chiburekki, which were cooked twice a week, were a 'delicious' and 'holy' dish [Kırım'da medrese hayatı, p. 9].

Traditional and sometimes conservatively scholastic teaching methods were employed. They relied on tutorship principles. The mudarrhis usually taught the senior sokht group. In the meanwhile, the other sokht groups studied under their buyuks' supervision, each in its oda. The buyuk usually sat in the centre of the oda. To quote a public education activist in the Taurida guberniya, 'sokhts lie in front of him on felt mats, reading' [Markov, 1869,

p. 109]. The *buyuk* maintained discipline while explaining difficult passages and correcting mistakes.

Some rich *madrasahs* contained small libraries. For instance, the complex of the Khan's *Madrasah* in Bakhchysaray had a separate library building. Up to 400 ancient books were kept there [Vakit, 1913, 29 August, No. 1283].

The medieval *madrasah* curriculum was well developed and progressive. As it remained unchanged, some subjects grew scholastic with time. This was especially true with *madrasahs* popular among Turkic-speaking Muslims. In the 1860s, Crimean *madrasahs* taught Arabic Etymology and Syntax, Logic (according to Arabic notes by Aristotle), three Rhetoric courses, the Quran, Islamic Spiritual and Secular Law—*Fiqh* and *Sharia*—insofar as it was consistent with all-Russian law [Markov, 1869, p. 110; Tärceman, 1895, January 7]. Arithmetics and Persian were sometimes on the curriculum.

Madrasah classes met daily and lasted for seven hours. Having delivered a lecture, the *mudarrhis* would make sure that the students understood them properly and provide additional explanation where necessary. It was the *mudarrhis's* personal responsibility to check and correct the papers and translations by *sokhts* [Tärceman, 1890, November 6].

Data on the number of *madrasah* in the Crimea has survived to the present. A 1865 report by the TMSA referring to statistics by *uyezd qadis* mentioned a total of 28 *madrasahs* in the 5 *uyezds* of the Taurida guberniya. In 1876, there were as many as 40 *madrasahs* in the Crimea [Markov, 1869, p. 99–101].

A public Crimean Tatar education system also existed. It consisted of the Simferopol Tatar Teachers' School (STTS) and a network of Russian and Tatar Ministry Schools (RTMSs). A decree was issued on 27 March 1872 under which the STTS was established to train teachers for Crimean Tatar primary schools, or RTMSs. Many representatives of the ethnic intelligentsia, who determined the paths of their people's development, went to the school. These included A. Mediev, A. Bodaninsky, D. Meinov, I. Firdevs and T. Boyatzhiyev.

Crimean RTMSs were established under the 'Rules' of 1870. They were funded from the *zemstvo* budget. Their main objective was to teach 'non-Russians' the Russian language. There were 18 RTMSs in 1881 and 33 in 1905. While in 1881 the total student count was 494, in 1906, it was already 945, including 40 girls [Abibullayeva, 2005, p. 12].

The government funded public education system faced numerous difficulties as it developed. However, it had a major influence on the development of Crimean Tatar culture during the many years that it existed.

I. Gasprinsky's creation of the 'Tärjeman' national publishing company and famous newspaper proved crucially significant in the development of spirituality and education among the Crimean Tatars. Starting in 1879, he made numerous attempts to found his own publishing company in the Crimean Tatar language called 'Faydali äglänjä' ('Polezniy dosug'/'Constructive recreation') (1879–1880), 'Zakon'/'The Law' (1881) [Gankevich, 2000a, p. 99–101]. Beginning on 10 April 1883, I. Gasprinsky was granted official permission to publish and edit the first Crimean Tatar–Russian newspaper, 'Tärjeman' (which was later shut down on 23 February 1918).

The theories of I. Gasprinsky circulated among the Muslim peoples of Russia using the 'Tärjeman' as a conduit. The newspaper also had a readership in Persia, China, Turkey, Egypt, Bulgaria, France, Switzerland and the USA. I. Gasprinsky himself believed that his newspaper was more popular among foreigners than his own compatriots.

In 1886 the enlightener organised the publishing of an advertising appendix to his newspaper called the 'Listok obyavleniy' ('Ad Sheet'). Then from the end of 1905 he started production on the first Crimean Tatar women's magazine 'Galäme nisvan' ('Women's World'), the editor of which was his daughter Shefika. This was his third attempt (the first two unsuccessful attempts were in 1887—the magazine 'Tärbiya' ('Education'), and in 1891 an appendix to the 'Tärjeman'—'Kadin' (Woman)) [Gankevich, 2000a, p. 146–153]. In 1906 I. Gasprinsky sought permission to publish the first comedic magazine titled 'Ha-ha-ha' in the

native language of the Crimean Tatars. Later, he created a new weekly publication for the Muslim faction of the State Duma, the newspaper 'Millät' ('People') [Gankevich, 2000a, p. 155–161].

I. Gasprinsky made an enormous contribution to the Europeanisation of Muslim peoples in Russia. At first, this could be observed in the reformation of the 'isuli gädit' school (the 'new method' for teaching literacy) he initiated as early as in 1884, and in the creation of an experimental maktab in Bakhchysaray, where mugalims from the Volga-Urals and other regions of the country came to study the 'new method'. Since that time, Jadidism developed through the reformation of religious schools, the creation and development of the national press, solving women's issues in accordance with the needs of modern societal development, strengthening cooperation in cultural, economic and social spheres among all Turkic-speaking ethnic groups, the formation of a national intelligentsia, the modernisation of the Muslim way of life and households, establishing contacts with the Russian government and members of the cultural and educational community, the foundation of philanthropic and patronage structures, and finally, the creation of political organisations. I. Gasprinsky's worldviews and theories were based on a liberal ideology, the idea of the progressive development of society, friendship between Slavic and Turkic peoples, religious tolerance between Christians and Muslims, and on an opposition to the radical demands of the socialists. His writings advocated for evolutionary forms of social development [Gankevich, 2000b].

I. Gasprinsky is the author of several literary works, including the novel 'French letters', one part of which is a utopian novella titled 'Darer-rähät möselmanlari' ('Muslim lands of prosperity'), the novel 'African letters—the Country of Amazons', the short story 'Arislan kiz' ('Lion-girl'), the short story 'The Grief of the East', and the essays 'Russian Islam. Thoughts, notes and observations of a Muslim', 'The Russian-Eastern agreement. Thoughts, notes and suggestions' and other works [Gankevich, 2009b, p. 13]. I. Gasprin-

sky is the ancestor of many literary and journalistic genres for both the Crimean Tatars and other Turkic peoples.

At the end of the 19–early 20th century, representatives of the younger generation made themselves known in Crimean Tatar national literature, including Osman Aqçoqraqlı (1879–1938), Asan Chergeev (1879–1946), Abdurešit Mediev (1880–1912), Usein Shami-lyä Tohtargaz (1881–1913), Abibulla Odabash (1881–1938), Memet Nuzet (1888–1934) and a number of other writers and poets [Fazyl, 2005, p. 58].

One particularly important phenomenon for Muslim public life was the creation in 1897 of the 'Crimean charity community in Simferopol for helping Crimean Tatars in need'. I. Muftizade (1841–1917), an eminent political figure among the Crimean Tatars, became the head of this community and directed its activities for many years to come.

Thus, the Crimean Tatars traversed a difficult, but vivid, dynamic and complex historical path as part of the Russian state. From the end of the 18th century until the beginning of 20th century, the residual phenomena of the previous period were being gradually eliminated. The Crimean Tatars attempted to incorporate themselves into the unified system of the complex state organism that called itself the Russian Empire. The reaction of the Crimean Tatars was ambiguous. They sought to revive the bodies of the Muslim Spiritual Directorate, preserve and reform people's schools, and create a powerful social movement and national press agencies. As a form of protest on behalf of the conservative-minded portion of the population, they turned to the inner life of their community and to massive, sometimes even catastrophic, waves of emigration into Turkey. After realising the harm these forms of protest could bring about, patriotic forces of Crimean Tatars began battling against such potentially dangerous phenomena. It was they who were called upon and active in directing the Crimean Tatars to incorporate themselves into the complex system of the Russian state while fully preserving their national identity, religion, language, culture, education and spirituality. At this stage they were seeing pros-

pects for educating the population aided by Jadidism, which had finally found formation in Crimea thanks to the efforts of I. Gasprinsky and his supporters. On the other hand, in

the early 20th century, centripetal tendencies emerged in the social and political life of Russian Turkic-Muslims, and the Crimean Tatars took an active role in this process.

§ 7. The Lithuanian-Polish Tatars

Yakov Grishin

The ancestors of the Lithuanian-Polish Tatars originated from the various peoples who were part of the Golden Horde state and formed after the demise of its Khanates. The mass migration of Tatars from the Golden Horde to Lithuania began during the reign of Grand Duke Vitold (1392–1430). These resettled members of the Golden Horde received vast estates from the hand of the Grand Duke, and in return they agreed to serve in the military. Benefiting from all the rights of Russian-Lithuanian boyars, they enjoyed guaranteed freedom of religion in addition to respect for their customs [Lappo, 1901, p. 462; Dziadulewicz, 1929, p. 26].

The Tatar population in Lithuanian-Polish lands were divided into 6 tribal groups called Chorągiews, including Bargins, Jalairs, Ushans, Kongrats, Naymans and Ulans. They were governed by their own religious law, a Sharia law that functioned in all religious hymns.

Social stratification remained among the Tatars, where the descendants of Horde sultans and murzas stayed locked into the most privileged positions. The title of Sultan in the Polish-Lithuanian Commonwealth belonged to only two Tatar families, the Ostrynskys and Punszkys. Senior members of the families are consistently referred to as princes, as they were descendants of the ruling khans. The remaining Tatar families descended from Horde murzas and were assigned the title of prince [Akty', 1906, p. 22, 41, 230].

The descendants of Horde sultans and murzas owned large votchinas and kholops, and in return they were required to serve in the cavalry. They also enjoyed the same rights as the dominant Polish gentry. In documents from the 16th century, they were called 'rich Tatars'.

Beneath them were the so-called Tatar-Cossacks (serving nobility), who descended from the ranks of ordinary soldiers who arrived in the Polish-Lithuanian Commonwealth by the unit transports of Horde sultans and murzas. They were given small plots of land, and they not only served in the military in return, but were also trusted with important duties to serve the Grand Duke and his courtiers [Mukhlinsky, 1887, p. 25].

The third group consisted of urban Tatars who were largely descendants of prisoners-of-war. The largest number of them resided in Vilno, Troki, Augustow, Ostrog and Grodno.

Urban Tatars were called 'simple Tatars' in documents. They were separated on legal grounds from the rich Tatars, and were tasked with various duties to a lesser degree. However, simple Tatars had to pay a tax for legal custody.

The availability of land, military service and the collection of taxes on par with the Lithuanian-Polish gentry gradually brought about the coalescence of the rich Tatar nobility class in the Polish-Lithuanian Commonwealth. Their nobility was proven in a similar manner to the Lithuanian-Russian gentry, meaning by the evidence of relatives and neighbours, as well as by official documents.

Almost all Polish sources from the second half of the 17th century included overtly laudatory assessments of Tatar soldiers. The military glory of their regiments in the Royal Army contributed to the fact that light cavalry in many armies from Western European countries started to take shape on the example of Tatar units. In the 18th century, Ulan units began to form in France, Austria and Prussia.

During the Partitions of Poland (1772, 1793, 1795), Tatars were far from detached

from the struggle for independence in their state, and they contributed greatly to the uprising of 1794 under the direction of Tadeusz Kościuszko [Kryczyński, 1984, p. 147–148].

When a section of the Polish territory fell under Russia's rule, Catherine of Russia confirmed all of the existing rights and privileges of the Tatars. Under Pavel the Great a Tatar regiment was formed under the command of a Tatar, one Major General Baranovsky [Tyszkiewicz, 2002, p. 50].

During Napoleon's invasion a portion of the Tatars fought for France, and the others for Russia. They therefore found themselves on opposite sides of the barricade during the Polish uprisings of 1830–1831 and 1863–1864.

The vast majority of Lithuanian-Polish Tatars professed Sunni Islam. In their places of residence they created a religious *gmina*—a *Jemat*—the competences of whom includes the election of the clergy and the resolution of issues relating to the *gmina*, especially the management of endowments. They convened meetings when it was necessary, and they were guided by either the captain of a horse or Tatar cornet. The latter held significant influence over the course of the assembly, particularly in the election of imams.

The symbol of the *gmina* was a mosque, although not all *Jemats* could afford one due to financial reasons. The mosques that cropped up among the surrounding Lithuanian-Polish buildings were modest and small. They were funded by either the religious *gmina* or a rich group of Tatar chiefs, and the interior of mosques was also quite subdued. Frequently they were composed of two parts, a male and female side. A separate room for women, what were known as *Babinets*, could only ever be seen in Russia in Lithuanian-Polish religious buildings. Prayers were performed in the men's half [Akty', 1906, p. 25–26].

There were also rituals associated primarily with the three most important moments in life: birth, marriage and death. However, it should be kept in mind that considerable distance from the Muslim East, as well as a lack of knowledge of the Quranic Arabic language, led to the fact that the Lithuanian-Polish Tar-

tars had little knowledge of the principles of their religion. These were usually limited to Friday prayers, which were held in mosques or in private homes.

The requirement of the Koran to give alms to the poor lost its original meaning for Lithuanian-Polish Tatars. Instead, it transformed into a normal disbursement of funds between the members of an alms prayer (*sadaq*).

The source of religious knowledge for Tatars could be found in writing, which had been preserved in the form of written *kitab* and *khamails* (*šamails*). Lithuanian-Polish Muslims called religious books '*kitab*s', and the contained the translations of certain sections of the Quran, stories from the life of the Prophet, explanations of rituals, legends and sermons. *Kitabs* were written in Arabic script, but the texts were in Polish or Byelorussian. The Grand Duchy of Lithuania had the arrangement and explanation of the Quran available in the Byelorussian language from as early as in the 16th century. *Kitabs* were often stored in mosques, but wealthy landowners were also known to keep them as well. Tatar *kitab*s were copied by copyists who knew the Arabic writing system and often made their own amendments in the form of stories and legends. The name of the copyist and date of the work's completion were specified on the last page of the *Kitab*. In the 19th century, copyists often did not even understand the Eastern texts they were rewriting [Lapicz, 1986, p. 66].

During the religious revival, especially the *Bairams*, Muslims came together and read aloud the old legends, stories about the life of the Prophet and the descriptions of ancient religious rites.

The main source of religious knowledge for Lithuanian-Polish Muslims were not the relatively hard to find *kitab*, but rather *khamails* or religious books. Each Tatar family kept their own. *Khamails* contained the basic texts of prayers in Arabic and Turkish, as well as Polish and Byelorussian explanations of religious rites. The vast *khamails*, besides a collection of prayers, contained various magic wordings and spells that were used in the treatment of patients, and for dream books, astrological tables and calendars. Tatar prayer

books influenced the formation of the Muslim religious worldview to a much greater extent than the kitabs, as they were available to anyone who was familiar with the Arabic writing system. Khamailies are a uniquely rich source of knowledge for ethnography and Oriental studies, but also for history as a whole, because in the margins Tatars often made notes of the important events they have been witness to themselves [Tamže; Kryczyński, 1938, p. 220].

In the late 19th century, Lithuanian Tatars occupied much more advantageous positions than the other Muslim peoples of the Russian Empire. They had no major obstacles to obtaining permission to build new mosques, and they chose their clergy members themselves. The submission of the Lithuanian-Polish Muslims to the Tauride Muslim Spiritual Assembly was a formality, and it never interfered in their affairs. This favourable religious situation stemmed from the benevolent attitude of the administration toward the Lithuanian-Polish Tatars.

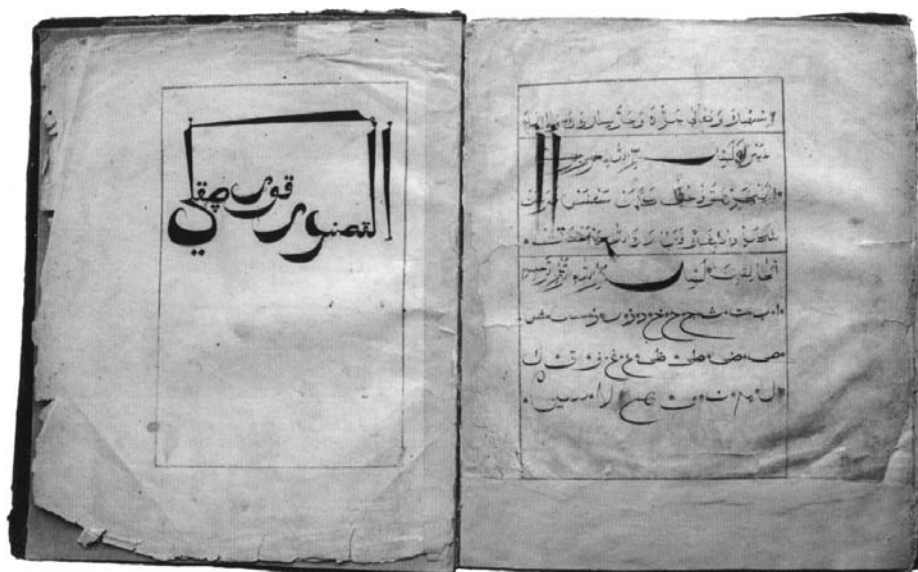

Lithuanian-Polish Tatars had a religious court, and while being Muslims and know-

ing their roots, they were culturally quite similar to the Poles and Belorussians, from whom in the past they had acquired not only language, but also many local customs. This led to the fact that they were almost indistinguishable from their Christian neighbours in everyday life, except for what concerns their Muslim rites. Their appearance was of course another differentiating factor, but the authorities did not present them with any particular obstacles in the promotion of their careers. Professor Julian Talko-Hryniewicz wrote on this matter, stating that 'Mohammedans, taking advantage of their privileged standing, occupied positions in the judiciary and police departments without even possessing the proper qualifications. The Russian authorities repeatedly showed them preference over Orthodox Christians, for they considered them to be more conscientious and unbiased. In certain years police were recruited mainly from among Muslims' [Talko-Hryniewicz, 1924, p45].

However, Lithuanian-Polish Tatars made their most significant career moves in the Russian army. At the beginning of the 19th century, the first Tatar General rose to power, Jozef Ulan (died in 1804). In the 19th century, there were several dozen Tatar generals and colonels, as well as several hundred Tatars serving as lower ranking officers in the Russian army. Before World War One, about 20 generals in the Russian military service were Lithuanian-Polish Tatars, including Khalyl Bazarevsky, Tamerlan Belyak, Josef Jakubovich, Jakub Yuzefovich, Alexander Romanovich, Matsey Sulkevich, Alexander Talkovsky and others. All of them were graduates from Russian military schools, including the Academy of the General Staff, and were considered to be some of the most loyal subjects of the Empire. They were not only trusted to command regiments, divisions, corps and armies, but were also accepted into the ranks of the Guard [Grishin, Sharafutdinov, 2001].

Besides military service, Tatars were also proficient in other professions. Thus, the main occupation of poor Tatars was agriculture, especially horticulture. They made significant progress in this sphere, despite the

The Quran
of Alexander
Koritsky.
The middle of
19th century

fact that they had only small fields to their names. The Trakai Tatars far exceeded all others, as for centuries they had been successfully planting and selling cucumbers [[Akty', 1906, p. 27].

Furmanstvo (professional coachmen) was another important commercial activity among the Tatars. However, by the end of the 19th century, in light of the construction of railways, this popular trade declined in the Tatar population. The tanning industry also offered popular occupations. Tatars specialised in the tanning of horse and goat skins, and making beautiful morocco and Juchten leather. The leather industry flourished even at the end of the 19–the beginning of the 20th century. Tatars living in the Butrimants area were especially famous for their leather tanning [Akty', 1906, p. 235], and also kept livestock, particularly cattle. They were known as horse experts, and no other peoples could equal them in that trade. They could do it all: breed animals, take care of them and masterfully train them by breaking them in. These traditions were maintained up to the 1930s.

Additionally, Tatars sold horses, which never fell out of popularity as a valuable commodity.

Lithuanian-Polish Tatars in the Western governorates of Russia after 1815 and especially after the Polish Uprising of 1831 start-

ed to become better integrated into the power structures. Muslim youth willingly attended school, and educational authorities aided them in this endeavour. Beginning in the 1840s, many Tatars also began to work in the treasury house, various financial and tax institutions, and in provincial departments. Tatars in districts more readily occupied positions in the police, courts and customs offices. At the end of the century, they were also working in the railroad and post services.

The common people never abandoned their old professions and trades.

After 1880, more and more Muslim youth started to enter various higher educational institutions in Russia, and a small group of Tatar students from the western governorates took up residency in the Russian capital. Among these students, the most well-represented families were the Ahmatoviches, Bayrashevskys, Bazarevskys, Buchatckys, Korytskys, Krychinskys, Mukhleys, Sulkeviches, Talkovskys and Tugan-Baranovskys, who would provide a whole plethora of generals, lawyers and scientists.

In St. Petersburg on the eve of World War One, the Tatar intelligentsia and student body formed a secret 'Circle of Polish Muslim students' led by the law student brothers Olgerd and Leon Krychinsky [Tyszkiewicz, 2002, p. 95–96].

The 'Lithuanian-Muslim society for helping poor Muslims', which was active in the educational sphere as well, was established in Vilno, and a similar society emerged in the spring of 1913 in Warsaw with Volga Tatars acting as its original founders. It consisted of 118 members, 55 of whom were from the Volga, Crimea and Caucasus regions, and the rest were Lithuanian-Polish Tatars. The chairman General K. Krychinsky was chosen from among them [Miśkewicz, 1990, p. 24].

It does not seem possible to determine the exact number of Lithuanian-Polish Tatars in the 19th century. In the work of A. Mukhlinsky we find the results of the 1853 census, according to which 5,485 Tatars lived in the northwestern governorates. The next census (in 1854), conducted by The Department of Religious Affairs of Foreign Faiths, reduced this number to 3,525 people. By 1887, the Muslim population had increased to 9,467 persons [Muchliński, 1858, p. 161].

According to the first general census of the population in 1897, in Grodno Governorate there were 3,731 Muslim people listed (3,054 men, 677 women), in Kovensky—1,920 (1,623 men, 297 women), in Vilna—4,375 (2,572 men, 1,803 women), in Minsk guberniya—4,619 (2,582 men, 2,037 women), in Podolsk—3,460 (3,427 men, 33 women), and in Volhynia—4,877 (4,703 men, 174 women). In general, these governorates contained a total of 22,982 adherents of Islam (17,961 men, 5,021 women). A total of 14,237 people spoke Tatar (11,940 men, 2,297 women) and 2,043 spoke Bashkir, notably only men. Other languages were spoken by 6,152 people, mostly Russian and Byelorussian. A predominance of men could be observed everywhere, which was associated with their inclusion in soldier lists. It can be assumed that the figure of 6,152 people is directly related to the ethnic group under examination [Pervaya vseobshchaya, 1904, vol. 8, 11, 16, 17, 22, 41].

Tatar colonies in the Kingdom of Poland were small and distinct; they lived in two guberniyas, Sedletsk and Suvalsk. And in 1851 there were only 272 people there. In early 1860, the Tatar population had increased to 325 (in Suvalsk guberniya—178, in Sedletsk—147).

According to the census of 1897, there were 669 Muslims in Sedletsk (643 men and 26 women), and in Suvalsk there were 786 (726 men, 60 women). As in other governorates, these figures also included men currently serving in the military. Tatar was spoken by 1,260 persons, including 1,249 men and only 11 women, while other languages were spoken by 159 Muslims, with 92 of them speaking Polish (28 in Sedletsk and 64 in Suvalsk guberniya). But the last two figures cannot possibly be true, as there was universal knowledge of the Polish language among the Tatars. To determine the total number only the earlier data is truly needed, based on which it can be concluded that both guberniyas consisted of around 300 Polish Tatars of both sexes [Miśkewicz, 1990, p. 15].

A few words must also be said about the Muslims of Warsaw, who came to this city as permanent residents somewhere in the beginning of the 19th century. They were quite likely Tatars from Podlyasye, but unfortunately no numerical data is available. Only a cemetery in the area between Chernyakov and Sekerki can hint at the presence of Muslims during that period.

Growth in the number of Muslims in Warsaw can be best seen in the 1820s, when Russian troops started to arrive there. Along with them, civilians engaged in commercial trade also arrived. In 1852 they appealed to the governor of the Kingdom of Poland with a petition to appoint a civil cleric for them. After considering their request, with the help of the Warsaw Oberpolizeimeister the authorities conducted a census of the city's Muslim civilian population. Its results showed that 15 Volga Tatars were temporarily living in Warsaw as of 7 (19) August 1852. In this regard their petition was rejected, and the duties of pastor had to be performed by a Muslim chaplain. Polish Tatars were not included in this list [Tamże; Nietyksza, 1971, p. 239].

A further influx of Muslims into Warsaw was observed after 1865, which was directly linked with the railway lines built between St. Petersburg and Tiraspol. In 1882 there were 85 Muslims (72 men and 13 women) in War-

saw, and in 1897 there were 589 (538 men, 51 women) [Nietyksza, 1971, p. 239].

The exact number of permanent residents of the Warsaw Muslim colony is impossible to determine. However, it is known that it consisted mainly of Volga Tatars who made regular trips between Warsaw and Kazan. A small number of Muslims also lived in this colony who came from Central Asia and the Caucasus, as well as individual families of Arabs, Turks and Persians. Warsaw Muslims opened their own bakeries, sugar production operations, butcher shops and workshops for the restoration of carpets, flourished in commercial trade, and were even trade intermediaries in some parts of Russia and even Turkey [Miśkewicz, 1990, p. 15].

How many Lithuanian-Polish Tatars lived in the Warsaw colony? Apparently not very many, as in the 19th century they never completed any type of large, organised emigration to Warsaw. There were allegedly only several families there.

Thus, Tatars who had long been living in the former Lithuanian state never constituted a significant element among other nations, and they never made any claims for political independence. It is no coincidence that the local peoples lived in peace and harmony with them.

By the end of the 19th to the early 20th century, Lithuanian-Polish Tatars had managed to preserve their identity, primarily in religious terms, in their professional work and in everyday life.

Section II

Class and Social Groups of the Tatars

Estate—a social and legal category of the population, tightly closed and characterised by inheritance rights, privileges and responsibilities determined by law or custom. Subjects of the Russian Empire were divided into four estates ('states'): the nobility, clergy, urban and rural residents. Every estate had rights and responsibilities that were determined by law and inherited. The estate structure was organised into a hierarchy expressed by inequality of an estate's positions and its privileges. The nobility and the clergy belonged to the highest, most privileged estates, and the urban class and 'village residents' belonged to the underprivileged peasants. From 1832, a new social estate of hereditary citizens and citizens by merit emerged in the urban environment.

CHAPTER 1

The Nobility

Liliya Baibulatova

By the early 19th century, due to the 'Zhalovannaya gramota dvoryanstvu' (Charter for the Rights) of 1785, the Russian nobility as a whole was fully established as a special privileged estate that was not obliged to serve the state, which essentially deprived it of its original function, and at the same time it was freed from paying taxes and corporal punishments, and was granted various exclusive rights of possession of lands and peasants. Nobles with the right to be engaged in commerce and industry grew, they created their own Social estates self-government, and this was the reason for their regional insularity and the absence of an all-Russian noble corporation. Despite the fact that the terms 'sostoyanie' and 'soslovie' [social group] were identical for the nobility of Russia [Rossiya, 2002, p. 91], arbitrary groups existed within it: 1) a division into nobility by birth and nobility by merit; 2) the classification of nobility by birth into six groups. The division of nobility by birth meant no legal differences, and it was provided in order to identify the oldest and titled Russian Orthodox clans compared to later and less noble clans. In addition, non-Russian and non-Orthodox nobles, including Tatar Muslims, were set apart.

Noble Muslims. The social and legal status of the Tatar feudal class was transformed in the first quarter of the 18th century by being registered in the Admiralty of Kazan and treated equal to the class of state peasants. They gradu-

ally became part of the Russian nobility after the edicts of 1 November 1783 and 22 February 1784, which the Tatar murzas and princes quickly took advantage of. The first decree (of 1 November 1783), which allowed Tatar murzas and high-ranking people to be accepted for military service and to be awarded officer ranks [Complete Code of Laws of the Russian Empire, Vol. 21, No.15.861], opened the way to the nobility through military service; and second of 22 February 1784, 'On permitting the Tatar princes and murzas to make use of all the advantages of the Russian nobility' allowed the acquisition of noble status for Tatars who could confirm their noble origin and thereby break away from poll status [Arapov, 2001, p. 48]. The government took these measures to bring the members of the Tatar Muslim elite to its side after the annexation of the Crimean Khanate by Russia.

Despite these opportunities, several factors interfered with their inclusion in the Russian nobility: first of all, many representatives of the Muslim elite who lived in rural areas were poor and were engaged in farming like the majority of peasants [Arapov, 2001, p. 19]; second, they did not have or had lost the documents confirming their noble status [Enikeev, 1999, p. 138]; third, the government restricted the number people seeking 'nobility'; fourth, a 'local factor' represented by the Russian nobility played a great role during ascent to the

'nobility'. For example, in Kazan Governorate, the 6th section (ancient honourable bloodlines) of a genealogical book did not record a single representative of the Tatar Muslim feudal elite¹.

By decree of Pavel I of 29 November 1796, 235 princes and murzas from the Yanbulatovs, Akchurins, Mamatkozin-Sakaevs, Chanyshevs, Diveevs, Mamins, Mamatkozins, Kashaevs, Yaushevs, Shikhmametovs, Biglovs, Enikeevs and Teregulov clans in Orenburg Governorates were restored to noble status. By edict signed by the tsar in 1797, 350 people were registered as hereditary nobility, including 231 from Orenburg, 8 from Tambov, 15 from Saratov, and 96 from Penza Governorate. By 1797, the complete list of those who had requested a move from the taxable estate to the noble one in the governorates of European Russia included 4,811 people from 177 Tatar clans in various governorates. They included 17 princely and murza clans from Saratov (1,008 people), 32 clans from Ryazan (388), 2 clans from Orenburg (61), 7 clans from Simbirsk (282), 22 clans from Penza (524), 1 clan from Nizhny Novgorod (55), and 96 clans from Kazan (2,793 people). However, only some of them were able to establish their noble origin and provide the documents granting them manor

from the tsar [Khayrutdinov, p. 89]. On producing the necessary documents, the local Noble Assembly that examined the claimant's application often declared them insufficient and demanded additional information. According to the Law of 27 March 1840, Tatar nobles were required to include their children in the genealogy book, reaffirming their rights by evidence from the parish register of the Orenburg Muslim Spiritual Assembly about their legitimate birth, despite the fact that hereditary nobility passed to children and descendants [Complete Code of Laws of the Russian Empire–2, Vol. 15, p. 1, No.13304]². The most likely method of restoring noble rights for Tatar murzas and princes was military and civil service. Starting in May 1800, after widespread restoration of smallholders' rights to the noble status of Kazan and Lithuanian murzas, those whose evidence of noble origin was confirmed had to enter military service for their final restoration and serve until they reached the rank of officer [Khayrutdinov, 1997, p. 92]³.

Participation in military campaigns and feats contributed to obtaining successive officer's ranks and receiving combat awards, which made it possible to gain nobility. Thus, in 1814, the Ufa Nobility Assembly elevated 64 people from Tatar murzas who participated in the Patriotic War of 1812 to the ranks of hereditary

¹ For example, in 1818, a noncommissioned officer of a Jaeger regiment, Kurmay Salikhov Kuldyushev, submitted a copy with five scrolls about the noble origin of his bloodline to the Kazan Nobility Deputy Assembly, but the Assembly considered this proof insufficient and proposed that the claimant submit a generation list witnessed by 12 noble persons, a certificate by court authorities that no one in his line had been under the per capita taxation, as well as a statement of the command about his service and behavior. Moreover, the Deputy Assembly was interested in knowing who influenced his decision to enter the military service, why his last name differed from the hereditary family name of Kildishev, as well as why he was not styled as a prince, like his ancestors [National Archives of the Republic of Tatarstan, f. 350, inv. 1, file 11, s. 3–3 reverse].

² All in all, nine Muslim Tatars were entered into the ancestral nobility book of the Kazan Governorate (the Alkins, Aleevs, Vagimovs, Ermukhametovs, Sainovs, Muratovs, Khalfins, Yunusovs, Elmurzins): Seven of them received the noble status through the military service and two through the civil service; they were entered into the book in the first half of the 19th century, before the rules of gaining the noble status became stricter [Dvoenosova, 2001, p. 27].

³ In the absence of a parish register entry, according to the same decree, it was allowed to provide a pedigree signed by the leader of the nobility and witnessed by a close relative who had already been ennobled; also, the testimony of 12 noblemen about the lifestyle corresponding to that of a person of noble origin was required, as was a statement from the public authorities that neither the claimant nor his father and grandfather had been subject to the per capita duty. If the claimant and his father and grandfathers had been subject to the per capita duty, then they, after confirmation of the provided proof, were restored to the noble class with the rights of single-householders.

³ During the reign of Catherine II, the rise to the noble class was ensured by receiving the first officer rank in the military service and Class VIII in the civil service. Such a low threshold granted access to the noble class to many natives from other classes. In 1845, this threshold was raised to Class 8 of the military service and Class 5 of the civil service. Starting from 1856, the hereditary noble status was granted after achieving Class VI in the military service and Class IV in the civil service [Korelin, 1979, p. 26].

* First General Census of the Russian Empire, vol. 2, 8, 10, 11, 14, 16, 17, 22, 24, 25, 28, 30, 31, 35, 36, 38, 39, 41, 42, 45. In the calculation of the Tatar nobles, only those who considered the Tatar language their mother tongue were registered. As a result, the table does not include Bashkirs, Teptyars and Meshcheryaks who indicated their mother tongues as the 'Bashkir', 'Teptyar' and 'Meshcheryak' languages. Table 20 and 21 have been prepared according to the same sources and criteria.²

^{1*} In addition to Tatars, the following nobles by birth lived in Ufa Governorate: Bashkirs—512 people of both sexes, Meshcheryak Tatars—10, Teptyars—2 people of both sexes.

^{2*} In addition to Tatars, the following nobles by birth lived in Orenburg Governorate: Bashkirs—452 people of both sexes.

^{3*} One Bashkir noble by birth was recorded in Saratov Governorate.

^{4*} In addition to Tatars, the following nobles by birth lived in Samara Governorate: Bashkirs—117 people of both sexes, Teptyars—8 people of both sexes.

^{5*} In addition to Tatars, the following nobles by birth lived in Vyatka Governorate: Teptyars—9 people of both sexes.

^{6*} In addition to Tatars, the following nobles by birth lived in Perm Governorate: Bashkirs—3 people of both sexes.

^{7*} One Bashkir noble by birth was recorded in Volhynia Governorate.

nobility [Arapov, 2001, pp. 19–20; Gabdullin, 2006, p. 82–83].

The most complete information on the settlement and number of nobles in the regions of the Russian Empire is found in the materials of the 1897 First General Census of the Russian Empire, which were based on oral replies given by the respondents without providing any documents.

As can be seen from data of Table 19, in the governorates densely populated by Tatars, the largest number of Tatar nobles were in Ufa (2,863 men, 2,833 women), Minsk (1,678 men, 1,756 women) and Taurida (875 men, 766 women) guberniya.

Ufa Governorate had the largest number of Tatar nobles, with more than half (54.5%) of all nobles by birth. After limiting the number of Bashkir nobles by birth, from 5 July 1829, the Tsarist government began to elevate Bashkir Cossack officers only with nobility by merit; from 28 May 1839, officers of the Bashkir Meshcheryak army who received the Order of St. Stanislav, could also gain only the status and rights of nobility by merit [Istoriya Bashkortostana, 1996, p. 348]. The Tatars were treated as a 'privileged' group due to their involvement in the suppression of the 1773–1775 rebellion, and as a result they were given preference over the Bashkirs, with respect to granting noble rights [Tagirova, 2011, p. 47]. The largest concentration of Tatar murzas and Serving Tatars serving in the irregular forces was also here [Dvoenosova, 2001, p. 25]. The local administration engaged representatives of the Tatar nobility to lead the Muslim population; starting in 1801, due to the formation of the Bashkir Meshcheryak army, the number of Tatar officers increased significantly, because command staff had been recruited from the Tatar murzas [Enikeev, 1999, pp. 139–140]. For example, in 1850 there were 59 nobles by birth from the Meshcheryaks among the canton officials [Istoriya Bashkortostana, 1996, p. 348]. Following the disbandment of the Bashkir army, in 1865, Meshcheryaks and Bashkirs rewarded for their service with actual and acting ranks obtained the status of nobles by birth and by merit [Yamaeva, 2002, p. 72].

Nobles from the Lithuanian-Polish and Crimean Tatars were also relatively numerous. As Table 19 shows, at the end of the century about a third (30.6%) of the Tatar population in five Polish-Lithuanian governorates were nobles, while the percentage of the nobles by birth among the Tatars in Minsk Governorate was the largest for the region at 84.6%. Tatars made up 13.2% of the total number of nobles by birth in Taurida Governorate.

The situation of the Lithuanian-Polish Tatars was such that at the end of the 18th century, that during the annexation of the Lithuanian provinces, their possessions and benefits, including the right to own serfs, were officially confirmed by the Russian authorities. Later on, in 1823, the procedure for becoming a noble was accelerated in order to attract experienced Tatar officers to the Russian army. According to the Senate's edict of 27 March 1840, Polish-Lithuanian Tatars who served in the Russian army or were the ancestors of those who served with the Polish-Lithuanian troops and had noble privileges were registered as belonging to the nobility [Grishin, 2005, p. 106].

For Crimean Tatars to gain noble status, it was sufficient to provide a document confirming their origin from individuals who owned land before the annexation of Crimea in 1783, or an oral testimony of their 'fellows' because of a lack of written evidence [Dvoenosova, 2001, p. 24].

In Russia as a whole, the number of nobles by birth was 1,221,939 people (0.97% of the population), of which 52.6% were Russians and 5.3% were Tatars [Rossiya, 2002, p. 96, 98]. The percentage of Tatar nobles in the governorates already discussed was 1.16% (14,209 people) of all nobles by birth. According to information provided by D.Yu. Arapov, about 70,000 Muslims were granted noble rights up to 1917, as nobles by merit and by birth, and estate officials; accounted for about 5% of all nobles in the Empire [Arapov, 2001, p. 28].

The census of 1897 also provided data on the number of nobles by merit ⁴ among the Tatars.

⁴Lifetime nobility as a social category appeared in 1722 and could be gained in three ways: 1) by the monarch's decree; 2) by gaining a certain position in the

Table 20

Total	31,817	583	1.8%	0.3%

^{1*} Besides nobles by merit among the Tatars there were: Bashkirs—133 people of both sexes, Meshcheryaks—15 people of both sexes.

^{2*} Besides nobles by merit among the Tatars there were: Bashkirs—207 people of both sexes, Teptyars—3 people of both sexes.

^{3*} Besides nobles by merit among the Tatars there were: Bashkirs—25 people of both sexes.

^{4*} Besides nobles by merit among the Tatars there were: Bashkirs—33 people of both sexes.

As Table 20 shows, the number of Tatar nobles by merit in all three regions was much lower than the number of Tatar nobles by birth. In the Volga-Ural region, the largest number of nobles by merit were registered in Kazan

Governorate, which was most likely correlated to their prevalence in the city (62.9%), where there were more opportunities for work giving priority for gaining nobility by merit. Most of the nobles by merit were in Taurida Governorate (566 people), but in comparison with Kazan, the majority of local Tatar nobles lived in the districts (80.2%).

active service; 3) by being awarded the Russian order for 'distinguished service'.

In general, the small number of nobles by merit among the Tatars can be explained by their lack of involvement (because of poor knowledge of Russian, a lack of proper education and insufficient financial security) in government institutions, in which service to a certain rank allowed the right to gain nobility by merit.

The data of 1897 about the resettlement of Tatar nobles by birth and by merit show they were mainly rural (Table 21).

In all three regions, the largest number of Tatar nobles by birth lived in the districts. The only exceptions were Lithuanian-Polish Tatar nobles by birth, for whom there was a small difference between urban and rural nobles (41.5 and 58.5%, respectively), and the largest number of Tatar nobles by merit in the North-West governorates were urban (70.6%). In the Volga-Ural region 90.6% of the nobles by birth and 61.5% of nobles by merit lived in rural areas.

One of the features of the social status of Tatar-Muslim nobles in the Volga-Ural region was the insignificance of their lands, which was the result of internal policy in the Middle Ages and in the New Time. In 1795, there were only 28 estates of Muslim landlords (Yaushevs, Alkins, Devletkildeevs, Maksyutovs, Tevkelevs, Bekovchi-Cherkasskijs) in the Ufa viceroyalty. There were only a few large landowners with 500 to 1,000 or more dessyatinas⁵ of land. The most extensive lands belonged to the Tevkelev clan, who in 1870 owned more than 72,000 dessyatinas in the Ufa, Orenburg, Vyatka, Ryazan and Penza guberniyas [Azamatova, 2008, p. 88]. During the post-reform period in the Cis-Urals, they set up profitable households using cheap hired labour, and also made large profits from agriculture, animal husbandry, renting fields and croplands and selling timber. However, at the end of the 19th and early 20th centuries, the Tevkelevs moved to the cities and gradually abandoned agriculture and began to sell real estate. In 1898, Kutlumukhamed Tevkelev put up 6,729 dessyatinas of land for sale, and another 5,294 dessyatinas in 1905 (together with his cousin Umma-Gulsum Saitgareeva Sheikh-Ali) in Belebey Uyezd. In 1906, The Peasant Bank purchased Sheikh-Ali's share (4,201 dessyatinas) and part of Kutlumukhamed's manor (688 dessyatinas). In 1892, Kutlumukhamed's younger brother Vladimir (Ahmet before baptism) took custody of his manor and sold it to the Peasant Bank in 1907. The Tevkelevs continued to sell their land, as was typical of the Russian nobility in the early 20th century. Whereas 38,000 dessyatinas were registered in Ufa Governorate in 1870, by 1913 there remained only 9,653 dessyatinas where there were no landlords' households [Azamatova, 2008, pp. 88–89, 91–101]. Two noble clans, the Teregulovs and Enikeevs, had large land allotments (more than 7,000 dessyatinas), but since these lands were distributed among heads of households in allot-

ments of 35–154 dessyatinas each, they may be considered as lower, small and medium landowners [Steinwede, 2011, p. 70]. Yusup Alkin owned more than 1,000 dessyatinas of land in Ufa Uyezd [Gabdullin, 2006, p. 97], and Shagiakhmet Alkin's heirs from the same Alkin clan in owned 1,200 dessyatinas in Mamadysh Uyezd in 1895 [National Archives of the Republic of Tatarstan, f. 350, inv. 2, file 676, s. 3]; members of the Akhmetshi and Sharif clans owned 1,065 dessyatinas of favourable lands [Gabdullin, 2006, p. 97], and Kazan nobleman Saetgarey Devletkildiev bought 3,000 dessyatinas in Sterlitamak Uyezd in the 1870s [Central Historical Archives of the Republic of Bashkortostan, f. I–10, inv. 1, file 892, s. 36 reverse].

The majority of small groups of Tatar nobles were settled in the Cis-Urals. Their land holdings in the post-reform period were smaller than townspeople's and peasants' private holdings, which were up to 250 dessyatinas. Thus, in the 1890s in Ufa guberniya, the Tatar nobles Bibizukhra Teregulova (90 dessyatinas) and Teregulov (118 dessyatinas) rented out their lands, and Prince Devletkildeev sowed part of the lands (265 dessyatinas) himself [Usmanov, 1981, p. 214, 218, 237].

It should be noted that unlike the Tatar nobility, poor Russian nobles were supported by the state, which gave them land and provided financial assistance [Romanov-Slavatinsky, 2003, p. 230].

Tatar nobles had small plots of arable land and essentially managed peasant households, due to the lack of serfs; thus, they did not experience the hardships faced by Russian landlords who had lost their free labor force. Some of them took advantage of the low cost of Bashkir country houses and bought them to increase their land estates.

Another feature of the Tatar nobles was the small number of serfs in their households. They lost Orthodox serfs by the decrees of Peter the Great of 3 and 27 November 1713 and 12 July 1715, and no longer had the right of 'purchase and ownership', which was confirmed once again by the edict of Catherine the Great of 22 February 1784. The largest serf owners in the Volga-Ural region were the Tevkelevs, who owned more than 1,800 males among Mus-

⁵ Based on the sizes of land portions, land owners could be divided into several groups: large-scale—from 500 to 1000 tenth shares or more; middle-scale—from 100 to 500 tenth shares; small—from 50 to 100 tenth shares; the lowest group—up to 50 tenth shares [Alishev, 1984, p. 63; Russia, 2002, p. 103].

lims in Ufa Governorate before the reform of 1861 [Azamatova, 2008, p. 75]; and 3,564 persons were recorded in Vyatka Governorate [Materialy' po statistike, Vol. 12, p. 11].

The social status of noble clan representatives in society was determined by their civil or military service. In the first half of the 19th century, priority was given to military service, which provided a relatively quick opportunity to become part of the nobility: in 1834, most of the 90 Tatar noble clans in the Volga and Ural regions gained this status through the officer's ranks or Russian orders [Gabdullin, 2006, p. 83]. There were not many Tatar nobles as a whole among the Russian military elite. Top-ranking officers of the early 20th century included major generals R.Sh. Syrtlanov (1877–1916) and A.A. Davletshin (1861–1918). Polish Tatars made successful careers in the Russian army; and at the beginning of the 20th century, the number of generals among them reached 20 [Grishin, 1995, p. 80].

Entering the public service was complicated by the conditions applied to candidates for a position. The 'Rules of National Education' of 1803 specified that people who did not graduate from a private or public school within five years after the opening of schools in a school district, would not be accepted for civil service. In 1809, tests were introduced for people applying for the rank of collegiate assessor, which granted the right to gain hereditary nobility, or *Statskiy Sovetnik* [Civil Councilor], for which the presentation of a certificate from a university verifying the skills needed for civil service, was also required. Thus, the government wanted to attract young nobles to the universities, which were empty at the beginning of the 19th century [Karnovich, 1897, pp. 88–89]. It was very difficult for Muslims to enter the civil service, because throughout the 19th century, the number of Tatars who graduated from schools, and

The mansion on the S. Tevkelyov family estate in Kilimovo village of Belebey Uyezd Ufa Governorate Photo from the early 20th century.

especially universities, was very small. The majority of nobles in the Volga-Ural region occupied positions of minor and, less commonly, mid-level officials. With respect to high-level positions, in the pre-reform period they reached the level of supervising Kazakhs in governmental institutions. Introduction of an empire-wide system of governance in Kazakhstan led to an abrupt reduction in the number of Tatar nobles in governmental institutions. The abolition of the Orenburg General Government in 1881 reduced the number staff positions for translators in the region's governmental institutions. In general, entering the civil service was difficult for Tatars for a number of reasons. One of the main reasons was the low level of fluency in Russian, which was unacceptable in the institutions with Russian language records management [Smykov, 1988, p. 77]. During the post-reform period, noblemen's children who graduated from Russian primary and secondary schools and Kazan Tatar Teachers School, worked as teachers and contributed to the spread of Russian primary education among peasants serving in the Orenburg Mohammedan Spiritual Assembly, *zemsky* councils and other local institutions. The highest civil service positions for them were the positions of Orenburg Mufti (Salimgarey Tevkelev, Muhammedyar Sultanov) and chairman of the *zemsky uyezd* [district] council: Abusut Akhtyamov (1883–1885) and Shakhkhaydar Syrtlanov (1888–1892) in Belebey Uyezd; Ahmetzyan Basimov (1882–1897)

in Zlatoust Uyezd [Azamatova, 2005, p. 196–197], and so on.

Descendants of the Tatar murzas—Russian nobles. The descendants of Golden Horde tsareviches and the murzas of the Turkic Tatar states after the fall of the Golden Horde, who came to serve the Grand Prince of Moscow and who had been converted to Orthodoxy and become Russified afterwards, can be separated into a special group. Historians calculate that in the period from Ivan III to Peter I 11 clans of baptised princes and murzas, became boyars (Saburovs, Davydovs, Naryshkins, Yushkovs, Glinskys and others), and about 120 clans belonged to the highest level of the Moscow service class (Dashkovs, Derzhavins, Velyaminov-Zernovs, Apraksins, Timiryazevs, Turgenevs, Yusupovs and others) [Alishev, 1984, p. 61].

During the reign of Peter the Great, another group of murzas, the princes Kulunchakov (the ancestors of writer A. Kuprin), Kugushev, Kadomtsev and others, were unable to withstand government pressure and wishing to preserve their privileges, received baptism.

Many Russian nobles of Tatar descent achieved great success in various areas of activity, for example, in public service, literature, philosophy and social thought. But by the 19th century, the origin of the Tatar nobles was mainly preserved only by surnames and genealogy, but some of them still knew the Tatar language.

They included well-known public officials who had achieved ministerial positions, such as A. Ordin-Nashchokin, G. Derzhavin, V.P. Kochubey, A.M. Gorchakov, G.V. Chicherin and others. G.R. Derzhavin (1743–1812), First Minister of Justice in Russia, Russian poet, and a descendant of murza Bagrim, converted to Orthodoxy during the reign of Vasily the Blind. The noble Derzhavin clan originated from his grandson Derzhava Narbekov. By the 17th century, their clan owned farmland along the Mesha River (Kazan guberniya) [Derzhavin, 2000, pp. 11–12; Garzavina, 1993, p. 233].

V.P. Kochubey (1768–1834), whose noble family originated from the noble Tatar Kuchuk-Beg, who was baptised in the middle of

the 17th century, managed the Collegium of Foreign Affairs, was a Minister of the Interior Affairs twice (1802–1815, 1819–1825), and Chairman of the State Council (from 1827). V.P. Kochubey belonged to the titular nobility after he was granted first the title of count, and later he was raised to the status of a prince [Baskakov, 1979, p. 125–126; Utischev, 2000, pp. 106, 108–109].

A.M. Gorchakov (1798–1883), a descendant of Gorchak, whose clan gained Russian noble status and the title of prince in 1439, held the posts of Minister of Foreign Affairs (1856–1882) and State Chancellor [Khalikov, 1992, p. 75]. The Tatar origin of Gorchakov's family was mainly based on their nicknames, Karachevsky and Gorchak, which had Turkic roots [Baskakov, 1979, pp. 162–163].

The descendants of Russified Tatar nobles in the regions were also promoted to high ranks. In the second half of the 18th century, Peter Kamenev, a descendant of the baptised Makulov-Kamenev princes, 18th Chairman of the Kazan Magistrate; and in 1773–1775 he was the Mayor of Kazan [Alishev, 1984, p. 62]. The descendants of the Tatar prince Tenish Kugushev's family, prince, current state councillor V.B. Tenishev was Governor of Kazan (1760–1764); and prince, current state councillor D.V. Tenishev was the Vice Governor of the Kazan Governorate in 1797–1802.

Therefore, in the late 18th–19th centuries, a small and economically weak group of Tatar nobility was formed. This became possible, first of all, due to the need to incorporate the Crimean Tatar murzas into the Russian elite and the liberal policies of the government. But not all the descendants of the former Tatar feudal elite could fulfill the opportunities, given to them due to objective (the lack or the absence of the necessary evidence and documents) and subjective (preconceived attitude of the local and central authorities towards the descendants of Muslim branch of the Tatar princes and murzas) reasons. Specific privileges were granted only in the regions (the north-western, south and south-western governorates), where the Tatar princes and murzas could play an important role in Russian politics. A specific feature of the Russian

A.M. Gorchakov.

G.R. Derzhavin.

V.P. Kochubey.

Tatar nobility formed by the end of the 18th–19th centuries, was the fact that among the Tatars, they were mainly descendants of the ancient noble Tatar families, while within the new Russian nobility, there were many representatives of the underprivileged estates. In its composition, the Tatar nobility was more hereditary than by merit, and the majority of Tatar nobles lived in rural areas. In regions with a small Tatar population, the number of Tatar nobles was insignificant in relation to the Tatar population, and even fewer in relation to the general population. However, this was a general Russian tendency, since the number of all nobles by birth in the Empire was insignificant. What is interesting is that there was only a small number of Tatar nobles by birth in Kazan guberniya, which was the historical homeland of the Tatars. In general, there were fewer Tatar nobles in the Middle Volga region than in the outlying governorates. The social and economic status of the Tatar nobility was different from that of the Russian nobility:

there were very few large landowners among the Tatars, and there were no Tatars among the Russian bureaucratic and military elite. The Lithuanian-Polish and Crimean Tatar nobility were a special group, who received benefits from proving their nobility, preserving their lands and so on.

The majority of descendants of the Tatar princes and murzas who were not included in the Russian nobility remained in the state peasant class. Some of them, due to their status and personal qualities, joined townsmen and merchant estates, supplementing the ranks of the Muslim clergy and industrialists [Alishev, 1984, p. 68]. Descendants of former murzas, the Akchurins, Ramievs, Yaushevs, Arslanovs, Utyamyshevs, Apanaevs and others, played a prominent role in commerce and industry [Alishev, 1984, p. 66–67; Salikhov, 1997, p. 102]. Another distinctive feature of these nobles was that despite the lack of confirmation of their noble status, they were held in high esteem among the Tatars as noble clan members.

CHAPTER 2

Urban Estate Groups and Their Bodies of Self-Government

Lyudmila Sverdlova

All people permanently residing in the cities or who had real estate there, an occupation, and who had been signed up into the merchant guilds, workshops and burghers, were classified as 'urban residents' in the Russian Empire. The urban classes included: honorary citizens, merchants, burghers and artisans, who were officially called 'citizens' and members of the 'middle class' [Rossiya, 2002, p. 123]. In the late 19th century, a large proportion of urban residents in the country—46.7%—were burghers (and artisans), merchants (1.3%), honorary citizens (1.1%); representatives of rural estates made up 43.5%, including peasants—39%. Nobles by birth made up 3.4% of city dwellers, while nobles by merit and officials who were not nobles made up 2.8% [Rossiya, 2002, p. 123].

Merchants. Merchants belonged to a privileged social group that was not officially assigned a separate estate. It occupied third place in the structure of Russian hierarchical society, after the nobility and the clergy.

The internal structure of the merchants was hierarchical. According to the declaration of Catherine II of 17 March 1775, a merchant freed from the poll tax gained preferential business rights and was divided into three guilds [Complete Code of Laws of the Russian Empire—1, Vol. 20, No.7275; No.14327]. 'Capitalists' and bankers who owned capital of at least 50,000 rubles, wholesalers, shipowners, members of the city administration, scientists, artists and musicians were included in a special group of noble citizens. The estate group of noble urban citizens existed from 1785 to 1832. There were no noble citizens among the Tatars.

Merchants of the 1st and 2nd guilds had additional personal rights, were released from corporal punishment, and could own large industrial and trading enterprises. Merchants of

all guilds were released from recruitment duty, and paid 360 rubles for every recruit. As a tax-paying estate, merchants paid class tributes, fulfilled zemsky and municipal duties, and had no right to enter public service; and even the children of merchants of the 1st guild could be accepted to it under certain conditions. However, this commercial and industrial estate had personal and economic privileges⁶. Thus, in 1804, there were 1,397 merchants in Kazan; their number increased to 1,762 in 1858, and in 1900, there were 2,064 merchants with their family members in Kazan. Tatars accounted for about 1/5 to 1/4 of guild merchants.

Establishment of privileged guild merchant class was the result of the policy of the autocracy, aimed at expanding social support in the cities, and also the interests of treasury.

A Charter of Rights and Benefits for the towns of the Russian Empire, which changed the sizes of declared capitals and taxes, and introduced a new levy for guild merchants, was published in April 1785. Merchants with capital of more than 10,000 rubles were assigned to the 1st guild. They received the right to wholesale trade in Russia and abroad, to maintain factories and plants, and build river and sea vessels. Merchants who owned capital from 5,000 to 10,000 rubles belonged to the 2nd guild. They had the same rights as the 1st guild merchant class, except for the right to carry out international trade, and build and own sea vessels. Merchants of the 3rd guild declared capital from 1,000 to 5,000 roubles, were involved in retail trade, and 'obtain machinery and do

⁶ Up to 1898, they had the privileged right to engage in entrepreneurial activities; members of the first two guilds were exempt from corporal punishment; when paying the fee prescribed by the law, their houses were exempt from billeting; the merchant class had proprietary self-government bodies.

The delegation of Kazan in St. Petersburg. 1864. Sitting (from left to right): industrialist Vasily Unzhenin; former mayor Ivan Tikhonov; Kazan governor Mikhail Naryshkin; councilor of commerce Sergey Aleksandrov; councilor of commerce Ibragim Yunusov; honorary citizen by birth Ibragim Apakov. handiwork', keep small river vessels and taverns [Complete Code of Laws of the Russian Empire–1, Vol. 22, Nos.16187, 16188].

Until 1874, merchants of all guilds were not recruited for military service, but were used as militiamen [National Archives of the Republic of Tatarstan, f. 98, inv. 1, file 959, s. 104, 134 and other], they paid class tributes equal to 4% of 'honestly' declared capital; 10% collected from taxable rubles for 'water and land routes' and also a quarter of a percent of capital.

Right up to the middle of the 19th century Tatar merchants combined trading and business activities in industry. It was common for Tatar merchants to divide their capital between different industries and thus protect themselves from bankruptcy to a large extent. In the second half of the century, there was a gradual separation of industrial and commercial capital, as well as separation of industrial production from commercial business.

Only two guilds remained in 1863; small traders began to acquire trade licenses. The decline of the guilds began in 1885 with the introduction of proportional taxes for guild en-

terprises. In 1898, a reform of commercial taxation took place, according to which acquisition of merchant class privileges was separated from selection of commercial and trade licenses [Complete Code of Laws of the Russian Empire–2, Vol. 38, No.39118; Vol.40, No.41779; Complete Code of Laws of the Russian Empire–3, Vol. 4, No.2282; Vol. 5, No.2664; Vol. 18, No.15601]. The role of guilds became less important, but they existed to the downfall of autocracy.

The merchant guilds were corporate bodies that protected interests of their members and strove to increase legal and customs privileges. The merchants enrolled in guilds according to their place of residence, that is, merchants living in the same city. This was a feature of guild organisation. Merchants from another city had to join the guild again and pay all the required class tributes at the new place of trade in order to obtain the right to do business. Residence, along with property status and specialisation of commercial and industrial business, became one of the most important factors in the existence of merchant society.

Burghers and peasants could be accepted in or expelled from the guild many times depending on their material well-being. For failure to pay the guild fee, an entrepreneur was automatically excluded from the merchant class and returned to his initial status.

It was possible to join the merchant class as a temporary merchant of a certain guild. Temporary merchants included nobles, subjects of other states, as well as merchants from other cities who had started a business in this city.

Table 22

Distribution of Tatar merchants in governorates of the Volga-Ural region in 1897

[Gibadullin, 2001, p. 59]

Guberniyas	Number of Tatar merchants and their family members	Out of the entire merchant class of the governorate, in %
Astrakhan	69	1.0
Vyatka	141	4.8
Kazan	441	12.8
Orenburg	686	24.7
Penza	19	0.8
Perm	128	2.5
Samara	77	2.6
Saratov	26	0.5
Simbirsk	105	7.3
Ufa	262	13.9
Total:	1954	6.4

Tatar merchants had the strongest positions in Orenburg, Kazan, Ufa and Simbirsk guberniyas, where they constituted a significant part of the local 'third estate'.

The starting capital for the Tatars in most cases was an inherited family business or a part of it received by a son, inheritance, and a wife's dowry placed under her husband's control. It is important to note the random factor which gave the entrepreneur a chance to become rich quickly. When capital was too small to join the guild, the closest relatives (brothers, uncles and nephews) could combine their money and forces in order to pay the required guild taxes and join the merchant class. It was common for the Tatars to use family capital; they divided the capital after the death of the head of the family less often than Russian families. Therefore, many Tatar families stayed in the merchant class for four or even five generations (the Apanaevs, the Apakovs, the Yunusovs, the

Khusainovs, the Musins, the Azimovs, the Zamanovs-Aitovs, the Burnaevs, the Usmanovs, the Galikeevs, the Arsaevs and others).

Active trade and business activities of the Tatar population contributed greatly to the growth of the national merchant class. It should be noted that usually the most wealthy representatives of the trading capital enrolled in the merchant class.

The ranks of the Tatar merchant class were filled gradually in other cities located outside of the Volga and Ural regions. Starting in 1810, Tatar merchants appear as part of the Kasimov merchant class. The first of them were M. Davletkildeev, M. Maksyutov and N. Mustaev (who also was a hereditary honorary citizen). The local merchant class already numbered 16 Tatar families (27.5%) by the 1830s, and 24 families by 1850 (21.8%) [Filippov, 2003, p. 119].

Whereas in 1801, the guild merchant class in Kazan numbered only 32 Tatar fami-

lies, and 35 Tatar families in 1809 [Khasanov, 1977, p. 87], there were 72 of them in 1860 [calculated according to: National Archives of the Republic of Tatarstan, f. 114, inv. 1. file 3357]. In addition, compared to the beginning of the century there were twice as many families enrolled in the 2nd guild—15 instead of 7 [calculated according to: National Archives of the Republic of Tatarstan, f. 114, inv. 1. file 3357]. In 1893, the 1st guild in Kazan numbered 11 Tatar merchants [National Archives of the Republic of Tatarstan, f. 98, inv. 3, file 1096], whereas in 1862, there was only 1 person.

The growth of capital of the national merchant class is also proved by the amount of real estate purchased by wealthy Tatar merchants. In the 1870s, the largest real estate owners in Kazan were the following merchants: the Yunusov brothers, Ibragim and Iskhak (their joint real estate was estimated at 47,706 roubles), Izmail Apakov (41,906 roubles) and his brother Ibrahim Apakov (38,187 roubles), Sultan Usmanov (owned property in the city in the amount of 29,816 roubles). As Table 23 shows, there were 61 large real estate owners in Kazan with a total estimated property value of 1.4 million roubles. Seven of them (16%) were Tatar merchant families. Their value of their property was estimated at 205,600 roubles (14% of the total value of the city's private real estate). There were only 6 (about 10%) large owners whose property was estimated at more than 60,000 roubles, but they only owned one-fifth of all real estate. Tatar merchants were not in this category. There were 12 (about 20%) owners of real estate estimated from 30,000 to 60,000 roubles; the value of their property amounted to 473,400 roubles (33%). Among them were 3 Tatar merchants (a quarter of the total number in this group and nearly 27% by real estate value). Lastly, there were 43 (more than 70%) small owners in the governorate centre, and the total value of their property was 675,212 roubles (47%), including 4 Tatar owners (9%) [Gubernskie Vedomosti of Kazan, 16 April 1877].

In 25 years (from 1861 to 1887), the total number of Tatar entrepreneurs in Kazan grew by 40.3% due to those enrolled in the 2nd

Iskhak
Yunusov.

of the 19th
century.

guild. A significant number of temporarily enrolled merchants was due to the introduction in 1898 of the 'Regulation on the State Trade Tax'. Fearing possible complications in the first year of law, the entrepreneurs protected themselves joining the guild as 'temporarily enrolled'.

It is obvious that investing money in city real estate was one of the best areas for investment. Most of the buildings were rented out for commercial and industrial enterprises, hotels and taverns, which brought their owners considerable income. In Kazan alone, the value of city real estate, owned by Tatar homeowners, increased from 1.1 to 3.9 million roubles from 1908 to 1912.

Thus, before and after the abolition of serfdom intensive capital accumulation took place among the Tatars, as well as consolidation of a significant amount of money in the hands of individuals. A crucial role in this process belonged to the national commercial bourgeoisie.

From the end of the 18th century, merchants who 'distinguished themselves in art and activities contributing to common good and were members of the 1st guild for 12 years in a row' were granted the rank of councilor of commerce or manufacture. It was equal to the 8th grade of the 'Table of Ranks' which granted hereditary nobility, but in this particular case, it just gave equal rights and did not apply to offspring. The rank of councilor of commerce was

Table 23

The number of Tatar guild funds in Kazan in 1862–1887

[National Archives of the Republic of Tatarstan, f. 114, inv. 1, file 1142, s. 14; f. 299, inv. 1, file 145, s. 13; f. 359, inv. 1, file 290, s. 93, 95]

given to Kazan merchants Iskhak and Ibragim Yunusov, and Troitsk merchant Mullagali Yaushev [Denisov, 2009a, p. 417].

One of the distinguishing features of the social structure in Kazan before the 19th was the allocation of a particular social group of Serving trading Tatars who were engaged in petty trade, kept inns and taverns, rented housing and warehouses, were engaged in carrier trade, owned small handicraft shops, but were not included in the guild system of the city. In 1804, 1,831 Serving trading Tatars lived in Kazan. The law of 1824 prohibiting all classes except for merchants from trading, gave them the right to enrol either in the guild merchant class or as burghers [Complete Code of Laws of the Russian Empire–1, Vol. 39, No.30115].

Starting in 1832, the privileged category of 'city residents' class included honorable citizens, who were represented by two groups: hereditary and personal honorary citizens. Honorary citizenship could be acquired by councilors of commerce and manufacture, merchants who were members of the 1st guild for 10 years in a row and of the 2nd guild for 20 years or those awarded a Russian order. Personal honorary citizens also included those who graduated from a business school. The rights of hereditary and personal honorary citizens were equal, but the children of the latter were assigned to tributaries.

Honorary citizens were granted freedom from the poll tax, conscription, and corporal punishment for committing a crime. They participated in elections regardless of real estate, were elected to city public offices, but no lower than those occupied by merchants of the first two guilds. In other words, honorary citizens differed from the noble class only in lack of rights to own serfs. In 1833, the first of the Kazan Tatars who received hereditary honorary citizenship along with his family was Kurban-Galei Arsaev. This class also included such old Tatar merchant families as the Yunusovs, the Arsaevs, the Kazakovs, the Apanaevs, the Azimovs, the Musins, the Apakovs, the Khusainovs, the Aitovs and others.

Merchants who distinguished themselves in business and public activities best of all were awarded with medals. Merchants who enriched the treasury with 50,000 arshins of cloth above the established standard received silver medals, while those who gave 100,000 arshins more received gold medals. Those who distinguished themselves in public office were also awarded. In 1839, Iskhak Apakov, Khasan Apanayev and Gubaidulla Yunusov were awarded two gold medals.

The Tatar merchant class was part of the Russian merchant class, but with some differences.

Tatar entrepreneurship was characterised by:

Latif Musin.

– the predominance of commercial capital over industrial, while the Tatar merchant class was more closely associated with small-scale production than Russian merchants—the focus was on development of the Eastern market, including foreign markets. In the latter half of 19th century, Tatar merchants gradually shifted to the local market, entered actively into non-Russian and non-Christian community of the region where they continued to take the advantage of language and religion; in the merchant community of multiethnic regions, there had long been a territorial division of areas of economic influence between Russian and the Tatar merchants accompanied by the division of areas for investment. This division allowed them to control capital inflow and impeded the intrusion of 'outsiders';—the dominant position among Tatar trading elite until the 19th century was occupied by tea merchants, many of whom were closely related to leather and textile production. They usually traded with China, Central Asian countries, the Caucasus, Siberia and the Urals. Industrialists that were manufacturers of large consignments of goods in high demand at the Nizhny Novgorod, Orenburg, Kyakhta and Irbit fairs stood out: mainly tannery and soap factory owners, owners of textile mills, and manufacturers of Tatar national clothes, shoes, hats and jewellery. Many of them influenced the economic development not only of their own region but the whole country; entrepreneurs from industrial and commercial dynas-

ties occupying leading position in this sector of the economy for several generations represented regional elite, and some of them belonged to Russian economic elite (the Yunusovs, the Apanaevs, the Musins, the Ramiyevs, the Yaushevs, the Khusainovs, the Agafurovs, Zagidulla Shafigullin and others);

– with respect to financial capital, it should be noted that large Tatar entrepreneurs in the latter half of the 19th century were involved in activities of bank and credit institutions and were on the board of many of them. First of all, this refers to joint stock institutions, for example, members of the board of the Kazan Merchant Bank included Muhammadgarif Utyamyshev, Suleiman Aitov, Muhammadsadyk Galikeev; and Ahmetzyan Rakhmatullin was a member of the board of the Mutual Credit Society [Kazansky Birzhevoy Listok, 25 March 1873; 14 March 1890; Kazansky Kurier, 1883, p. 101; Vsyaz Volga, 1907, p. 192; Prokofiev, 1910, p. 188]. Tatar entrepreneurs did not establish their own national banks or mutual credit societies, because they did not have enough capital and realised they were unable to withstand competition in the financial market; furthermore, they were restricted by norms of Islamic law. The majority of Tatar merchants preferred to borrow large sums of money from each other by making verbal agreements;

– Tatars did not take part in any activities of officially established Russian commodity exchanges; but, for example, on the Sennoy market in Kazan (the centre of Tatar trade in

the city) there was a kind of Tatar exchange—an informal organisation of Tatar capital that existed according to traditional national and religious principles;

– Muslims obeyed Sharia law, Adat law, which was organised, rationalised and edited in accordance with Russian legal concepts. The vast sphere of Muslim relations (such as marriage, family, inheritance, agreements and civil offenses resulting in reparation, testimony, charity, vows and sins) were regulated by Sharia law in whole or in part. However, this did not deprive Muslims of the ability to apply Russian laws.

In terms of legislation, there were not any restrictions in commercial and industrial activities for Muslim merchants. However in 1886, the government, in attempting to limit the influence of Tatar entrepreneurs in Akmola, Semipalatinsk, Semirechensk, Ural and Turgay regions, reserved the right to purchase real estate in this region only for representatives of the indigenous population and Orthodox entrepreneurs. In reaction to this discrimination, Tatar merchants trading in Tashkent who came to Nizhny Novgorod fair asked the fair committee to apply for abolition of this restriction. However, the request of the Nizhny Novgorod fair committee was unsuccessful. According to the law dated 29 November 1893, purchase of lands and other property in the Turkestan region was only permitted to those societies and associations with shareholders who were

Orthodox Russian subjects and local natives. These restrictions undoubtedly slowed the development of industry and trade [Laverechev, 1974, p. 59].

Tatar merchants were very sensitive to the demands of both domestic and external markets. Merchants supported national crafts, actively developed industrial production, invested in promising sectors of industry and, satisfying consumer needs, supplied goods to foreign (Eastern mostly) and Russian markets.

In most Russian cities, the Tatar guild merchants were members of the multi-ethnic merchant class; and in large and economically strong Islamic communities they had an autonomous class institution headed by their merchant chief.

The position of the class chief was an important social position in the system of city class organisation. The position of merchant chief was first equal to the 14th grade of public service; and at the end of service it was possible to refuse the lowest positions [Complete Code of Laws of the Russian Empire–2, Vol. 9, p. 664]. According to tacit tradition, a Russian merchant chief had the highest social status, and therefore, influence in Kazan. Formal signs of the special status of a Russian merchant chief are the following: 1) chairing all-class meetings; 2) his signature was the first on all documents prepared on the results of the general city assembly; he also documented all-class public gatherings.

Burghers. As mentioned above, the majority of citizens belonged to the meshchansky (burgher) tribute-paying class. The differences between the merchant and the burgher classes were approved by a declaration of 1775, according to which all citizens who did not own capital of 500 roubles and could not be enrolled in merchant class were called burghers. In the 'Letters Patent to the Towns' dated 21 April 1785 all the representatives of the third estate received the name 'burghers': 'the name of middle class people, or burghers, is the result of their industry and good nature, which helped them to make a fortune' [Complete Code of Laws of the Russian Empire–1, Vol. 22, p. 80].

Burghers were part of the tribute-paying class, formed the burgher community, paid a poll tax, were subject to conscription and corporal punishment, had no right to enter public service, and when entering military service did not enjoy the rights of volunteers. As the main payers of taxes and tributes the burghers, along with merchants, belonged to the category of 'pattern citizens'. Starting in the middle of the 19th century, the burghers were excused from corporal punishment; and starting in 1866—from a poll tax, instead of which the real estate tax was imposed in cities, posads and small towns, which was not a special burgher tax. In 1904–1906, other restrictions were removed from members of former tribute-paying classes.

They could travel more than 30 versts from their city with temporary passports. To obtain this passport, it was necessary to pay all tributes and duties, personal debts, find two sureties for emergency expenses, obtain permission of the burgher society, and if a burgher transferred to other societies (such as merchant), approval of the authorities was also required.

In the first half of the 19th century, the government pursued a policy of creating conditions for increasing the number of citizens, the main elements of which were differentiation of rights of city communities and empowerment of administration to accept new members of the city. In 1812, state peasants received the right to duty-free trade in agricultural products in cities. The year 1824 was a milestone for the state village, when favourable conditions were created to enrol peasants in burger and merchant classes. In 1827, the difference between peasant and merchant trade licenses was eliminated, and appanage and state peasants received the opportunity to build and buy houses in provincial towns. Starting in 1848, all categories of peasants received the right to own houses in cities. In 1849, the law was implemented in all cities allowing the 'enrolment in the burgher class' of free people without the consent of burgher societies [Mironov, 1990, p. 69].

The meshchanins had to pay levies for licenses to keep small commercial and industrial establishments, as well as for prikazchich'i

(sales) licenses. Starting in 1825, the trading meshchanins in governorate cities had to pay 40 roubles, in uyezds and other undistinguished towns—30 roubles; peasant certificates of the 4th grade cost 100 roubles. For a special license to keep a small shop the trading meshchanins were charged half the price of the certificate, and peasants were charged 40 roubles [Complete Code of Laws of the Russian Empire—1, vol. 39, No. 30115]. The most serious drawback of this system of taxation was the fact that the main burden was placed squarely on small entrepreneurs, which significantly hindered the development of industry and trade at a very early stage.

The activities of the meshchanin class were extremely varied, as was the level of their mate-

rial welfare. Meshchanins were allowed to participate in small-scale trade, practice various crafts, and be employed. In order to engage in craft and trade, they had to join guilds. According to the law, meshchanins could only operate small craft enterprises, participate in small trade, and accept buy-backs and small contracts (up to 4 thousand roubles). Local authorities and merchants who did not want any competition made sure that production and trading operations did not exceed the allowable sizes.

Trade, mainly small-scale, was the main occupation of a considerable portion of Tatar meshchanins. They traded (retail only, according to the law) using their own capital and on credit in amounts between 100–500 roubles, engaging in retail delivery trade.

Table 24

Distribution of Tatar townspeople of both sexes in governorates of the Volga-Ural Region in 1897 [Pervaya vseobshhaya, Vol. 2, 10, 14, 28, 30, 31, 35, 36, 38, 39, 45]*

Governorates	The total number of commoners of both sexes relative to the population of the governorate, in %	Including Tatar commoners						
		in the cities		in the uyezds	total	of the Tatars in the governorate, in %	of all commoners in the governorate, in %	relative to local Tatars, in %
		governorate	district					
Astrakhan	9%	3,054	607	1,023	4,684	9%	5%	7.4%

Total in the region:	5%	15,085	21,021	27,297	63,403	4%	5%	100%

*Table compiled by Kh.Z. Bagautdinova.

The materials of the 1897 census show that the proportion of meshchanins among the Tatars of Ryazan guberniya (14%) is more than three times larger than the overall governorate numbers, while these numbers were exceeded twofold in Orenburg guberniya (24%), and by one-third in Ufa guberniya. In Astrakhan guberniya this proportion totalled 9%. The remaining governorates were falling behind in terms of the average statistical data, as in general these ratings came out to 5% and 4% respectively.

It is also important to note that up to 70% of Tatars from the meshchanin class lived in three governorates of the Volga-Ural region: Orenburg (35.4%), Ufa (18.2%) and Kazan (16.2%) guberniyas. Meanwhile, the statistical data showing the population's resettlement in January 1897 totally dismantle the idea of Tatar meshchanins as permanent city dwellers. Forty-three percent of the Tatar meshchanins of the region lived in rural areas, 23.8% lived in governorate centres, and 33.2% in uyezd cities. In Vyatka (78%), Penza (85%), Saratov (73%), Ufa (63%) and Perm (55%) guberniyas more than half of the Tatar meshchanins lived in villages.

In big cities there were three meshchanin communities numbering more than 1 thousand people of both sexes: in Kazan (5.6 thousand), Orenburg (5 million) and Astrakhan (3 million). It is noteworthy that only in the Kazan, Astrakhan and Penza guberniyas did the number of Tatar meshchanins in big cities exceed the number of members of this class living in uyezd centres. The assumption can therefore be made that the Tatar meshchanins living in rural areas owned certain real estate in the city and were members of the relevant city's class societies. The fact that they lived in rural areas was, in our opinion, related to their professional (business) activity. It is entirely possible that some city dwellers could move away to rural area to avoid the census, which according to rumours, was fraught with the danger of baptism. However, this circumstance could not radically change the current settlement trend of the Tatar meshchanins throughout the region.

As they purchased goods in the city and nearest fairs and transported them to sell

throughout other rural fairs and the nearest Tatar villages, trading meshchanins bought agricultural products and raw materials, such as leather, from Muslim peasants and then resold them in fairs or in cities to industrial and craft establishments. Acting as buyers, they gradually took control over the procurement and sale of agricultural products produced in Tatar rural areas, and in some way put small producers, such as craftsmen, under their control and divided them from the market. The meshchanins played a key role in small and medium Tatar businesses. They used three main forms of trading capital as part of their operations: the purchase of goods by the owner from small producers, the unification of trade operations with small-scale producers, and ware-for-ware bartering.

Trade was no doubt the most profitable form of business and also provided the opportunity to raise capital, which in turn facilitated the transition to another, higher class of merchants. Throughout the whole period of its existence, the meshchanin class was one of the main talent pool sources to replenish the ranks of Tatar merchants.

The Tatar meshchanins were the owners of small-scale craft and manufacturing industries characterised by a remarkably low level of material and technical development. The regulation of their economic activity and competition did not contribute to the development of small and medium-sized businesses.

One common activity among the Tatar population of the city was renting, anything from city bath houses, fisheries, carrier trade contracts, city contracts for the delivery of firewood, potable water, etc. for public establishments, and for the construction of buildings built from the city's budget or treasury.

A significant number of trade practitioners were from the Tatar meshchanin class. Their career began with serving as 'a boy' in a small shop of a Tatar merchant 'to get food and knowledge'. They could serve until they became hucksters, that is, sellers in a small shop, or become trading agents of not just Tatar, but also Russian merchants on the 'Eastern trade' route. The license price for meshchanins and merchants of the 3rd guild depended on the

area where the trade took place. But the price of the licenses for merchants of the 3rd guild (until it was abolished in 1863) was approximately two times higher than that for townspeople [Complete Code of Laws of the Russian Empire–1, Vol. 39, No.30115; Complete Code of Laws of the Russian Empire–2, Vol. 14, No. 12867].

A significant portion of the owners of craft establishments were meshchanins. The leather industry was particularly well developed among the Tatars [Goncharov, Chutchev, 2004, p. 89].

When speaking about the development trends of the Tatar meshchanin class during burgeoning bourgeois relations, it should be noted that on the one hand, this was a source of formation on the classes of bourgeois society, and on the other hand, while adapting to the new conditions it sought to preserve the national purity within a Russian city, meaning preserve a separate national social group destined to ensure special conditions for their own economic and socio-political activity together with the national merchant class.

The meshchanins formed a meshchanin society with an elective authority and a chief, and were under magistrate jurisdiction. Members of meshchanin meetings were people aged 21 and older with certain property qualifications. The meeting was convened by the chief of the meshchanins.

'The city reform' of 1870 resulted in a different structure of the permanent meshchanin governing bodies in different urban settlements.

In cities with comprehensive public governance, the meshchanin society was headed by the meshchanin council, and in cities with a more simplified form of governance, by a meshchanin or city chief.

Tatar and Russian meshchanin communities in Kazan and Mamadysh existed separate from one another, and In 1885 Ministry of Internal Affairs ordered to include them in Russian communities. This meant that the Tatar Muslims were deprived of the public organisation that typically performed the function of preserving cultural traditions and language autonomy. For nearly a year Tatar meshchanins from Kazan and Mamadysh sabotaged the activity of the local administration by refusing

to unify with the Russians. The Tatar meshchanins in Kazan lodged a complaint in the Senate against the governor's actions. After the abolition of the Tatar meshchanin communities in Kazan and Mamadysh in 1886, all the affairs of the Tatar meshchanins were transferred to the joint Russian-Tatar councils [Kaplunovsky 1998, p. 95, 160–162].

Before the introduction of the 'City Regulation' of 1892, there were meshchanin city chiefs in every city of the Kazan guberniya, whereas there were only two councils—one in Kazan and the other in Chistopol. The composition of the councils was multi-ethnic in both cases. Chairmanship there belonged to communal chiefs (Russians) and, in addition, the council consisted of two more members—a Russian and a Tatar. Such national representation was established on the principle of the election of Jews into the meshchanin and merchant councils in the settled areas at a proportion of no more than one third. It was forbidden to elect meshchanin community chiefs from among non-Christians [Kaplunovsky, 1998, p. 94; Complete Code of Laws of the Russian Empire–3, Vol. 9, Nos.883, 989].

The meshchanin council in Chistopol was closed at the insistence of the Russian meshchanins in order to reduce the cost of its maintenance. As a result of this, '...controversies did not occur because of any ethno-cultural or religious intolerance between the Russians and the Tatars. They were, as a rule, artificial and provoked, on the one hand by administrative bodies executing government orders, and on the other by Russian meshchanins who tried to use the "Tatar" factor for their own benefit. In addition, conflicting situations inevitably occurred due to the general Tatar movement for the equalisation of their civil (social and economic) rights with the rights of the Orthodox population' [Kaplunovsky, 1998, p. 169].

To solve these general matters, joint meetings of Russian and Tatar meshchanin societies, chaired by the Russian meshchanin chief, were conducted. The execution of the decisions of meshchanin communities to a greater extent 'was left to the discretion' of the local authorities, but some decisions also required the governor's approval.

In other cities of the Volga-Ural region it was impossible to organise independent Tatar meshchanin communities due to the small number of Tatars, so they became a part of local Russian meshchanin communities.

The meshchanin government managed the lists of the meshchanin class, accepted new members and was also responsible for the needs of the class. In addition, the meshchanin governance gave permissions of absence to subordinate persons. Until 1900, the meshchanin society still had the right to expel members who disgraced themselves, and left these questions to the discretion of the government, the consequence of which was deportation to Siberia. But the main purpose of the meshchans' community was to levy various tributes and fees on the townspeople.

One of the features of the social life of Kazan and Seitov posad was the parallel existence of national urban authorities and estate societies. The government of Catherine of Russia pp. , given the high concentration of Tatar merchants and meshchanins, in 1781 allowed the establishment in Kazan of a local government body, that is, a City Pall (in the Old and New Tatar slobodas it was opened in 1784 and functioned until 1855), and in 1784—in Seitov posad in Orenburg guberniya (operational until 1832). The decree of Catherine II on the establishment of a City Hall for Muslim merchants in Tara of Tobolsk guberniya remained unfulfilled [Ibrahimov, 2001, p. 11].

The composition of the city halls in Russian cities and slobodas was determined in each specific case based on local conditions. The governance of the Tatar City Hall in Kazan was represented by a burgomaster, two ratmanns, and merchant and townsmen chiefs and their assistants. Citizens of Tatar slobodas elected judges in the court of verbal conscience and trade, as well as the court of wards, and sent their representatives to work in Kazan guberniya, other city magistrates, and in the Chambers of the Civil and Criminal Courts [National Archives of the Republic of Tatarstan, f. 299, inv. 1, file 20, s. 56 reverse–62; file 21, s. 13]. The issues resolved in the meetings of the residents of the Tatar slobodas were largely similar to those put on

the agenda by Russian urban society [see: Izmaylov, 2009].

In 1834, investigative, civil and criminal cases filed against the Tatars that were in the proceedings of the city magistrate, along with the functions of the city's judicial authority, were placed under the jurisdiction of the Tatar city hall of Kazan [National Archives of the Republic of Tatarstan, f. 22, inv. 2, file 21, s. 1]. This decision resulted in a combination of administrative and judicial functions in city hall activities. In fact, the function of the city magistrate was restored in a new version of the law of 1721. The Tatar city hall handled all criminal and civil cases, monitored the distribution and levying of tributes, time served by the Tatar urban population, and the urban economy and landscaping within the bounds of Kazan Tatar slobodas. From this point on the Tatars were finally shifted to being under the jurisdiction of this local government body, which significantly raised the status of the city hall and made it an official government body, even though it was limited to two city slobodas. As a result of the expansion of Kazan, Tatar City Hall witnessed a significant increase in the number of cases in its proceeding, which led to an increase of the number of staff in this governmental body, as well as the court, in the position of clerks—povytchiks—who headed the departments of the city hall and the governorate registrar, and journalists, whose responsibility was to maintain the journal of city hall meetings. These positions were occupied exclusively by Russians because all the documents were maintained in the state language of the Empire. These people were on the staff of the governorate administration that was in fact in charge of appointing and dismissing them [National Archives of the Republic of Tatarstan, f. 299, inv. 1, file 20, s. 11 reverse].

Since all the documents were in Russian, the city hall members were not able to check the execution of their agenda, as they did not know 'Russian reading or writing'. In fact, this meant that city hall members elected from the Tatar community were dependent not only on the higher administration, but also on the small clerks transferred into the local government by the governorate's administration.

In order to unify administration at the local level, the Tatar city hall was closed in 1855.

The verbal court had been functioning in Russia since 1754 as a judicial institution under the magistrates and city halls to resolve trade cases, especially market and promissory cases. Starting in 1775 the verbal court was established under police units. Here claims were considered for the purchase and sale of goods, monetary loans, renting, conflicts between owners and prikazchiks, and others [National Archives of the Republic of Tatarstan, f. 37, inv. 1, file 8a, s. 11–23, 33, 34, 35 and others].

The courts consisted of a burgomaster and two elected members from merchant and trading meshchanins, cases were conducted orally, and judgments were read immediately. In 1864, the magistrate verbal courts were abolished, and the trade verbal courts under the Kazan Tatar City Hall functioned until 1855.

In Kazan, the Tatar and Russian courts of wards functioned according to the ethno-confessional division of the population. The chairmen of both courts was a city head, but in the Tatar court of wards this position was held by the head of the Kazan Tatar City Hall. In 1854, the chairmanship of the Tatar court of wards was transferred entirely to the city head. Functioning in a multinational city, this court consisted of a city head, and two members of the magistrate and merchant city chiefs from Russian and Tatar communities, and since 1864, it also featured members of city estates elected for three years under the chairmanship of the city head.

The general city meeting was conferred the right to determine the number of members of the court of wards. By decision of the general meeting of the city estates dated 22 January 1871 the Russian orphan's court consisted of three members: the merchant class was repre-

sented by a merchant chief, one member was elected by the merchant community, and the final member—by the craft community. The Tatar court of wards consisted of two members: A Tatar merchant chief from the merchant class, and one person elected by the Tatar meshchanin community. Based on the fact that merchant chiefs and their associates held their positions for one year, the term of their service in the court of wards was also a single year; other members served the prescribed three-year term [National Archives of the Republic of Tatarstan, f. 37, inv. 1, file 26, s. 4 reverse].

However, such a frequent turnover of merchant estate representatives in the court of wards (three times during a single term) created obstacles for its successful operation. Therefore, in the latter half of the 1880s, there were some cases when merchant estate representatives were elected as members of the court of wards for three years, even though they were not merchant chiefs [National Archives of the Republic of Tatarstan, f. 37, inv. 1, s. 86, 87–87 reverse]. Record management in the court of wards was handled by 'officials and servants' who were registered in public service.

In 1892, the Tatar court of wards was merged with the Russian court. As a result, the majority of Russians then began to only elect Russians as members of the court of wards [National Archives of the Republic of Tatarstan, f. 98, inv. 1, file 90, s. 10, 10 reverse]. Only after numerous petitions of the Tatar councillor-merchants, on 10 September 1896 the city дума opted to include members of the city's Islamic community in the Kazan court of wards [Zhurnal, 1896, p. 239–242, 251–252].

Despite certain unique aspects of the estate structure of the urban Tatar population and the urban estate self-government, their overall development was in line with all-Russian trends.

CHAPTER 3

The Military and Service Estate

§ 1. Orenburg and Ural Cossacks

Elena Godovova

Settlement and population. The Ural (Yaik) Cossacks in the 16–early 20th centuries successfully reclaimed the middle and lower reaches of the Ural (Yaik) river and the Ural steppes. In the first half of the 19th century their numbers then doubled, and in the latter half of the century they increased by a factor of 1.7, due mainly to a natural increase [Kortunov, 2009, p. 20–23].

The Orenburg Cossack Army (OCA) occupied the territory from Iletsk to Orenburg, and then through Verkhneural'sk and Troitsk up to Zverinogolovskaya fortress, which bordered Siberia.

In the first half of the 19th century, the government undertook a number of measures to increase the size of the Cossack army and even further centralise the troop's command and control structure. The reorganisation of the Orenburg frontier line (1835–1840) contributed to the increase in the number of Orenburg Cossacks.

The change in the dynamics of the Orenburg army's numerical composition can be observed in the following statistics: in 1798–44,000 people of both sexes, in 1834–70,050, in 1846–160,600 and by the end of the 19th century—350,614 people of both sexes [Materialy', 1905, pp. 83–84; Materialy', 1913, pp. 256–258; Russian State Military Historical Archive, f. 414, inv. 1, file 312, s. 43–46; Kortunov, 2004, p. 23].

Control system. The main goal of reforming the irregular army was to make the Cossacks an 'obedient instrument' of public policy. 11 Bashkir, 5 Meshcheryak cantons, 5 Orenburg cantons and 2 Ural Cossack cantons were organised in 1798 [Complete Code of Laws of the Russian Empire–1, 1798, No.18477]. An-

nually from the 16 May to 16 November the cantons were assigned to protect the Orenburg frontier line, which stretched from the Tobol river down the Ural river to the Caspian sea. It was divided into five distances. The first one included the fortresses and redoubts from the Zverinogolovskaya fortress to Verkhneural'sk, the second one from Verkhneural'sk to the Orsk fortress, the third one from the Orsk fortress to Orenburg, the fourth distance from Orenburg to Uralsk, and the fifth one—from Uralsk to Guryev. The Bashkirs, the Meshcheryak and the Orenburg Cossacks were on frontier guard duty in the first four distances with a total length amounting to 1,239 versts [Istoriya Bashkortostana, 1996, p. 357]. According to the 'Regulation on the organisation of control over the Cossack Army' dated 1803, the Ural Cossack Army (UCA) fell under the jurisdiction of the Orenburg governor (until then they reported to the supreme government authorities) [Istoriya kazachestva Urala, 1992, p. 128], as for the Orenburg Army, a Military Office was established on the Black Sea model, and the Ural Cossack Armies, which were under the jurisdiction of the Orenburg inspectorate in terms of military affairs, and under the jurisdiction of governorate authorities (especially the governor) in terms of civil affairs' [Complete Code of Laws of the Russian Empire–1, Vol. 27, No. 20786].

For the first time ever a uniformed outfit was introduced in the army.

During the reign of Nicholas I, the newly-organised Cossack Army was growing at an intensive rate. In 1840, the 'Regulation on the Orenburg Cossack Army' was adopted, as a result of which the army legally received jurisdiction over the vast territory for the first

time that included about ten villages, private lands and such cities as Verkhneursk, Troitsk and Chelyabinsk. The total number of army lands in 1840 amounted to 7,749,944 dessiatinas, which later totalled 8.5 million dessiatinas of continuous territory [Starikov, 1890, p. 108].

The new 'Regulation' replaced the canton system with regimental districts. In time of war each regimental district was formed from among the Cossacks living on its territory.

Control of the OCA, based on the experience of the Don Army, was divided into military and civil administrative offices and belonged to the military appointed chieftain who reported to the commander of the Separate Orenburg corps. The Military Board was the executive body, and it had a military medical council and military prosecutor. Civil cases were handled by regimental and stanitsa administrations. Regimental administrations, which ended up replacing the cantonal offices, were established in each of the ten districts and were headed by staff officers. The lower echelon of the military governing structure were the stanitsa administrations headed by stanitsa chiefs.

The 'Regulation' of 1840 segregated the army in terms of its judicial system as well. Military crimes were under the jurisdiction of the Military Court Commission under the Military Duty, while civil cases, property disputes and petty crimes were dealt with in the stanitsa courts and by the officials of the regimental administrations [Shadrin, 1999, pp. 160–161].

The system of governance established by the 'Regulation' of 1803 remained in UCA with some additions; power here was concentrated in the hands of the military chieftain and the military office, which had both military and civil expeditions.

During the post-reform period, the reformation of the Cossack armies began in order to eliminate the estate isolation of the Cossacks and 'their conversion into a civil state'. In 1865, the structure of the OCA underwent changes, the nature of which was completely opposite to what had happened in the army in 1840: it became a part of the governorate again, and in terms of the judicial system and police it was under the control of government agencies.

Similar changes also took place in the UCA as well [Istoriya kazachestva Urala, 1992, p. 144]. In 1869 the military office and the office of the appointed chieftain were replaced by a military administrative office, which consisted of the chairman appointed by the government, two counsellors of the treasurer chosen from the army, and three Cossack deputies—one from each uyezd. In addition, a congress of 62 elective stanitsa deputies was formed to resolve military administrative affairs [Savelyev, 1913, p. 2].

Self-government. In 1870, the Cossacks received a new 'Regulation on public control in the Cossack Army', according to which an important role was now played by stanitsa gatherings, which had acquired the right to elect the stanitsa chieftain, judges and clerks, who were later approved by the military chieftain. Stanitsas thus gained the right to solve the economic and military issues of their own lives (renting stanitsa lands, the order of military duty) [Futoryansky, 2000, p. 84]⁷.

The stanitsa government addressed the issues of stanitsa gatherings, and checked the stanitsa funds and bread stores monthly. Between 4 and 12 regular judges were elected annually for stanitsa courts by stanitsa gatherings. The stanitsa court was assembled every two weeks on Sundays, or more often if circumstances required [State Archive of Orenburg Region, f. 6, Inv. 13, file 3574, s. 6].

The introduction of the 'Regulation' of 1870 weakened the administrative control system, and the military population gained certain rights and began to solve some local issues relating to economics, the opening of educational institutions, and the prioritisation of field service.

In 1880, a new 'Regulation on the public and administrative control of the Ural Army' was adopted that concentrated all power in the hands of the appointed chieftain and abolished

⁷The Cossack village meeting welcomed all households belonging to the community. The leader of the meeting was the Cossack village chieftain, responsible for maintaining order and well-being within its limits. The Cossack village government comprised the chieftain, his assistants, and the village treasurer.

the election of counsellors [Savelyev, 1913, p. 2].

The system of public control over stanitsas and settlements that was formed entirely in the early 1890s had a number of shortcomings, primarily regarding the division of powers at different levels of government [Ganin, 2006, p. 16].

Functions According to the 'Regulation' of 1840, the OCA was obligated to protect the Orenburg military line, and also send troops to the steppe, the local governorates for police service, and the field army during wars, etc. [State Archive of Orenburg Region, f. 6, inv. 8, file 169, s. 4-4 reverse].

As for the military service of the Ural Cossacks, according to the new regulation adopted in the Ural region it was permitted to recruit volunteers, but on the condition that every Cossack had already served in field units for at least a year. In turn, the young Cossacks had to study at stanitsas for three years, and privileged Cossacks still had to come to the camp annually for three weeks for a period of seven years, and all other field Cossacks had to report annually for an inspection of their outfit and equipment. During wartime, the army was supposed to field 9 mounted regiments, a hundred guardsmen and a hundred newcomers [Savelyev, 1913, p. 15].

In the middle of the century the number of compulsory duties increased significantly. To ensure 'peace and quiet' the Cossack units were being sent to different governorates of the empire to fulfill military and police service. The OCA annually sent one regiment to Moscow, one joint detachment numbering 400 soldiers to the Nizhny Novgorod fair, and also sent units to maintain order in Perm, Kazan, Vyatka and other guberniyas. The Cossack units were used to suppress revolutionary actions on the outskirts of the Empire and to fortify the zemsky and city police [Godovova, 2007, p. 61].

Ethnic and confessional composition of the OCA. In the late 18th century the Tatars of

The Orenburg Cossacks Photo from the 2nd half of the 19th century

Seitov posad were officially numbered among the OCA [Materialy', 1905, p. 80] and formed three regiments of 500 soldiers each (pyatisotnya), with a staff consisting of: 3 colonels (pyatisotniks), 3 esauls of the pyatisotnya, 3 regimental clerks, 15 sotniks, 15 centurion esauls, 15 cornets, 30 pyatidesyuatniks (lieutenants), 1,416 private Cossacks, totalling 1,500 people. According to this staff list G. Rakhmatullin, Suleimanov and A. Sagyatov were appointed to the positions of colonels of the 1st, 2nd and 3rd pyatisotnyas. The 1st pyatisotnya consisted of 407 serving soldiers and 583 retirees and minors. The 2nd and the 3rd pyatisotnyas numbered 412 and 392 people respectively, containing 577 retirees and minors each. Clothes and horses for Cossack commanders were provided by the community, and gunpowder and lead came from the treasury [Materialy', 1905, pp. 81–82]. To control the Tatars of Seitov posad the stanitsa administration was established under the authority of the military office. It consisted of a lieutenant colonel as the chairman along with two attendees, and solved all the criminal and other Cossack affairs [Delo o zapisi, 1900, pp. 52–54].

In the first half of the 19th century the Tatars from Chesnokovka, Zubachistenka 1 and Zubachistenka 2, Uskalytskaya, Novoumerovskaya and other villages were enrolled in the army for service. [Kortunov, 2009, p. 82].

The Tatars were mainly enrolled in six regiments of the army (the 1st, 2nd, 3rd, 6th, 7th, 8th regiments) [Kortunov, 2009, p. 92; Godo-

vova, 2007, Table 2]. In 1853, the total number of Muslims totalled 4,885 people, and by 1855, there were 5,650 people, long with a total of 24 mosques [Kortunov, 2009, p. 85].

By the end of the 19th century the territory of the OCA was occupied as follows: 87.4%—Slavs, 9%—Tatars, 1.7%—Bashkirs, 1.2%—Mordvins, 0.3%—Kazakhs, 0.23%—Kalmyks, 0.12%—Chuvashes and 0.05%—Mari [State Archive of Orenburg Region, f. 164, inv. 1, file 64a, s. 56–58; Savelyev, 1913, p. 4].

Starting in 1736, the baptised Tatars (Nagaybaks) were a constituent part of the OCA. This group was formed by the mutual integration and cultural convergence around the Nagaybak fortress of the Teptiars (including the baptised), and the old-baptised peasants and Cossacks. In 1842, due to changes in the OCA's borders, 1250 male Nagaybaks 'who were members of the Bakalino and Nagaybak stanitsas' were resettled far to the East (Verkhneuralsk uyezd). In 1843, these settlements received more modern names: Kassel, Fershampenuaz, Parizh, Trebia, Krasnokamensk, Astralenka, Arsi, Kulikovskiy. Some of them settled in Cossack settlements such as Nezhenskoe, Ilyinskoe, Pogorniy, Giryal and Alla-Baytal. At the same time or a little while later, the Nagaybaks were settled in the Popovo, Varlamovo and Klyuchevskiy-tvoroy settlements [Iskhakov, 2004].

Tatars in the Ural Cossack army. The Ural army was initially made up of multi-ethnic refugees: the bulk of Cossacks were Russians, but they also included a lot of Nogays and Kuban and Volga Tatars, who were gradually adopting Christianity. However, the later immigrants 'even after transitioning to the Cossacks' retained the same ethno-confessional identity [Materialy po statistike, 1877, p. 139].

Strangers were rarely included in the UCA, and only the following mass assignments are known: in 1817, 176 Serving and yasak Tatars from the Uskalytskaya and Novoumerovskaya villages moved to Nikolskaya village with the permission of the government. In 1832, by order of the government 762 nomadic Bashkirs were enrolled in the Cossack estate of the Ural army 'along with the land' [Istoriya Bashkortostana, 1996, p. 345]. The UCA numbered less Cossacks than the Orenburg army. Thus,

in 1856, the UCA numbered 72,109 people of both sexes, and by the end of the 19th century it totalled 111,927 people [Savelyev, 1913, p. 3].

The majority of Muslims was represented in ethnic terms by the Tatars, until in 1838 when the 9th Bashkir canton, which consisted of Bashkirs resettled to Saratov guberniya and united into three yurts, was attached to the UCA 'because of the long distances in terms of control'; the canton was enrolled as the Bashkir unit, although it retained its previous daily routine [Zagidullin, 2006, p. 120] and remained part of it up to 1865. [Borodin, 1891, p. 313].

The UCA had both fully Tatar and fully Kalmyk settlements. The Muslims were the significant part of the population of Ilets and Chiza, and the Mustaev, Mukhor, Mukhran, Glinsk and Ozersk settlements [Dubovikov, 1996, p. 342]. In 1855, the Muslims (3,407 people of both sexes) were settled in 38 settlements, and public worship was performed in 8 cathedral mosques and 6 mosques where prayers were said 5 times a day.

In ethnic terms in 1858–1862, the UCA consisted of Russians (86%), Bashkirs (7%), Tatars (5%) and Kalmyks (1.4%) [Materialy, 1866, p. 334].

There were few Tatars among the officers. For example, in 1813 there were no Tatars at all among the 7 colonels and lieutenant colonels, and only one Tatar among 7 troop sergeants—Uzbek Tyunyaev [Russian State Military Historical Archive, f. 489, inv. 1, file 3092, s. 5]. There were no Tatars among either esauls or Cossacks, who had 'regular' ranks of poruchiks and majors. Only 3 people among 104 sotniks and cornets were Tatars [Russian State Military Historical Archive, f. 489, inv. 1, file 3092, s. 53, 57, 61]. There were also not many Tatars even among the uryadniks (subaltern officers), only 5 out of 128 people. Among the lucky possessors of the Cossack rank of first officer was cornet A. Akirov [Ural'skie, 1867, No. 38].

Land ownership and land tenure. Land is the main wealth and privilege of the Cossack troops. The main wealth of the Orenburg Cossacks was the land granted them by the decrees of 1736, 1743, 1744 'for various merits during

the Bashkir riots' [Ιστορικησκαπα ζαπισκα, 1904, π. 65], as well as the right to use lake and river water and the right to hunt and mine.

In the early 19th century, each Cossack cultivated as much land as they could, as there were no strict rules of land tenure. However, by order of the state chambers a portion of land was given to other estates, so many stanitsas were left with 15 desyatins (or less) of land per capita, which certainly caused discontent among the Cossacks. In 1832, the Orenburg Cossacks received 30 desyatins of land per one man, as the Cossacks who had even 20 desyatins of land were not able to serve 'properly, or provide themselves with their own clothes, weapons and horses' [Russian State Historical Archive, f. 1263, inv. 1, file 2340, s. 85].

According to the 'Regulation' of 1840, 30 desyatins of land per capita was the minimum when calculating the total amount of land for each of ten regimental districts formed in the OCA, and the soldiers and retired officers of the army were given 'special lifetime lands' [Stoletie, 1911, p. 261]. Renting in the OCA was common practice, and it not only brought in decent income to the landlord, but also increased the army capital [Godovova, 2007, p. 78].

To solve issues regarding the land given in 1798–1842, a General Survey of Cossack lands was conducted in Orenburg guberniya. However, land division projects were not implemented, and only in 1862 was the 'Regulation' on the division of OCA land approved [Polozhenie o razmezhevanii, 1862].

By the end of the 19th century OCA lands had been divided into the following categories: military, stanitsa (or yurt), officers' and officials' lands. The UCA lands were divided into military lands and lands granted for use to the Kazakhs. The Ural Cossacks used the lands in the form of undivided community ownership.

The nature of land tenure and land ownership adopted various forms, but the supreme owner of the Cossack lands was always the state. The lands of separate Cossack troops were in their 'eternal use' [Futoryansky, 1997, p. 64]. Subjects with the right of ownership of these lands were estate communities and institutions, such as the 'rural community', which was much the same as the 'stanitsa community' [Makhrova, 1999, p. 26]. However, even while recognizing the army as the land owner, the state still did not allow the military administration to dispose of the land and its mineral resources fully and independently [Godovova, 2007, p. 86].

§ 2. Serving Tatar Cossacks in Western Siberia

Gulsifa Bakieva

Serving Tatars (jomyshly) were one of the estate groups of the Siberian *Tatars* whose descendants came from the military-feudal nobility of the Siberian Khanate. Among the Serving Tatars were former Kuchum 'murzas' and 'murziches', 'beys' (the owners of independent appanages), tribal princes and clergy [Bakhrushin, 1955, pp. 164–165]. The Russian government 'represented by the serving nobility received trained military forces that played an important role in the process of the further colonisation of the territory' and smartly used them as 'the most powerful and influential portion of the subject population' [Tychinskikh, 2010, p. 236].

Throughout the 17–19th centuries, changes were taking place in the governance system of the Siberian Tatar service class. Until the middle of the 18th century, serving Tatars and other Cossack units were under the jurisdiction of the Siberian prikaz, which was what paid them their salary for their service. By a decree of the Senate dated 1744, all regular and irregular troops in Siberia were placed under the jurisdiction of the Military Board. In 1797, the gorodovye kazaki [patrol Cossacks] of the Military Board were placed under the jurisdiction of civil governors. The 'Statute on the Siberian gorodovye kazaki [Patrol Cossacks]' of 1822 confirmed the subordination of Cossack

regiments to the civil authorities, meaning to governors and regional chiefs, while city and uyezd units were under the jurisdiction of district chiefs and *gorodnichys* (town governors).

In the 18–early 19th centuries, members of the Siberian Tatars from the Kulmametyev family served as the heads of the Tobolsk Serving Tatars. The Russian authorities considered the indigenous chiefs as their agents at the local level. The Head collected *yasak* from the *Yasak* Tatars, judged and punished them and watched over the political reliability of Serving and '*zahrebetny*' (dependent) Tatars [Bakhrushin, 1955, p. 77]. By the Charter of Catherine of Russia the Kulmametyev family in 1787 was elevated to the noble rank [Russian State Historical Archive, f. 1286, inv. 2, file 347, s. 18]. However, at the beginning of 19th century. the Kulmametyevs had started to lose their power, and the decisive factor of their downfall was the 'Statute on Siberian *gorodovye kazaki* [patrol Cossacks]' of 1822, which abolished the institution of Serving Tatar heads. 'Chieftains from among the Russian officers were now approved' as heads of Siberian Tatar regiments [Tychinskikh, 2010, p. 125].

The Statute of 1822 gave the *gorodovye kazaki* [patrol Cossacks] mostly police functions and attached them directly to the governorate and district police. In addition, the *gorodovye kazaki* [patrol Cossacks] were also involved in other activities, such as delivering and selling food, collecting tributes from the local population, organising the land-use system, etc.

The law regulated the method of Cossack regiment formation, which enshrined the estate principle of recruitment. Till the age of 16, the children of Cossacks held the rank of their fathers, and upon reaching 16 they were included in the 'nominal list' and received an allowance; at the age of 17 they started their own service. The Statute enshrined the right to receive a salary for their service, lands in the amount of 15 *desyatinas* per capita, as well as an exemption from tributes and *zemsky* (territorial) fees [Complete Code of Laws of the Russian Empire–1, Vol. 37, No.29131].

In the early 18th century, the Serving Tatars of Tobolsk, Tyumen, Tara and Tomsk (the

Tobolsk guberniya) were united in the Siberian Tatar patrol regiment, which consisted of 5 Tatar Cossack units. Three of them were located in the Tobolsk uyezd, one was in the Tyumen uyezd, and the last in Yalutorovsk uyezd [Tychinskikh, 2010, p. 97]. In 1849, the Tobolsk mounted regiment was formed on the basis of a pre-existing Siberian Tatar regiment as an irregular troop formation designated for escort-guard service [Arapov, 2002, p. 126]. In 1861, the Tobolsk mounted regiment, along with Tobolsk and Tomsk regiments, became the part of the Siberian line troop [Shcheglov, 1883, p. 441]. In 1868, the Tobolsk mounted regiment was disbanded, and Serving Tatars shifted to the peasant estate [Complete Code of Laws of the Russian Empire–2, Vol. 43, p. 822].

For their service, Serving Tatars received a monetary and salt compensation, but not everyone was provided bread as compensation. The government considered their service as a form of *yasak* collected from the indigenous population [Goncharov, Ivonin, 2006, p. 26]. The fact that the monetary and salt allowances of the majority of Serving Tatars were lower than those of other serving categories confirms that Serving Tatars were close to *Yasak* Tatars in their legal status. The sizes of compensation were different not only among various categories of serving people, but also within a certain category of different cities [Tychinskikh, 2010, p. 73]. The salaries of Serving Tatars in Tobolsk were higher than those in other cities. In the middle of the 18th century, the salaries of the majority of Serving Tatars were equalised, and ever since that time they started to receive bread and food compensation during their service. The situation remained the same throughout the 19th century.⁸

⁸ In 1812, out of 236 Cossacks of the Tobolsk group, only 69 were receiving food and oats [Russian State Military Historical Archive, f. 489, inv. 1, file 3758, s. 4]. In the Tomsk group, food and oats were given to 16 Cossacks out of 28, and 10 people received food and feed through the plant authority where they served [Russian State Military Historical Archive, f. 489, inv. 1, file 3764, s. 8 reverse]. Cossacks of the Tyumen Tatar Cossack group did not receive food and oats since they owned inherited 'arable lands and haying lands' [Russian State Military Historical Archive, f. 489, inv. 1, file 3770, s. 4].

Settlement and population. In the Tobolsk Uyezd Yurt Serving Tatars lived together with Tatars in Tobolsk and neighbouring settlements along the Tobol and Irtysh, and in total 38 settlements were registered. A portion of the Serving Tatars were retired Serving Tatars, their children and zahrebetniks (brothers, nephews). In 1816, there were 721 Serving Tatars (including retirees and children) in the Tobolsk uyezd [Russian State Historical Archive, f. 1264, inv. 1, file 4, s. 147 reverse–148], and in the middle of the 19th century there were 929 [Polozhenie, 1849, pp. 51–53].

In the Tara uyezd Serving Tatars and their zahrebetniks had their own settlements. They lived in the Kyrgapsky, Turalinsky, Aitkulov, Atacky and Shihov yurts, and in such villages as Itkuchakov, Atacky, Babin, Seitov and Batuganovo [Tomilov, 1981, p. 67, 140]. The part of the Serving Tatars in the population of the Tara uyezd in the 17th century was small in comparison with other uyezds. By the end of the 18th century, Serving Tatars ceased to exist as an ethnic estate group, and fully blended in with the Yasak Tatars [Tychinskikh, 2010, p. 166].

Tyumen Serving Tatars lived together with Tatars in yurts along the Tobol from the mouth of the Iset river to the mouth of the Iska. In the neighbouring Yalutorovsk uyezd they were registered in four different yurts [State Institution of Tyumen Region State Archive in Tobolsk, f. 329, inv. 13]. In the middle of the 19th century, the Serving Tatars of Yalutorovsk uyezd (5 settlements), together with part of the Tyumen Serving Tatars, were included in the 4th sotnya (172 people). The 5th sotnya consisted of Serving Tatars from 14 different settlements of the Tyumen uyezd. In the middle of the 19th century, the 5th sotnya numbered 253 Serving Tatars [Polozhenie, 1849, p. 53; Tables 7–8].

Thus, in the 19th century, the majority of the Serving Tatars lived in settlements, and only a small part of them lived in such cities as Tobolsk, Tyumen and Tara, although initially (in the 16–17th cc.) Serving Tatars were assigned to cities. According to the census of 1816, 134 Serving Tatars lived in Tobolsk: 1 officer, 1 lieutenant colonel, 71 Cossacks and 61 Cossack children. Only Serving Tatars of the Tomsk

A Cossack from the Regiments of gorodovye kazaki (settled territorial Cossacks, garrison troops) of Western Siberia: Tobolsk, Siberian Tatar and Tomsk. 1824–1825

Cossack unit in the early 19th century lived in the city in their entirety: 1 lieutenant colonel, 19 Cossacks, 20 Cossack children and 14 retired Tatars [Tomilov, 1981, p. 79, 197–198].

Functions In the early 19th Serving Tatars, along with their military service, participated in the collection of tributes, escorted convicts and state cargoes, worked in offices as couriers and counters, and handled other tasks as well.

By decree of the 'Statute on the Siberian gorodovye kazaki [patrol Cossacks]' of 1822, the serving class was primarily assigned with police functions—the capture of fugitives, enforcing order in cities, patrolling at night, transferring exiled criminals. In addition, just as in the previous period, they collected tributes from the local population, participated in construction, land planning and the protection of state property, and were used as postmen, treasury counters, etc. [Complete Code of

Laws of the Russian Empire–1, Vol. 37, Section 29131].

Land tenure. Serving Tatars could own and use lands on service performance conditions. The 'Statute on inorodtsy' and the 'Statute on Siberian gorodovye kazaki [patrol Cossacks]' of 1822 confirmed the assignment of lands to Serving Tatars in the amount of 15 desyatinas per 1 male. After the abolition in 1868 of the Tobolsk mounted regiment and unmounted half-battalion, Serving Tatars were transferred to the peasant class and made equal with them in terms of land tenure rights. However, the right to receive lands was given only to 28-year-old Cossacks capable of working. People under the age of 28 and elderly people did not receive any lands. The lands of deceased Cossacks fell into the community ownership of the Yasak Tatars [State Institution of Tyumen Region State

Archive in Tobolsk, f. 335, inv. 1, file 26, s. 9–10]. Since then the former Serving Tatars have had to pay tribute and carry out duties for the right to use these lands, just like the Yasak Tatars. In addition, the Serving Tatars were granted certain privileges in terms of tribute payments.

However, even after the abolition of their irregular units in 1868, Serving Tatars were still recorded separately from the other categories of the Siberian Tatar population due to the fact that they received privileges regarding the payment of tributes. Only during the course of administrative reforms in 1910 were they made equal with rural groups of Tatars.

Throughout the entire period of their existence, Serving Tatars retained their ethnic and religious identity. This fact predetermined the separate position of Serving Tatars among other groups of Siberian Cossacks.

§ 3. The Meshcheryaks

Leila Tagirova

The canton governance system. The introduction of the canton system in 1798 in the Ural region brought with it a whole new system of governance. Canton chiefs were placed at the heads of the administrative units from among Muslims. Among the functions of the canton chiefs was the execution of orders, instructions and decrees of the higher authorities, and for that reason they were given significant rights in the military, political and administrative, judicial, police and economic arenas. Their duties included drafting and presenting to the governor lists of officials, clergymen, the number of yards, the recruitment of new serving men to the line of service, the appointment of the appropriate number of campaign soldiers, etc. They also managed the execution of state and zemsky duties, the collection of taxes from the dwellers of their cantons, and the sale and lease of land. In addition, they controlled the economic activity of the canton dwellers 'so that they were engaged in housebuilding, land cultivation and all other works, while lazy people were forced to do so as well... by taking away

their lands for some time and sending them as workers to good owners... until they changed their behaviour and were able to work on their own'. Canton chiefs were also in charge of solving petty court cases [Complete Code of Laws of the Russian Empire–1, Vol. 25, No. 18477].

The elections of canton chiefs were held by balloting in the presence of zemsky court representatives whose duties were to ensure that only smart officials 'of irreproachable behaviour' with knowledge of Russian and the 'Turks' were allowed to be elected. In addition, people who have been put on trial 'were not allowed to stand for election' [Asfandiyarov, 2005, p. 138]. It should also be noted that the first canton chiefs were appointed by the military governor without formal elections [Complete Code of Laws of the Russian Empire–1, Vol. 25, No. 18477].

The chiefs of the Meshcheryak cantons belonged to military officials and received ranks typical for the Cossack army. The relation between the acting and formal ranks were about the same.

To proceed with their current affairs, the cantons had headquarters, correspondence books, and registers of collected monetary taxes. Canton chiefs were allowed to have 1 or 2 assistants depending on the area of their canton, and two officials occupying the position of clerk [Complete Code of Laws of the Russian Empire–1, Vol. 25, No.18477]. Moreover, canton chiefs were supposed to have two messengers 'for service assignments' from among the retired young men who lacked sufficient service abilities. Cantons were divided into yurts, which consisted of groups of villages, and the yurts were headed by petty yurt officers who reported directly to the canton chief. They were appointed by the governing canton from among the candidates chosen by the officials from each yurt. The main duty of the yurt officer was managing the shipment of units that consisted of awaiting Cossacks from the subordinate villages to line service twice a year. In addition, they controlled the collection of taxes and the execution of state and monetary duties. Yurt officers mainly performed the same functions as the canton chiefs, only within the yurts entrusted to them.

In addition to the officials of the canton internal administration, there were also officials of the military and labour service. The duties of the latter included the escort and management of Cossacks during their secondment to service.

In 1798–1834, canton chiefs were released from non-monetary duties, but they still did not receive a salary [Russian State Military Historical Archive, f. 405, inv. 6, file 5874, s. 49 reverse], which was one more reason for their corrupt practices. And until the 1830s, canton chiefs were also directly subordinate to the Orenburg military governor and had very little control over their activities.

In 1834, the Bashkir Meshcheryak army was formed and the position of commander of the army and office was introduced. Then starting in 1837, all issues concerning the population of cantons were resolved by the commander with their subsequent approval by the governor general. Criminal investigation cases were removed from civil proceedings and this referred to the military court. In 1835, the positions of canton curators (who were elected

The Orenburg Caravanserai Mosque, a house of worship of the Bashkir-Mishar army. Photo from the early 20th century.

from Russian military staff officers) and solicitors (from civil officials) were introduced.

There were 6 curator districts that included anywhere from 20 to 60 thousand males.⁹ The duties of curators were: 1) control over the execution of the orders of governorate authorities; 2) control over the military service of the canton population; 3) medical examinations of people registered as retired or incapable of service, and medical examinations of 'minors'; 4) obligatory presence during the election of canton chiefs and yurt officers; 5) control over carrying out duties; 6) supervision of 'agricultural activities'; 7) run investigations and court cases for petty crimes and thefts within the as-

⁹The first ward included the 1st, 2nd, and 3rd Bashkir cantons, the second ward—the 4th and 5th Bashkir and 1st Meshcheryak cantons, the third ward—the 6th and 9th Bashkir cantons, the fourth ward—the 7th Bashkir and 2nd and 5th Meshcheryak cantons, the fifth ward included the 8th and 10th Bashkir and 3rd and 4th Meshcheryak cantons, the sixth ward—the 11th and 12th Bashkir cantons [Istoriya Bashkortostana, 1996, p. 351].

signed curator districts (since 1841, less than 15 silver roubles [Russian State Military Historical Archive, f. 405, inv. 6, file 9049, s. 279], since 1854–30 silver roubles [Russian State Military Historical Archive, f. 405, inv. 6, file 12941, s. 8]).

The solicitor's scope of activity included the observation of court cases related to land ownership, presence during the land survey and 'renting' of lands, and reporting to the authorities about the harassment of Bashkirs and Meshcheryaks by other departments [Asfandiyarov, 2005, pp. 40–41]. Thus, curators and solicitors were an additional link in the system of the army's population control.

From 1840, the canton chiefs began to receive a salary in the amount of 185 silver roubles and 90 kopecks annually, and from 1845 the assistants of canton chiefs received 50 roubles, and yurt officers earned 15 silver roubles annually [Russian State Historical Archive, f. 1284, inv. 232, file 206, s. 9].

The end of the period of continuous military campaigns (the beginning of the 19th century) and the further development of small arms and artillery weapons, as well as the improvement of the army governance system, made archaic irregular troops equipped mainly with melee weapons entirely ineffective. After the suppression of the rebellion led by Kenesary Kasimov (1837–1847), the Russian influence in the Kazakh steppe became even stronger. The Orenburg frontier line, which was actually the state border in the southeast of the country, had become irrelevant by the middle of the 19th century. As a result, there was no need for the military units of Bashkirs and Meshcheryaks.

The authorities gradually shifted to the transfer of the population to the peasant class, but were still hesitant that the loss of military status might spark displeasure among the population. In this regard, by the decree dated 21 January 1837 it was 'ordered to transfer to the taxable class those Bashkirs and Meshcheryaks who found the conditions and organisation of their service oppressive and burdensome' [Russian State Military Historical Archive, f. 405, inv. 6, file 9049, s. 277 reverse]. Orenburg governor general V. Perovsky during his reign

levied duties on 6,849 people, his successor V. Obruchev (1842–1851) in 1843 levied duties on 30,750 people from the 10th and the 4th Meshcheryak cantons, and in 1844, that number totalled 38,807 people [Russian State Military Historical Archive, f. 405, inv. 6, file 5874, s. 51 reverse; Asfandiyarov, 2005, p. 182]. By the end of the 1840s, cantons had been divided into 'serving and non-serving'. The latter were released from military service, but were still under military control and had to pay a monetary duty in the amount of 3 silver roubles from each serving man and 1 silver rouble from each retired Cossack and 'minor' [Russian State Military Historical Archive, f. 405, inv. 6, file 5874, s. 50 reverse].

The next step of transferring Bashkirs and Meshcheryaks to the peasant class was made in 1855, when the teptyars and bobylys (landless peasants) from Orenburg, Perm and Vyatka guberniyas were attached to the army. The army itself was called Bashkir and included 28 cantons. Nine of them were declared serving (the 1st–6th and 26–28th cantons), and the rest of them non-serving.

The situation remained like this until 14 May 1863, when the 'Regulation on the Bashkirs' was approved, which did not abolish the canton system completely, but rather provided a two-year period to prepare the final merging of Bashkirs, Meshcheryaks and Teptyars with the peasant population. Eleven new cantons, geographically coinciding with uyezds, were formed instead of the 28 previous ones. The heads of the cantons were Russian officers, but not representatives of the national military officials.

The canton governance system was completely abolished by the decree dated 2 July 1865. From the end of 1865 to the beginning of 1866, the Bashkirs, Meshcheryaks and Teptyars gradually fell under the jurisdiction of the governorate and uyezd offices related to peasant affairs and conciliators, and were forced to pay monetary duties.

Land tenure. In the 18–30s of the 19th century the bulk of Meshcheryaks remained on patrimonial Bashkir lands on the basis of contract records about settlement on the basis of monetary tribute payments to the landown-

ers. A small number of Meshcheryaks owned lands partly acquired as owners. Some settlements also arose on Bashkir lands previously confiscated by the treasury (including lands confiscated for participation in rebellions) and on lands granted by the tsars. Starting in 1832 after the issuance of the land decree, the Meshcheryaks, as members of the military class, were granted 30 desyatinas of land per one male according to the 7th census of 1816. Those who could not present contract records on settlement or bills of sale presented by the Bashkirs were only granted 15 desyatinas per one male [Asfandiyarov, 2006, pp. 205–206].

All the Meshcheryaks of the Bashkir Meshcheryak army were settled people who engaged in arable farming and cultivated garden crops. Bread was sold at rural markets or in the cities [Russian State Historical Archive, f. 1284, inv. 232, file 52, s. 6].

Settlement and population. Meshcheryak cantons were formed in the places where Meshcheryaks were densely concentrated and had no special names (they were different in their sequence numbers). Population dynamics were determined by natural growth. In 1829, 872 officers, 29,709 Cossacks and 578 clergy members were registered in Meshcheryak cantons, meaning 31,159 males in total [Zhurnal Ministerstva Vnutrennikh del, 1831, pp. 124–125]. In 1842, there were 72,894 Meshcheryaks (36,768 male and 36,126 female) [Russian State Military Historical Archive, f. 405, inv. 6, file 5874, s. 48], in 1848, their number totalled 85,153 people [Russian State Military Historical Archive, f. 846, inv. 16, file 18900, s. 43], and in 1856, it reached 110,595 people [Keppen, 1857, pp. 270–273].

The 1st Meshcheryak canton was composed of yurts in the Troitsk and Chelyabinsk uyezds of the Orenburg guberniya, in the neighbourhood of the 4th Bashkir canton, and on the border of the Shadrinsk uyezd of the Perm guberniya and Yekaterinburg uyezd. 'The capital' of the canton was Adzitarovo village [Complete Code of Laws of the Russian Empire–1, Vol. 25, No. 18477]. In 1847, the 1st Meshcheryak canton was abolished, and the first four yurts were assigned to the 5th canton (starting in 1847 it was called the 6th Bashkir canton), the

A Company Officer and a Cossack of the Bashkir Meshcheryak army. 1845–1855

5th yurt was assigned to the 4th tramontane Bashkir canton (starting in 1847 it was called the 4th Bashkir canton), and the 6th yurt was assigned to the 4th Western Bashkir canton (starting in 1847 it was called the 5th Bashkir canton) [Complete Code of Laws of the Russian Empire–2, Vol. 22, No. 21741].

The second (starting in 1847 it became the first) Meshcheryak canton was located in the Strlitamak uyezd (canton centre in Buzovyazy village), and the third canton (the second starting in 1847) in the Birsk, Belebey and Ufa uyezds [Complete Code of Laws of the Russian Empire–1, Vol. 25, No. 18477]. Yurts of the 4th Meshcheryak canton (the 3rd starting in 1847) were located in the Birsk and Menzelinsk uyezds (canton centre in Bogdanovo village). The 5th (the 4th starting in 1847) canton included Meshcheryaks of the Belebey Uyezd (canton centre in Turkeevo village).

In 1855, after the formation of the Bashkir army and 28 new cantons, the administrative units were no longer divided into Bashkir and Meshcheryak. It is known that the majority of the Meshcheryak population (50% or more of the canton population) lived in the 24th can-

ton located in the Ufa uyezd (22,341 people of both sexes) and in the 11th canton located in the Yekaterinburg and Shadrinsk uyezds (12,245 people of both sexes) [Keppen, 1857, pp. 270–273].

Duties. The entire male population of cantons from the age of 17 to 45 were required to serve in the military. Initially this was not limited to any certain period of time, and only in 1840, when a permanent staff for the Bashkir Meshcheryak army's management had been approved, was military service limited to: 25 years for officials and 30 years for Cossacks, 25 years of which was to be field service, and 5 years internal duty [Russian State Military Historical Archive, f. 405, inv. 6, file 9969, s. 21 reverse].

Their main duty was ultimately military service on the Orenburg border line. Summer service lasted 6 months (from 15 May to 15 November), after which the squads returned home and were replaced by others. The amount of people on winter service was three times less due to the rarity of encounters with the Kazakhs in winter.

Compulsory duties were produced according to 'subsequent' lists, one drafted for each canton. The number of uniforms for border guard duty as well as for other works, was determined on an as-needed basis and at the discretion of the Governor General [Russian State Military Historical Archive, f. 846, inv. 16, file 18900, s. 118]. The Bashkirs and Meshcheryaks served at their own expense, that is with their own weapons and horses [Central Historical Archives of the Republic of Bashkortostan, f. I–2, inv. 1, file 6755, s. 26]. According to the rules, each canton had two or three distance chiefs assigned to accompany and manage the Cossacks during their period of service.

As representatives of the military Cossack estate, the Meshcheryaks were active participants in wars. There were two Meshcheryak mounted regiments formed to fight in the Patriotic War of 1812 [Asfandiyarov, 2006, p. 255]. In addition, up until the 1820s the Meshcheryaks had been contributing to border control in Bessarabia, and also sending people for police and convoy service to Moscow, Ka-

zan, Nizhny Novgorod and Perm. The government also used detachments of Meshcheryaks for punitive operations in Orenburg guberniya and Kazakhstan, and up until the 1840s they were involved in milestone service along the Siberian Route.

Starting in the 1830s, the majority of Bashkirs and Meshcheryaks was enlisted in working and transport squads that were responsible for the construction of military facilities, cargo transportation, road construction, etc. While in the late 1830–early 1840s 30% of people on military duty were enlisted in working and transport squads, in the early 1850s this number reached 86% [Central Historical Archives of the Republic of Bashkortostan, f. I–2, inv. 1, file 6755, s. 26].

Along with military service, the population of cantons were responsible for a list of other duties, including mail transportation on the Orenburg borderline. In 1834, this duty was replaced by a fee of 23 silver kopecks from each male citizen. Starting in 1822, the Bashkirs and Meshcheryaks paid a special tax of 25 kopecks [Istoriya Bashkortostana, 1996, p. 361] (in 1842, 30 kopecks) from every person on the census list (except for public officials and clergy) to the special monetary fund to supply provisions during leaner years [Russian State Military Historical Archive, f. 405, inv. 6, file 5874, s. 49 reverse]. In 1834, the fee collected from the Bashkirs and Meshcheryaks of the agricultural cantons was replaced by a non-monetary levy of 0.5 pood of rye and wheat and 10 pounds of oat or barley per person. The population of cantons were also responsible for other non-monetary levies, such as mail delivery, road construction and repair, and a housing duty. Furthermore, they paid state and local governorate zemsky levies, money for maintaining clerks and scribes, and also for the stationery expenses of the canton administration [Istoriya Bashkortostana, 1996, pp. 358–362].

The introduction of a canton administration system and the Mishars obtaining a special status in the 19th century contributed to the isolation and preservation of a specific self-consciousness, which made it impossible for them to integrate into the social estate groups of the

Tatar population. The fact that the Mishars were a part of the military Cossack estate allowed them, as well as the Bashkirs, to study in secular and military educational institutions. Thanks to their military service, they could climb the career ladder while receiving brevet

and acting ranks, as well as personal and hereditary nobility, as in the following example:; it happened to the dynasties of the Valitovs in the 1860s, the Ishbulatovs in the 1860s, the Rezyapovs in the 1860s, the Tupeeys in the 1860s, the Yanyshevs in the 1860s etc.

§ 4. The Bashkirs

Ildus Zagidullin

In the 18th century the Bashkirs were serving irregular military duty and were still under the supervision of the civil administration. One of the main reasons for the fundamental change in their administrative office was the establishment of Bashkir cantons [Nigmatullin, 1959, pp. 169–171], and in 1803 their number totalled 12. All administrative military units were formed on a territorial basis, with cantons were divided into yurts (squads), each of them including from 700 to 1,000 male citizens [Istoriya Bashkortostana, 1996, p. 343–344]. In 1855, after the inclusion of the Teptyars and the bobylys (landless peasants) according to the new administrative division, the Bashkir army consisted of 9 protectorships, 28 cantons and 394 yurts [Istoriya Bashkortostana, 2004, p. 322]¹⁰. In 1862, it included 1,008,875 people,

including 549,452 'Bashkirs', 138,819 Meshcheryaks, 8,631 Tatars, 241,950 Teptyars, 51,340 'Cheremis' (Mari, Chuvash, Mordva), and 18,684 'Votyaks'. When it came to religious affiliation, the Bashkir army consisted of three groups: 936,568 Muslims, 70,221 pagans, and 2,087 Christians [Alishev, 2005, p. 275].

The irregular army had the following ranks introduced that differentiated it from Cossack organisations: a 'field master sergeant', who was in charge of troop units while heading towards the final destination of service, and also a 'remote commander', who had several Bashkir squads at their disposal. In service, Bashkirs were subordinate to Cossack officers [Zapiski, 1907, p. 29]. Men from the age of 20 to 50 were sent to the fighting troops based on their number of courts (on average 1 person for every 4–5 households) and servicemen, the support of whom was carried out at the expense of local residents. From 1798–1848, the Bashkirs and Meshcheryaks provided the Orenburg border line with more than 65% of its servicemen annually; they were the foundation of the irregular troops. In 1822, they totalled roughly 11 thousand people (70%). The detachments sent to catch fugitives were maintained by means of the state land tax. They served on this duty for three years, after which they were replaced by others [Asfandiyarov, 2005, p. 51–52, 57].

¹⁰ After the 1803 establishment of another Bashkir canton within the Shadrinsk Uyezd of the Perm guberniya, previously a part of the 2nd Bashkir canton, they were numbered as follows: The 1st canton—in the Osa and Perm Uyezds, 2nd canton—in the Yekaterinburg and Krasnoufimsk Uyezds, 3rd—in the Shadrinsk Uyezd, 4—in the Troitsk Uyezd, 5—in the Chelyabinsk Uyezd, 6—in the Verkhneuralsk Uyezd, 7—in the Sterlitamak Uyezd, 8—in the Ufa Uyezd, 9—in the Orenburg Uyezd, 10—in the Birk Uyezd, 11—in the Menzelinsk Uyezd, 12—in the Belebey, Bugulma and Buguruslan Uyezds. The Meshcheryak cantons were distributed among the following uyezds: The 1st canton—in the Troitsk and Chelyabinsk Uyezds, 2nd—in the Birk and Menzelinsk Uyezds, 3rd—in the Sterlitamak Uyezd, 4—in the Ufa Uyezd, 5—in the Bugulma Uyezd. Depending on the place of residence of canton leaders, the centers of the cantons varied. In 1847, the 1st Meshcheryak canton was discontinued. The first four yurts included in it were allocated to the 5th Bashkir canton, the 5th yurt—to the 4th Zagorny canton, the 6—to the 4th Western canton. (In 1832, the 4th Bashkir canton was divided into the 4th Zagorny and 4th

Western cantons that in 1847 became known as the 4th and 5th cantons, leading to a change in the numbering of Bashkir cantons: the former 5th one became the 6th, the 6th turned into the 7th, the 7th into the 8th, etc. The 2nd Meshcheryak canton became the 1st one, the 3rd one turned into the 2nd, 4—into 3rd, 5—into 4th) [Asfandiyarov, 2005, pp. 24, 48].

The government policy for the reinforcement of supervision over Bashkirs and Meshcheryaks eventually led to all the issues being transferred to the jurisdiction of the military governor. There was also a Military Office and the position of troop commander, who was in charge of the canton chief officers [Tagirova, 2011, p. 90]. (During this period the management of irregular troops was further centralised, and in 1835–1840 the Orenburg border line was reorganised, which led to an increased quantity of Cossack troops [Godovova, 2009, p. 157].) In 1853, the commander of the Bashkir Meshcheryak troops gained the right of division commander, which corresponded to the rank of appointed hetman in the Orenburg Cossack troop. The appointed hetman was in charge of troop management with counselling from the Military Office [Asfandiyarov, 2005, p. 36].

In the 1820s, the Bashkir troop capital was formed using the funds raised by various levies from the population and other income. It was used for providing loans during lean years, the education of Bashkirs in Russian educational institutions, and opening schools and hospitals, their maintenance, etc. After the canton administration had been abolished, the capital of the Bashkir troop (roughly 3 million roubles), became the property of the state [Asfandiyarov, 2005, pp. 136–137].

The latter half of the 19th century clearly reflected the aspirations of the Imperial authorities to turn the Bashkir military estate into peasants. In 1832–1834, with the help of recruited Muslims, the government built the Verkhneuralsk-Sterlitamak route, in 1835–1838 the Orsk-Troitsk new border line (9 redoubts and 12 pickets), actively involved the irregular troop in the transport squad for cargo transportation, and also utilised it to harvest timber and raft along the Sakmar and Ural rivers, repair and develop the buildings in Orenburg, Ufa and Uralsk, and work in the military administration in the potash, horse and bee industries, gathering ash for potash production in production units, etc. At the end of 1840, a significant portion of Bashkirs leading a settled life and Meshcheryaks were levied with a monetary tax instead of military service

(200,190 people). A total of 101,126 people from the census lists remained in the position they were. By the 1850s, line service by Bashkirs was no longer needed by the government. Instead, it was replaced with service duty in working squads that carried out various works for the state (labour duty), which in fact turned out to be more burdensome than line service [Asfandiyarov, 1968, pp. 161]. By 1860, the Bashkir troop had completely lost its significance as a military force: up to 90% of people drafted for service were deployed to work for the state [Asfandiyarov, 2005, pp. 98].

The people in different Bashkir cantons had significantly different lifestyles and economic structures. According to information from 1846, members of the Bashkir estate in the first canton (the Osinsky and Permsky Uyezd of the Perm guberniya), and the 10th (Birsky Uyezd) and the 11th canton (Menzelinsky and Sarapulsky Uyezd) led an exclusively settled lifestyle. Agriculture was also dominant in the 4th western canton (Troitsky Uyezd, 90.1%), and in the 8th (Ufimsky Uyezd, 83.3%) and 12th cantons (Belebey, Buguruslan and Bugulma Uyezd, 77.7%). In total, more than a half of all households in the Bashkir cantons led a settled lifestyle (52.5%), 47.4% lived a semi-nomadic existence, and the rest adhered to a nomadic lifestyle. According to information from the first quarter of the 19th century, the Belebey (2.78 quarters of sowed grain per person), Menzalinsky (1.75) and Ufimsky (1.71) Uyezds were the most developed agricultural regions. All in all, the Bashkir cantons were divided into three economic areas: agricultural (the 1st, 10th and 11th cantons), arable-livestock (the 2nd, 4th western, 8th and 12th) and livestock-arable (the 3rd, 4th tramontane, 5th, 6th, 7th and 9th). Most notably, the military administration throughout different periods and with varying levels of intensity engaged in endeavours to fight against the nomadic lifestyle of the Bashkirs. Due to the seizure of patrimonial lands in the Bashkir cantons, the livestock population was on the decline: from 1827 to 1855, the number of horses in farms had decreased on average from 1.37 to 0.98, and cows from 0.72 to 1.14 heads, but at the same time the number of sheep and goats had

increased from 0.99 to 1.44 [Asfandiyarov, 2005, pp. 112–115].

The nature of farm management can be explained by the fact that the term 'Bashkir' had two meanings, as a social estate and as an ethnicity. Tatar migrants from the Middle Voga River region to the Cisurals were listed as Bashkirs back in the district century. This occurred as follows. In the beginning, they paid tribute for their lands left behind in the Kazan Governorate, because as they had been put under the supervision of the Ufa administration, they were imposed with the same taxes as *yasak* Bashkirs. Not only did this stimulate the settlement of new-comers on the new lands, but the *yasak* also contributed to the consolidation of their position in the future. According to the historical sources of the latter half of the district century, a *yasak* *bobyl* [landless peasant], after he had 'established himself on the new land and gotten his farm in order', could be transferred to the Bashkir social estate by submitting a petition, paying a *yasak* on equal terms with the Bashkirs, or receiving a certificate from the local governor to reside on the given territory, and so on. The one and only document confirming ownership rights were *yasak* books. From the Bashkirs' point of view, the *yasak* was a symbol of the patrimonial right to land. Another way of penetrating into the ethnic Bashkir community was through the institute of *priпуск* [permits to settle in patrimonial lands] to patrimonial lands on the basis of contracts [Ramazanova, 1984, p. 41–50]. As a result, the taxable peasant Tatars of the Western and Northern parts of the Ufimsky Uyezd were now being referred to as 'Bashkirs' [Alishev, 2002, p. 25].

In the early 18th century, contemporaries distinguished three types of permits: the purchase of land, ownership on equal terms with Bashkir great landowners, and tenant occupancy. Often tenancy was set for an unlimited period of time [Ramazanova, 1984, p. 50]. As a result, the Bashkirs also included Serving Tatars and Serving Tarkhans from the Tatars, as well as Orenburg Cossack Tatars¹¹ [Denisov,

2006a, p. 79, 80, 113; Gabdullin, 2010, p. 41–42; Amirkhanov, 2010, p. 67–68]. To phrase this another way, 'the meaning of the notion of Bashkirs as an estate is proven by the fact that in the 19th century the members of other socio-ethnic groups joined the Bashkirs, sometimes under the name of "Bashkirs from Votyakin the" or "New-Bashkirs"' [Kappeler, 2012, p. 24]. The Bashkir estate included not only Tatars, but local groups of other non-Russian nations as well¹². And, vice versa, if a Bashkir family did not have the means to complete the tasks of the authorities, they could be transferred to the Teptyar estate. In the first half of the 19th century such families were not allowed back to the 'Bashkirs' [Central Historical Archives of the Republic of Bashkortostan, f. I–2, inv. 1, file 5017, s. 1–3 reverse].

One aspect that played an important role in land regulation was the law 'On the rights of Bashkirs for their lands in Orenburg Krai', dated 10 April 1832, which abolished the decree of 11 October 1818 prohibiting the sale of patrimonial lands. Compared to the decree of 11 February 1736, the requirements for the sale of patrimonial lands trading were now simplified by requiring only the agreement of 2/3 of large landowners, as opposed to all members of the community. They were also allowed to rent the lands for a period of no longer than 12 years. Another important condition was that the government had to make sure that the Bashkirs had enough lands to engage in livestock and agricultural farming. The lands could be sold only if each of the Bashkir *volost* had a

decree of the military authorities, a significant portion of residents in the Seitova Sloboda and its satellite settlements, villages of Verkhniye and Nizhniye Chebenki, Zyak-Ishmetovo, Aydaralino, Tyater-Araslanovo, Ashirganovo, Balykly, Lower Ibraevo, Sterlibashevo, the Nogai people of the Vozdvishensaya Fortress, Zhel'tiy and Nikitinsky Redoubts, Kundrovskaya Sloboda, the serving-class Tatars of the villages of Duvekayevo, Bolshaya Oka, Asekeevo, Sultngulovo, Kulsharipovo, etc. were included into the category of the Bashkirs [Denisov, 2006a, pp. 79–80].

¹² For example, in 1879, the Bashkirs of the villages of Novo- and Staro-Yanmyrzino of the Birsk Uyezd, numbering 19 and 14 families respectively, insisted that their ancestors descended from the pagan Maris [Central Historical Archives of the Republic of Bashkortostan, f. I–295, inv. 2, file 143, s. 318].

¹¹ Based on a study of the archival sources, D. Denisov established that in 1798–1865, following the

land fund of 40–60 desyatinas per person in the census list. Land relations among large landowners and *pripushhenniks* (settlers) were regulated by law as well. The *Meshcheryaks*, *Teptyars* and *bobylys* [landless peasants] residing in Bashkir patrimonies and serving Cossack duty were to receive 30 desyatinas per head, whereas Tatars, state-owned, appanage and other groups of settlers were given 15 desyatinas each (according to the 7th census) [Akmanov, 2007, pp. 288–289].

In the Bugulma, Buguruslan, Buzuluk, Menzelinsky and Troitsky Uyezds the General land survey was carried out quite fast, and now the state had a significant amount of land at their disposal. During the survey some settlements of the *pripushhenniks* (settlers) confirmed their right to separate dachas,—that is, the rented Bashkir lands. Just as before, the majority still continued to rent them as they did before. In order to put the law of 10 April 1832 into action, in 1848, the government established a Bashkir Land Survey Committee that in the 1850s, based on the results of the General Land Survey, determined the necessity of providing landless settlers with land in 157 (11.6 million desyatinas in total) out of 203 Bashkir dachas located in the Orenburg, and partially in the Perm, Vyatka and Saratov guberniyas. After the *Teptyars* and *bobylys* (landless peasants) had joined the Bashkir troop, in 1858, the Orenburg administration and the Bashkir land survey committee started providing these land-poor groups of the population (4081 male persons) with lands of 30 desyatinas per person listed in the census, by resettling them in the Bashkir dachas that were left as a result of land distributions among large landowners and settlers on military duty [Akmanov, 2007, pp. 296, 312, 315, 319].

The results of the work completed by the local authorities on dividing up land for the landless in 1858–1860 were quite disappointing. A total of 1.7 million desyatinas of Bashkir dachas were granted to the landless, and 1.3 thousand male souls were resettled from land-poor Bashkir dachas to areas with much more land [Akmanov, 2007, pp. 317].

Although according to the information from the General Land Survey of 1797–1804 the Bashkir large landowners had on average 40 desyatinas per person (according to the 7th census), this number gradually dropped later due to population growth and some of the owners losing their lands for various reasons. As a result, the increasingly expanding group of Bashkir settlers (135 thousand by 1857) could only count on 15 desyatinas per male soul [Asfandiyarov, 2005, pp. 114–119].

Thus, the Bashkirs and *Meshcheryaks*, although assigned to the canton government system and considered representatives of the military service class, were in fact part of a unique estate. A system of military organisation unique to the Cossack troops resulting from the modernisation the management quality and its modification to meet general military standards, was only introduced in 1834 with the establishment of the Bashkir *Meshcheryak* troop. Almost right after its establishment the government started to focus on putting an end to the military functions of Bashkirs and *Meshcheryaks* by replacing them with civil duties. The sphere of landownership (large landowners and settlers) also had dramatic differences with the same area in the Cossack military serving class. For them, the period of the canton system was when they had the most independence, as during this period Bashkirs and *Meshcheryaks* were administered by officials of the same faith.

CHAPTER 4

Teptyars and bobyls

Ilshat Fayzrakhmanov

The question of Teptyars and their origin remains one of the most controversial issues in historical studies. There is no doubt that the history of the Teptyars is closely connected to the history of the Bashkirs and economic development of the Cisurals. The Teptyars, settled mainly in the Ufa and partly in the Orenburg, Samara, Perm and Vyatka guberniyas, were influenced by the local ethnographic environment.

Historiography does not offer us a conclusive opinion concerning the time when this population group originated, but most researchers of the 18th century support the version according to which the Teptyars came into existence in the latter half of the district century [Georgi, part 2; Rychkov, 1770]. But in the 20th century, especially the second half, there emerged the opinion that the Teptyars did not actually appear until the late district to the beginning of the 18th century [Iskhakov, 1979; Pakhmatullin, 1988].

In Russia, bobyl referred to a person who had no household or, if they had a household, did not have to pay taxes for it or paid less. When it comes to land tenure, Teptyars and bobyls were made up of Bashkir pripusheniks (settlers); Bashkir large landowners allowed them to temporarily settle in their lands as tenants, meaning they had to pay the rent or perform some sort of service for the Bashkirs. It is known that the Teptyars documented their tenancy, whereas the bobyls lived there without any entitling documents (that is, without prior agreement). There were Tatars among the bobyls as well, however this group primarily consisted of members of the Finno-Ugric peoples. Initially, bobyls paid a yasak that did not have a fixed rate. In 1747, the bobyl and Teptyar yasaks were replaced with a poll tax at the rate of 80 kopeks, after which the of-

ficial documents started mentioning the term 'Teptyars and bobyls'.

The main theories of the 'Teptyar' socionym origin boil down to two versions. G. Akhmarov had associated this name with the Arabic word 'dāftār' ('book, notebook'), assuming that Teptyars were settlers, and Bashkirs wrote down the list of their settlers in special notebooks (dāftār, tāptār) or entered into agreements of tenure with them (the same 'defters' used in the meaning of 'notes') [Akhmarov, 1907a, p. 340–364]. According to the version suggested by A. Asfandiyarov, 'tiptār' is translated from Bashkir as a person rejected by their community and segregated into a separate estate of Teptyars [Asfandiyarov, 1987, p. 59–83].

The combination of poll taxes paid by Teptyars included a 'special' levy, recruit fees, taxes for military expenses, zemsky taxes (to the state), and governorate and social levies. N. Kazantsev counted the total number of taxes in the 1850s to come out to 2 roubles 55 kopeks (poll tax, 95 kopeks; state levies, 50 kopeks; governorate levies, 15.5 kopeks; national supplies, 8 kopeks; pension, 1 kopek; for Teptyar schools, 0.25 kopeks) [Kazantsev, 1887, p. 63]. According to B. Davletbayev, in the 1860s the Teptyars paid a total of 4.32 roubles [Davletbayev, 1984, p. 349].

In the middle of the 19th century the Teptyars paid state duties on 13 accounts: they provided recruits and horses for station posts and for 'conveying officials', took care of housing for the district superintendent of police and rangers, delivered mail, were responsible for the maintenance of post roads, bridges and river ferries, provided guards to escort prisoners and deliver mail, provided 'officials, arrestees and passing troops' with accommodations (especially if there were no post roads or tracks), provided guides, sent

people to serve as peasant police, etc. [Cheremshansky, 1859, p. 280].

Up until the 18th century the Teptyars did not have private ownership over the lands they resided in; instead, they rented them from the Bashkir communities. In the 18th century the procedure of land tenure for Teptyars was not regulated, which resulted in numerous land disputes. The Teptyars also occupied state-owned, private (rented) and their own lands [Yakupov, 2001, p. 109]. In 1832, the government issued a decree confirming the patrimonial rights of Bashkirs to their land, but also obligating them to cede some of those lands to Teptyars [Usmanov, 1981, p. 168]. With the passing of that decree, the Teptyars were freed from their dependence on the Bashkir large landowners.

From the 1730–1860s, squads headed by elders were the territorial units of the Teptyar's social organisation. The foremen supervised sotniks, desyatniks (peasant policemen) and the heads of villages. These individuals were responsible for scheduled tax collection, the execution of duties and levies, the execution of laws and orders, and the registration of the population [Kazantsev, 1887, p. 63]. They were also in charge of other material, social

and economic issues. Along with mullahs, the elders took part in trials for all disputed cases between the Teptyars and their families (arbitration). The role of elders and peasant policemen was particularly important during the period of Teptyar 'Cossack' regiments (1790–1835).

In 1790 Russia was at war with Turkey and Sweden, and in order to accelerate army reinforcements with irregular troops, in 1790, the government made a decision to form a five-hundred person Cossack regiment of Teptyars and bobylys. There were two Teptyar regiments formed in 1798 [Rakhimov, 2008, p. 26, 28, 34], and as a result the Teptyars became a semi-military estate. Although the documents often referred to the Teptyar regiments as 'Cossack', the service of Teptyars was not irregular in the true sense of the word, and they provided recruits to their regiment to serve for 15 years [Yakupov, 2001, p. 106]. The Teptyar population did not provide gear, supply food and so on, but they did pay the treasury 86 kopeks a year per person for regiment maintenance [Davletbaeva, 1984, p. 348].

The question of the reorganisation of Teptyar regiments arose at the beginning of 19th century, but an intensification of the for-

eign political situation and the Patriotic War of 1812 put the final decision on hold.

In 1835, the Teptyar military troops were involved in suppressing the rebellion of state peasants and restoring order, but in the course of action demonstrated 'unreliability', which was the official reason for their disbandment. Instead of in the disbanded five hundred people regiments, Teptyars continued to serve military duty in the Orenburg Cossack regiment of one thousand people: they provided recruits (1 person per 500) and paid special taxes for maintaining the Orenburg (later Ufa) Cossack regiment [Yakupov, 2001, p. 108].

The issues concerning the number of Teptyars and bobylys in the 18–19th centuries have been quite thoroughly studied by historians and ethnographers. From 1795 to 1815 their number had almost doubled (from 104,386 to 199,800 males, about 48%, or on average about 4.57% annually), which happened due to the natural population increase and the inclusion of *yasak* 'foreigners' or 'new settlers' in the Teptyar estate [Yakupov, 2001, p. 121–122]. From 1815–1834, the Teptyar population totalled 16,617 male souls, which was an increase of approximately 8%, or on average around 0.44% annually. From 1834–1858 the number of Teptyars once again increased significantly by 87,740 male souls, approximately 40.5%, or on average about 1.7% annually. The flow of 'new settlers' into the Teptyar estate was reinforced after the introduction of the 1832 'Provision' on granting lands from the Bashkir patrimonial lands to the Teptyars and bobylys (landless peasants) [Yakupov, 2001, p. 122]. Thus, while by the middle of the 18th century their number came out to 60 thousand male souls, by the middle of the 19th century they totalled 262 thousand [Bikbulatov, 1970, p. 2].

To fully understand the ethnocultural and ethnolinguistic processes running through the Teptyar social group, it is crucial to examine its ethnic structure. Up until the 1740s, the majority of Teptyars were represented by Finno-Ugric peoples. During the period between the second (1748) and third (1763) censuses, the population of Tatars was gradually growing due to the arrival of new settlers. According to the calculations made by U. Rakhmatullin, at the end of

the 18th century 40% of Teptyars were Tatars, 38% were Mari, 18% were Chuvash, and about 4% was composed of Bashkirs, Udmurts and Mordva [Rakhmatullin, 1975, p. 15]. D. Iskhakov believes that the main ethnic component of Teptyars (as an ethnic group) was Tatars mixed with Bashkir, Chuvash and, to some extent, Bersermyan and Mari. The Finnish-speaking part of the settlers was composed of Mari, Udmurts and, to a smaller extent, Mordva [Iskhakov, 1993, p. 90–91]. B. Davletbayev, as well as D. Iskhakov, points to the large number of Teptyars as such, but fails to mention their ethnicity.

According to G. Akhmarov, 'the entire body of Muslim Teptyars speaks a version of Tatar that is close to the dialect of the Kazan Tatars. Language, appearance and tradition-wise, they represent the Tatar element and are no different from Kazan Tatars. The exterior lifestyle of the Teptyars (buildings, clothes, homeware, food, etc.) is also Tatar in nature' [Akhmarov, 1907a, p. 17–18].

The Teptyars and bobylys fell in between taxable and serving estates, meaning they possessed characteristics of both categories. As a tax-paying population, they had limited land estates, paid a poll tax, served non-monetary duties for the state, etc. As a military serving population, the Teptyars and bobylys had to maintain at their expense and serve in two regiments of five hundred people. In 1855, the Bashkir troop was joined by the Teptyars and bobylys of the Orenburg, Perm and Vyatka guberniyas. Teptyars and bobylys were exempt from military service, and instead were levied a tribute of 60 kopeks from each male. Nine cantons out of 28 were declared serving, and the rest of them were non-serving. This means that 3/4 of the Bashkir troop population did not have any military obligations, while the remaining portion was under the military administration [Tagirova, 2011, p. 93]. Their social position thus changed as a result of the government policy aimed at the unification of various categories of the rural population with the status of state peasants. As a result, the Teptyars converted into 'rural dwellers' as part of the 1865 Reform for the abolition of the canton government system and the Bashkir troop [Shaykhislamov, 2006, p. 38].

CHAPTER 5

Peasantry

§ 1. State peasants

Ildus Zagidullin, Ramil Khayrutdinov, Ilshat Fayzrakhmanov

The social and legal status of state villagers in the first third of the 19th century The legal registration of state peasants in Russia was started off by the reforms of Peter the Great's administration. The decrees of 1718–1723 for the reinforcement of the tax system introduced a poll tax that significantly increased the number of taxpayers. In addition to the poll tax, a rent tax was also imposed on state peasants who did not belong to any landowners, as well as palace, monastery and manor serfs. The tribute gathered for this was practically equal to the feudal rent paid by serfs [Complete Code of Laws of the Russian Empire–1, Vol. 5, No. 3245; Vol. 6, Nos. 3481, 3747, 3816; Vol. 7, No. 4145].

The 'Plakat' dated 26 June 1724 that united all previous decrees listed all the population groups in detail that were included in the group of state peasants and specified the tax rate of 74 kopeks per person and the rent rate 'instead of the income paid by the palace serfs to the Palace, the synod serfs to the Synod, and the manor serfs to landowners' of 40 kopeks per person [Complete Code of Laws of the Russian Empire–1, Vol. 7, Nos. 4533, 4536]. The introduction of Tatars and yasak peasants of the Middle Volga region, along with Siberian peasants, smallholders, the chernososhny (free) peasants and the polovniki (landless and free) of the Northern Pomorye, to the group of state peasants was part of the Russian policy aimed at reinforcing feudal relations in the country, and legally consolidated the bondage of state peasants to the supreme landowner, the State.

The term 'state peasants' was changing its meaning from census to census and included various categories of the rural taxable population. 'The estate of state peasants in its broad

sense was gradually forming from a base of diverse components from the chernososhny (landless and free), yasak, bonded (to private and state factories, to the admiralty, etc.) peasants of smallholders, and old services of serving people. In the first half of the 1780s economic peasants were also added to this group, which included dismissed, vacant and other peasants. The term 'state peasants' in a narrow sense referred to the chernososhny and yasak peasants', as was pointed out by V. Kabuzan, the leading expert in census statistics [Kabuzan, 2002, p. 159–162].

The government was consistently pursuing its policy of forming the state peasant group by unifying various categories of the free rural population of the country. Back in the middle of the 1780s, taxes paid by state peasants were imposed on smallholders, in the early 19th century bonded peasants started to gradually quit factory jobs¹³, in 1816 the children of retired soldiers became taxable, in 1922 about 40% of yamshhiks (postmen) were added to the state peasant group, and in 1829 so were suitcase Tatars who were maintaining post offices (yams) at their expense (5,144 people from the census list), in 1828 taxable status was given to salters included in the Iletsk production field, as well as 'trading Tatars' (according to the 8th census, 310 people from the Orenburg guberniya), etc. [Buldashova, 2005, p. 32–33; Naydenova, 2006, p. 44, 46; Khayrutdinov, 2002, p. 23, 25]. Thus, in the first third of the 19th century the formation of the state peasant estate in the

¹³ The Tatars of the village of Bukeni of the Mamadysh Uyezd in the Kazan Governorate were assigned to work at the Izhevsk plant [Khayrutdinov, 2002, p. 22].

Russian Empire came about step by step to its completion.

In the Volga-Kama Region the population of the state village was increasing in number due mainly to natural population growth, and in the Cisurals one of the important factors was the migration of agriculturalists from neighbouring governorates, which had a positive impact on the dynamics of the state peasant population.

By 1857, state peasants made up 43.3% of the taxable population in the European Russia [Merkushin, 2002, p. 150]. The governorates of the Volga-Ural region were among the main regions of settlement for state peasants. Quantity-wise, the largest enclaves of state agriculturalists settled in the Vyatka (812.5 thousand, or 88.2% of all peasants), Kazan (541.8 thousand, or 82%), Saratov (538.8 thousand, or 58.1%), Orenburg (502.1 thousand, or 75.9%) and Perm (239.1 thousand, or 47.2%) guberniyas [see Annex 1, Table 6a].

While still forming one social whole, the state peasantry was also divided into numerous groups varying widely in their origin history, development, and ultimately, numbers. The state peasantry of the Kazan guberniya, for instance, included former yasak peasants, former Serving Tatars and Chuvash, murzas and their household peasants, economic peasants, *odnodvorye* [smallholders], dismissed, vacant, peasants-workers of factories, Ukrainian state serfs, Circassians and other groups of the taxable population. The three large social groups of former yasaks¹⁴, Serving¹⁵ and economic

peasants,¹⁶ made up more than 97% of the state peasants in the governorate [Russian State Historical Archive, f. 558, inv. 2, file 51, s. 53 reverse–54; f. 571, inv. 9, file 10, s. 33 reverse; inv. 9, file 35, s. 94 reverse].

At the same time, state peasants were being transferred to other categories of the rural taxable population (*appanage* peasants) or social estates. The Tatar state peasants in the Cisurals were also joining the Bashkir estate or Cossacks on their own initiative or as instructed by the government¹⁷. The residents of state-owned village were one of the main sources that contributed to the formation of the Tatar *meshhane* (*burgher*) and merchant estates.

The success of agriculture was significantly dependent on the availability of the lands, and the average size of the allotment given to state peasants in the Kazan Governorate in the early 19th century amounted to about 10 *desyatinas*. However, due to natural population growth, this number started to gradually decrease. Officials had counted a total of 532 land-poor settlements in the governorate, thus the government and local authorities tried to solve this problem by organising a resettlement of land-poor state peasants to free lands within the governorate, as well as to other less populated regions of the country [Khayrutdinov, 2002, p. 39–40].

During the first third of the 19th century, the number of serving-class Tatars increased by 29,359 people; their share grew from 15.54 to 17.41%. The increase of this group of peasants was also promoted by relieving the serving Tatars—the *Laschmann*—in 1818–1843 of the duty of supplying recruits, which couldn't but show in the natural reproduction figures.

¹⁶In 1837, there were 50,000 former economic peasants. Apart from natural reproduction, their ranks were supplemented by church officers, people 'unable to perform their duties', soldiers' children, and freedmen.

¹⁷In the beginning of the century, 4000 peasants were transferred to the Orenburg Cossack Army. This process was continued in 1835–1840 during the creation of the New Border Line in the Southern steppe. In 1840, when an independent territorial administrative unit was created for the OCA, all peasants residing within its borders were registered as a part of the Cossack class; in the Troitsk Uyezd, grain farmers of three *volost's* (the Kundravinsky, Lower and Verkhneuvelsk *Volost's*) became Cossacks, totaling 8,750 people in all. All things considered, 25,000 treasury peasants were transferred to the OCA [Naydenova, 2006, pp. 53–54].

¹⁴Yasak peasants were comprised of representatives of different peoples from the territory. In 1796, out of 216,259 recorded yasak peasants of the Kazan Governorate, the Chuvash prevailed—there were 112,514 (51.55%) of them. They were followed by the Tatars—55,732 (25.53%), the Mari—27,121 (12.43%), the Russians—15,094 (6.93%), the Mordva—5,401 (2.47%), and the Udmurts—2,397 (1.1%) [Russian State Historical Archive, Fund 558, List 2, File 51, Sheet 3ob–5].

¹⁵The numbers of serving-class murzas according to the 1796 order registration book was 219 people, that of servants of the Serving Murzas—266 males [Russian State Historical Archive, f. 558, inv. 2, file 51, s. 5]. According to the 5th revision, the governorate had 128 'princes of the murza class', 1566 murzas and 'serving Tatars of the murza class' (including 57 converts), 18 yasak murzas, and 1712 males in total.

In the Volga-Kama Region state peasants acted as tenants of state-owned lands. There was also a fourth type of land ownership in the region's governorates: lands granted to serving Tatars, or smallholders. Thus, by 1838 in the Kazan Governorate there were 23 dachas (granted lands) of 'serving Tatar Murzas' who did not prove their rights for manorial land [Khayrutdinov, 2002, p. 32].

There were a few different types of land tenure in Orenburg krai. In the early 19th century unauthorised settlements were forbidden, nevertheless, and up until 1843 state peasants were allowed to choose their own lands to settle themselves, all they had to do was pay all the tax arrears. The state granted the migrants a number of significant privileges for the execution of certain duties and tax payments. Although most state agriculturalists in the Cisurals occupied state lands, unauthorised settlements of peasants on state-owned and private lands were very common, with migrants often settling in the lands of Bashkir large landowners¹⁸. Settlers, only a small part of whom were Russian, as opposed to the migrants from the Volga region, resided alongside large landowners or in separate settlements. According to data from the Orenburg Treasury Chamber, in 1800 there were 1,380 settlements in the Bashkir volosts with 97,792 male settlers of all social estates, which totalled more than a quarter of the governorate's population. In total, 22.5% of them were peasants, or more than 13% state agriculturalists, and by the 40s their share among settlers had already reached 28%. A particularly large number of settlers resided in the Birsky (345 villages), Menzelinsky (187 villages), Belebey (163 villages), Ufimsky (124 villages), and Bugulma (more than 90 villages) Krai [Shaykhislamov, 1998, p. 55].

After the issuance of the decree dated 10 April 1832 [Complete Code of Laws of the Russian Empire–2, Vol. 7, No.5287] that lifted the ban on the sale of Bashkir lands, the state began to grant land allotments to settlers. The

lands fell to the disposal of the appropriate institutions. As state settlers, state peasants were granted allotments of 15 desyatinas per head according to information from the most recent census. However, the decree was not executed to its proper extent, which is why many state peasants continued using Bashkir lands without any partitions [Naydenova, 2006, p. 33].

As their financial status was changing, state peasants either purchased the rented lands or refused to vacate them when the lease expired. According to writer S. Aksakov, almost none of the settlements vacated their lands upon the expiration of their contracts [Buldashova, 2005, p. 76–79, 93].

As is well known, the law of 12 December 1801 had allowed state peasants, along with merchants, burghers, state immigrants and freedmen, to freely purchase non-occupied lands [Complete Code of Laws of the Russian Empire–1, Vol. 24, No.20075]. State peasants purchased a massive amount of land at low prices from the Bashkirs in the second half of the 19th century. By the end of the 1850s, landowning state peasants made up 50–70% of the state village population in the Belebey, Birsky, Starlitamasky and Ufimsky Uyezds. On average, throughout the Orenburg guberniya there were a total of 14.85 desyatinas per each 21,480 landowners. As a result, in the first half of the 19th century South Cisurals was one of the first regions in terms of the number of landowners among state peasants in European Russia, and the first in terms of the number of desyatinas; it showed numbers that exceeded the average across Russia by a factor of 3.5 [Buldashova, 2005, p. 96, 97, 99]. State peasants in the Kazan Governorate were not as active in this sphere [Khayrutdinov, 2002, p. 37–38].

As a result of the administrative reform of 1775, state peasants were assigned to three parallel institutions: the Treasury Chamber, which dealt with economic matters, the Lower Zemsky Court (the uyezd administrative police institution headed by the zemsky captain elected by the local nobility and subordinate to the provincial government headed by the governor) and the Lower Zemsky Board in uyezds in charge of legal cases.

¹⁸ In the 1850s in the Belebey, Birsk, Ufa, Troitsk, Sterlitamak Uyezds, where the Bashkir lands were particularly abundant, the treasury lands were used by less than a quarter of the state peasants.

In 1797, the 'Surveying office of state farms and tutelage over foreign and rural household management' was created to develop all the industries of state farms. After the establishment of Ministries, the functions of the Surveying office were passed to the Ministry of Internal Affairs, and in 1811 to the Department of State Property established in the Ministry of Finance.

Starting in 1787, residents of the settlement totaling more than 1 thousand people had been electing a rural elder, and for every 500 households a headman, two elected judges and one tax collector. In order to centralise the power and authority in larger and more strongly organised associations, in 1797 Pavel I created a new administrative unit on the example of the local authorities in the form of a volost covering up to 3 thousand people from the census list. Each of the volosts was administered by a volost government consisting of an elected volost head, a headman and a clerk. Moreover, each settlement also elected peasant policemen, tax collectors and grain store keepers to maintain order. These elections were generally staged, as contenders for these positions were in fact assigned by the district police captain. General issues of peasant life were addressed during volost meetings by the board of trusted peasant house-keepers [Shaykhislamov, 1998, p. 79–81].

Up until the latter half of the 1820s, a state peasant, leaving his home settlement more than 30 versts even for a small period of time had to receive a passport for at least one year. Passports were expensive, which put the brakes on the development of seasonal works. In 1826, passport prices were reduced, and new less expensive passports for half a year were introduced. In 1827, the government introduced leave tickets, which granted the right to leave the settlement for 2, 3 and 4 months, allowing peasants to go to markets located more than 30 versts away without any documents. Starting in 1827, peasants also no longer had to wait for passports to be delivered to the local volost administration, they could receive them themselves in the Uyezd Treasury, which significantly sped up the time it took to receive documents.

Social inequality among peasants in the state village formed due to the course of the

government's internal policies. The autocracy exploited the multinational peasantry by charging them with monetary (sometimes food) levies and compulsory state service. In 1833, the state introduced the following order for the collection of monetary levies: 1) state taxes, including a poll tax, rent, for the maintenance of water and land routes; 2) zemsky levies according to the governorate's plans; 3) civil levies as payment for the authorities and the construction and repair of spare grain stores; 4) various state fees for loans, unauthorized felling, and people not listed in the census record.

From 1796 to 1818, the poll tax increased from 1 ruble 26 kopeks up to 3 rubles 30 kopeks of paper money (then it remained unchanged until the end of 1861), and from the late 18th century to the early 1860s the rent had risen 3.4 times: from 3 rubles 57 kopeks to 12 rubles 30 kopeks [Shaykhislamov, 1998, p. 116].

In addition to general state taxes, state peasants also paid the main bulk of zemsky levies and served natural duties. Monetary levies were essentially a second poll tax, and service duties covered state rent and were basically no different from the villein socage. In fact, numerous general state expenses that were not included in the state budget plan were paid for by zemsky levies.

The decree of 14 June 1816 divided the zemsky monetary levies into general (governorate) and personal ('civil' levies for state settlements). The general duties included the following services: 1) post, 2) road, 3) military building maintenance, 4) repair and security for these buildings. 'Civil' levies were collected for the needs of the local rural administration, the maintenance of volost offices, payment for rural and volost administrations, the employment of guards and delivery men, and the maintenance of wagons for the zemsky court, spare grain stores, fire-fighting tools, etc. These levies were articulated by peasants during village meetings. Civil verdicts were approved in each rural community separately and eventually depended not so much on local need, but on the arbitrary decisions of the authorities, volost and uyezd administrations. The list of general and 'civil' levies was constantly updated with new, expense items.

The law of 28 November 1833 divided 'civil' levies into compulsory 'for the needs determined by law' and voluntary levies that were determined by the peasants' own arbitrary decision. Compulsory levies were designed for the maintenance of the rural volost administration, tracking fugitives running from recruitment, repairing country roads, and other purposes. Voluntary levies were intended for repairing churches, the maintenance and construction of public facilities, and natural duties. Rural headmen also had new types of report documentation, including log books and taxation books. In 1834, the taxable population was imposed with an additional district levy (in Kazan guberniya, 21 kopecks per person). The next year, the state introduced a new levy for the maintenance of the zemsky police at 30 kopecks per person.

Along with paying monetary fees, peasants had to perform zemsky duties for the district, which was a type of feudal villein socage. Service duties were rather wasteful and struck at the root of the peasant economy. Peasants had to suffer road duty (repair of roads, bridges, tow paths, verst stones, and the maintenance of river transport), which they sometimes were unable to do themselves, so they had to hire contractors, sometimes at outrageous prices. At any time of day or year they were obligated to provide passing officials, cargos, military squads, recruits, and prisoner squads with wagons. The true disgruntlement of peasants arose over housing (free quarter) duty.

A large part of the district monetary levies paid by state peasants was spent on the maintenance of rural and volost administrations. According to the reports of Kazan governors, during the period from 1807–1817, the amount of money collected for these purposes had increased from 54,433 rubles 42 kopeks to 138,982 rubles 10 kopeks, which is 2.5 times larger, and in 1826–1837—by a factor of 1.6.

The most wasteful duty for the taxable population was recruitment, which involved men aged 20 to 35¹⁹. In 1793–1833, military

service was limited to 25 years, and in 1834 to 20. Before 1831, recruitment was carried out when required, but then became an annual affair. The only time men were not recruited was from 1856 to 1861. Families sent their men in according to the lists drafted and approved beforehand, and unmarried men had to go 'before the married' [Buldashova, 2005, p. 107].

According to the 'Recruitment regulations' of 1831, special recruit stations were established in every volost if there were Muslim Tatars, regardless of their number, whereas other nationalities were recruited in one common station. The reason for this was that the local administration had to choose recruits from Tatars very carefully to avoid any refusals to serve [Ustav rekrutskij, 1857, Art. 713, 884]. In the volosts where Tatars were clearly a minority, the maintenance of special recruitment stations and recruitment headmen required additional expenses. The salary of recruitment headmen was specified by law ranging from 7 rubles 50 kopeks to 15 rubles, and additionally the same amount if there was 'record management'. Recruitment duty was 'completed' with a recruitment levy to pay for escort and food for recruits before they were sent away²⁰.

Exactions demanded by officials of all levels (this could also be specifically said about volost clerks), along with the inconsistent distribution of duties and taxes, bribery and abuse of power by officials were very common in Russia.

Thus, the autocracy laid duties and obligations on the shoulders of peasants that by all means exceeded the obligations the state had to its other subjects. Peasants suffered great expenses to manage to pay all their taxes and duties, which led to an accumulation of arrears. The arrearage of peasant farms was caused by an increase in the tax, duty and monetary levy rates from state peasants, land shortage, reduction of arable land plots, and unstable economic conditions in the first third of the 19th century. This process was also encouraged by the abuse

¹⁹ Coachmen, laschmanns and Iletsk salt makers were relieved of the military duty [Buldashova, 2005, p. 107].

²⁰ In the mid-1830s in the Orenburg guberniya, each recruit cost the land community at least 40 rubles [Buldashova, 2005, p. 107].

of power and iniquity of officials, the staff of serving authorities, the state village court, and peasant refusals to pay money.

In order to eliminate the main negative factors of the life of state villages, P. Kiselev started the state reforms of 1837–1841.

The 1837–1841 P. Kiselev Reforms in state villages. At the end of the 1850s, the residents of state villages (20,640 thousand male souls) made up one-third (32.9%) of the Russian Empire's population. By that time some of the Tatars of the Volga-Ural region were still within the groups of the rural taxable population that legally had a special status regarding service duties. This included the following groups: laschmanns (transferred to the state peasant class in 1860), Yurt Tatars²¹, horse-breeding peasants obligated to maintain state horse-breeding farms²², and Tatar immigrants. By taking into account said groups, according to the 10th census the Ministry of State Property was in charge of 513,809 male 'Tatar peasants'²³ [Druzhinin, 1958, p. 298].

Almost one-third of the treasury's income in the Empire came from the exploitation of state villagers. The government was therefore highly interested in improving the status of this category of peasants, which was the main source of its income. It was important to stop granting state lands to landowners, and instead allocate them among rural communities to equalise their territories, reduce the growing arrears of agriculturalists, and bring the duties of the rural taxable population into compliance with the profits of their land, and so on.

The all-around failure of grain harvests, cholera outbreak, peasant riots and shortage of arable lands, which intensified in the 1830s,

Count P. D. Kiselev.

quickened the development and implementation of reforms in the Ministry of State Property established in 1837 with Minister P. Kiselev (1837–1856) in charge, who was a passionate antagonist against serfdom. The reform was supposed to consolidate the civil rights of state peasants and the 'patronage' of the Ministry of State Property on the improvement of their financial status as the foundation of the country's material well-being. Eventually the reformation was aimed at increasing the solvency of state villages by supporting peasant farms [Naydenova, 2006, p. 127].

The lands still remained property of the state, and the peasant community rented it. From 1843 to 1856, thanks to measures taken by the Ministry in terms of land cutbacks, the sizes of allotments for agriculturalists in the Volga-Ural region had generally increased: from 2.8 to 4.1 desyatins in the Kazan Governorate, from 4.9 to 5.3 desyatins in the Perm Governorate, from 5.2 to 5.7 desyatins in the Vyatka Governorate, and from 8.9 to 9.4 desyatins in the Orenburg Governorate. At the same time, the size of allotments in the neighbouring governorates was decreasing: from 10.6 to 6 desyatins in the Saratov guberniya, from 4.6 to 3.4 in the Penza guberniya, from 3.3 to 3.1 in the Ryazan guberniya, and from 21.6 to 10.9

²¹ According to the data of the 10th revision, 11,464 male Yurt Tatars lived in the Lower Volga Region [Druzhinin, 1958, p. 298].

²² For example, in the Penza guberniya, a number of Tatar settlements were assigned to the Pochinkovsky Horse-Breeding Authority. Apart from paying the per-capita tax, they had to provide the workforce, 'feeding bread', wood and other materials [Merkushin, 2002, p. 167].

²³ The Imperial statistics also included in their number the settled Tatars distributed around the national periphery in the South and East of the Empire (153,882 males).

desyatinas in the Astrakhan guberniya [Druzhinin, 1958, p. 209, 210].

The P. Kiselev reforms helped to significantly expand the personal rights of state peasants, thanks in part to a reduction in the requirements for family sections, which was previously discouraged by the state. They also received certain privileges when migrating to less populated areas, started using their right to means, and were able to inherit property and dispose of unpopulated lands and houses in cities and settlements. By the law of 24 January 1849, peasants were able to transfer to urban estates with their families or alone, granted they paid taxes and arrears and had consent from the rural community, regardless of the opinion of their self-government authorities. This innovation provided the opportunity to transfer 'small trade producers' to the urban estate [Druzhinin, 1958, p. 17].

One particular accomplishment was the development of 'Additional rules' to the Regulations on the improvement of cities and settlements, which specified the terms of peasant migration and allowed land-poor communities (less than 5 desyatinas per head) to move to neighbouring regions (while receiving some privileges to settle in the new area), as well as the intra-governorate migration procedure [Druzhinin, 1958, p. 19].

From then on seasonal workers did not have to get a passport, and peasants received short-term tickets that could be renewed upon expiration. The only requirement was the community's consent for them to leave.

In order to resolve the issue of land deficiencies, on 23 January 1850 the state introduced a law that created favourable lease terms for state-owned taxable lands to land-poor rural communities. To provide the peasant farms with construction materials and firewood, on 25 August 1847 the state introduced a law, according to which every rural community that did not have a forest, received plots of land at the rate of 1 desyatina for every soul listed on the most recent census. The Ministry of State Property also created favourable terms for the purchase of state forest lands. In the land-poor districts, where it was impossible to set up allotments, peasants were granted the opportu-

nity to buy forest in the closest state dachas for half the price [Druzhinin, 1958, p. 16, 17].

In 1841, the government made an attempt to regulate social protection for the wives of state peasants who had been called up for military service. In 1851, the wives of peasants deported to Siberia received the right to refuse to follow their husbands without having to divorce them [Druzhinin, 1858, p. 75].

Nevertheless, in Russian terms, the status of 'free, rural dwellers' meant that agriculturalists were in fact under the supervision of and feudal bondage to the state: the authorities practiced forced attribution to other estates, meaning that their statuses changed (they put an end to the notorious 'exchange' of state lands and peasants in favour of the local authorities) [Druzhinin, 1858, p. 74, 574].

The Ministry of State Property was the first to attempt to improve the agricultural, veterinary practices and medicine of the countryside. However, the low socio-cultural level of Russian society and the critical need for agronomes, veterinarians, doctors, land surveyors, paramedics and other specialists were significantly holding back the implementation of P. Kiselev's plan. The Ministry of State Property was thus forced to adjust the training level of required personnel [Druzhinin, 1858, pp. 233–268].

One important step in solving this problem was the propaganda of progressive production methods and processes through the creation of model farms and village halls, and also the holding of regional exhibitions of agricultural produce, handcrafted and manufactured items. For instance, in 1847, the Ministry of State Property founded an agricultural farm just outside of Kazan featuring primary general education and a four-year practical training course, which in 1864 was transformed into the Kazan Agricultural Academy [Gubernskie Vedomosti of Kazan, 21 June 1872]. There was a total of three regional exhibitions held in Kazan, which was the start of an excellent tradition in this field. While the exhibition of manufacturers and natural producers of 1837 in Kazan guberniya mainly showcased manufactured items, the exhibitions held by the Ministry of State Property in 1845 (for Kazan guberniya), 1852 (for the Middle Volga Region governor-

ates) and 1860 (for the Volga-Ural governorates) presented items made by peasants, including Tatar agriculturalists [Istoriya Kazani, Book 1, pp. 536–568]. Such events helped reinforce the citizen activism of peasants and gave them insight into the latest achievements in the field of agriculture.

Thanks to the endeavours of the Ministry of State Property, state villagers now had more opportunities to actively develop businesses in various fields. One important factor of the spread of the best methods in agriculture was the effect of administrative resources. They were most prominently used in the implementation of the 1840 law on compulsory potato planting and communal tillages, which provided a solution to the food deficiency problem for rural communities during hungry and lean years [Druzhinin, 1858, p. 53–54].

The state started fighting land fraud committed by landowners, managed to decrease the overlapping of state and manorial lands, and legislatively determined the terms of using rented and forest estates. In 1839, in order to encourage agricultural development, peasants were allowed to open savings and subsidiary cash accounts. The introduction of compulsory mutual insurance was also another step in the general movement towards progress [Druzhinin, 1858, p. 61–62].

The readjustment of peasant duties was also another important factor. The Ministry of State Property was striving for the clear definition and equal distribution of zemsky duties among rural communities. One of the most important objectives of the reforms was to bring the monetary levies into conformity with income sources, which is why it called for a unified system of administrative interactions. For fiscal reasons, the government continued to widely use the frank pledge principle in land communities [Naydenova, 2006, p. 125]. The total arrears were reduced through the use of administrative pressure on peasants and threats from the authorities. Punitive measures were also quite common. V. Bervi-Flerovsky, who served in the Kazan Chamber of Criminal Court in the 1850s, describes the collection of arrears from Tatar state peasants in one of the settlements: 'First, after catching the defaulter Aminov, the

chief declared that "he will be whipped until he pays for everything in full". And the poor fellow was then whipped at different intervals. Meanwhile, his wife was looking for a benefactor who could pay off the arrears of her whipped husband. It cost her massive efforts to find just one-third of the money, and when she had it she came running to the chief to give it to him and beg for a deferral on the rest of the payment. But it was too late: the peasant was already laying dead under the whip' [quoted from: Druzhinin, 185, p. 209, 210].

Based on the appraisal works carried out in 1842–1856 in 21 governorates, a poll tax was imposed on land and trade (a land and trading levy), which made it possible to bring the rent payment closer to the typical state tax, and peasants to the tenants of state lands. Based on the results of cadastral works, the state first determined the average gross yield capacity of the land, then gross income was used to calculate the cultivation expenses using the average cost of working days in the region, and the remainder was considered net income. The rent made up a portion of net income [Naydenova, 2006, p. 129]. More than anywhere else, this innovation affected the western and central regions of the country, as well as a few of the Volga region governorates. The previous system of tax payments remained in effect in the Kazan, Vyatka, Perm, Orenburg and Astrakhan guberniyas [Druzhinin, 1858, p. 209, 210].

In 1840, a law introduced on the communal levy, which was designed to replace the previous district levies and was supposed to maintain the current government authorities, land division and formation of business capital. The total was determined on the basis of the expense lists of volost and village institutions, and also with regard to the needs of the Ministry of State Property. Despite the introduction of the communal levy, some private 'village-communal' levies were still collected by verdict of certain rural communities for the installation of bridges and embankments, the heating and lighting of multistory barracks near big routes, etc.

During the governance of P. Kiselev, monetary levies from agriculturalists were increased progressively. From 1846–1856, the

communal levy that replaced the previous 'village-communal' levies had increased 1.5 times, and zemsky duties (road, troop maintenance, etc.) by a factor of almost 2.5. In addition, peasants paid a levy for national food supplies, the arrears of previous years, and-so called fiscal penalties (for unauthorised felling, people hidden from the census, etc.), and in 1854 every male resident paid a total of anywhere from 7 rubles 28 kopeks to 7 rubles 44 kopeks. In the 1840–1850s, the average state rent and poll tax arrears of state peasants in Russia amounted to 50% of their annual salary, but in the governorates this average was dramatically different (in the Vyatka, Perm and Orenburg guberniyas it came out to 9%) [Buldashova, 2005, p. 114]. On the occasion of Alexander II's coronation, the state reduced the arrears of state peasants twofold, and by 1856 they totalled 5 rubles 13 kopeks per one male [Druzhinin, 1858, p. 209, 210].

The Ministry of State Property also introduced a more advanced recruitment system drawing procedure (from the men available, not the census lists), and in 1840 a drawing procedure system based on family lists went into operation. However, this innovation did not make duty any more orderly, and the local authorities still saw it as a means of personal enrichment and gain [Merkushin, 2002, p. 166]. Positive changes were brought about by dividing recruits on the basis of marital status into three categories offering the appropriate privileges (exemption for widows, families with two workers, the only worker in a family, etc.). Starting in 1847 rural communities were now allowed to hire volunteers [Buldashova, 2005, p. 109].

As is well known, by the beginning of the 1860s the monetary fees of state peasants in the South Cisurals increased to 6 rubles 43 kopeks. More than half of this was feudal rent, otherwise known as the 'state tax' [Buldashova, 2005, p. 107]. Nevertheless, state peasants paid much less than appanage peasants and serfs. In the middle of the 1850s, the rent payment came to approximately 78.2% of what was paid in the appanage department and a few times less than paid by the manorial peasants [Druzhinin, 1958, p. 133].

Before the P. Kiselev reforms there was no centralised system of state village management. As a result of the reform, the government created a uniform five-level system of state estate administration: 1) The Ministry of State Property; 2) governorate palaces of public assets, which were divided into economic and forest (for supervision over state forests) divisions; 3) districts that unite volosts and supervise the volost-communal self-government system; 4) volosts; 5) rural communities that were in charge paying the salaries of officials. One important addition to the new administration system was a rural police institute created in 1839 [Naydenova, 2006, p. 124].

Districts, which were typically localised to separate uyezds, were responsible for the execution of state orders and supervised the volost village administrations. The district chief was in charge of district forest rangers.

Districts were divided into volosts of 6 thousand male peasants each, and the volost management team was responsible for the improvement of settlements and the proper execution of duties and tax collection from peasants. Each volost elected a volost foreman and two assessors, who also had a clerk (who managed the records and was the main figure in the volost). The decisions of the Village Rasprava (Judiciary Committee) that needed to be further considered were passed to the Volost Rasprava [Uchrezhdeniya vlastej i mestny'x volostny'x, 1857, Art. 4578–4593, 4961–4978].

Village communities included the following institutions: village board for solving public affairs (village elder, head man, tax collector, public store keeper, and delegates: 2 people from every 10 households), village administration (a village authority of some sort), and Village Rasprava (Judiciary Committee) for court trials. Volost elders had the following administrative rights: the right to charge peasants with fees up to 1 ruble, punish them with up to 20 strokes with a stick and place them under arrest for up to 6 days.

The times of village board meetings were strictly regulated. The law stipulated that the peasant board meet three times a year, which was a strictly economic and fiscal decision. Thus, the peasants met: at the start of a year to

allot tributes, duties and levies; in the spring to organise field works and, when required, take measures against defaulters who had tax and rent debts from the previous period; and in autumn to discuss the issues of community village needs and measures against defaulters. The village board only had additional meetings in cases of emergency. The village board was also responsible for the following issues: elections of village elders, head men, tax collectors and other positions of the village administration for a term of 3 years, the nomination of candidates to volost administration positions, the dismissal of peasants to other estates, the admission of people from other estates to the village community, the issuance of migration permits, the division of village community lands among peasants, levy allotment procedures, measures for charging and preventing the accumulation of arrears and shortages, the investigation of recruitment duty cases, the appointment of guardians for underage orphans, reviewing requests for funds in case of accidents, and others.

Communities had specific legal rights; they could appeal to the court on behalf of the workforce, and entrust management to one of the members. Rural communities gained the right to force out unwanted villagers under a communal sentence (as a punitive measure) with the allotment of the appropriate means for travel expenses [Uchrezhdeniya vlastej i mestny'x volostny'x, 1857, Art. 4979–5033, 5068–5084]. Peasant communities were entitled to rent the state lands they used for a maximum of 50 years.

The elders and headmen were usually assigned regardless of communal opinion, and their work was supervised by uyezd officials [Druzhinin, 1858, p. 113].

A village headman was elected for every 100 households (two headmen for 300 houses). This position was in charge of order within the community, had the right to release villagers from community service and duties, served as police officer and supervised economic matters. Peasant policemen were assigned on a voluntary basis out of every 10 households for a term of one month [Uchrezhdeniya vlastej i mestny'x volostny'x, 1857, Art. 5034–5037, 5056–5062].

The solution to the national problem of the organisation of peasant self-government bodies manifested itself in the following way: the authorities tried to prevent national volosts consisting of Muslim Tatars from forming, and Christians from being assigned as volost elders in volosts with a multiconfessional population. The law stated as follows: 'In settlements, communities and volosts where idolaters live along with Christians, idolaters cannot be chosen as members of the village and volost administration, and where Christians live with Muhammadans, the head man is elected from among Christians, and those under his supervision can be chosen from among non-Christians' [Complete Code of Laws of the Russian Empire–2, section 1, No. 23, part 3, Art. 106]. As a result, when organising the territories of new volosts, the officials tried to organise them in a way so that the population in each of them was multiconfessional.

The Village Raspravas (Judiciary Committees) dealt with disputes between peasants: 1) if the dispute was based on oral agreements and terms of purchase and rent; 2) if the dispute concerned real and personal property that was not documented; 3) when peasants appealed with complaints about fellow villagers seizing their land lots [Uchrezhdeniya vlastej i mestny'x volostny'x, 1857, Art. 5398–5409].

However, village boards were not of significant social importance, public sentences were determined by default, ignorance of the rural taxable population allowed the village and volost administrations to add various decisions to the texts that were not approved by the community, signatures were gathered without including all the members of the village board, and so on [Druzhinin, 1858, p. 119].

Volost Raspravas dealt with complaints about the unsatisfactory verdicts of the Village Rasprava, material lawsuits up to 15 rubles, complaints about the Village Rasprava making decisions on cases entitled to be heard in 'common court forums', on disputes about domestic spiritual will and testaments, and other issues [Uchrezhdeniya vlastej i mestny'x volostny'x, 1857, Art. 4964–4969].

'Common Court Forums' heard the disputes of peasants on real and personal property that

costed over 15 rubles if the real property had not been documented or was owned by peasants, or when the dispute was between members of various estates. Volost and Village Raspravas investigated cases of personal insult, public order offense, theft and embezzlement, vagrancy, fights, debauchery, etc.

After the retirement of P. Kiselev, the number of volosts and village communities was decreased by means of their reinforcement, and village administrations and raspravas were abolished. But institutes of village headmen or delegates in settlements still remained in force. Chiefs of district administrations were also replaced by officials of special orders, who were sent by the House of Public Assets to supervise volost authorities and manage local state property.

The village and volost self-government widely practiced blackmail and collected various levies for public need that were typically not controlled by the district officials. For instance, an additional 5, 10 and 15 silver kopeks to the passport tax were demanded from those left for seasonal work in the volost administrations of the Ryazan and Perm guberniyas; volost clerks in the Orenburg guberniya charged up to 6 silver rubles for each discharge ticket [Druzhinin, 1858, p. 122].

The main objective of the government's course was to increase agricultural profitability by virtue of the policy of 'patronage' and by reinforcing management and control. However, the government managed to fully achieve only the second objective: the growth of economic returns from peasants by increasing taxes and duties. The increase of monetary levies from peasants was predicated by an attempt of the government to solve their financial problems and led to an increase of arrears from 1838 to 1856 by 65%. The established system of peasant self-government was transformed into an executive institute of governorate houses of public assets [Druzhinin, 1858, p. 575]. Nevertheless, unlike the majority of Russian reforms, the reforms of P. Kiselev were one of the most successful administrative projects.

During the chairmanship of M. Muravyev (1857–1862) in the Ministry of State Property, the policy of state administration underwent

drastic changes. 'The attempt to bring manorial peasants into the category of "free rural dwellers" was replaced with open ambitions to transfer state peasants into the conditions of the private economy, reduce their allotments, increase their rental payment and start selling the land' [quoted acc. to: Druzhinin, 1858, p. 577].

Thus, the transformation of state peasants into 'free rural dwellers' endowed with legal, property and personal rights, was of the utmost importance, considering that the government was intending to abolish serfdom and, as time has shown, the model of state villages created by the government in the second half of the 19th century became an example for the reform of the social and legal status of manorial and appanage peasants in the beginning of the 1860s.

Laschmanns. One of the categories of state villagers was referred to as 'laschmanns'. The social group of laschmanns was introduced as a result of the efforts of Peter I to create a Russian Navy. The ship-building yard, founded by Peter I in Kazan in 1718, was developing quite successfully. From 1722–1829 the Kazan Admiralty (decommissioned in 1831) built 324 ships of various sizes, including 7 bomb vessels, 12 rowing frigates, 24 cutters, 57 launches, and others.

Ship construction materials in the Kazan Admiralty and other shipyards were prepared by groups of the rural taxable estate, including former murzas and Serving Tatars. The term 'laschmann' (Low German *laschen*—to chop off, to adze, to cut, and *mann*—a human) can be translated into English as 'a person who chops, adzes and cuts wood'²⁴.

As for issues that did not concern timber harvesting, the laschmanns were governed by the governorate and uyezd authorities and the court, the lower echeleons of which were the authorities of peasant self-government. The double subordination of laschmanns to the Ka-

²⁴ The fundamental document for the system of stocking ship timber was the order of 31 January 1718, based on which the entire non-Russian serving population of the Kazan, Nizhny Novgorod, and Voronezh governorates and the Simbirsk uyezd was assigned to the Admiralty [Complete Code of Laws of the Russian Empire—1, Vol. 5, No.3149].

Table 25

The number of laschmanns [loggers] assigned to fell and haul ship timber according to the provisions of 25 August 1817 [Russian State Archive of the Navy, f. 159, inv. 1, file 26, s. 317–320; Russian State Historical Archive, f. 383, inv. 22, file 32226, s. 28]

Governorate	Laschmanns [loggers], males			
	total number (1821)	in the %	Total number (1856)	in the %
Kazan	57,850	48.1	59,589	49.6
Nizhny Novgorod	8,631	7.2	9,427	7.8
Simbirsk	27,550	23	29,966	24.9
Vyatka	6,173	5.1	10,719	8.9

Tambov	11,925	9.8	7,597	6.4
Total:	119,990	100	120,214	100

zan Admiralty and local authorities continued in short intervals up until 1817.

But by virtue of the 'Regulation on laschmanns and their duties for ship timber harvesting and storage' dated 25 August 1817, the management of the ship timber of the country was passed to three administration institutions according to the number of districts: the North, Nizovoy, and Baltic. Laschmanns of 8 guberniyas²⁵ were transferred under the supervision of the Nizovoy District Administration (subordinate to the Admiralty) on all issues that concerned ship building, and on all other issues they were under the jurisdiction of the governorate's administration. The state established laschmann volosts, and the Nizovoy District Administration of Ship Timber was located in Kazan, in the Admiralty Sloboda [Complete Code of Laws of the Russian Empire–1, Vol. 44, part 1, p. 109–110].

The system of laschmann peasant self-government was the same as in the state villages.

Population dynamics and settlement. During the first half of the 19th century, the number of laschmanns changed many times over, both increasing and decreasing. According to the 15 census data, in 1795 their number totaled 112,357 individuals [Complete Code

of Laws of the Russian Empire–1, Vol. 24, No.17772]. To prevent the long-distance travel of laschmanns from their residencies to the timber harvesting sites, another 609,664 yasak peasants, mainly Tatars, Chuvash, Mordva, Mari and Udmurt were assigned to perform the harvesting and hauling of ship timber starting in 1800²⁶. According to the 16 census (1811), all the workers registered in the Admiralty combined totaled 943,139 men, including 133,192 Serving Tatars [Russian State Archive of the Navy, f. 159, inv. 1, file 24, s. 47 reverse–50].

By virtue of the 1817 Provision, the number of laschmanns was reduced by almost 8 times—down to 120 thousand people [Complete Code of Laws of the Russian Empire–1, Vol. 34, No. 27023]. The territory where laschmanns resided was limited to 32 uyezds of 8 governorates, and almost half of all foresters lived in the Kazan Governorate. In 1821, an additional 15,832 Serving Tatars from the Saratov guberniya were allocated to the laschmann duty, which resulted from the need for ship timber guards in this governorate [Complete

²⁵ The Kazan, Nizhny Novgorod, Simbirsk, Vyatka, Penza, Saratov, Orenburg, and Tambov guberniyas.

²⁶ For the Nizhny Novgorod Governorate—13,308 males, for the Vyatka guberniya—143,804 males, for the Simbirsk guberniya—94,551, for the Kazan guberniya—219,083, for the Saratov guberniya—47,969, for the Orenburg guberniya—90,949 [Complete Code of Laws of the Russian Empire–1, Vol. 25, No.19224].

Code of Laws of the Russian Empire–1, Vol. 37, No.28791].

Any excess number of laschmanns were transferred to the state peasantry from census to census. For instance, according to the 8th census (1834) their number reached 160,460 people, in 1837 an 'excess' 40,324 of them were transferred again to the appanage (11,361 people in the Simbir guberniya) and state (28,963 people in other governorates) peasantry [Russian State Historical Archive, f. 383, inv. 30, file 416, s. 45–45 reverse].

According to the 19th census, in 1850 the total number of laschmanns came to 146,798 people; by the virtue of the Provision dated 7 August 1856, their number was once again reduced to the number established in 1817 [Veshnyakov, 1857, p. 33] (see Table 25).

Laschmann duty. Laschmanns were obligated to carry out work on ship timber sites on the basis of a feudal duty: harvest ship timber 'as much and as often when needed for orders, cut, finish and haul timber from the forest to piers and fields', and prepare mast pine, pieces (wooden parts) for artillery and construction timber for admiralty buildings [Complete Code of Laws of the Russian Empire–1, Vol. 34, No.27023].

Timber harvesting presented numerous difficulties, including winter accommodations in the woods, and the hazards of cutting and felling trees. Cutting and felling huge boles and laying roads for timber hauling (so-called *saban roads*) required tremendous effort and immense amounts of strength. They had to cut the thickest and strongest trees, including centuries-old oak, pine, ash, maple and other trees, which made the job of foresters even harder. The only tool they used to cut wood was the axe, as saws in that period were not common. Men and horses were dying at work, and most of the time laschmanns spent the night in huts made of tree branches. Mounted workers had no more than 7 hours a day to feed the horses and let them rest [Russian State Archive of the Navy, f. 159, inv. 1, file 411, s. 80].

In the first half of the 19th century, the work of laschmann was progressively becoming more demanding, as the amount of trees acceptable for ship building was dwindling

in number, which made their placing, cutting and hauling more difficult. The average distance from felling sites to the piers where the ship timber had to be hauled to added up to 51 versts, but now trees had to be carried to a distance from 25 to 250 versts [Russian State Archive of the Navy, f. 159, inv. 1, file 411, s. 63 reverse, 65 reverse]. As the felling sites were getting farther away from where the laschmanns lived, they had to cross distances of between 300–500 versts. According to the Provision of 1799, unmounted laschmanns had to harvest timber not for just two working months (October, November) like they used to, which included only 46 working days with the exclusion of holidays, but for 60 full working days, meaning from 1 October until 18 December [Complete Code of Laws of the Russian Empire–1, Vol. 25, No.19224]. In order to provide the navy with the needed amount of ship timber, labour norms were made even more severe: every day a mounted worker had to deliver timber weighing up to 15–18 pood a distance of 25 versts. Every two unmounted workers had a target of at least 10 logs of 4 sazhen to cut and process every day. If a worker failed to meet their target, not only could he be paid less, but also paid nothing at all [Complete Code of Laws of the Russian Empire–1, Vol. 25, No.19224]. Typically, at the beginning of hauling (from December until the middle of January) each horse could carry up to 12, 13, and even 14 pood daily. From the middle of January the exhausted horses could barely even carry 8–10 pood a day [Russian State Archive of the Navy, f. 159, inv. 1, file 411, s. 76 reverse–77].

The 1817 Provision doubled wages compared to the amount it was in 1799: when they hit the target unmounted laschmanns were paid 40 kopeks a day, and mounted workers 80 kopeks; in addition, the practice of hiring outside help to work instead of them, which became very common, was legalised [Complete Code of Laws of the Russian Empire–1, Vol. 34, No. 27023].

Laschmann settlements were obligated to send an annual average of 8 thousand workers, men from the age of 18 to 55, specifically for timber harvesting. In the end of 1817, the annu-

al duty for unmounted laschmanns was served by an average of 2576 people.²⁷

About 5.5 thousand mounted laschmanns worked on the hauling of ship timber every year.

Payment for laschmann work was increased twofold at the end of the 18th century, which is why for laschmann peasants residing close to felling sites, admiralty jobs were an additional source of income. This increase explains cases when the laschmann of certain villages sent their representatives to Kazan to the manager of the Nizovoy District Ship Timber Administration with petitions to continue their laschmann duty. Therefore, from 1831–1837, 1311 peasants formerly included in the Admiralty submitted petitions of such kind [Russian State Archive of the Navy, f. 159, inv. 1, file 411, s. 30–30 reverse].

From 1818–1843, unmounted laschmann made up 28% and the mounted 72% of the total number of workers [Russian State Archive of the Navy, f. 159, inv. 1, file 411, s. 73 reverse]. Thus, the number of mounted laschmanns compared to the 18th century when their quantity was approximately equal to the quantity of unmounted workers, was gradually increasing, which could be explained by the ever-growing distance between the timber harvesting sites and piers.

Due to a lack of horse feed, mounted laschmanns often left duty without authorisation. On many occasions commission agents dismissed laschmanns to return home before the end of their work for a certain fee, which could total up to 6–12 rubles from each. Some of the laschmanns, referred to as yamshhiks (lashers), whose horses were used by commission agents for travelling, were freed from working in shipyards. For such a privilege the commission agent charged them a monetary fee of 15–17

rubles [Russian State Historical Archive, f. 383, inv. 22, file 32226, s. 5–5 reverse].

Taxes. The lashmann fought to better their condition and completely abolish their duty. They wrote petitions in which they asked to improve their conditions, which included an absolute release from logging [Gilyazov, 1982, p. 167]. As A. Kleyankin noted, 'the entire history of the lashmann is the history of their continual fight against the 'laschmanness' [Kleyankin, 1978, p. 213].

The system of payment for laschmann in the 19th century did not undergo any sweeping changes. All funds determined for payment to the laschmann were included in the treasury as a tribute. State help in the provision of laschmann with horses, food, and forage for horses was minimal [Russian State Archive of the Navy, f. 159, inv. 1, file 411, s. 59 reverse–60].

They also made attempts to change the method of payment for laschmann labour, which resulted from the increasing accumulation of arrears in the treasury²⁸. The main reasons for the accumulation of arrears were a lack of land allotments, poor what harvests, a fall in prices for farm products in the production of which they were engaged, and quarantine restrictions resulting from cholera outbreaks [Russian State Historical Archive, f. 560, inv. 1, file 809, s. 8–9].

In the first half of the 19th century, the authorities tried to pay actual earnings instead of how they used to formally offset them as tributes, and to collect taxes according to when they were owed. However, the new system also had many imperfections [Russian State Historical Archive, f. 560, inv. 1, file 809, s. 3–4].

According to our calculations, over the period from 1818–1843, the proper expenses of laschmann for their labour exceeded their salary counted as tribute for the treasury by a factor of seven [Russian State Historical Archive, f. 383, inv. 22, file 32226, s. 12 reverse]. Unmounted laschmanns spent money on clothes

²⁷ For better a arrangement of works, the laschmanns were divided into 6 groups: Four parties (2,000 people) were busy with stocking timber, one party (336 people) treated the logs at clearings, and another party—the doggers (240 people)—sawed and prepared the ship timber for release [Complete Code of Laws of the Russian Empire–1, Vol. 44, Part 1, Page 109–110. About 5.5 thousand mounted laschmanns worked on the hauling of ship timber every year.

²⁸ In 1832, in 7 governorates included in the Lower district of ship timber, there were 117,707 laschmanns, annually due to pay state duties in the amount of 1,596,000 rubles. For the previous years, they accumulated a 1,076,700 ruble debt.

and footwear, 2 axes with repairs and welding, and self-sustenance during work and travelling the woods, with each expending a minimum of 19 rub 17 kopecks. The expenses of mounted laschmanns in one working season amounted to 59 rub 60 kopecks [Russian State Archive of the Navy, f. 159, inv. 1, file 411, s. 71–72].

Unlike the governorates pertaining to the Nizovoy ship timber district, in the Baltic and Northern districts, as well as in the Western and Ostzeysky guberniyas where they logged and delivered timber to piers, all works were performed by employees. Considering the proximity of these governorates to St. Petersburg and Arkhangelsk, timber delivery from piers to wharves was less costly than delivery from the governorates of the Nizovoy district. From 1836–1845 (10 years), in the Nizovoy district 335,248 rub were paid to laschmanns for the felling and delivery of ship timber to the rivers, while the delivery of timber to ports itself cost 1,643,715 rub (the ratio is about 1 to 5). In the Baltic, Northern districts, and in the Western and Ostzeysky guberniyas this ratio was about 1 to 1.4 [Russian State Archive of the Navy, f. 159, inv. 1, file 689, s. 111 reverse–112. Therefore, one of the main reasons for the continuation of forced laschmann labour

in the governorates of the Nizovoy district lies in the unwillingness of the government to incur extra charges during logging and the delivery of timber to piers.

Thus, despite the set of measures taken by the government for the improvement of the laschmanns' condition, the compulsory nature of their work did not change. Overall, improvements were limited, as their efficiency fell owing to the ongoing exploitation of laschmann labour by the government. While they engaged in the logging, primary processing and delivery of ship timber to piers, laschmanns also played an important role in the development of the Russian fleet. On 28 March 1860, the decree was announced on the transfer of laschmann to the state peasantry class [Complete Code of Laws of the Russian Empire–2, Vol. 35, p. 1, No. 35611]. The main reason for the rejection of the Russian government of the use of laschmann labour was the social and economic situation in the country, which was characterised by the growth of the hired labour market and other elements of capitalist development, meaning it was impossible to continue with former state serf institutions like the laschmann peasantry. From this time on they began to log timber with the help of hired employees.

§ 2. Peasant serfs and appanage serfs

Svetlana Eremina, Ildus Zagidullin

The Tatar peasant serfs. The legislative initiatives of Peter I designed to eliminate the Tatar-Muslim feudal nobility, especially the decree of 12 July 1715 (it was allowed to keep Muslim serfs and take serfs from Christians together with the land allotments allocated to them), led to the loss of a considerable part of Tatar murza lands and a drop in the number of their serfs.

In the first half of the 19th century, the absolute majority of Tatar serfs belonged to the Tevkelev family. In the last quarter of the 17th century, Davletmambet Tevkelev had estates in the Yaroslavl and Vladimir uyezds, and the estates of his son Mamesh were in the Vladimir, Kasimov and Kerensky uyezds. Over

the course of time his estates in the last two uyezds were given to his daughters as dowry [Azamatova, 2008, p. 67]. Their brother, the Russian diplomatic official Kutlu-Muhammad (1674–1766), obtained Nazar village in the Tersinskaya volost in 1718, and Tangachi across the Kama River in 1720 from the Yaushevs [Alishev, 1973, p. 21]. Most likely, in the 18th century he also bought some other Tatar settlements located on the lands of the Yaushevs²⁹. In the 1780's, in the Yelabuga

²⁹ In the latter half of the 17th century, the Yaushevs owned the villages of Tersya, Nazyar, Nazyarbash, Akkozino, Agryz, yarykly, Mordovskaya, Ardash, and Pseev [E'tnoterritorial'ny'e gruppy', 2002, p. 95].

uyezd of Vyatka guberniya the Tevkelevs had 540 serfs [Pislegin, 2011, p. 101]. The Serf Tatars of the uyezd lived in the settlements of Tersya, Staro-Baltachevo, Biktovo (Yur'), Nazyar, Tuba, Mordovo, and Chishma. In the first half of the 19th century, Mordovo belonged to Yunusova and Nazyar belonged to the successors of G. Muratov, and the others belonged to the Tevkelevs [E'tnoterritorial'ny'e gruppy', 2002, p. 94].

In Ufa province, the lands and serf population were 'granted' ³⁰ to K. Tevkelev after his suppression of the rebellion of 1735–1740, in other words for his 'merits' in the cruel suppression of a civilian riot, and also for uniting Kazakhstan with Russia. Therefore, they pardoned his capture and enslavement of the Muslim Yasak people [Azamatova, 2008, pp. 67, 74–75].

According to census records, the ethnic composition of Tevkelev villages was in a state of constant change. At the initial stage of the formation of the landowner household, people were brought in mostly from the Kasimov uyezd of Ryazan guberniya (village of Podlipki), and the Yelatma Uyezd of Tambov guberniya (the village of Antonovo (Narma)). These migrations did not stop over the following decades from the places where the ancestors of the Tevkelevs received their first lands. Among the transferred peoples there were also peasants who earlier belonged to other murzas. However, the main supplies of human resources to Tevkelev villages in the Ufa province were the Tatar settlements located in the Yelabuga and Sarapul uyezds of Vyatka guberniya. Through careful migration management they equaled out the number of men and women, and formed new ancestral lands (Novy'e Kar'avdy', and others). The attitude of landowners towards their serf brothers in faith corresponded to the general attitudes of the period: in the documents there are many cases of peasant punishments like exile to Siberia and military recruitment [Azamatova, 2008, pp. 76–77]. As a communal feature, the polygamy of serf Muslims should be noted in particular.

In Belebey Uyezd, Muslim serfs who belonged to the Tevkelevs lived in the settlements of Kilimovo, Novo-Kilimovo (from the 19th century), Baltachevo, Novo-Baltachevo, Ustyumovo, Akhunovo, Novoe Akhunovo (from the 19th century), Lomovo, Tyuryush-Tamash, Karavdy, Novye Karavdy and Kugul, in Ufa uyezd the village of Kugushevo, and in Menzelinsk uyezd in the village of Kadykeevo [Azamatova, 2008, p. 76].

At the end of the 18th century, the serf Tatars belonging to the Timashevs lived in Orenburg uyezd in the Tamgachi (Almaly') settlement. They obtained them from the Tevkelevs from among the peasants living in the villages of Novo-Baltachevo and Tersya. After receiving manumission, they were expelled from their lands and the settlement by the landowner. In the sources from the 18th century, there is a mention of serf Tatars in the Verkhniye Yerykly village (the lands of the Yaushevs) in Menzelinsk uyezd. In the 19th century, three more villages were established in Ufa uyezd: Agirdi (which belonged to the Maksyutovs), Sorokamy'sh (the Bayryakovs' possession) and Uzy'tamak (the possession of the Alkins) [E'tnoterritorial'ny'e gruppy', 2002, p. 96].

Thus, the small group of serf Tatars who lived in about 30 villages was only a portion of the total mass of the Tatar rural tribute population.

Appanage serfs. In the 18th century, state peasants of the Volga-Ural region were not influenced by the autocratic policy of their transfer into private hands. However, in 1797, after the development of the appanage department, some state peasants were transferred under the supervision of this new department because imperial lands and properties were formed with the help of simple partitioning. In some governorates, Tatars were ascribed to the serfs of the appanage, in particular in the Ardatov uyezd of Simbirsk guberniya there were 241 Serving Tatars among them [Research Institute of Humanities under the Government of the Republic of Mordovia, I-1234, p. 32].

In October 1797, nine appanage distribution centres were formed, each of which managed 50–70 thousand male serfs. Peasants of Simbirsk, Nizhny Novgorod, Penza and Kazan Governorates fell within the Kazan appanage

³⁰ The first serfs were the enslaved wives and children of rebels.

distribution centers. Country governing bodies named 'prikazy' were organised at the local level, and several dozen villages (3–3.5 thousand peasants) fell under the jurisdiction of each of them [Gorlanov, 1986, pp. 95–97].

This system of government showed the awkwardness of its design within the first 10 years of its operations and arrears increased sharply, which gave the government quite a scare. Alexander I made an attempt to reform the administration of the appanage department, and appanage offices were formed instead of the previous distribution centres. In Russia, there was a total of 19, and under the control of each of them were about 200 thousand peasants of the appanage, along with retired soldiers, corporals and peasants of other titles.

The main task of the appanage office was the efficient collection of tributes and supervision over the payment of arrears by peasants. They also had to execute the orders of governors, zemsky police and the treasury chamber about the delivery of recruits, the payment of state tributes and the execution of various public duties by peasants.

Appanage peasants acted the same way in relation to the imperial family as private peasants did in relation to their landowners. But as for personal rights, there was a substantial difference between appanage peasants and serfs, although the legislation was based on similar principles. Only in 1858 were appanage peasants given personal and property rights equal to other free rural social classes.

When searching for work, seasonal workers ('otkhodniki') had to obtain the agreement of the land community, then get permission from the local authorities after providing them proof that their allotments would be cultivated by their relatives or other fellow villagers. Starting in the 1830s, the appanage authorities reduced their number of issued passports, as they considered that the expansion in the number of seasonal workers caused more losses than profit. The appanage department applied various means to reduce the number of seasonal workers. Except for direct prohibition and an increase in the cost of passports, they also made other attempts to heighten the interest of peasants in agriculture by using the latest agricultural tools, etc.

In 1835, in Simbirsk guberniya all inhabitants of state villages, including *Iaschmann*, were transferred to the jurisdiction of the appanage department. Thus, the Tatars of Simbirsk guberniya, generally the descendants of Tatar *murzas* living there in the 17– the beginning of the 18th century totaling 56,715 serfs of both sexes and smallholders, began to represent a new category of rural inhabitants—appanage peasants.

Farming was the main occupation of appanage peasants, and at the same time the average per capita allotment for an appanage peasant was significantly reduced. In Simbirsk guberniya in 1800, 4.48 desyatinas of land was the per capita share listed in the census, and among the land 3.9 desyatinas were arable. By 1862, these figures had fallen, with the total allotment on average coming out to 3.84 desyatinas, with arable land making up no more than 3.2 desyatinas [Gorlanov, 1986, p. 164].

The appanage department suggested the idea of establishing agricultural schools that would provide 'mentors who can introduce the rules of arable farming everywhere' [Istoriya udelov, 1902, pp. 180–181]. In these schools they planned to train specialists and the owners of 'model farms', which they planned to build in each and every appanage. The authorities received the money to construct such schools from members of the common people. In addition, the community undertook to keep indigent pupils of schools at their own expense [Central State Archive of the Chuvash Republic, f. 193, inv. 1, file 4178, s. 1].

The model farms where they planned to teach other peasants using the examples of agricultural school graduates to use the latest techniques and tools, and also to promote new crops, and the use of fertilizers, etc., were closed 14 years later owing to a frustration of the hopes they were originally invested with [Istoriya udelov, 1902, pp. 212–213].

The appanage farm management control reform of 1808 did not affect the lowest rung of the administrative hierarchy—the country community, which ultimately preserved its status as an intermediary between administrative structures and ordinary peasants.

The head (starosta) who was in charge of the community was elected at the village community assembly. The term of his service was from 3–5 years depending on the uyezd, and his main duty was to mediate between the 'mir' (commune) and the appanage office, and manage the treasury of the 'mir'. The head presided at village community assemblies, took charge of general labour activities, maintained order in the settlement within his jurisdiction, considered minor cases, heard simple cases and quarrels, and had the right to punish the guilty party of minor crimes.

Within the appanage department there was some discrimination of the non-orthodox population. In fact, there was an officially recorded provision that only Russian peasants, or as a last resort—members of other nationalities professing Orthodoxy, could be elected to administrative positions within the community: 'In the settlements, societies and volosts where Christians live together with idolaters, idolaters cannot be elected to rural and volost leadership positions' [Serkina, 2002, p. 89].

Heads were obligated to coordinate the activities of the society in critical situations such as fires, floods, loss of cattle, etc., to prevent deforestation and the destruction of crops. Thus, rural heads combined the functions of a representative power, administrative apparatus and police.

Heads were paid a salary out of the funds of common community members, and usually did not exceed 6–8 rubles. In addition, they were exempted from all types of natural servitude for the period of their duty. Heads had deputies such as tax collectors, sailors (rangers), forest rangers, and field guard and fireguard heads who were elected from among community members [State Archive of Ulyanovsk Oblast, f. 537, inv. 1, file 161, s. 14].

Rural heads were obligated to appear before the volost board twice a week to resolve current issues. Volost boards were soon replaced by the prikaz, which in the first half of the 19th century was the highest administrative unit of local serf government. The board of the prikaz was usually located in the central settlement of the volost community. It consisted of a head of the prikaz, a state chief, a chief of the pri-

Additional record of possessions of the peasant community in Nizhnyaya Sun village of Mamadysh Uyezd Kazan Governorate. 1867.

kaz, and a scribe. The head was required to inform peasants of all government and appanage orders, 'to keep them in order', and to enforce moral principles.

The enlargement of officialdom, increase in maintenance expenses and complication of the decision-making procedure, all this caused the opposite effect of its intention. Instead of the expected rise in profitability of appanage farms, peasant arrears started to grow, the arbitrary actions of officials intensified, and bribery continued to flourish. The complex vertical power structure could not solve essential problems, and likewise deprived common peasants of the right to control their farm.

Thus, the inhabitants of appanage villages made up the local group of the rural Tatar tribute population. According to law of 23 June 1863, appanage peasants acquired the rights of free rural inhabitants and obtained ownership of their own allotments which were required to be purchased.

§ 3. The land tenure of Tatar farmers in the post-reform period

Ildus Zagidullin

The post-reform period became an important stage in the formation of a new relationship between the state—that is, the regulator on land matters, the owner of state lands and the Russian peasantry. In respect to the solution of the land problem, the actions of the authorities were evasive towards the country's tribute population, and it in large part remained absent from the Great reforms of the 1860–1870s. They contributed to the preservation of conservative relations in rural communities and the consolidation of its positions on the land issue, hindered the development of capitalist relations and aggravated the agrarian question in the multinational village.

The results of the land reforms of the 1860s.

The abolition of serfdom and the registration of redemption payments poorly affected the residents of Tatar villages owing to the small number of landed peasants among them. In Ufa and Orenburg guberniyas, peasants of the Tevkelevs received on average 5 desyatinas per capita (census data), and only the inhabitants of Kilimovo acquired donated lands [Azamatova, 2008, pp. 83–88]. In 1859, the Tatar farmers who moved from Ufa guberniya to Belyi Klyuch (Alkino) in the Mamadysh uyezd of Kazan Governorate for the third time 'were poorly arranged' by the landowner Alkin. Owing to crop failures in 1865, they could not pay redemption payments for 17 per capita lands. In 1869, the government allowed them to postpone their payments for 5 years, and by 1879, they had accumulated 2482 rubles in debt. During the estate's inventory it turned out that only 11 farms out of 15 had one horse, and as for real estate, they had no household buildings except for some shabby houses and grain warehouses. Only manifesto of 15 May 1883 abolished arrears on redemption payments of all sizes and allowed them to resume payments, even though peasants desired to refuse their allotments [Materialy', 1936, pp. 40–50].

Under law of 26 June 1863, *appanage peasants* were given 'possession' of lands that were in their use, and the poll tax ('podushnaya podat') was transformed into an obligatory re-

demption payment that never went up but they had to pay off in the span of 49 years (starting in 1865). The redemption sum was based on the former rent capitalised at 6% per annum [Istoriya Udmurtii, 2004, p. 263]. According to the 10th census, there was a reduction of per capita allotments owing to a natural population increase after the last reduction of lands that belonged to appanage peasants. The allotment area in Kazan guberniya was reduced nearly 11% (3.9 desyatinas), and in Simbirsk guberniya they were also given 3.9 desyatinas [Khodsky, 1891, pp. 119, 123].

The law of 24 November 1866 entitled 'Land Arrangements of State Peasants in 36 governments' [Complete Code of Laws of the Russian Empire–2, Vol. 41, Section 1, No.43888] defined the legal basis of the land use of state villagers. In 14 governorates, including Kazan, Ryazan, Samara, Saratov and Simbirsk guberniyas where lands were delimited, title-deeds were to be printed within two years, in Astrakhan within 4 years, in Nizhny Novgorod and some other governorates where the land survey was not yet finished, within 6 years, and in those governorates where land plans had not yet been drafted (Vyatka, Orenburg, Perm, Ufa, etc.), also within 6 years. The state also required farmers to pay labour rent—a feudal rent—that took into account the revaluation of land payments over the last 20 years.

In Kazan, Ryazan, Samara, Saratov, Simbirsk and some other governorates, the labour rent sum remained in its pre-established amount. Beginning in 1867 in the remaining above-mentioned governorates, labour rent increased due to the addition of a special surtax.

Time showed that the levying of a 20-year invariable labour rent was unprofitable for former state peasants. Considering that according to the reforms of the 1860's, the redemption price of 1 desyatina of land allotment in Kazan guberniya for former landed peasants amounted to the absolutely massive sum of 22 rubles and 7 kopeks, and for former appanage peasants 13 rubles 56 kopeks. Former state peasants also

paid 77 kopeks of labour rent over 20 years, or 15 rubles 40 kopeks, for the use of 1 desyatina of good land [Smykov, 1984, p. 74]. But in reality they actually paid 2/3 of the repayment sum of former landed peasants and did not become the owners of the allotments.

The law allowed repayment by communities and some peasant farms through the payment of a labour rent capitalised from 5% at the rate of 1 ruble for every 5 kopeks of labour rent. However, this right was not supported by government lending and borrowing, as was the case with landed peasants and its effect of depriving them of the possibility to buy out their own allotments.

Compound communities received common title-deeds that later frequently led to land disputes. They also registered meadow and forest estates under the ownership of several rural communities [Materialy' dlya sravnitel'noj, Ed. 7, p. 40]. In the Kazan uyezd, for example, of the 71 communities using 31 unmarked lands with a total area of more than 8 thousand desyatinas, 11 communities were attached to two common allotments, and one—to three allotments [Materialy' dlya sravnitel'noj, Ed. 3, p. 31].

Forest was to be allotted at the rate of 1/8 (12.5%) of a communal allotment, which translated into a considerable reduction of forest lands. In Kazan Governorate, the ratio of forest area in all peasant lands was three and more times less than the original ratio stipulated by the legislation. In fact, they had no more than 23% of the wood they used till 1866 [Chernyshev, 1948, p. 409].

The law appointed the existing allotments to state peasants, but no more than 8 desyatinas per capita (census data) in land-poor uyezds, and 15 desyatinas in uyezds with large amounts of land.

However, almost everywhere much less land was appointed to communities than was officially permitted. In our opinion, in most cases 'title-deeds' recorded the lands the agricultural communities had been using before. In other words, the authorities did not make expensive arrangements for the reduction of additional allotments necessary for sustainable farm management. As a result, in a number of governorates where the Tatars lived, their communities received less allotments than any other ethnic groups of state villagers. Because the local administration ignored

the requirement for additional allotments during the preparation of 'title-deeds', in our opinion the reasons for the less-than-desirable situation might possibly be the following: the Tatar communities received less allotments during the previous reduction than the neighboring nations, and the rather high natural population increase rates in the pre-reform period that had a negative impact on the size of per capita allotments.

Among the multinational peasantry of the former state villages of Kazan Governorate, per capita allotments were irregular: the Russians received 6.4 desyatinas, the Mordva and Udmurt—6 desyatinas, the Mari—5.7 desyatinas and the Chuvash—5.0 desyatinas. The Tatars received the lowest allotment of all—4.7 desyatinas [Krest'yanskoe zemlevladienie, 1907, pp. 84, 88]. The Tatars witnessed a reduction of field acreage, which subsequently led to the deterioration of the overall condition of fodder resources and resulted in a lower level of animal stock supply on their farms [Trudy' statisticheskoy, pp. 55–56].

According to the results of the agrarian reforms of the 1860s 19th the farmers of former state villages acquired more land than landed peasants. In Kazan Governorate, former landed peasants received an average of 2.7 desyatinas per capita (census data), former state peasants—5.2 desyatinas, in Samara guberniya—3.4 and 10.8 desyatinas respectively, and in Vyatka guberniya—3 and 6.6 desyatinas [Khodsky, 1891, pp. 30–36].

The agrarian reform of 1866 not only did not improve the economic and social situation of peasants, but eventually led to a reduction of forest area and delayed the beginning of buy-back operations for 20 years.

Thus, as a result of governmental transformations in the communal land ownership of the Tatars, several groups of rural farms, and subsequently several different behavior models, were formed: 1) the local group of former Tatar serfs bought out their allotments or received small donation plots of land; 2) the main part of Tatar rural population—former state peasants—continued to pay labour rent; 3) according to the reform of 1863, appanage peasants who became 'owners' of the used lands were transferred to obligatory redemption payments; 4) the delimi-

Tatar family harvesting. Photo from the early 20th century.

tation of lands of landowners and former military and civil settlers (*pripushchenniki*) continued right to the downfall of the autocracy.

Agrarian reforms of the 1860's did not affect the system of land tenure in the Orenburg and Ural Cossack army.

The transformation of labour rent into redemption payments for former state peasants. The inequality of land assignments and the amount of tribute levied on the lands of various categories of farmers put the rural tribute population in varying conditions. Considering the difficult economic and social situation of former landed peasants who received minimum allotments and paid unreasonable redemption payments that exceeded the value of the land, the government decided to shift a part of their taxes onto the shoulders of former state peasants. The financial aspects of the reform were directed at a gradual equalisation of the economics of all main categories of the Russian peasantry.

The transformation of labour rent into obligatory redemption payments was connected with the cancellation of the poll tax. On 1 January 1884, the government started to pursue its plans and reduce the poll tax amount. In 1886, it was cancelled for former landed and appanage peasants, and in 1887 this extend-

ed to former state peasants as well [Anfimov, 1976, pp. 32–33].

In accordance with the law of 12 June 1886, farmers were transferred over to obligatory redemption payments consisting of labour rent and a forest tax that increased by 20%. If there were any objections regarding redemption payments, peasants had the right to ask by proxy for a reduction in their payment. 'If necessary', their petitions were checked at the local level. However, the administration always had the last word concerning the ultimate repayment.

In Kazan Governorate, the sum of the labour rent and forest tax was increased on average by 45%, in Penza—by 39%, in Samara—by 31%, in Vyatka guberniya—by 40%, in Saratov—by 57%, in Ufa—by 55%, and in Orenburg—by 59%. Peasants had to pay this sum annually (without any changes) over the span of 44 years. For the purpose of long-term profits and considering the experience of other agrarian reforms, the government established the deadline for their payment till 1 January 1931 [Anfimov, 1976, pp. 34–38, 40].

In terms of financing, the law of 12 June 1886 was 'a predatory operation performed for fiscal reasons' [Ananyich, 1974, p. 201]. The redemption price of one *desiatina* of a peasant

allotment in Kazan Governorate was raised to 41 rubles, in Penza guberniya—to 67 rubles, in Saratov—to 38 rubles, in Samara and Ufa Governorates it was 19 rubles, in Vyatka Governorate—16 rubles, and in Orenburg—6 rubles. As a result, the annual redemption payment in Kazan and Vyatka guberniyas turned out to be only 10% less than the total amount of labour rent and poll tax paid before, in Penza guberniya—2%, in Samara—0.6%, in Saratov—4%, in Ufa—6%, and in Orenburg—3% [Anfimov, 1976, pp. 40–41].

It is interesting to compare the sum of the redemption payments of former landed peasants after the mitigation in 1881, and of state peasants under the law of 12 June 1886. In Kazan Governorate the first annually paid 1.39 rubles, the second—1.05 rubles, in Penza—1.66 and 1.29 rubles, respectively, in Perm—0.5 and 0.6 rubles, in Saratov—1.37 and 0.97 rubles, in Samara—1.16 and 0.48 rubles, in Vyatka—1.13 and 0.66 rubles, and in Ufa—1.14 and 0.79 rubles [Khodsky, 1891, Table 24].

In cases of prior redemption operations, peasants had to pay money at the rate of 1 ruble for ever 5 kopeks of repayment without the extension of credit or any additional resources by the Ministry of Finance. In 1893, pre-term repayment was allowed for certain owners of their allotments only upon the agreement of 2/3 members of the rural community who had the right to vote in the community.

Analysing the financial estimates of the reform, prominent Russian economist P. Migulin agreed that 'the repayment of rent by state peasants was not carried out as a correct credit transaction, and furthermore could not be, as there was nobody to act as creditor. In general, all these operations concerning the repayment of rent by state peasants appear to actually be a disguised increase in labour rent' [cited by: Ananyich, 1974, p. 211].

The payment of redemption charges by all categories of peasants was ceased by the government in 1907, but before this peasant allotments were excluded from the market.

In general, the transformation of labour rent into redemption payments in 1886 made former state peasants the main taxpayers, and gradually led to a decline in living standard and the equali-

sation of their economic and social position with other categories of peasants.

Changes in land tenure. From the 1870's–1905, generally speaking it was all-Russian tendencies in land issues mainly caused by regional differences and government policies that were characteristic of the land tenure of various groups of the Tatar population.

Communal land ownership. The results of the agrarian reform of 1866 and the natural increase of the Tatar population, as a result of which they now occupied the leading position [Smykov, 1973, pp. 39–40], in many respects predetermined the development of rather deep-running distinctions when providing them with land.

Twenty years later, after the territorial revision of Kazan guberniya, the Tatars had the greatest proportions of communities (43%) and farms (43.5%), with allotments up to 3 desyatins of land. Among the Chuvash these figures amounted to 19% and 2.5% respectively, and among the Russians 16.2% and 10.7% [Obshchij svod, 1896, p. 217]. By the beginning of the 20th century, the situation grew even worse: from 1866 to 1907, Tatar allotments were reduced by 46.8%, and as for other nations this process was continuing along at a more modest pace [Krest'yanskoe zemlevladienie, Ed. 13, pp. 88–95].

In Vyatka guberniya at the end of the 1880's, allotments of arable land totaled 12.3 desyatins in Tatar farms, 26 desyatins in Russian farms, and 24.6 desyatins in Udmurt farms. An analysis of the average data in these groups paints a rather miserable picture. Among Tatar farms, landless and land-poor farms with allotments up to 10 desyatins totaled 47.5%, 'with the average amount of land' (10–25 desyatins)—45.4%, and farms with a lot of land made up 7.1%. On the peasant farms of other ethnic groups the situation was much better, and the Russians had the following figures: 30.7%, 52.5%, and 16.6%, respectively, while the Udmurts had 9%, 51.9%, and 39.1% [Morozov, 1936, p. 28, 29].

From 1877–1905 in Ufa guberniya, the average provision of per capita allotments for former state peasants decreased considerably from 19.5 to 14.3 desyatins, and in Orenburg guberniya from 32.7 to 24.3 desyatins. The

sharp decrease in the allotment areas of Bashkir landowners and settlers can also be explained by the sale of patrimonial lands by the former and the delimitation of the lands of the second, when the 'excess' allotments of military settlers were handed over to the treasury. In 1877 in Ufa guberniya, Bashkir landowners and settlers owned an average of 37.3 desyatinas of allotments and in Orenburg—91.1 desyatinas; in 1905 these data sharply decreased to 24.2 and 44 desyatinas, respectively. It should be noted that the actual provision of settlers with land was below the figures mentioned below. As their lands were not divided thoroughly, it is impossible to speak of more precise data [Usmanov, 1973, pp. 39, 43]. During the reduction of lands, former military settlers lost half of their allotments, and a further decrease of the allotment area occurred under the influence of the natural population increase. However, in comparison with state peasants they lived in rather favorable conditions.

For the purpose of expanding arable lands, the peasantry also engaged in intensive deforestation. However, this could not serve as the final solution to the 'land hunger' that appeared in the Middle Volga region in the 1880's.

Quaternary tenure. At the turn of the 17–18th centuries in Russia, there was a unification of service people 'on the principle of a common homeland' into a closed class of nobility provided with exclusive privileges. According to the methods of land tenure, service people were equated 'based on their tools' with smallholders, and retained their right of personal land use. After the Serving Tatars and Murzas were registered as state peasants and taxes were levied on them at the end of Peter I's reign, only those who had official documents were able to retain ownership of their property. As a result, according to the law, Serving Tatars who did not have confirming documents were not owners, but holders of state land. In the late 18th century, the sizes of the land allotments of most Serving Tatars in the Middle Volga region were no larger than those of state peasants because they had been split up, and often were a part of communal private lands that were used only by members of their families [Gilyazov, 1982, pp. 109, 111].

In the 19th century, land allotments of former Serving Tatars were reduced even further.

In 1882 in Tambov guberniya, more than half the farms of former small holders who owned lands under the quaternary right had allotments of 3 or less desyatinas, and only about 4% of the farms were 15 or more desyatinas, which made it possible for the farms to function properly [Mukhamedova, 2008, p. 57]. In Kazan Governorate, 34 of 37 villages with quaternary land tenure (8831.4 desyatinas) belonged to the Tatars [Nikolaev, 1997, p. 88]. At the end of 19–beginning of 20th centuries, quaternary land tenure decreased. Some quaternary peasants sold their land to 'a third party', some of them changed over to communal land ownership [Nikolaev, 1997, p. 30].

In the latter half of the 19th century, quaternary land tenure for Tatar peasants meant ownership of land that belonged to a group of persons as common property. The plots of joint owners were not individual lands, but parts of common land. Though quaternary lands were not subject to radical repartition and joint owners considered them to be private property, the government issued redemption payments for these lands [Obshhij svod, 1896, p. 370].

Quaternary land tenure changed over to communal ownership due to difficulties and complications in the land relations of joint owners. The Serving Murzas in a number of settlements of Kazan Governorate experienced such changes to equalized communal land ownership under pressure of members of communities [Zagidullin, 1992, pp. 39–40].

In a number of settlements where Serving Tatars lived together with state peasants, a new type of land tenure appeared. Contemporaries called it *household land tenure*—the right of prominent peasant families to have a particular number of desyatinas of common land without designating the areas [Materialy', 1936, pp. 100–101].

Private land ownership. Private land ownership existed in the form of personal property and the property of village communes or unions.

During the post-reform period, the Russian merchant class took over the role of active agricultural land buyers. By 1877, 15% of all land that was purchased in Middle and Lower Volga guberniyas belonged to merchants. In some cities, they bought and rented out land, and even

A peasant household

Chistopol Uyezd.
Kazan Governorate
Photo, 1902.

tilled fallow ground. They owned the largest purchased lands (1336 desyatinas) [Statistika pozemel'noj, Ed. 4, pp. 15–16].

Tatar merchants were also interested in land, although their acquisitions were not so large. In 1868, 8 Kazan and Arsk merchants owned 3554.1 desyatinas in Kazan uyezd. The largest areas belonged to Iskhak and Ibragim Yunusov (2,000 desyatinas), Ismail Apakov (937 desyatinas), Khasan Yakupov (146 desyatinas), and Mustafa Usmanov (174.4 desyatinas) [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 12198, s. 362 reverse–346, 368 reverse–383].

In the Ural region in mid-19th century, predominantly Russians were the main landowners, partially along with Tatar and Bashkir nobility [Usmanov, 1973, p. 35]. Land allotments began to be made to merchants, townspeople and peasants in the region in the following decades. The law of 10 February 1869 allowed Bashkir landowners to sell plots that exceeded 15 desyatinas per capita according to the 10th census. As a result of such 'free' sale of land, in 1869–1878 Bashkir landowners lost 1.047 million desyatinas of land. In Ufa guberniya, the land was sold for 1 ruble per desyatina, which was 7–25 times less than the market price at the time. Taking advantage of the cheap Bashkir land, in 1869–1878, Tatar and Bashkir nobles, merchants and officials bought 30,000 desyatinas of land in Ufa and Orenburg guberniyas at unbelievably low prices [Usmanov, 1981, pp. 45–47].

The government was forced to intervene in the unchecked situation and changed the rules for selling in the law of 9 May 1878. From then on, the initiative to sell the land had to come

from the village communes, and the guberniya administration held public bidding based on that. This practice was changed in the law of 15 June 1882, according to which land could only be sold by Bashkirs themselves, with no bidding, and only to the treasury and peasant settlers.

In the late 19th century, the Khusainov brothers owned a large amount of purchased land in Orenburg, Orsk, Chelyabinsk and Troitsk uyezds, where their cattle grazed and then were driven to Orenburg, to the slaughterhouse they owned, every autumn [Denisov, 2009b, p. 53].

Tatar entrepreneurs who did the preliminary processing of animal products rented pastures for grazing cattle from Bashkir landlords. In the late 19th century, Khusainov merchants had 44 such plots with a combined territory of 73,745 desyatinas in Orsk uyezd [Denisov, 2009b, p. 53]. Another group of people interested in purchasing large plots of land were manufacturers. At the beginning of the 20th century, the Ramiev brothers, gold industry entrepreneurs, rented Tamyano-Tangaulovskaya volost, which was half a million desyatinas in size, and also a major part of the 1st and 2nd Burzyan volosts, for a low price [Raimov, 1941, p. 13].

The size of the land purchased by townspeople and peasants was much smaller than the land purchased by merchants [Materialy' dlya izucheniya, 1880, pp. 16–19]. Tatars formed the local group among those people. Tatar crop

farmers bought small land plots (for tillage, pasture, hayfields) according to the needs of their peasant households or communities. During this period, peasants saw the chance to enlarge their tillage in renting plots.

As a result of redistributing Bashkir dachas, it was only at the end of 19–beginning of the 20th century that pripushchenniki (Bashkir and Tatar settlers) received relatively small allotments. According to M. Rodnov's opinion, 'objectively, redistribution of land between landowners and settlers prevented the mass migration of Tatars from densely populated North-Western uyezds to "empty" Bashkir lands, where eventually an influx of Russian and other settlers went. Tatar communities lacked sufficient land, while entrepreneurs predominantly turned to trade' [Rodnov, 2004, p. 394].

The pripushchenniki, who generally received land that was smaller than the space they took up, tried to become land owners by getting title deeds. Many cases were handled in court [Usmanov, 1976, p. 35]. In Bugulma Uyezd of Samara guberniya, 70 Tatar and 'Bashkir' communes received 'ownership registrations' as state serfs in 1868. However, at the end of the 1870s all 7,164 households sued, claiming that they were incorrectly registered as state serfs, since their ancestors had been granted the land by rulers or had bought the land themselves. The communes managed to prove that they were the owners of their lands (they had an average of 10 desyatinas per registered person) and freed themselves from paying rental taxes [Sbornik statisticheskix, Vol. 5, pp. 29, 30, 422].

The property acquired in Volga region belonged mainly to the treasury, local authorities and landlords; in the Ural region there were large properties of Bashkir landlords as well [Rodnov, 2004, p. 318].

By 1905, the percentage of private property owned by communes and unions in the European Russia was 14.5%, in Ufa region it was 33%, in Orenburg region it was 44.3% of all privately owned land, which can be explained by the influx of settlers. In Orenburg guberniya, half of the available private land (451,900 desyatinas)—the larger plots—was taken by industrial and commercial unions [Usmanov, 1976, pp. 29, 33]. Local village communes

and unions owned smaller areas; the relatively large plots among those generally belonged to unions of settlers who didn't form official land communes when they received land [Rodnov, 2004, p. 171].

Thus, the main tendency in land ownership amongst multinational peasantry during this time period was that allotted lands decreased and the thirst for land began in the Middle Volga region in the 1880s. Meanwhile, discrepancies in plot sizes remained high among landowners of the Volga-Kama and the Ural regions. Development of large farms was hampered by the tax burden, redemption payments, and rural overpopulation. Among Tatars, only Meshcheryaks, Teptyars, bobylys and landlords owned their lands outright. Among peasants, most land was bought by communes. A new phenomenon was rural communes buying lands to expand agricultural production. These communes united groups of the most enterprising farmers.

Repartition of land. The order in which peasants could use the land was determined by communal traditions. Agricultural communes were subdivided in three categories: simple (consisting of residents of one village), separate (several communes in one village) and complex communes (ones that combined residents of two or more villages). From the administrative point of view, each separate commune was a separate village community.

In 1907, 18% of communes among agricultural unions were separate due to their relatively high percentage among Russian former peasant serfs (37%) and Mordovians (21%). Separate communes were typical for multinational villages as well. Combined communes accounted for 14.6%. In this group, Chuvash (50%) and Mari (60%) communes prevailed, among other ethnicities the percentages were as follows: Tatars—4%, Russians—3%, Mordovians—7%, Udmurts—11%. Simple communes prevailed in the guberniya (68%): among Tatars—95%, Udmurts—90%, 50%, Maris—39%, Russians—61%, Mordovians—71% [Krest'yanskoe zemlevladienie, Ed. 13, p. 38 Counted by us].

All ethnic groups typically separated from the 'main' villages. When moving to new plots, Tatar peasants broke the connection with their

former communes and formed their own. There were separate communes in a number of settlements where descendants of former Serving and yasak Tatars lived. In Simbirskaya guberniya, for example, 18 multicommunal Tatar villages united to form two village communes each. Quarters of land owned by Serving Tatars were not redistributed among the households, which was the reason that complex communities functioned among them [Nikolaev, 2003, pp. 303, 306, 308].

If during the pre-reform period the profound repartitions were regulated by systemic censuses, in the post-reform period, beginning in the 1880s, communities themselves started to regulate the equal use of land among peasant households. Tatars usually conducted repartitions every 12 years [Sbornik statisticheskix, Vol. 5, pp. 21, 30], rarely—once every 3, 5, 6, or 15 years [Obshhij svod, 1896, pp. 351–353]. In this regard, the law of 8 June 1893 on increasing the period of time between repartitions up to 12 years didn't cause any major changes.

Profound repartitions did not stimulate an increase in productivity of the plots. Essentially, the commune rented land to its members for a given period of time with the help of repartition. Current owners of plots were not interested in fertilizing their land when it came time for a repartition. The previous owners kept their plots in very rare cases [Obshhij svod, 1896, p. 361]. Apart from profound repartitions, communities did private repartitions to redistribute land more fairly when a household handed over land to another for some reason.

Mixed strip farming provided equal distribution of tilled land. Having widely distributed land strips protected farmers from natural disasters [Rodnov, 2004, p. 208].

As communes began to experience a lack of land and some commune members of Ufa and Orenburg guberniyas went bankrupt, they began to distribute land among former state serfs by nalichnaya dusha (each registered person that was considered present until the next census took place). The previous rules applied to landlords and settlers who had large plots [Usmanov, 1981, pp. 163, 180]. As decades went by without repartitions, crop farmers started to perceive the plots as their private property. Un-

official personal land ownership *formed inside the commune* [Rodnov, 2004, p. 289].

One of the major reasons for shortage of land and the weakness of peasant households was frequent family partitioning. Partitioning and forming two-generation families was more intense among Tatars in the following cases: after the head of the family died, or if newlyweds wanted to run the farm on their own, or as a result of family quarrels where women played major roles, etc. [Materialy' dlya izucheniya, 1880, p. 80; N-ch, 1869, p. 28; Zagidullin, 1965, pp. 81–82]. This bankrupted poor farms and impoverishing middle-class ones; turned prospering households into weak ones; decreased the average draught power and cattle on farms, which required considerable amounts of money to buy [Belkovich, 1887, pp. 105].

To 'hinder family repartitions', the government law of 18 March 1886 shifted the approval rights to village gatherings. However, in Tatar communities it was unaccepted to interfere in your neighbours' family affairs.

A. Chayanov, agronomist, pointed out that there was great potential in increasing the number of workers in households [Chayanov, 1989, pp. 90–110]. Many multi-crop households of wealthy peasants were large family patriarchal farms [Rodnov, 2004, pp. 246–247]. Zemsky leaders also saw a direct connection between how many workers the farms had and how much draught power they had. This, in turn, influenced the amount of farmland and the size of the rented land [Sbornik statisticheskix, Vol. 5, pp. 40, 65]. For example, in Malmyzh uyezd of Vyatka guberniya during the period between 1858 to 1884, Tatar households decreased from 10.1 people to 5.5. Among these were a large percentage of weak farms—70.5% (6.5% of farms had no workers, 64% had one) [Materialy' po statistike, Vol. 1, p. 28]. In Kazan Governorate, the average household size decreased by one-third to 5.7 people [Zagidullin, 1992, pp. 57–59]. In Bugulma Uyezd (1885), every Tatar household had an average of 5.4 people, 72% of farms only had one worker, 6.7% didn't have any [Sbornik statisticheskix, Vol. 5, pp. 13, 14, 40].

Rental relationships. Renting land became a necessary part of agrarian relationships. This

was a consequence of numerous factors mutually influencing each other in peasant agriculture. Rental relationships can be subdivided roughly into several levels: communes renting land to or from somebody; rental relationships inside a commune, between peasants of different communes, etc. The actual amount of land used by peasants didn't correlate with the land they owned. Renting land was a result of the low welfare of farms and income inequality between residents of post-reform villages. County councils noted that peasants rented out their land because of their financial insolvency; not because they had a surplus of land. The smaller the size of land owned by a crop farmer, the more often land was rented among Tatars: weak farms that didn't have cattle, equipment or seeds offered their 'vacant' land for rent—the parts of their plots that weren't used. The plots with no owners were rented out to the well-off members of the commune or the neighbouring farmers for half the crops as payment, or for money needed to pay the taxes [Materialy' po statistike, Vol. 19, pp. 22, 111, 115; Sbornik statisticheskikh svedenij, Vol. 5, pp. 86–87; Daishev, 1955, pp. 64–66].

In the last quarter of the century in all uyezds of Samara guberniya, Tatars and Bashkirs handed their land over to speculators. As a result, their plots were smaller than the averaged-sized ones that determined their needs [Svodny'j sbornik, Ed. 1, p. 64].

In the majority of cases, when land was rented out or by the commune, it was done to benefit its members. Some Tatar communes found themselves in dead-end situations when paying their taxes after bad harvest years. Usually their land was used to get the money they needed. These were mostly unfavourable lands, wastelands, pastures and grasslands. It often happened that a commune didn't have enough to feed its cattle and bought its lands back. There were also fictitious rents: land was pawned to debt holders and then bought back after the first harvest. In the 1880s, the Tatars of Kazan Governorate had the largest amount of rented out lands—73.7% (4,524 desyatins). Among them 6 communes rented out all their land [Obshhij svod, 1896, p. 378].

Another significant reason for renting land out together as a commune was the strict gov-

ernmental measures for collecting arrears from peasants. For example, in Tetyushinsky uyezd in February–March 1885 (arrears were collected during this period), peasants had to turn in 1564 desyatins of land for 1 to 12 years as arrear due to this policy.

During the post-reform period, the number of households that stopped farming rose. These were farms whose owners left their home and found a source of subsistence on the side, and farms with no owners. In Kazan Governorate most of such households were found in Russian former landlord communities (17.7%), among Tatars—9.8% [Obshhij svod, 1896, p. 387].

Economic insolvency of Tatar households was becoming the major reason for inactive renting. In the 1880s in Kazan Governorate, grasslands were rented by half of all communes of Russian former landowners and serfs; among Tatar peasants it was only by 1/5 of village communes. Almost the same dramatic difference can be seen in renting tilled land: among Russians—86% of communes, among Chuvashs and Mordovians—50%, among Tatars—41%. The availability of nearby vacant lands played a major role in choosing tilled land for rent [Obshhij svod, 1896, pp. 427, 442].

According to Y. Smykov, during the last quarter of 19th century, entrepreneurial rent prevailed in the Middle Volga region. In southern uyezds of Samara guberniya, capitalistic farms appeared that 'accepted hired man power to develop trade agriculture' as well as improved equipment and machinery [Smykov, 1984, pp. 106–107, 116]. Tatar farms, the majority of which had land and tillage of up to 10 desyatins, were in a group of farmers with a half-subsistence, patriarchal economy.

In 1892, Orenburg guberniya led the European Russia in the size of purchased, traded and rented peasant land (22.5 desyatins); after it was Don Oblast (11.4), Astrakhan (10.5), Ufa (8), Samara (6.9), and Saratov and Perm guberniyas [Svod staticheskikh, 1894]. Lands of votchinniks (large landlords), which were rented at unusually low prices, were very profitable for entrepreneurial peasants of the Ural region. In the latter half of 19th century, the well-off household class appeared among pripushcheniks (settlers) and votchinniks (large landlords),

as well as the Bashkir and Tatar peasantry [Rodnov, 2004, p. 323].

It's important to note that in villages, groups of farm hands and poor people appeared. There was a surplus of man power and it increased along with natural population growth. In the last quarter of the century in Middle-Volga region Tatar poor people and farm hands comprised more than half of their commune members (56.8% in Kazan Governorate), which was much higher than the percentage of the same category among Russian peasants (39.7%) [Smykov, 1973, p. 60]. At the turn of the century, the surplus of man power was one-third of the total working population [Materialy' Vysochajshe uchrezhdennoj, part 1, pp. 216–217, 348].

The well-off class formed due to agricultural initiative and diligence of certain peasants, expansion of tillage, intensive work of family members, usury, and different pre-capitalistic forms of exploiting poorer neighbours (using other people's labour as 'favours' or 'help', etc.) [Zaynullina, 2008, p. 46–48]. Acute agricultural overpopulation, land hunger, transition to repartitions based on *nalichnaya dusha* (last census count) worsened the position of wealthy crop farmers. At the turn of the century, there were fewer and fewer well-off farms. At the beginning of the 20th century, up to the First World War, the social structure of agricultural communes of the Ural region was notable for the nu-

merical predominance of patriarchal subsistence classes (poor to middle class), which made up to 60% of the whole rural population; the percentage of well-off households was less than 10% [Rodnov, 2004, pp. 297, 305].

The social-economic development of Tatar villages was generally characterised by a tendency for capitalistic relationships to spread unevenly in agricultural regions. In Volga-Kama villages in particular, the average plot sizes decreased, the average draught power of farms decreased, and the number of horseless farms increased. Groups of farms that didn't till their lands formed in such villages. According to P. Savelyev, 'this decrease, bordering on pauperization, cannot be accepted as capitalistic differentiation' [Savelyev, 1994, p. 358].

Thus, in areas where traditional semi-subsistence economy predominated, the usual way of life didn't allow a market economy to develop, which often led to decline and regression. The level of regional social-economical development played a major role in the development of farming for non-Russian peasantry. In areas where entrepreneurial farming developed quickly, the rules of market economy interfered in the life of patriarchal villages and destroyed community traditions [Rodnov, 2004, p. 381]. Favourable conditions for organizing capitalistic peasant farms were found in the rich and

fertile southern uyezds of the Volga and the Ural regions with low population density and low land prices.

§ 4. Taxes and duties of former state peasants from the Middle Volga region in 1866–1905

Oleg Mariskin

Estate restrictions. In general, the reforms of the 1860s reinforced one of the remnants of serfdom—the stratification of the tax system. Peasant communities remained mandatory and burdensome. The peasantry remained the lowest tax level, and was obliged to carry all the burden of poll tax, perform various monetary and natural obligations, and had conscript obligation. Peasants were subject to corporal punishment (which was abolished for other classes in 1863). They

were not eligible for state service, etc. The establishment of the *volost* (peasant) court also demonstrated that significant elements of the class system still existed. Members of *volost* courts were annually elected from peasants at *volost* meetings. At least three of the elected judges participated in court sessions. The courts only heard civil (claims for sums under 100 rubles) and minor criminal cases (fights, insults, waste of property, etc) of peasants. As forms of punishment, a *volost* court could sentence an offender to community service for up to 6 days, arrest for

up to 7 days, could fine up to 3 rubles and could order corporal punishment of up to 20 lashes.

The reforms that followed in local government, education, and military service extended the rights of the peasantry. Peasants were eligible to be elected to local government bodies. They received access to secondary and higher educational institutions. Individuals that graduated from higher educational institutions, as well as from secondary educational institutions with honours, had the right to join the civil service regardless of their class origins.

In 1874, recruitment was abolished, and the entire male population (21 years old) became subject to the draft. Admittedly, this didn't fully eliminate the class inequality of peasant rights.

Natural obligations. According to the 1861 'Regulations Concerning Peasants Leaving Serf Dependency', peasants were obliged to pay the following state and zemsky monetary taxes: 1) poll tax; 2) crop failure fund levy; 3) zemsky levies, both state and general governorate and specific ones; 4) levy used to prepare tax registers. As a form of self-taxation, peasant communities developed mir (volost and village) levies and natural obligations.

During the post-reform period, peasant communities were burdened with the following zemsky natural obligations: road obligation (to maintain postal, trade and military dirt roads connecting towns in the guberniya and uyezd to one another and to mooring docks, fortresses and other military facilities, also to maintain bridges, dams, dikes and other crossings); water navigation obligation (to maintain so-called 'natural tow paths' for navigable and drifting rivers, lakes and bays); cart obligation (to maintain and sup-

ply carts for policemen, investigators, and civil servants travelling on official business, as well as for zemsky postal service; to provide carts for recruits and various military units); quartering obligation (to provide flats to uyezd police and civil servants of certain ranks and help them in their everyday needs, as well as house troops); and prisoner transfer obligation (to escort prisoners if there are no military guards, to provide night lodging to prisoners and their escort, to heat and light these premises, to maintain carts for prisoner transfer). Village communities and landowners of all classes were obliged to exterminate insects and animals that could harm fields and meadows. Zemsky institutions had the right to turn natural obligations into monetary payments at their discretion [Ustav o zemskix, 1903, pp. 2, 263, 264, 267, 268].

The 'Statute on Village Condition' listed the following mir natural obligations of peasant communities: to maintain local public administration; to set up and maintain village produce shops; to keep dirt roads, boundaries and boundary signs, lotic waters and ditches in good condition; to support a village guard; to support elderly, senile and crippled members of community; to take action in case of fire (including forest fire), flood etc. [Polozhenie o sel'skom, 1903, p. 361]. Additionally, former state peasants alone were given the forest natural obligation to dig and plow the forests in order to create fire-fighting boundaries.

All in all, as N. Brzhevsky rightfully noted in the beginning of the 20th century, 'Considerably burdening peasants unevenly, and encumbering only the former taxable classes, the natural obligations, by their general constitution and their

Table 26

The composition of peasants of the Middle Volga region in the post-reform period (in %)

[Trudy' komissii, 1872, p. 4, 6, 8]

Governorates	Peasants		
	former state	former landowners'	former appanage
Kazan	82.61	15.01	2.38
Penza	47.87	52.13	—
Samara	64.43	16.34	19.23
Simbirsk	8.31	42.38	49.32
Total:	54.15	29.33	16.52

everyday practice are, so to speak, an anachronism from the pre-reform period' [Brzhevsky, 1908, p. 22].

The quartering obligation in the multiethnic Kazan Governorate was hindered because of the different ethnic customs of the local people. More specifically, in Spassk uyezd (1867), only Christian peasants fulfilled the quartering obligation to house troops, while Muslim peasants evaded this obligation [Mulgaliyev, 2011, p. 86].

Tax functions of the community. Communal ownership of land was the basis for community's existence as a taxable unit. State, zemsky and mir levies as a general rule were distributed between householders at a meeting using the same numbers that were used for community land division.

Volost levies were divided between villages at volost meetings, in most cases taking into account the census data on population [Brzhevsky, 1908, p. 128]. The unevenness of such taxation is obvious. First of all, since the 10th census—that is, since 1858, census data on the actual population of different volost villages was totally inaccurate; secondly, individual peasants from different villages received different amounts of land.

As for the mir village levies, a part was distributed on the same terms as state and zemsky levies—the very levies covering the mandatory expenses of a village community. The rest of mir levies were quite often distributed on other terms, depending on their purpose. For instance, levies from cattle herders and to keep a common ox were distributed based on the number of head of livestock; levies for night guards and for fire carts were paid equally by each homestead, etc. [State Archive of the Russian Federation, f. 586, inv. 1, file 586, s. 14 reverse–15].

During the post-reform period, the idea of progressive income taxation didn't receive approval among the peasantry: communities didn't adjust any type of taxation based on the earnings of a homestead. Distributing taxes based strictly on the distribution of land was influenced by the traditional idea of the economic and tax significance of land as the main capital held by peasants. In peasants' opinion, using income as a basis for distributing levies, more than any

A drawing of wooden bridge No. 3 on the Bazarovskiy Tract in Spassky Uyezd of Kazan guberniya, which should have been built by peasants as road duty.

other basis, could have led to 'village meeting abuse'. At the same time, village communities quite consistently resisted preferential taxation of poverty-stricken or temporary needy householders. The exceptions were very rare.

The formal criteria for evaluating a family's ability to work was whether payments from land plots were regular or irregular. In order to do this, the community had the authority to discipline. There was a system of coercive measures that laid at the core of joint responsibility. But at the same time, being a 'land allotment possession' union, in many respects it retained democratic characteristics. In respect of taxes, the village community actually served as a kind of a

Sending carts with rye to the mill. Ufa Governorate Photo, M.A. Krukovsky Early 20th century.

barrier buffer. On the one hand, it was a mechanism for seizing funds, an element of the state tax system. But on the other hand, it protected peasants from being treated arbitrarily when officials collected taxes and was a tool in the fight against excessive tax burdens. As a rule, village communities did not coerce individual members, resorting to it only under police pressure. [Russian State Historical Archive, f. 91, inv. 2, file 756, s. 10 reverse].

Property seizure and sale were the most commonly used coercive measures. In the 19th century, property of non-payers was seized in some 60% of debtor villages in Russia. Non-payer property was sold in—20% of villages where seizures had been performed [Svod svedenij, 1898, p. 43].

Village administrations suffered from police pressure as well [Russian Museum of Ethnography, f. 7, inv. 1, file 1339, s. 3]. For instance, in Spassk uyezd of Kazan Governorate, the non-payer peasants were arrested for 3 to 5 days, while a village elder was arrested for 5–14 days for improper collection [Russian Museum of Ethnography, f. 7, inv. 1, file 466, s. 29].

In Chistopol uyezd, peasants were banned from selling grain until non-payer communities paid all the levies imposed on them in grain [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 7482, s. 3 reverse].

By the end of the 19th century, the decision to distribute arrears between all payers

was extremely rare at meetings, which signaled the disappearance of joint responsibility [Simonova, 1969, p. 173]. Joint responsibility for collecting peasant taxes was abolished legally step-by-step. In 1869, joint responsibility for paying direct taxes was abolished (except for redemption payments) in villages with less than 40 recorded persons [Ministerstvo finansov, part. 1, 1902, p. 478]. According to the law of 23 June 1899, villages or their parts with communal land that by record owned less than 60 individual allotments were freed from joint responsibility in all fixed state and zemsky levies. The introduction of zemsky administrators significantly decreased the importance of police in collecting state and zemsky levies [Brzhevsky, 1908, p. 14]. Tax inspectors, on the other hand, initiated more rigorous control over tax book-keeping in volosts and over how public money was handled and transferred to the respective departments.

The law of 23 June 1899 granted village communities the right to set their own periods of the year when each individual village had to pay a part of the yearly taxes. Beginning in 1899, communities consisting of two or more villages (compound communities) were divided into separate tax units, and each community received its own tax list.

In many villages of Kazan Governorate, the specific periods set earlier didn't coincide with the time when peasants sold grain and worked

odd jobs—that is, with the times they were most capable of paying, which also made the administration reconsider the dates. In particular, already in 1900 new specific periods were set by uyezd congress acts in Kazan, Mamadysh and Cheboksary uyezds [National Archives of the Republic of Tatarstan, f. 3, inv. 1, file 6550, s. 3] and the primary tax payment time was postponed to autumn. According to minutes of 1901–1914, village meetings available to us, in Kazan guberniya, 4–6 particular periods were set up to pay state and zemsky taxes.

The introduction of particular payment periods encouraged payers to treat their tax obligations more conscientiously and eliminated the former instances of arrears accumulating in a disorderly manner and joint responsibility being exercised arbitrarily.

According to the law of 12 March 1903, payment of fixed levies was made the personal responsibility of each householder, both for communal and homestead (hereditary) land holdings. The task of collecting arrears was given to tax inspectors, who could decide whether to apply various coercive collection measures to non-payers or to add the arrear to the tax sum if the former was no greater than 20% of the latter.

Poll tax. After the reform, the poll tax still remained the main tax burden for peasants. All in all, in 1867 poll tax revenues made up 44.3% of all state tax revenues. Depending on local conditions, the Russian poll tax ranged from 1.15 rubles to 2.61 rubles [Ministerstvo finansov, part 1, 1902, pp. 476–477]. Across the Middle Volga region, it was from 1.68 to 1.78 rubles [Trudy' komissii, 1872, pp. 4, 6, 8].

Table 27

Total poll taxes and replacment levies collected from peasants of the Middle Volga region in 1872 (in rubles per recorded person) [Trudy' komissii, 1872, pp. 4, 6, 8].

Guberniya	From former state peasants	From former landowners' peasants	From former demesne peasants
Kazan	1.78	1.78	1.78
Penza	1.68	1.68	–
Samara	1.78	1.78	1.78
Simbirsk	1.82	1.88	1.88

In 1875, a per-person state zemsky levy and a public levy on former state peasants were added to the poll tax. By 1875, the poll tax had increased up to 49.5%, then lowered gradually and made up 34.7% of all taxes in 1884 [Statisticheskij vremennik, Ed. 15, 1886, pp. 150–151].

Until the end of the 1860s, tax policy was characterised by an increase in direct taxation, a determined course to use forced collection measures, and an absence of tax exemptions.

The abolition of the poll tax in 1886, 1887 was an important step on the path of replacing class taxation with property-based taxes. N. Bunge's reforms initiated the modernisation of the Russian taxation system, thus contributing to the process of industrialisation in the country.

However, in addition to the general easing of state tax obligations, sources indicate indirect taxation and mir levies increased [Podatnaya inspekciya, 1910; Statisticheskie dannye, 1883; Statisticheskij vremennik, Ed. 13, 1886]. A. Anfimov estimated that between 1881 and 1894, mir expenses alone almost doubled for peasants of European Russia [Anfimov, 1984, p. 79].

After the abolition of the poll tax, collection of arrears continued. In 1888–1891, the excess budget revenue was 209.4 million rubles [Schwanebach, 1903, p. 13].

Land taxation. In guberniyas where zemstvos were introduced, the publication of temporary rules changed first and foremost the very notion of zemsky obligations. On the one hand, the temporary rules limited the notion of zemsky duties, taking out state obligations and

specific obligations. But on the other hand, they broadened the notion by introducing guberniya and uyezd zemsky obligations [Trudy' komissii, 1869, p. 9]. This initiated the division of the Russian budget into several levels. Guberniya and uyezd zemsky levies actually made up the local budget of regions.

State zemsky obligations were essentially state taxes [Vasilchikov, 1870, p. 305]. In 1865, the average levy per person was 0.98 ruble (from 0.33 to 1.33 rubles) [Trudy' komissii, 1869, p. 10]. On 1 June 1870, when estimates of state zemsky obligations for the 1872–1875 period were made, one-fourth of the total sum was shifted to land taxes from all the owners 'indiscriminately' (the distribution of the remain-

ing three-fourths was left the same). The levy was estimated to bring 40.5% per year, of which 60.5% was placed on peasant land [State Archive of the Russian Federation, f. 678, inv. 1, file 684, s. 12–12 reverse].

With the edict of 10 December 1874, the state zemsky levy no longer existed as an independent revenue item. During the distribution of this levy, some changes were introduced to dividing the guberniya into categories, and additional property classes were taxed. For instance, Kazan guberniya was assigned a higher 4th category, while Samara guberniya was lowered by one and ranked as 8th category [Vestnik finansov, 1884, p. 139–140; Trudy' komissii, 1879, p. 54–56].

Table 28

Distribution of state land tax in the late 1870s for village community lands

Guberniya	Category	Rate for 1 tenth share of good land, kopecks			Average charge of 1 tenth rate, kopecks
		middle	lower	upper	
Simbirsk	2nd	8.00	0.25	31.00	12.20
Penza	3rd	6.20	4.00	8.25	6.40
Kazan	4th	4.50	0.90	6.10	4.81
Samara	8th	1.10	0.02	10.50	1.04

Land taxation was based on double land valuation: guberniyas were categorised as separate tax units in order to determine total taxes due from each of them; land inside the guberniyas was appraised in order to distribute the taxes between parts of the guberniyas with different revenue capacities. As a result of the varying earning capacity of lands within a guberniya, the taxes assessed for each payer were not the average guberniya amount, but were specific amounts set by local institutions. For instance, the average tax rate in Kazan guberniya was 4.5 kopeks per desyatina, but the lowest rate was set at 0.9 kopek, and the highest was 6.1 kopeks [Russian State Historical Archive, f. 573, inv. 1, file 117, s. 3].

In 1883 after the land tax overhaul, taxes were calculated based on the amount, value and earning capacity of lands (table 29).

State land tax was a distributed tax. According to the law of 17 January 1884, it was left to guberniya zemsky meetings to distribute this

tax between uyezds, and up to uyezd zemsky boards within uyezds under the terms established for local zemsky levy distribution.

Thus, total direct obligations of former state peasants included separate taxes established during different periods of time and distributed in a peculiar way, with no relation to other payments and mostly without taking paying capacity into consideration, which significantly undermined both the economic basis of peasant agriculture and financial stability of Russia.

Zemsky levies. In average across Russia from 1871–1900, guberniya and uyezd zemsky levies from allotment lands increased by 109.1%, including 150% in Kazan, 107% in Simbirsk, 100% in Penza, 14.29% in Samara guberniyas (table 30). Zemsky levies increased only slightly in the latter guberniya because of the 40% decrease during the famine of 1891–1892 [State Archive of Samara Oblast, f. 150, inv. 3, file 296, s. 21].

Table 29

Land valuation and amount of the state land tax and zemsky fees in 1883 by governorates of the Middle Volga region [Russian State Historical Archive, f. 573, inv. 1, file 325, s. 13, 29, 35, 37; State Archive of Pskov Region, f. 60, inv. 1, file 4011, s. 76–98; State Archive of Pskov Region, f. 60, inv. 1, file 4602, s. 99–115]

Table 30

Average amount of territorial payments from allotments in the guberniyas in the Middle Volga Region, kopecks per desyatina [Materialy' vy'sochajshe, Part 2, 1903, p. 258–262, 290]

Years	Samara guberniya	Kazan guberniya	Simbirsk guberniya	Penza guberniya	In 50 guberniya
1871–1875	7	12	14	13	11
1876–1880	7	14	19	19	14
1881–1885	10	19	21	22	16
1886–1890	10	20	21	21	17
1891–1895	6	26	25	24	20
1896–1900	8	30	29	26	23

Between 1880 and 1901, direct taxes rose by 50 million rubles. Direct tax revenue increased from 172.9 to 220.9 million rubles. At the same time, the revenue from indirect taxation increased by 108%—from 393 to 819.6 million rubles, with especially significant increase during S. Vitte's tenure as minister. Between 1880 and 1892, the revenue from indirect taxation increased by 37% and from 1892 to 1901—by 50% [Schwanebach, 1903, p. 31].

In the late 19th century, peasants remained the main group of direct taxation payers, bringing in 123.3 million rubles (86%), or more than six-sevenths of total monetary taxes (141.25 million rubles); while only one-seventh was distributed (almost evenly) between the categories of private landowners (6.9%) and urban inhabitants (7.1%) [Svod danny'x, 1902, p. 11].

Village community taxes. The structural division of rural community administrations re-

mained practically unchanged up to the Revolution of 1917. According to the law, it was made up of the village gathering and the village elder. A village meeting was attended by householder peasants of the rural community as well as all elected village officials. A householder (head of the family) represented the family before the authorities, the community, and the religious establishment. He was responsible for his house, farm, paid all taxes and also was the one who answered for all misdeeds of his dependents. In the Mamadysh uyezd of Kazan guberniya (out of 306 communities studied), both married and single men were called to meetings, but the latter could vote on the condition that they take a portion of the land share [Russian State Historical Archive, f. 91, inv. 2, file 777, s. 298]. In Tatar settlements, traditionally, the Muslim clergy had a great deal of influence over the intracommunity life.

Poor Tatars. Kazan Governorate Photo by V.A. Karrik. 2nd half of the 19th century.

Apart from the village elder, officials such as tax collectors; wardens of bread stores, schools and hospitals; forest and field watchmen, etc could be elected. After the reform, the rural community started performing the role of a lower administrative unit, acted as a sole legal entity before the state to perform its administrative, business, financial and court obligations.

Traditionally, the community had the right to levy local taxes. Village community taxes differed from other taxes primarily in that first the needs of the community were determined in advance, and then the community established the amount of the tax accordingly. Peasant communities established village community taxes for building and maintaining churches, starting village schools, paying teachers and taking care of other public and economic needs [Sbornik statisticheskix, 1883, p. 86]. The upkeep of mosques, clergy and schools of the Muslims was carried out under Shari'ah regulations and common law. On the whole, about 35% of village taxes in the early 80s of the 19th century in guberniyas of the Middle Volga area went towards salaries of officials

[Statisticheskij vremennik, Ed. 13, 1886, Appendix].

Apart from village taxes, peasants were expected to pay for district expenses, most of which were of an administrative nature. During the post-reform period, a volost was not so much a self-government unit, but a territorial unit to manage peasants. At the volost level, administrative functions were performed by the volost government. A volost was headed by the volost foreman and his assistant. The staff of the volost government consisted of village elders, tax collectors, leaders of ten-man and hundred-man police units, wardens, and clerks. Judgments over peasants were handed down by volost judges. Affairs of major importance were resolved at volost meetings attended by elected representatives from all settlements. A mandatory volost meeting was held annually at the end of the year. It was devoted to reviewing the estimated amounts spent to maintain the volost government [State Archive of the Russian Federation, f. 586, inv. 1, file 115, s. 67].

According to data from 46 guberniyas of the European portion of Russia, in 1881, salaries of officials made up 45.3% of community expenses, maintenance of public buildings made up 10.3%, horses for travelling made up 26%, public education made up 6.1%, and public health made up 2.5% [Statisticheskij vremennik, Ed. 13, 1886, p. 20]. In the Middle Volga region, the salaries of officials, maintenance of public buildings, clerical expenses, official trips and per diem consumed over 90% of all volost taxes [Statisticheskij vremennik, Ed. 13, 1886, pp. 272–273]. Clerks and tax collectors received salaries, the other village officials performed their duties without remuneration and in most cases were exempted from community natural obligations [Russian State Historical Archive, f. 91, inv. 2, file 768, s. 3 reverse; file 777]. In Kazan guberniya, volost foremen in different communities received a salary from 110 to 300 rubles, volost clerks received 480 to 1040 rubles, village elders received 47 to 488 rubles, and tax collectors received 50 to 485 rubles [National Archives of the Republic of Tatarstan, f. 156, inv. 1, file 17, s. 5–6].

In 1895, in 47 guberniyas of the European portion of Russia, 80% of all volost expenses

Table 31

were attributed to maintaining volost management [Leontyev, 1914, p. 83].

In the late 19th century, N. Brzhevsky stated that increasing community expenses tended to lessen the burden of treasury duties [Brzhevsky, 1908, p. 200]—that is, as soon as payments to the state treasury were reduced, community expenses immediately grew, sometimes consuming all or most of the income freed by the reduction of state taxation.

According to the reports of tax inspectors, general community taxes in the late 19–early 20th centuries (with the exception of the famine of 1891–1892) increased by 2.9 times and in 1912 amounted to 6,873,100 rubles in the Middle Volga region, and tripled in Kazan guberniya. While in 1893, 18 kopecks were levied on average per desyatina of taxable land, in 1912 this amount reached 50 kopecks.

Before 1905, community taxes were much lower than government taxes; after elimination of redemption payments, they became equal. At

the same time, the proceeds from community taxes exceeded zemsky taxes by 1.4 times on average. An analysis of tax receipts indicates peasants paid community taxes rather stably even in the years of bad harvests, indicating they were a priority for the rural population, unlike government and zemsky taxes.

In the late 19–early 20th centuries, within the structure of community collections, the ratio of volost to village collections was practically the same and amounted to 1:1.5 in the guberniyas of the Middle Volga region. The share spent on maintaining the volost and village administrations decreased due to the relative increase in tax receipts and in 1905 amounted to 27% (in 1881–45.3%). Over 9% of community amounts comprised expenses for public education, the same amount was attributed to religious needs; about 8% was spent on paying government, zemsky and other taxes; and 5% on the cart tax [Mirskie doxody', 1909, s.32, 34; Mirskie doxody', 1895, s. 19, 31]. During this period,

the taxes used to cover agricultural expenses increased significantly (over 15%)³¹.

Later, agricultural expenses grew even more, which indicated they were of utmost importance for the peasants [Popov, 1915, p. 10]. Therefore, the volost and village community taxes in the late 19–the beginning of the 20th centuries, in fact, were essentially a local budget that provided peasant communities with significant financial resources, a certain share of power and authority within the limits of the settlement, volost, and uyezd.

Burden of taxation. During the post-reform period, the total amount of taxes collected from peasants did not correspond to the profitability of their land or to peasant field holdings in general [Bekhteev, 1902; Nuzhdy' derevni, 1904; Schwanebach, 1903]. Documents from a government commission indicated that 'in certain localities, even in the Black-Earth Belt, the total of all payments is 5 times higher than profitability' [Doklad vy'sochajshe, 1873, pp. 35–36]. This circumstance had already led to an increase in arrears in the 1870s. By 1875, arrears of peasants in Kazan guberniya amounted to 451,800 rubles; by 1882, within 7 years, this sum had increased by more than 6 times. Within 9 years, by 1891, the tax arrears amounted to 8,405,807 rubles, meaning that they had tripled during the period, and during the entire 16-year period they had increased by 18.6 times [Engelgardt, 1892, p. 50].

The fiscal position of peasant households after the poor harvests and famine of 1891–1892 was catastrophic. For example, while by 1 January 1891, peasants of Kazan guberniya were registered as owning 410,000 horses, by 1 January 1892, only 280,000 of them remained [Engelgardt, 1892, p. 7]. The rest of them had died due to lack of funds for feed. By 1 January 1892, arrears reached 12.5 million rubles.

Archive documents contain numerous petitions from village elders asking for tax deferments and for loans for food and seeds for the fields. There were many who wanted to move

to Siberia [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 8447, s. 50–372]. At the same time, in 1891–1892, the government granted 'loans for food and seeds' amounting to 13 million rubles [Engelgardt, 1892, p. 8].

By the end of 1891, in the European portion of Russia, tax arrears had reached 72.6%, including commodity taxes, which were 41.3% of the amount due, government—79.1%, zemsky—75.1%, community—17.3% [Svod svedenij, 1898, p. 2]. The relation of government tax arrears to zemsky tax arrears in Samara guberniya was 625%, in Kazan guberniya—469%, in Simbirsk guberniya—374%, and in Penza guberniya—370% (Table 32).

In 1893, the arrears on general taxes per male resident in Kazan guberniya on average amounted to 14.02 rubles, and in Penza guberniya—8.61 rubles, Samara guberniya—15.69 rubles, Simbirsk guberniya—6.96 rubles [Zadolzhennost' sel'skix, 1894, pp. 6, 11, 13]. The arrears per desyatina in Penza guberniya amounted to 266 kopecks, in the Simbirsk guberniya—226, Samara guberniya—245, Kazan guberniya—394 (the largest in Russia) [Svod svedenij, 1898, pp. 3–4].

The payment sizes were inversely proportional to the size of the peasant's land allotments: the larger the allotment, the smaller the payment per desyatina, and, conversely, the smaller the allotment, the larger the payment per desyatina. According to the 1882–1883 household census, in Samara uyezd, a peasant with an allotment from 1 to 2 desyatina per taxable person paid about 5 rubles annually in total per desyatina, while a peasant with an allotment from 8 to 10 desyatina paid no more than 1.50 rubles per desyatina [Sbornik statisticheskix, 1883, p. 12–13]. According to the household censuses held in Samara guberniya in the latter half of the 1880s, redemption payments amounted to 38.4%, state payments were 13.6%, territorial taxes were 15.1%, and volost and community taxes were 33% of the tax burden for households [Sbornik statisticheskix, vol. 1–6].

When recalculated per worker, the ratio of the total of all taxes in Kazan guberniya is different: former government peasants paid 19.52 rubles, former appanage peasants paid 19.94

³¹ In the Kazan and Samara guberniyas, the public collection from former state peasants was 38 kopecks per person, in the Penza guberniya it was 39 kopecks [Trudy' komissii, 1872, pp. 16–17].

Table 32

Amount of tax arrears of peasants in the Middle Volga region in 1893

[Zadolzhennost' sel'skix, 1894, Art. XXVII]

Governorate	Total tax arrears, rubles	Percentage of tax arrears			Percentage of tax arrears in Russia in total
		kazennye sbory	zemsky sbory	mirskie sbory	
Kazan	13,548,236	93.0	6.3	0.7	11.44
Penza	5,946,171	82.1	16.4	1.5	5.02
Samara	17,547,148	90.8	8.2	1.0	14.81
Simbirsk	4,730,810	84.6	11.0	4.4	3.99
For All Russia	118,475,442	81.0	15.6	3.4	100.00

rubles, and former peasants of landowners paid 16.86 rubles [Dudkin, 1884, pp. 111, 125].

For all three classes of peasants, the tax on the poor was equally burdensome and consumed almost a quarter of the gross income that did not cover the immediate needs and mostly comprised side income. At the same time, even for a rich family, taxes amounting, according to Anuchin, to 40–50 rubles on average (13 to 20%) could not be considered small by any means for net incomes of 200–300 rubles [Anuchin, 1881]. According to budget research, in Kazan guberniya in the late 19th century, peasants paid 3 to 5% of their gross income in taxes. Rich households paid 14% of their net income, average ones paid 28%, and poor ones paid 52% [Stanishevsky, 1899, pp. 14–17; Sherikh, 1899, pp. 25–30; Komarov, 1900, pp. 17–20; Iznoskov, Ed. 2, 1900, pp. 16–23, 38–42; Ed. 3, 1900, pp. 27–41].

When assessing the tax burden of peasant households in Kazan guberniya and the other Middle Volga guberniya, A. Engelhardt remarked, 'As related to income, taxes consume 1/6 of the gross income. It seems impossible to compare taxes with net income because peasant households, in fact, do not have a net income, but we calculate theoretically that taxes consume 53.2% of agricultural profits.

All this indicates the discrepancy between the income received by peasant households and the capital being spent. This discrepancy is so significant that the income received is barely sufficient to support the worker and his family, and also indicates the low profitability of the agricultural industry and the abnormal

conditions it is laboring under. The accumulation of arrears can also be explained by this fact' [Engelhardt, 1892, p. 50].

Data from budget research of peasant households in 13 guberniya of the European portion of Russia (1870–1880) indicate that on average from 5.5% to 27.1% of the gross income and from 11 to 76% of the net income from agricultural went towards taxes [Materialy' vy'sochajshe, part 3, 1903, p. 208].

By paying taxes out of the working capital every time, the population became economically weaker each time and less able to obtain the missing funds, which made arrears grow, despite cuts in direct taxes in the late 19th century.

The economic and tax burden gave the peasants a legitimate reason to protest. During the post-reform period, the peasant movement in the Middle Volga region primarily spoke out against excessive taxes, charges and duties. The peasants categorically refused to pay the numerous taxes—oborok, redemption fees, poll taxes, zemsky taxes, community taxes, state taxes, insurance fees, etc. According to the calculations of Yu. Smykov, 51.5% of all uprisings in the region in 1861–1865 were against duties and tributes [Smykov, 1973, pp. 111–112].

Revolutionary events forced the state to abolish the collection of redemption payments starting in 1907 and to halve them in 1906. However, peasants continued paying the arrears on this tax for past years. The manifesto of 21 February 1913 (in honor of the 300th anniversary of the rule of the House of Romanov)

Lean Year. The hut of peasant Salavatov in Kadomka village of Sergach District. Nizhny Novgorod Governorate.
Photo by M.P. Dmitriev. 1891–1892

formally did away with all arrears on the abolished redemption payments [Ministerstvo finansov, 1914, p. 102]. This way, the financial aspect of the peasant reforms of 1861 was finally eliminated.

In the early 20th century, the general burden of taxes and duties paid by peasantry lightened a little. According to the calculations of A. Anfimov, the ratio of the entire amount of taxes and payments to the income from agriculture in 1901 was 28.74%, and in 1904 it was 24.80% [Anfimov, 1984, p. 111]. After redemption payments were abolished in 1907, taxes and duties paid by peasants did not exceed 12.86% of their income on average [Weinstein, 2000, p. 84]. The share of direct and indirect taxation of the peasants in the Middle Volga region corresponded to the general Russian level: 11.7% of income went towards taxes [Kratkie byudzhety, 1915; Itogi ocenочно-statisticheskogo, 1923]. This had a positive impact

on the development of the peasant economy and the country's economy in general.

The revolutionary events of the early 20th century forced the state to make important reforms, such as abolishing joint responsibility among the rural population (1903); modifying the passport regime (1906); canceling the special punishment rules for peasants falling within the purview of the volost courts (1906); granting the right to leave the community (1906); equalizing the rights of peasants with other classes with respect to entering state service or educational institutions, receiving a clerical title or joining a monastery (1906); finally abolishing the poll tax (1907); and abolishing redemption payments for land (1907). With the introduction of the representative institution and new political rights, the peasantry was legally freed from its specific, birth status-related restrictions and start quickly turning into a social class.

CHAPTER 6

Parish Islamic Clergy

Ildus Zagidullin

After the fall of Kazan, the spiritual development of the Tatars started to stagnate. The destruction of the funding system of Islamic institutions that had been maintained mostly at the expense of waqfs and state support and other factors transformed the functions, composition and names of titles of the parish clergy.

The radical changes that took place in the region are noticeable when one compares the titles of the clergy of the former Crimean Khanate with the Volga-Ural regions during the Russian period. For example, there were the following clerical titles in Crimea: a mufti, qadi-esker, qadi (exercised judicial functions according to the Shari'ah), khatib, imam mu-ezzin, ferrashi (a servant at a mosque), shaykh (an elder at a teqie), mudarris, and gochi (a teacher at a maktabeh). Each of them, as a rule, performed only their own spiritual duties [Zagidullin, 2009, p. 90–94]. Spiritual leaders performed several functions at a time in underpopulated Tatar rural communities that were unable to maintain several clerics: that of an imam, who presided over public prayers and performed spiritual needs for the locals; a qadi (judge), who resolved the issues of inheritance and disputes between parishioners; and a mugallim (mudarris), who taught the basics of Islam. In the 17–18th centuries, in the Tatar mahallahs, members of the clergy were known as abyzs and (or) mullahs. Sh. Marjani wrote that in past centuries, every mullah and person able to read and write was known as an 'abyz', from the term 'hafiz', a person who has memorized the Quran [Marjani, 1989, p. 242–243]. The title 'mullah' (from Arabic *Mawla*—ruler, master, minister, an honorary title of a learned person) was frequently used as a synonym for the term 'imam' [Farkhshatov, 2006, p. 286]. Notably, during the Empire period, all parish clergy were named mullahs in clerical corre-

spondence; they were divided into those designated—that is, appointed by the authorities, and undesignated—public clergy that had not passed the approval procedure in the manner prescribed by the law. In Muslim parishes of the Middle Volga region, undesignated mullahs could be found even as late as in the last years of the first quarter of the 19th century [Kobzev, 2007a, p. 76], and in some locations near the Urals, up to the early 1880s [Farkhshatov, 2006, p. 287].

Data going back to the second quarter of the 18th century recreate the ecclesiastic positions in effect in the Urals region: 'afende, ahun, mullah, abyz, and where there is a mosque, a muezzin as well, who, like a sexton or church warden, always serves at the mosque; the Bashkir have few mosques, and each of those is a cathedral mosque, while in other uyezds the Tatars have a mosque almost in every village, where they gather every Friday or during holidays for prayer; in ecclesiastical positions in other locations of the Great Tataria; seals are given by teachers to ahuns based on scientific principles, so that the latter can make others ahuns based on the same principles, though without a seal' [Proceedings of the Society of Archeology, History, and Ethnography, Ed. 6, pp. 166]. In this region, the government recognized the Muslim clergy, whose legitimacy was expressed in the fact that yasaq was collected from every Bashkir household with the exception of elders and spiritual leaders [Istoriya Bashkortostana, 1996, p. 199].

In the first third of the 19th century, in the Orenburg Muslim Spiritual Assembly district, there was another, not quite traditional ranking of ecclesiastic titles. For example, according to 1833 data, there were the following ecclesiastic titles: ahuns (68 persons), hatibs (100), imams (1792), mullahs (1164), muhtasibs

Mullah dressed in a holiday suit Ufa Governorate, Chishma village. Photo by M.A. Krukovsky Early 20th century.

(343), mudarrises (439), but there were no muazzins. Obviously, the hatibs were dispersed among the mullahs. According to the statistical data for 1839, they are also missing; however the ecclesiastical titles of mullah and mudarris had disappeared but the numerical strength of hatibs had increased exponentially (1903), the number of imams grew a little (1185), while the number of ahuns (65) and muhtasibs (285) somewhat decreased [Zhurnal ministerstva vnutrennix del, 1840].

By founding the Collection of Muhammadan Laws in 1788, the government regulated the procedure of appointing parish clergy by making a synthesis of Shari'ah and Russian laws. An ecclesiastical position was not hereditary; the parishioners endeavored to elect the most studious graduates of madrasas as imams. A public resolution signed by 2/3 of heads of parish households was considered legitimate. The document was drawn up in the presence of volost heads and rural officials, and among the military serving class in the presence of canton officials and yurt aldermen; then it was

presented by peasants 'for witnessing' at the volost administration, and by the representatives of the military serving class through canton officials to the zemsky court and from there to the guberniya administration [Svod uchrezhdenij, 1857, Art. 1247, 1245, 1246, 1248].

The governorate administration made sure that the persons elected as imams were politically reliable and 'of good standing'³². Candidates were approved before they passed the examinations at the Spiritual Assembly. By sending them for testing to the Orenburg Muslim Spiritual Assembly, the governorate administration in fact decided the issue of his appointment to the ecclesiastical position, the examination was secondary, and the subsequent approval of the clergyman in the position by the local secular authorities was a mere formality [Russian State Historical Archive, f. 821, inv. 8, file 594, s. 5 reverse-6]. Based on results of the examination, the Orenburg Muslim Spiritual Assembly issued a certificate stating the ecclesiastic title of the candidate to the spiritual position. As a rule, a hatib was at the same time assigned the title of a mudarris (head of a madrasa, senior teacher); an imam was assigned the title of mugallim (teacher); and a muezzin, that of a mugallim-sabiyan (teacher of small children) [Azamatov, 1996, p. 144]. Then, by a recorded resolution, the governorate administration approved the candidate to the spiritual position. After the candidate made an oath at the police office, using the text from the Sacramental Obligation of a person taking a bureaucratic post, he was issued a statement (decree) and explained the duties of a spiritual official.

According to the Senate Decree dated 31 August 1826, the clergy of Orenburg and Tavria districts were recommended to re-

³² The following persons were not allowed to take an ecclesiastical title: 1) 'those under investigation or on trial for crimes and actions, and also imprisoned or punished more severely based on a court order, as well as those who, after being on trial for the crimes or actions resulting in such punishments, were not exonerated; 2) those eliminated from service based on a court order or from the clergy for wickedness, or from the communities or classes, to which they belong; 3) those declared to be poor debtors; 4) those in trusteeship for squandering' [Ustavy' duxovny'x, 1857, Art. 1570].

frain from engaging in 'commercial business' [Azamatov, 1996, p. 144] with the exception of minor trading.

In 1891, Russian education qualifications were introduced for those wishing to hold spiritual positions that did not apply to candidates to the posts of muezzins.

Starting in 1892, a circular letter of the Ministry of National Education prohibited imams who had studied at foreign Islamic religious educational institutions from teaching. Local authorities did not always exercise their right to prohibit imams who had studied abroad from teaching, they examined each case individually.

One of the first spiritual titles to receive recognition from the authorities was the title of *ahun*. In the Ural region, an ahun was elected by spiritual leaders and elders of the area, and he represented the interests of Muslims before the administration. In 1735, in Orenburg krai, all 10 ahuns were Tatars from Kazan and other uyezds; however, their allegiance to the government was considered doubtful by the authorities, and their activities were uncontrolled. As a result, by the Decree of 11 February 1736, one ahun was appointed for each daruga (administrative unit) after he swore allegiance to the Russian sovereign. The ahun was then approved by the governor and issued a certificate. The administration started neglecting the principle of the local clergy electing an ahun, preferring to personally appoint 'a convenient person' to the position. In the instructions to the Legislative Commission (Ulozhennaya Komissiia) of 1767–1768, the Bashkirs requested to restore the frequency and elective nature of ahuns [Azamatov, 1996, pp. 16, 17, 19; Gvozdkova, 1999, p. 190].

The cooperation of authorities with spiritual leaders in the Ural region was influenced by geopolitical interests of the Empire in the Kazakh Steppe. The Orenburg Expedition established in 1734 had an official position of an ahun used to resolve foreign political issues [Denisov, 2009b, p. 20]. In 1785, the position of ahun was created in the Orenburg Border Commission. It was given to the future first Orenburg mufti M. Khusainov, who in 1786 received the title of 'the first ahun of

the territory' with the right to issue permits for building mosques and assigning religious titles [Islaev, 2004, pp. 349]. He also recommended Tatar mullahs for the administration to send to Kazakh camps [Sultangalieva, 2011, pp. 155–156].

Prior to the establishment of the Orenburg Muslim Spiritual Assembly, in Orenburg krai ahuns held examinations for future spiritual officials to check their knowledge of fundamentals of Islam, awarded the spiritual titles established in the Islamic world, decided whether to 'allow or not allow' the Friday midday prayer, and participated in the decision making regarding the building of a mosque. It is important to mention that in the draft provision of 1789 on the competence of the Orenburg Muslim Spiritual Assembly compiled by Baron O. Igelström, the institute of ahun was established in every uyezd. The ahun was charged with supervising mosques, schools and ecclesiastical persons [Materialy' po istorii, Vol. 5, pp. 566].

In the district of the Orenburg Muslim Spiritual Assembly, along with the mufti, ahuns were considered senior clergy and were exempted from being recruited [Svod uchrezhdenij, 1857, Art. 1228, 1231]. However, the growing number of ahuns and the ensuing devaluation of this title forced the Spiritual Assembly to introduce the post of senior ahun. During the rule of Mufti Gabdessalyam Gabdrahimov (1825–1840) first the senior ahuns, and then during that of Mufti Gabdelvakhit Sulejmanov (1840–1862) the ahuns were given the duties of the district representative of the Orenburg Muslim Spiritual Assembly at the local level [Azamatov, 1996, pp. 92–94]. They investigated infractions of the clergy and represented the religious administration and the clergy before the regional government.

In the latter half of 19th century, the attempts of the Orenburg Muslim Spiritual Assembly to secure ahuns as a medium-level institution in the system of management of spiritual affairs were unsuccessful. Their positions, rights and duties were not regulated officially, which made ahun status an honorary spiritual title, in most cases awarded to reputable and learned imams. In the late 19th century, there were occasions of awarding

this title even to candidates to the positions of mullahs based on results of examinations to the Orenburg Muslim Spiritual Assembly. After leaving ecclesiastical service, a person lost the honorary spiritual title of ahun [Russian State Historical Archive, f. 821, inv. 150, file 404, s. 71]. However, at the regional level, reputable ahuns still acted as an intermediary between the Orenburg Muslim Spiritual Assembly and parishes. They supervised the activities of the clergy, checked parish registers as necessary, and conducted investigations, made inquiries, etc. at the request of Orenburg Mohammedan Spiritual Assembly [Steinfeld, 1893, p. 276].

In Western Siberia, when interacting with the local authorities, ahuns acted as district clergy in uyezds [Bakieva, 2011, p. 13].

In 1856, in the district of the Orenburg Muslim Spiritual Assembly there were 37 ahuns, in 1889–65, in 1908–150 [V pamyat' stoletiya, 1891, p. 32; Zagidullin, 2007, pp. 143].

Muhtasibs (from the Arabic word for 'to teach, check') were required to monitor the morals of the parishioners and spiritual leaders. According to the explanation of the Orenburg Muslim Spiritual Assembly, in the 1850s, the main duty of a muhtasib was to see that the parish registers were kept properly [Russian State Historical Archive, f. 821, inv. 8, file 954, s. 13 reverse]. In the middle of the century, the number of muhtasibs decreased fivefold: in 1855, there were 66 of them [Zagidullin, 2007, p. 143]. The status of muhtasibs was also not defined. It became an honorary spiritual title assigned based on a recommendation of the Orenburg Muslim Spiritual Assembly and resolution of the governorate administration 'to reward good service'. Moreover, the title of muhtasib was given not only to hatibs but also to persons who had left the spiritual path [National Archives of the Republic of Tatarstan, f. 2, inv. 2, file 3741, s. 1–13]. At the end of the century, the spiritual title of muhtasib was rarely encountered in the lists of clergy.

In the district of the Orenburg Muslim Spiritual Assembly, the lowest spiritual positions were held by *hatibs*, *imams*, and *muezzins*. Their duties were regulated superficially by the laws, their duties were governed by the instruc-

tions of the Orenburg Muslim Spiritual Assembly and the Ministry of Internal Affairs. The Muslim clergy performed occasional religious rites, effected and dissolved marriages, examined claims on wills and divisions of property according to the laws of Shari'ah, and examined cases of children defying their parents and of spousal infidelity [Ustavy' duxovny'x, 1896, Art. 1347, 1418]. An important aspect of the legal status of a religious person who was in charge of civil affairs was his conciliatory duty, which largely gave him authority among the Muslims [Reisner, 1905, p. 178].

Their hierarchy was not maintained at all times, causing disputes and in-fighting. If there were two spiritual leaders holding the same title in a parish, the Orenburg Muslim Spiritual Assembly elected the senior mullah from among them. The main duty of a hatib was to read the khutbah during holiday services. He also kept the parish register in the Tatar language and supervised other spiritual leaders with regard to performing occasional rites for the parishioners. Muezzins were allowed to perform the duties of an imam only if this had been specifically stated on their certificate from the Orenburg Muslim Spiritual Assembly. The duties of a muezzin including calling the parishioners to worship (they called 'azan' from the minaret or the mosque roof); praying special prayers (*du'a*) before each prayer began; and ensuring cleanliness and order at the mosque [Farkhshatov, 2006, p. 71]. To hold this position, one did not need to graduate from a madrasa.

In 1855, to stop the abuse of power, an age restriction was established: to become members of the Orenburg Mohammedan Spiritual Assembly, ahuns, muhtasibs, mudarrises, candidates had to be at least 25 years old, to become hatibs and imams they had to be 22 years old, and muezzins had to be 21 years old [Complete Code of Laws of the Russian Empire—2, Vol. 30, No. 29040].

Mullahs could perform rites only in their own parishes [Russian State Historical Archive, f. 821, inv. 8, file 666, s. 141]. It was typical for Islam in Russia that the authorities allowed only the appointed mullahs to perform all Islamic religious rites and teach religious subjects.

The parish clergy were the court of first instance and the Orenburg Muslim Spiritual Assembly was the highest court that Muslims could petition if they disagreed with the decision of the mullah.

The government assigned the clergy a number of administrative duties. As a representative of the authorities, a mullah 'administered the oath' to officials, advisory organs of city local government, zemsky assemblies, recruits or conscripts [Klimovich, 1936, p. 63], witnesses

and defendants at court proceedings [National Archives of the Republic of Tatarstan, f. 98, inv. 1, file 2219, s. 281, 282], and parishioners after a new Russian tsar was crowned [Central Historical Archives of the Republic of Bashkortostan, f. I-295, inv. 11, file 13629]. They drew up civil state documents and issued certificates of birth, death, marital status, and conscription age of parishioners based on the parish register (starting from 1829). In 1891, the Orenburg Muslim Spiritual Assembly commissioned imams to deliver lists of infants that needed vaccinations to the uyezd zemsky administration every six months [Naganava, 2006, p. 104].

The clergy answered to the Orenburg Muslim Spiritual Assembly and were subject to its judgment and fines for neglecting their duties. They could be temporarily or completely removed from their posts, and the decision of the Orenburg Muslim Spiritual Assembly was approved by the governorate administration. The clergy were fined for improperly fulfilling their duties, drinking alcohol, immoral acts, conflicts with parishioners, etc. based on the public verdict of the mahallah. If a criminal case was brought to court, orders of the authorities were ignored or statements were made against the government, they were re-

Certificate ('ukaz') of mullah Yarulla Shamsutdinov. Kurmanakovo village of Laishevo uyezd. Kazan guberniya, 1869.

moved from the post administratively, without a court session or investigation [Russian State Historical Archive, f. 821, inv. 15, file 404, s. 50]. Complaints about decisions of the Orenburg Muslim Spiritual Assembly were submitted to the local governor who referred them to the Minister of Internal Affairs [Ustav' duxovny'x, 1896, Art. 1424, 1425].

The Orenburg Muslim Spiritual Assembly was frequently unable to maintain control over the parish clergy; it merely reacted by making decisions based on claims submitted by parishioners or imams about each other. Its decisions were delivered to the person in question through the governorate or volost government after an investigation by the Orenburg Muslim Spiritual Assembly that, as a rule, was assigned to the local administration as well as a reputable imam [Garipova, 2011, p. 174].

Imams were not civil servants and did not receive a salary or pension. Therefore the maximum age at which they could serve was not regulated and was determined mainly by the state of their health and their ability to perform their duties.

Starting from the mid-19th century they started to award medals to parish spiritual leaders for faithful performance of their duties, usually on an anniversary of their service.

The government took steps to make the status of the Muslim clergy close to that of the Christian clergy. In 1850–1873, imams were exempt from recruit duty. In 1874, they again were bound to military service, and were freed from it only by the law of 23 June 1912 [Iskhakov, 2003, p. 245].

In 1850, ahuns and parish spiritual leaders were no longer subject to corporal punishment [Arapov, 2001, no. 83]. In 1863, this provision was extended to their children [Complete Code of Laws of the Russian Empire—2, Vol. 38, No.39594, item 10]. In 1893, the Ministry of Internal Affairs allowed parish spiritual leaders to mail their correspondence addressed to authorities and government institutions free of charge through police departments and volost administrative offices [Sbornik czirkulyarov, 1902, p. 62].

In order for imams to regulate the five daily prayers and maintain control over the movements of the parish clergy, in 1896, the Ministry of Internal Affairs introduced the rules of dismissal. They took vacations with the permission of the governorate administration and were allowed brief absences (not more than two weeks) at the discretion of governorate officials, with the knowledge of the local police department. In 1900, receiving permission for short absences was simplified by granting them the right to leave after notifying the uyezd police office.

In Muslim irregular regiments, represented in the Ural region by the Bashkir and Meshcheryak, the Muslim clergy were considered a privileged social group. They were exempt from all duties in cash or in kind. In the parishes of teptiyars, the clergy did not enjoy such privileges as in mahallahs of irregular troops [Azamatov, 1996, p. 105]. After the Bashkir Army was abolished in 1865, all imams had the same social status in the district of the Orenburg Muslim Spiritual Assembly—they were governed by the provision stating that a spiritual leader in the district of the Orenburg

Mohammedan Spiritual Assembly paid duties as a representative of the social class to which he had belonged before being appointed to the spiritual post.

Just like the Orthodox clergy, the Muslim parish spiritual leaders were not members of the village land community, even though most of them were peasants and were subject to the corresponding duties and taxes. Starting from 1826, parishioners were allowed to distribute the taxes and duties assigned to them between members of the land community.

A long period of study at the madrasa, the learning of the Arabic and Persian languages as well as of religious subjects required financial expenses and intellectual abilities, as a rule, more available to the sons of mullahs; the latter conveniently placed their children in spiritual leadership positions. In this manner, dynasties of clergy were formed in which positions were successively passed down in mahallahs, creating a caste-like clergy [Kobzev, 2007a, p. 70]. As S. Rybakov justly noted, 'the Russian law created the Muslim clergy as a class, mullahs with rights and prescribed duties, foreign to the Muslim world, not stipulated by the Muslim law (Shari'ah)' [Rybakov, 2001, p. 267].

Along with a growth in the number of parishes, there was a dynamic growth in the numbers of clergy. While by 1833 certificates had been issued to 3,907 spiritual leaders (in 3,133 mosques), by 1868 their number increased to 6,553 (in 4,053 mosques). In 1889, the spiritual needs of the 3.4 million Muslims in the district of the Orenburg Mohammedan Spiritual Assembly were serviced by 7,203 clergy members (in 4,254 mosques), in 1908, 8,312 clergy members (in 5,230 mosques) [V pamyat' stoletiya, 1891, p. 32; Zagidullin, 2007, p. 143].

Therefore, the Muslim clergy, thanks to their high social status within the parish in the Tatar and Bashkir communities, comprised an influential social stratum, to a certain extent similar to a corporate group.

Section III

The Socio-Economic Development of the Tatars in the Volga-Ural Region

CHAPTER 1

Socio-Economic Processes Among the Tatars of the Volga-Ural Region in the Pre-reform Period

§ 1. Socio-economic development in the region

Nailya Tagirova

The socio-economic development of Russia in the 19th century has been defined by contemporary researchers as a period of modernisation when an industrial economy and society were established, and urbanisation took place. The start of the century saw the 'steam revolution,' and it ended with the oil and electrical 'revolutions' that laid the foundations of 20th century industry. The economic success of industrial countries of Western Europe made them leaders of the global economy.

In Russia in the 19th century modernisation 'germinated' gradually, maturing deep in socio-economic life. Proto-modernisation is a term commonly applied by researchers to the first half of the century¹ [Proskuryakova, 2006;

Arsentiev, 2004a; 2004b]. At the same time, the Russian Empire was 'growing' new territories: in the west (the Kingdom of Poland and the Grand Duchy of Finland), in the south-west (North Caucasus), and in the south-east (Middle Asia, Turkestan). The eastern boundaries of the Russian Empire stretched as far as North America, including Alaska (until 1867). The empire was 'constructed' over the course of the entire century, and by its end it was the largest empire in the world by size.

The empire's territorial expansion; the maintenance of military stability and governance of new borders; the development of the borderlands and promotion of economic growth, and, as a result, the country's economy were all important aspects of life in the empire and were subject to Russian modernisation in the 19th century.

P. Milyukov presents an overview of the development processes that took place in Russia in his 'Essays on the history of Russian culture.' He identified three geographical zones, three triangles that faced different sides of the country, but which were, 'if not by nature, but by history... associated with the Russia's core.'

1) 'Russia's central triangle rests upon its western boundary and tapers into the Middle Volga Region. This represents the strong connection between Russia and Europe, both geographically and historically.'

'The two other triangles face the opposite way, tapering to the west. They take us to Asia':

¹ 18th –the first half of the 19th century is a special period known as 'proto-modernization' among modern scholars. At this stage, the economy: 1) is based on agriculture; industry is 'built' in the agrarian economy and closely connected with it; 2) a rather high level of commodity production is established; 3) proto-industrialization is presented in various forms of industrial production, including small (urban craft, artisan and homemade peasant crafts) and large (manufacturing, centralized and scattered, and 'proto-factory'); 4) there is a spatial division of labour, and it does not always coincide with the later geography of industrial centres; 5) trade is carried out not only at local but also remote (including foreign) markets, which contributes to the development of the domestic commodity market (and the internationalization of markets), the concentration of capital, the formation of the labour market; 6) the transition from natural productive forces (when individual agricultural and handicraft production prevailed) to public, which involve, firstly, 'cooperation' (cooperation on the basis of a market functional division of labour); secondly, on a division of labour in the labour process (manufacture); 7) personal dependence relations were replaced by personal independence relations on the basis of a person depending on the flow of

goods and money, that is, the market: by the end of this period, the main classes of a bourgeois society began to form' [Proskuryakova, 2006, pp. 4–8].

2) The north-eastern triangle, 'which is more closely related to the central triangle, leads to Siberia'; 3) The south-eastern triangle 'leads to the Caspian-Aral steppes' [Milyukov, volume 1, pp. 90–91].

The interests of central government in the 19th century were focused on the Volga-Ural lands. This was where geostrategic, economic, political, and administrative issues aimed at furthering the empire's eastern expansion were decided.

Administratively, these lands were divided into guberniyas and krais under the control of governors and governor-generals. The territory, stretching from the Caspian Sea in the south to the area between the Volga-Kama and Volga-Vyatka Rivers in the north, from the Ural Mountains in the east and the Oka-Sura River basin in the west, in the administrative areas of the first half of the century was made up of Kazan, Penza, and Simbirsk guberniyas (the Middle Volga Region), Saratov and Astrakhan guberniyas (the Lower Volga Region), Vyatka and Perm guberniyas (the Northern Cisurals), and Orenburg guberniya (the Southern Cisurals). Siberia (Asian Russia) in the 19th century was still 'a primary zone of empire-building' [Milyukov, volume 1, p. 470], or 'a third stage province' [Sverkunova, 1996], when the 'resettlement of the Russian population from non-Russian territory in the Urals to Siberia' had just started.

The agrarian economy had expanded in these lands for centuries. The direction, nature, and particularities of its expansion were determined by geography as well as other natural and climatic conditions. Plains made up most of the territory. Rolling hills were interspersed with lowlands and gentle rises, river systems (Volga, Kama, Belaya, their tributaries) and forests. From the north-west to the south-east, the landscape gradually changed from forest to forest-steppe, to steppe, forming three bands of land requiring three methods of economic management:

Forest band:—the Kazan and Penza Guberniyas, most of the Simbirsk Guberniya, the northern lands of the Samara (the Stavropol, Bugulma Uyezds) and Ufa (the Birs, Menze-

linsk uyezds) krais. Here there were predominantly podzolic and grey forest soils. The forest area extended towards the Vyatka River to the north-east.

Forest-steppe band:—the south of the Simbirsk Guberniya (the Syzran Uyezd), most of the Samara Volga Region (the Samara, Buguruslan, and Buzuluk Uyezds), the central Uyezds of the Ufa krai (Ufa, Sterlitamak, Belebey).

Steppe band: the Novouzensk and Nikolaev Uyezds in the Samara Trans-Volga Region, the Kamyshin and Tsaritsyn Uyezds in the Saratov Guberniya, most of the Orenburg Region and the Astrakhan Region. Feather-grass steppes with fertile chernozem soil were present in the south of the Belebey and Sterlitamak Uyezds of the Orenburg krai. The steppes extended to the south-east, including Siberia. The Siberian and Trans-Ural areas had their own unique characteristics. Climatically, they were divided into the lands from the Urals to Yenisei (an almost European climate), Central Siberian (a strictly continental climate) and eastern (influenced by the Pacific ocean) [Milyukov, 1994, pp. 92–93].

The mountainous terrain of the Ural range, which was surrounded by forests (the Zlatoustovsk Uyezd, the western parts of the Orsk, Verkhneuralsk, Troitsk, Chelyabinsk Uyezds of the Orenburg Guberniya), jutted into the black earth region like a wedge.

In the early 19th century the Volga was regarded as the border between Europe and Asia.

Various types of economic activities were present: agriculture, nomadic stock raising, and mixed farming methods (agricultural-stock raising, stock raising, and forestry) [Kuzeev, 1978, p. 100], were adapted and integrated in surprising ways to suit the environment and climate of the Volga-Ural Region. Agricultural economies and mixed agricultural and craft economies were developed in the forest and forest-steppe bands of the Middle Volga Region, which were inhabited by indigenous communities and Russians. Bashkirs and Kalmyks were involved in nomadic stock raising in the steppe regions. Siberia in the 19th century was inhabited by 'aborigines' (the local population), exiles, and

the military, and there was a necessity to move away from military development and building of fortified local agricultural centres towards the creation of regular trade relations.

In the first half of the 19th century the government's domestic policy was aimed at settling the south-eastern territories with natives of the empire's central regions in order to gradually displace nomadic activities and develop agriculture. These processes have been described in depth [Tarasov, 1984; Kabuzan, 1992; Povolzhye (The Volga Region), 2007; Ocherki (Essays), 2010]. In particular, it has been noted that in the 18th and first half of the 19th centuries the more central territories—the Volga Region, the Cisurals, Novorossia—were more actively settled² (see: Appendix I, Table 1). In the 1840s migrants from the neighbouring Volga Region guberniyas were replaced by peasants from Central Russia, Ukraine, Lithuania, and Belarus (Russians, Ukrainians, later, Poles, and Estonians). These processes changed the ethnic composition of the region: the proportion of Russian peasantry increased, and in some regions even became the majority. The male population increased (from 27.4% in 1795 to 36.3% in 1857) (see: Appendix I, Table 2). The ratio of landlords to state peasants also changed in favour of the latter [Ocherki istorii, 2010, p. 91]³.

By the middle of the century (based on the 10th census), the population of the Volga-Ural Region was over 6 million (6,390,763 people), the overwhelming majority of whom were peasants—that is, 80.7% (5,155,957 people). At the beginning of the 19th century the Volga Region was considered a densely-populated region comprising mostly Slavic peoples. Only the southern and south-eastern steppe areas remained poorly populated. The concentration of manpower in this promising region with its rich and partially virgin lands was the basis for

a breakthrough in agriculture, as long as the necessary institutions were present. Agricultural immigration contributed to the expansion of agriculture, while nomadic stock raising and cattle breeding steadily declined. Agricultural structures adopted characteristics and priorities that were clearly agrarian in nature.

The demographic changes were accompanied by economic changes. They are not significant over a one or two generation period, but a civilisational 'shift' related to fundamental changes in land use did in fact occur. Nomadic stock raising did not simply give way to a production-based agricultural economy. The changes in land use also changed the economic relations: traditional landownership transformed into capitalistic landownership.

Let's look at these processes in detail.

In the upper reaches of the Volga and its middle course land was traditionally owned by private farms belonging to noblemen-landlords and serving Tatars (quarter landownership). Most of the land in the Trans-Volga and Orenburg Regions was owned by the state and managed by the Ministry of State Property. Nomadic peoples used the land based on common (patrimonial) law passed on by inheritance. The tsar had few lands (known as appanages, managed by the Office for Appanages). In the south-east relations between the supreme and real landowners were not so much confused as not legally formalised. Boundaries were often only nominal.

The migration policy and land provisions made for migrants significantly changed these relations. Private landownership remained unchanged, its formation even being encouraged⁴. The users of state lands changed⁵. Newly-arrived peasants were provided with 15 dessiatinas of land per man for collective use and were

² In the Lower Volga and Cis-Ural regions during this period alone, more than 1 million 220 thousand people resettled there [Kabuzan, 1971, p. 43].

³ The total population changed, including according to the categories of taxes to pay, in the first half of the 19th century, as reflected in Table 3–3a [see Appendix 1]. In 1857, landed peasants accounted for 25.2% (calculated on the basis of Table 6 (see Appendix 1)).

⁴ The granting of lands to nobles continued until the 1880s. The landed estates created there were small and medium-sized (often up to 60 desyatinas), and primogeniture (prohibition of sale) was applied to them.

⁵ Terms of land allotment for new settlers (mostly state peasants) were defined in the Senate's decree of 22 September 1802 'On the rules of granting lands to state peasants in Simbirsk, Saratov, and Orenburg guberniyas' [Complete Code of Laws of the Russian Empire–1, Vol. 27, No.20426].

offered tax breaks (exemption from duties and recruiting duty for three years) and economic privileges (sale of forest and timber for house-building) [Istoriya Bashkortostana, volume 1, pp. 335–336]. New villages in the steppes of the Trans-Volga Region were able to obtain 40–60 dessiatinas of useful land. Such plots were very large compared to those in the central guberniyas and even ones neighbouring the Volga Region (Kazan, Simbirsk, Penza). The organisation and financial costs of land management were covered by the Ministry of State Property from the revenues gained from the lease of state lands (quit-rent legislation).

Although there were plans to provide newcomers with land from the reserve fund, this was often far from the case in reality. This created a basis for land disputes, some of which carried ethnonational overtones. The relationship between newcomers and indigenous people was not easy. Court proceedings, mainly connected to land management and squatting disputes, lasted for decades, requiring further refinements of the legal code⁶. These topics have been described in detail in research studies [Usmanov, 1981, p. 41; Samarskaya letopis', 1993, p. 67; Ocherki, 2010, pp. 72–74; Shaykhislamov, 2007, p. 8]. These court proceedings were a result of one traditional land use (communal nomadic) being replaced by another, also traditional (communal agricultural). Traditional relationships with the land, regardless of the time when the territory was annexed and type of economy (nomadic or agricultural) or form of ownership (noble, state, appanage), were prevalent in the entire Volga-Ural Region.

Alongside these traditional relationships the government permitted uninhabited lands to be sold on the open market to noblemen, merchants, or peasants. However, local officials

did not always consider whether the purchased land was being used [Usmanov, 1981; Rodnov, 2002]. A small number of purchases of state land signaled a new market trend, paving the way for further land-related entrepreneurial activity. Use of leases (relating to the right to use land temporarily) became widespread (both with regard to state land and among landlords and Bashkiri landowners)⁷.

The formation of market conditions while simultaneously strengthening traditional communal practices created an inconsistency regarding the treatment of land while the south-eastern territories of the Volga-Ural Region were being developed. It formed the basis for future social conflicts.

The authorities' desire to simultaneously resolve social issues (strengthening imperial positions through immigration policy: landlords and peasants), financial issues (increasing state budget revenue sources through the lease and sale of part of the state fund), and economic issues (agricultural development of the region and long-term industrial grain production) by managing migration and land policy created a complex 'tangle,' which led to future conflicts.

There were changes in agricultural production as well as land management. The area of land used for agriculture increased. An increase in cultivated areas led to an increase in the gross grain yield. Even if they were 10–15% lower than scholars estimated at the time, they show the general trend (see: Appendix I, Table 4). According to official data from the Ministry of internal Affairs, the average grain yield in European Russia was 3.4, 3.5. In the new lands, in the Lower Volga Region and Cisurals, grain and crop yields per head were higher average: 3.6–4.0 (see: Appendix I, Tables 4, 5).

⁶ The 1832 decree 'On the rights of the Bashkirs to lands belonging to them in the Orenburg region' allowed peasant settlers to buy land or rent it from Bashkir land owners. As of 1858, there were almost five times fewer buyers of these lands from the Bashkirs than those who rented it (12,800 versus 51,500 people respectively).

⁷ Bashkir lands had long been rented by peasant settlers (military and civilian). Over time, the terms of lease were forgotten, and there were disputes and litigation, which required introducing special rules (February 1869) to regulate the prevailing conditions. The rules stipulated that the lands of military settlers went to the treasury, and the other types of lands were to be owned by those settlers. Civilian settlers began paying redemption payments, as well as specific and state peasants.

Prospects for cattle breeding, livestock raising, and the traditional industrial processing methods associated with them became less favourable in these conditions. The expansion of grain industry was accompanied by a reduction in cattle breeding. In general, it led to a gradual change in the structure of agriculture.

Industry in the outlying areas of the Volga-Ural Regions was dominated by exports. Production was linked to the export of natural resources from the region: salt,⁸ fish, underground mineral resources from the Urals, and raw minerals such as potash,⁹ metals, ores, and gold¹⁰. These resources were integral to the commodities market, with central government being the main customer. A number of mining industries were monopolised by the state. With growing demand, there was a need to increase production and modernise technology. As a result, private capital was allowed to enter these industries¹¹.

Part-processed goods, such as leather and textiles, as well as finished products made from these materials were exported from the region. Grain as an export crop is mentioned in sources dating back to the first half of the 19th century, but it was far from being a market leader. Siberia exported furs and peltry.

The structure of industry in the Urals mimicked the traditional relationship between the

centre and the provinces. The mining regions were home to a range of economic activities consisting of mining, smelting, and metal processing. Other industries in the region provided the factories with coal, ores, minerals, and materials. They were all part of the same technological supply chain. In the Zlatoustovsk mining region alone there were 29 mining related factories: 15 iron-smelting and iron-making plants and 14 copper-smelting plants. Plants tended to be privately-owned rather than state-owned. Mining combined very different types of technology: both manual and partially machine-based. Bonded labourers and free peasants were both employed in the mining industry, and the nobility and banks both invested in it.

The industrial revolution, which began in the Urals in the 1840s, was financed by private owners (patrimonial capital), who themselves took out loans from the State Credit Bank, pledging entire regions as collateral¹². The Urals industry owned by the noble banking elite of the Russian Empire was formed on this general financial basis.

Big business, forming an industrial culture was based on machine technologies and aimed at infrastructure industries (water transport), the mining industry (gold mining, metallurgy), and cities. The most enterprising nobles with free capital and ties in the capital city felt 'changes in the air' and joined the newly established joint-stock companies. However, the main capital was formed in big cities.

The first steamship travelled along the Volga as early as 1817, and the first joint-stock steamship companies Along the Volga (1843), Carrier, (1853¹³) and Mercury (1849, after consolidation in 1858, Caucasus and Mercury¹⁴) were formed

⁸ Salt was exported from salt lakes (the district of Lake Ilets, the solar salt lakes Elton and Baskunchak near Astrakhan). In the 1820–1840s, up to 950,000 poods of salt were produced there; it was about a twentieth of the total salt produced in the country (20 million poods per year) [Mударисов, 2003, pp. 33, 38].

⁹ Potash (potassium carbonate), derived from wood ash through leaching and calcination in special pots, was used to make glass, soap, leather, cloth, and in other industries. It was produced across the entire region, and there were financial incentives for this type of production. Potash was exported to the Holland, England, and Germany [Bogatyrev, 2006, pp. 105–115; Мударисов, 2003, p. 38; Арсентьев 2004, pp. 129–130].

¹⁰ The commercial production of gold at the Miass goldfields began in 1817. In the 1830s, the Russian Empire ranked first in the world in gold production; the volume reached 5–6 thousand poods per year. In 1858–1862, 731 poods of gold were produced per year at the Miass gold mine [Мударисов, 2003, p. 30].

¹¹ The state monopoly on salt production was canceled in 1806, on gold mining in 1842.

¹² In 1849, whole districts were pledged to the State Loan Bank, including the Kananikovsky, Beloretsk, Voskresensk, Troitsky, Blagoveschensky, and Yuryuzan-Ivanovsky districts. The total amount of collateral exceeded 1 million silver roubles [Мударисов, 2003, p. 21].

¹³ By the end of 1850, the company Samolet owned 20 steamers and shipyards in Nizhny Novgorod, Tver, and Rybinsk.

¹⁴ By the time of the merger, Mercury owned 14 cargo steamers, 46 barges and a large number of small

century.

thirty years later, almost at the same time. They brought a different way of life to the region: the funds of steamship companies were used to improve many wharves along the Volga, Kama, Belaya, and other rivers. They were equipped with outdoor winter boat yards for ships, warehouses were built, etc.

In the pre-reform era steamship companies had a monopoly over the entire Volga-Kama-Ural Region for transportation of public and private commercial cargoes, mail, and other correspondence.

Gold mining was a promising sector of the economy. There was no gold rush in the region similar to the one in California (1830–1840s in the USA), and yet there were noticeable technical advances: a wheel-operated ore transportation line and washing machines that appeared in 1840s doubled the savings on labour and horses.

At that there were 29 gold-mining joint-stock gold mining companies in the Southern Ural. Their stockholders were nobles (84 people), merchants (67 people). The first 'promoted' the business in the highest government circles,

vessels. Authorized capital amounted to 900,000 roubles. After the merger, it reached 4.5m roubles. The company's board was located in St. Petersburg. Among the shareholders there were known dignitaries, and later, the largest commercial banks.

often through personal and family ties; and the second, with funds.

The capital of steamship companies was metropolitan and foreign, while local (belonging to the nobility and merchants) capital prevailed in gold mining. In other industries consolidation and concentration of capital were much slower, often within a family or a group of partners: the Kazan Tannery Partnership (founded by P. Kotelov and A. and V. Krestovnikov), the Steam Butter-Making Plant Partnership (Gorodishche Uyezd of the Penza Guberniya), etc. Joint-venture companies were actively formed, especially in 1850–1860s, simultaneously with the technical revolution.

Enterprises of other industries that operated on the Russian and local markets developed on their own financial basis. This was a different level of the economy where simple commodity reproduction prevailed. Cattle breeding and the associated industry not only provided employees with food products but also supported a complex of interrelated industries. Raw material for soap makers and tanners in the Volga Region were supplied from the lower reaches of the Volga.

Animal oil, leather and Russian leather manufacturing facilities operated in the villages of Kazan, Ufa, and Simbirsk. The woolen industry developed on the basis of sheep wool

and buck fleece processing. Entire villages were engaged in the tanning business (processing of leather, production of Russian leather) in the Kazan Uyezd, and in the sheepskin and lambskin business, in the Mamadysh Uyezd. In the Kasimov Uyezd of the Ryazan Guberniya entire trading quarters made a living from the fur business. Wool washing and felt making developed in the northern districts of the Middle Volga Region. In the Trans-Volga Region peasants in Samara villages rendered large amounts of tallow.

Processing of livestock products (rendering tallow, shearing, washing, and cleaning wool, production of butter and meat, soap and candles, various types of leather and wool finishing, etc.) was the basis of a diversified local industry. This industry may be called rural, by the location, equipment, and by the relation to this segment of economy, although by sales volume and territory it went far beyond the borders of the Volga-Ural Region.

Another area of rural industry was timber processing: resin distillation, tar distillation, cooperage, cartwright, and bast-mating bag crafts were present almost in every village, especially in the northern part of the region. Peasants of trade settlements in the Tsarevokokshaysk and Kozmodemyansk Uyezds (except the south-western end), the northern industrial half of Cheboksary, the southern part of Kazan, the northern part of the Sviyazhsk, and the southern ends of Tsivilsk and Yadrinsk Uyezds were engaged in the timber processing. Entire villages in the Krasnoslobodsk and Cheboksary Uyezds of the Kazan Guberniya, in the city of Kozmodemyansk were engaged in boat building. These villages were inhabited by peasants who were considered the best pilots on the local rivers.

In villages, but more often in the noble patrimonies, there were wineries, beet sugar, and wool production facilities, often referred to as factories. These were large patrimonial manufactories, but by equipment capability they were not much different from peasant crafts. Skilled bonded peasants worked at the manufactories. Some of the wool and glass making enterprises (they were provided with state privileges and

public contracts¹⁵) sold their goods throughout the country (wool manufactories of Akchurin, the Maltsov' glass and cut glass plants) [Shaposhnikova, 2007].

Peasant industry determined the overall image of Volga-Ural industry. Apart from cottage industry, there was also family industry. In conjunction with cottage industry and scattered manufacturing (with elements of division of labour for various operations), they formed the 'basis' of ordinary peasant life in the north and north-east of the region. Together with a small agricultural plot on the landlord's land, a peasant family still could live independently, reaching the market through a merchant buyer.

In the south-east of the region and in the steppe regions there were fewer crafts, and peasant life was increasingly oriented to grain growing and monoculture. Therefore, it was difficult to exist there without external economic contacts and ties to the market.

Diversity and complexity of processes in the region's industrial sector were mainly shown in the Middle Volga Region, in its north-eastern border areas. It was there where one could see first-hand the industrial, technical, organisational, and financial differences in the development of the economic set-up.

Two new trends associated with drawing the region into the general financial flow of the empire (establishment of joint-stock companies) and deployment of technological changes appeared in the Volga-Ural Region around the 1840s. Big business and machine technologies 'went hand in hand,' creating totally different opportunities for development of industry in

¹⁵ The cloth manufacturing business enjoyed state benefits. When opening new factories, they set preferential prices for the purchase of cloth, and an order for the production of certain varieties and types of great-coat cloth was distributed. It was possible to receive a comfortable loan, sometimes even interest free, secured by serfs engaged in manufacturing, or production equipment, etc. [Arsentiev 2004, pp. 52–57]. Already in 1859, four guberniyas of the Middle Volga Region hosted 77 of 176 (43.8%) of the country's cloth companies which had government contracts. This kind of business was profitable as long as there was a nearby source of raw materials [Arsentiev 2004, p. 120; Mudarisov, 2003, p. 38].

the region. However, villages retained their traditional economic set-up, sticking to their specialisation. Various stages of growth, from the simplest (cottage and handicraft industries) to modern (steamship companies), different ways of management (from family crafts to joint-stock companies) formed a 'multi-stage' (multi-level) industry meeting the requirements of different customers and having specific rules and relations at every stage (set-up).

Peasants could provide for themselves by the cottage industry; large industry, focused on the Russian consumer and supplying products, developed along the available transport routes.

The main transport routes of that time were country roads. Cart, postal, and cattle paths and rivers were part of the national transport system, even though by no means all of them were equally convenient and used throughout the year.

At the beginning of century the authorities' special interest in the Volga River was expressed by the reconstruction of the Vyshny Volochyok and construction of the Tikhvinsk (1810) and Mariinsk (1811) water systems. This significantly sped up cargo transportation (three convoys of vessels per year) and increased the carrying capacity of vessels moving along the Volga, Neva, and Northern Dvina to Saint Petersburg from Astrakhan. The main ports on this route were Astrakhan (for shipping), Saint Petersburg, Rybinsk, and Nizhny Novgorod. The interior of the Russian Empire gained additional opportunities for entering the European market, thus increasing its status and economic value.

The importance of changes in the road sector cannot be overestimated. The image of a road had gradually transformed in the public mind. For centuries, for the majority of people a road was a symbol of suffering, deprivation, torture, and physically demanding labour (movement of exiled convicts, barge haulers). Steam navigation and the outlet of the Volga and its tributaries to the northern seas formed a different image of the river, making it a symbol of prospects (including economic), new impressions, and first journeys.

The means of exchange and trade between people, cities and villages, regions and the country as a whole remained unchanged. Seasonal fairs¹⁶ served as a usual place for buying and selling on different levels—from simple exchange to large batch purchases of agricultural products. Wholesale merchants dominated at the large fairs (dealers, according to F. Brodel). This small group of merchants, who were engaged in international wholesale transactions over large distances and who had personal connections in other countries, was almost out of state control.

National and international trade was carried out at the Kazan, Orenburg, and Irbit fairs. The Nizhny Novgorod fair was known as 'the exchange court of Europe and Asia.' The Leipzig—Nizhny Novgorod—Irbit—Tobolsk—Irkutsk—Tyumen—Kyakhta fair chain functioned concurrently throughout the year, allowing merchants to move successively and connecting Europe to Siberia [Vybornov, 2004, p. 14].

The south-eastern direction of international trade was supported by the Orenburg and Kazan fairs, where goods from Central and Western Asia and the Middle East were traded. 18–19th centuries were the golden age of Kazan as a major transit trade centre of the empire. Merchants from Kasimov, Nizhny Novgorod, Rostov, Kazan, and Astrakhan (up to 150 people) came to Orenburg. It took 1.5–2 months for camel caravans to get here from Bukhara or Khiva, and from here the route followed the Indian-Iranian border to Calcutta (India). This foreign trade direction was serviced by Tatar merchants. Knowledge of the language and customs and religious confession were conditions for provision of government privileges (3% instead of 5% of turnover according to the Trade Charter) to them in trade with merchants from Central Asia, India, and Iran [Shkunov, 2002, p. 23]. Strengthening of the south-eastern direction of foreign trade was important for the Russian

¹⁶ In 1863, there were 6,287 trade fairs in the Russian Empire, including 419 in the Volga guberniyas: Kazan, Simbirsk, Samara, Saratov, and Penza.

Empire in the context of Russian-British tensions because of the influence on Iran and India. Although the scale of exchange with countries of the East in the first half of the 19th century was small¹⁷, trade along the Nizhny Novgorod—Kazan—Astrakhan—Orenburg route made the south-eastern region an important element of international cooperation and competition.

Foreign relations of these cities had increased their status on the domestic market as well. Shopping arcades—the first permanent trading stores—were built here.

The diversity of processes of the socio-economic life in the Volga-Ural Region does not fit into narrow class boundaries. In this region, as in Central Russia, there were state, demesne, and manor peasants. However, apart from the traditional division, there were also other, taking into consideration the time of settlement (indigenous population, new settlers), ways of paying the state tax (*yasak*, quit-rent peasants, tree fellers, military service) and possibilities for using land (landowners, landless settlers¹⁸, *Teptyars*), or affiliation with a civil or military class (Bashkir-Meshcheriak army, Orenburg and Ural Cossack army, Stavropol Kalmyk army)¹⁹.

The mining region was inhabited by mining peasants equal to manor peasants and state peasants. Despite the fact that they spent most of their time at a factory, where they were

considered artisans and workers, they were registered as peasants. The literature contains many examples of how trading peasants, engaged in auxiliary works, and mine workers, who had side jobs,²⁰ hired other people to do their work.

The trading class was made of up merchants. Their dynasties originated from the wine trade (buy-out), state contracts, and various intermediary transactions. Using the opportunity to buy up furs, wool, and fabric with a significant difference in prices, they made a profit of up to 20–50% over the initial price, and sometimes they doubled the amount of investment just by exchanging the goods. As a rule, these merchants lacked expertise and acted according to the circumstances and on the basis of personal relations with high risk. This probably explains why the Kazan merchants known at the beginning of the 19th century, for example, created their wealth based on the business established by their fathers, rarely their grandfathers [Sverdlova, 1998, p. 8]²¹.

In the early 19th century peasants, who were allowed to engage in trade (1804) and register as traders, began to compete with merchant dynasties. By the middle of century 40% of all newly registered merchants in Orenburg Krai were people from the peasant class [Bannikova, 2011, pp. 157–158]. Accumulation and expansion of capital of these 'new merchants' were based on purchasing and processing livestock products. Leather production, soap making, tallow rendering, and wool production represented the typical merchant business of the 1830–1840s. However, with the expansion of agriculture in the south-eastern regions, the most far-sighted entrepreneurs expanded real estate transactions by buying lands, leasing commercial lands and retail shops.

¹⁷ These enterprises were carried out by 150–200 people, and the volume of work did not exceed 1 million roubles.

¹⁸ Peasant settlers could belong to the category of tributaries or state peasants, or be the property of a landowner, who settled with his permission on the land of another land owner as 'allowance', and paid the rent for the use of the land. In this case, in a legal sense such settlers were not the serfs of the owner of the land allotted to them, although they were the serfs of their original owner.

¹⁹ 1,024.6 thousand people, including the Bashkir host of 546.5 thousand people, *teptyars* 246.8 thousand (in 1855, they were included in the Bashkir host), the Orenburg Cossack Host of 166.7 thousand (Russians, Ukrainians, Tatars), Ural Cossack Host of 64.8 thousand (Russians, Bashkirs, Tatars, Kalmyks). In the 1830–1840s, the government made a number of inconsistent solutions, which, according to the plan, should have led to the complete food self-sufficiency of the Cossacks in terms of bread.

²⁰ The trade and entrepreneurial stratum among bonded peasants, who hired workers to fulfill their obligations, was about 15% at Zlatoust factories [Istoriya Bashkortostana, Vol. 1, p. 287].

²¹ As L. Sverdlova notes, no Kazan dynasty of the time of Peter I managed to survive to the early 19th century, while families established in the second half of the 18th century stayed in the market until 1917. [Sverdlov, 1998, p. 8].

Modern scholars are actively studying processes of entrepreneurial development²². In the Volga-Ural Region this social group consisted not only of merchants but also of nobles, peasants, canton managers, military officers and government officials, mining manufacturers, and gold diggers—all those who wanted to make a profit. However, their daily life was subject to ethnic and religious rules more than to amount of capital [Bannikova, 2011, p. 10].

Under Russian law, men and women had equal property rights, which made them independent in entrepreneurial activity. It was reflected in the law of 10 June 1857 'On Permission to Issue a Certificate for Wives of Merchants to Trade Separately from Their Husbands' [Ulyanova, 2009]. Female entrepreneurship in the Volga-Ural Region was already gaining momentum in the latter half of the century.

Thus, in the first half of the 19th century lands in the Volga-Ural Region underwent socio-economic changes. With active migration and expansion of farming, the transformation (especially on the south-east of the region) of traditional land ownership into a market factor of production, otherwise known as the agrarian revolution, started here. In the majority of cities of Western Europe it went on for hundreds of years, accompanied by social conflicts, in general preceded the industrial revolution, and ended by the 19th century. The agrarian revolution was embedded in legal, institutional, and organisational changes. In the Russian Empire almost all of them occurred in the 19th century, while in the Volga-Ural Region they coincided (or resonated) with 'waves' of colonisation.

In general, administrative, economic, and social structures in the region reproduced the system of relations that prevailed in central regions of the empire. They were what made the region the 'inner margin' and not a border territory. In the socio-economic sphere this was shown by:

- Demographic growth and an increase in population density due to immigrants;

- Economic colonisation (development) and a focus on agricultural development

- Expansion and support of landlord tenure and peasant communal land tenure.

At the same time, the region had retained significant features reflecting historical and cultural processes driven by previous development and ethno-confessional features:

- Preservation of traditional forms of land tenure and land use with inherent features of normal (patrimonial) right;

- Significant numerical predominance of state peasants over demesnil and manor peasants

- Use of different forms of state tax collection (yasak, quit-rent duty), including in the form of military service (military service class) (The attitude to the military service class in that period was ambiguous; however, the general trend indicated the desire of the authorities to stop using the military here and transfer them to full economic and food self-sufficiency.)

- Uneven distribution of landlord tenures across the region, which were owned not only by nobles but partially by merchants, a few individual peasants, and peasant societies (This phenomenon was particularly noticeable in the southern and south-eastern steppe regions, which had a low population density and unoccupied lands.)

- Preservation of historical forms of land tenure and land use of the national elite (the quarter land tenure of the Serving Tatars, lands of Bashkir patrimonial estate owners, and Kalmyk noyons (princes)).

The direction of industrial development trends does not give grounds for characterising this period exclusively within the concept of the crisis in the feudal serf system. For the Volga and Cisural Regions it was a period of growth, which was ahead of the Russian average: share of industry of the Middle Volga Region in Russian industry as a whole increased from 4% to 6.8%. Moreover, in that period it had developed without strong state intervention. Privileges and state contracts were retained by defense-related

²² The word 'entrepreneurship' was increasingly applied to economic activities aimed at making profit and based on self-reliance, initiative, and the responsibility of owners of capital [Clein, 1994, p. 6].

enterprises (metallurgy in the Urals, weapon factories in the Vyatka Governorate, wool manufactories of the Volga Region).

All stages of technical improvement (cottage industry, manufactories, and the first factories), organisational and administrative complexity (single proprietor, family, state enterprises, joint stock companies) were present in the region. Modern machine technologies and joint-stock forms of capital organisation started being implemented in the 1840–1850s, initially in the transport industries (steamship building) and gold mining.

A mixed economy adapted to the requirements of various consumers was a specific feature of industry in the Volga-Ural Region.

Fairly liberal conditions for development of trade, including foreign trade (the eastern and south-eastern directions), and the ability of peasants to be engaged in trade indicated a desire of the imperial authorities to strengthen trade relations (primarily with Muslim countries) for further advancement and involvement of new territories in the general market space. The south-eastern margins became the main bases for this strategically oriented trade. Key players here were the cities of Orenburg, Astrakhan, Kazan, and Nizhny Novgorod.

Economic, property, national, and civil-military differences in the daily life of people living in the Volga-Ural Region were quite noticeable. The original, motley, and diverse image of the region remained unchanged. Multiple versions of socio-economic life as potential ways of development still seemed to be possible.

In a monograph devoted to global empires American historians J. Burbank and F. Cooper highlighted three features of the special 'Russian way' of the Russian Empire: awareness of regional diversity (geographical, confessional, ethnic), creation of 'areas of aspirations' for separate classes (for example, the ability of peasants to be registered as merchants), but not for individuals, while preserving the customary law in matters of the local life of various ethnic groups [Burbank, 2010, p. 272]. The third principle was that the rules could always change and at any time. These rules were controlled by officials, who were the main persons of influence. They saw the empire not as a single entity but as a country consisting of separate parts. These principles maintained social peace in Russia, low costs and at the same time provided the ability to use local resources by collecting taxes.

§ 2. The Tatar peasant economy

Nail Khalikov

In the first half of the 19th century the overwhelming majority of the Volga Region Tatars belonged to the state peasant class. Land use, distribution of taxes and duties, and public works were regulated by communal law.

Communal rules and traditions had positive and negative sides. It was more rational and easier for a commune society to solve economic issues and challenges, more effective in resisting state administrative claims to the rights of commune members, abuses by public officials, village chiefs, etc. In addition, a certain inertia and conservatism of commune in the socio-economic sphere contributed to preservation of village and separate economies with

their sustainable economic and cultural traditions. On the other hand, progressive and successful development of villages and households restrained compulsory egalitarian regulation of land use, particularly of arable lands and hayfields that were vital for peasants. The existing system of distribution of taxes and duties often did not correspond to the economic viability of individual farms, especially since peasants were responsible for prompt payment of taxes and fulfillment of obligations to the community ('mutual responsibility'). Leaving the community, even for a short time limited by the passport regime, was hampered by the same mutual responsibility, etc. Long absences of peasants

for seasonal work were generally hampered by the rural rich, who had the upper hand in the village and community and needed a cheap local workforce of farm and day labourers.

Some Tatars, mainly Mishars, who were previously of the Serving Class, owned land according to demesne law (so-called smallholders). However, in most cases, the economic life of their villages was based on the same communal principles.

With regard to land use, the situation was as follows. Whereas by the beginning of the 19th century peasants were legally granted plots of 15 dessiatinas, by the middle of the century, due to increased population density in the region (by 80% in the Kazan Guberniya, for example) [Istoriya Tatarskoj Avtonomnoj Sovetskoj Soczjalisticheskoi Respubliki, 1951, volume 1, p. 297], the plots were officially reduced to 8 dessiatinas—that is, by half or even more [Obshhij svod, 1896, pp. 24–25, table V]. It should be noted that a plot of 8 dessiatinas was the minimum for normal operation of a peasant farm. Reduction of the plots to 2–3 dessiatinas in the mid-to-latter half of the 19th century actually had disastrous consequences. Former private owners, who previously had sizable plots of land, were in a very difficult situation. Due to population growth and family parceling, by the middle of the century they owned even less land than former yasak-paying Kazan Tatars. Thus, many former smallholders in the Simbirsk Guberniya owned plots of even less than 1 dessiatina [Lipinsky, part 1, p. 270]. It was only in the south-eastern areas that people were provided with much more land: the Tatar Cossacks of Orenburg Governorate had allotments of 25–30 dessyatins or more. For example, in the village of Kassel each man had 43 dessyatins, 35 of which were arable lands [Statistical Data, s. 165]. About the peas-

Drying house (şäs även). 19th—early 20th century. Reconstruction.

ants of the Samara Volga Region it was written: 'Everyone ploughs and mows where and how much they wish' [Solovyov, 1857, p. 217]. This was no coincidence: in the middle of the 19th century in Chelyabinsk Uyezd of Orenburg Governorate the ratio of arable lands to the total area of the district was 1 to 23; and in Orenburg Uyezd it was—1 to 45 [Voenno-statisticheskoe obozrenie, Vol. 12, part 1, p. 57].

The specified allotments (of 15, 8, 3 dessyatins or less) included a number of lands: arable land, hayfields, pastures, forests, and so on. On average, arable lands made up half of a man's allotment. Furthermore, during this period the area of arable lands increased at the expense of meadows and forests; for example, in Kazan Governorate the area increased from 1,886,000 to 2,477,000 dessyatins [Alishev, 1990, table 6]. Of course, half a dessyatina or one dessyatina of arable land per man was not enough to provide a family with food or to pay taxes. This forced peasants to rent out their allotments and seek other income on the side.

Meadows and hayfields for livestock were extremely scarce: a 1:1 ratio of arable lands to hayfields was considered reasonable, but in Kazan Governorate in mid-century there were 10 dessyatins of arable lands to 1 dessyatina of meadows [Laptev, 1861, p. 263]. Lack of food forced peasants sell off their livestock.

Hand-mills (kul tegermäne) and stupa (kilä (mortar)).
Reconstruction by N. Khalikov.

Among the Tatars 14% had no horses, which was more than among Russians, Chuvash, and others [Archive of Tolmachev, s. 18]. The shortage of livestock meant a shortage of dung as well; there was nothing to fertilise arable land with. It was noted with good reason that in the early 1840s the land in the Kazan Governorate was depleted, which resulted in crop failures [Xozyajstvenny'e zametki, pp. 390–391]²³.

The two core reasons were the progressive lack of land and increasing tax burden, combined with the development of trade and monetary relations during the formation of capital-

ism, and the development of Russian national and local markets, which led to the socio-economic differentiation of the country and the emergence of a sizable class of landless and indigent peasants. A. Lipinsky's remark describing Simbirsk Governorate is typical: '...there are a lot of poor families among the Tatars' [Lipinsky, 1868, p. 325]. One of the important consequences of this situation was the abandonment of farm work by a large number of peasants on the allotments. Their main sources of revenue became handicrafts, local and travelling businesses, and petty trade. All of these processes, which had emerged in the first half of the 19th century, were developing on a large scale in the second half of the 19th century and the early 20th century. Since the negative processes in the territory's economy especially affected the Tatars (a high percentage of landless, and so on), businesses at their allotments were widespread among them. The following example is quite typical: among the Kasim Tatars, who had only 3 dessyatins of poor land per person, a third of the peasants provided for themselves by travelling businesses and trade [Baranovich, 1860].

Still, regarding traditional Tatars' activities, agriculture, despite the unfavourable economic situation, there was a progress in the sphere of arable farming, though that progress was slow. For example, it was written about the Tatars of Penza Governorate: 'Agriculture is very successful among the Tatars' [Prozin, 1886, p. 259]. Cropping systems were improved, new crops, ploughs, etc., were becoming widespread. A gradual increase in grain sowing and harvesting may be considered actual evidence of the positive trend in agricultural development. Thus, in the mid-century the Tatars of Buinsk Uyezd in Simbirsk Governorate often had sevenfold rye harvests, eightfold spring crop harvests [Materialy' dlya istorii, 1866, p. 53], which was considerably higher than average in the region.

The ancient farming traditions of the Tatars should be also considered here. That was why a peasant stuck to his allotment and farming at all costs. The influence of communal customs and traditions, the stable family lifestyle, 'the love for hearth and home'—one's village and house—were also important.

²³ The exception was the Tatar population of the Southern Ural, especially the Cossacks, who owned large herds. Thus, in the village of Varna in the Verkhneuralsk uyezd of Orenburg guberniya, there were around 15 horses, cattle, and small cattle per every man in the middle of the 19th century [Statisticheskoe vedomosti, s. 123–124] (estimated by us.—N. Kh.).

The Tatar peasants' household activities as a means of providing food and money for themselves had many aspects. To some extent, depending on the socio-economic situation, climate conditions, and traditions, peasants were involved in agriculture, business, trade, etc. According to the peasants' social status, the direction and level of development of productive forces—given the prevalence of feudal methods—an important role in the Volga Tatars' household was played by agricultural production, first of all, by crop farming.

The Tatars farming culture was quite well developed for that time. At the very end of the 18th century I.G. Georgi noted: 'The Tatars of today can be called great crop growers that do not let their crop lands rest' [Georgi, 1779, part2, p. 11].

The type of farming activities and agriculture was determined by the method of maintaining land fertility. In the Middle Volga, Kama, Oka-Sura interfluvial Regions crop rotation system in a three-field form was predominant. In eastern and south-eastern regions (the Perm and Orenburg Governorates and southern Uyezds of Samara Governorate) sowing was often random, with short-term fallow added to three- or two-field crop lands. Thus, it was reported of agriculture in Saratov Governorate that there 'is no positive farming system' [Beznosikov, 1852, p. 92]. The Tatar Cossacks of Orenburg Governorate practiced the classical long fallow system as well. The Sarapul and Yelabuga Uyezds still preserved slash-and-burn farming system, not in its typical form but as fallow woodland, a way of cutting down forest for crop land.

Tools for threshing: 1—trestles (stan, kaja) for threshing sheaves through lashing; 2—types of threshers (chabagach); 3—threshing stone (aslik bastira torgan tas); 4—water mills. 19—first half of the 20th century. Reconstruction by N. Khalikov.

According to the prevailing three-field farming system, the main crop in the Tatar peasants' fields was winter rye. Oats, barley, farro, buckwheat, and millet were also cultivated. In south-eastern areas of the territory, where the long fallow system often prevailed, wheat dominated, and its harvests reached 15-fold [Statisticheskije trudy', 1858, p. 10]. The Tatars also cultivated wheat in more northern regions, for example, in the Buinsk Uyezd of Simbirsk Governorate. However, by the middle of the 19th century, as arable lands became depleted, harvests in the central parts of the territory fell, and planted areas decreased [Materialy' dlya istorii, 1866, p. 39].

Old three-field crop lands corresponded to a wooden plough, and long fallow lands were tilled with a saban (single-blade) plough. But even where the saban was widespread (in the south-eastern parts of the territory), it was used only by well-off householders, since 4 to

Volga plough—saban. 18–19th centuries.
Reconstruction by N. Khalikov.

A plough used in the Volga Region and the Urals.
18–19th centuries. Reconstruction by N. Khalikov.

8 horses were needed for its team; poor peasants could afford only a wooden plough. The comment of the well-known plough researcher G. Firstov is typical: 'The saban is widespread mainly among the Tatar peasants of Orenburg, Simbirsk, Saratov, and Astrakhan guberniyas, and to some extent of Kazan Guberniya' [Firstov, 1840, p. 208]. Scythes were used in woodland areas, but Kungur and Vyatka ploughs appeared in the mid-19th century in Tatar villages of the Vyatka and Perm Governorates, in northern Uyezds of Kazan Governorate. These tools, which were in between a wooden plough and a modern plough, became widespread later.

A tine (spike) harrow, often with iron teeth, was widespread. A chain harrow was still used on light soils of the Vyatka, Kazan, and Nizhny Novgorod Governorates.

Rye and most spring crops were harvested with a sickle almost everywhere. A long straight scythe was used in south-eastern districts, especially for harvesting wheat. During the period of interest, use of the latter tool became more widespread since a scythe had a lot of advantages over a sickle.

Sheaves in the woodlands of the territory (Vyatka and Perm governorates, northern uyezds of Kazan guberniya) were formed in the fields as shocks and bundles and in the Oka-Sura interfluvium (Nizhny Novgorod, Penza, and other guberniyas) as crosswise sheaves. In forest steppe districts, dungiz, zurat, chumala typical *Tatar agriculture* were used. In farmsteads, sheaves were placed for long storage in barns as *kibens*. In forest and forest steppe areas sheaves were mainly dried in drying barns: log

and simpler, more archaic shisha drying barns. Contemporaries typically called the latter 'Tatar drying barns' [Candidate Pell, 1845, p. 134; Cheremshansky, 1859, p. 315]. In south-eastern districts of the territory sheaf thrashing without previous drying in drying barns was practiced. Winter rye and many spring crops were thrashed with a flail. However, Tatar peasants commonly thrashed sheaves with horses' hooves and carts. Grain was processed into flour at water and wind mills and was crushed into groats in horse-drawn shellers. In addition, each homestead had hand mills and mortars. Grain, groats, and flour were preserved in bins and hoppers storerooms and barns; poor householders kept their stores in inner porches (in vats and sacks). The very ancient method of grain storage in earth pits was preserved in some steppe districts.

During the first half of the 19th century agriculture (crop farming) developed rapidly. New more effective ploughs appeared; efficient methods of harvesting crops with a scythe, horse-drawn thrashing, thrashing of sheaves, especially of wheat sheaves, without drying were practiced more and more extensively [Beznosikov, 1852, pp. 101–102].

Rural Tatars rarely grew vegetables but bought them from Russian neighbours if necessary. Vegetables were grown only in suburban settlements, where there were opportunities to sell them, and among rich peasants in general. A. Lipinsky noted: 'And the Tatars, especially well-off ones, care about their gardens a lot, with a wide variety of vegetables' [Lipinsky, 1868, p. 423]. With difficulty, through 'potato

riots,' because the unknown crop also broke common sowing principles, by the middle of the century potatoes were planted in gardens, and sometimes fields, and later became a staple crop ('The potato is the main garden vegetable of the Cheremis, the Chuvash, and the Tatars' [Laptev, 1861, p. 270]). Orchards were rare in Tatar villages.

Livestock breeding was only supplementary to crop farming for the majority of Tatar peasants. Horses were used for ploughing and transportation. Cattle, sheep, and goats were sources of food (meat, milk) and raw materials (furs, skins, wool) for handicrafts.

Tatar livestock breeding was of a pasture-and-stable type. From spring to autumn livestock was pastured by herders. In forest steppe areas and adjacent districts of forest and steppe areas livestock was kept in cold wattle sheds in the winter; in Vyatka and Perm governorates warm log sheds were often used; in the south-eastern areas card pens with straw roofs were typical.

The Tatars put a lot of effort into maintaining and caring for livestock²⁴. Contemporaries noted: 'In general, livestock breeding is one of the best parts of a Tatar household' [Candidate Pell, 1845, p. 135]. In the Chistopol Uyezd of Kazan Governorate the Tatars had more chickens, geese, and ducks than any others; they were better cared for, so chicken, for example, was tastier [Lindegren, s. 11 (reverse)–12].

In the first half of the 19th century the socio-economic status of the rural Tatar population, the majority of whom were state communal peasants, was characterised by the main trends in agriculture: land became increasingly scarce, and taxes and duties became higher. As a consequence, by the middle of the century there was a material differentiation that became especially significant in the Tatar countryside. However, due to the rich economic and cultural experience as well as natural diligence, the Tatar household, crop farming, livestock breeding, and business developed slowly but steadily.

§ 3. Russian trade fairs

Lyudmila Sverdlova

Trade fairs flourished in Russia in the 18th century. It was facilitated by the large territory, underdeveloped transport system (which slowed down the integration of the regions into the Russian market), and also by the fact that stationary capitalistic trade and a credit system were only beginning to emerge.

By the early 19th century an extensive trade fair system had formed in Russia. It included rural market fairs, regional trade fairs, and Russian national trade centres such as Nizhny Novgorod, Irbit, Kyakhta, Orenburg, and other trade fairs. Kazan inhabitants invari-

ably had key positions at them. The Kazan, Bugulma, Menzelinsk, and Laishevo trade fairs were of great importance.

The Trade Charter read: 'In every town, settlement, trading quarter (posad), or hamlet and also outside of settlements a trade fair may be held once a year or more often, depending on the circumstances and convenience. When a trade fair is established, its start and duration (for important trade fairs) are determined, and likewise the ones that follow each other should be planned so that those who come to trade fairs can visit another one when the previous one is over' [Ustav Torgovyj, 1903, p. 184].

These were wholesale trade fairs—a kind of meeting place for merchants, wholesalers, intermediaries, and producers who established mutual connections to buy and sell large amounts of goods or to exchange large amounts of goods at the actual trade fair. Rus-

²⁴ However, despite all efforts, animal husbandry among the Tatars, similar to other peoples of the region, was in a 'complicated state' due to economic circumstances, starvation, and epizootic outbreaks. In particular, it was noted that cattle in the Ural guberniyas 'suffered from the plague' [Voenno-statisticheskoe obozrenie, 1848, p. 36].

sian national trade fairs were also international trade centres.

Trade deals at the fairs can be conventionally divided into three categories: 1) wholesale buying to sell it later in places where there was demand: in Russian capitals, at Russian national fairs, the shipment of goods abroad; 2) trade operations with fairly large amounts for resale (wholesale and retail), mainly in large trade and production centres of the country and in the reside of entrepreneurs; 3) small wholesale, where goods could be bought by wholesale traders looking for large lots as well as by retailers for later petty trade.

In the early 19th century Russia-East trade was centred in Odessa, Taganrog, Astrakhan, Kazan, Orenburg, and Siberia, including Kyakhta [Shkunov, 2007, p. 13]. The success of the centres largely depended on the development of transportation routes in their region of activity. In the late 18th century, due to the development of Russian trade relations with China and Central Asia, the main transit route between European Russia and Siberia was the so-called Kazan road: it started in Kazan and went through Tyumen, Yekaterinburg, Kungur, and Perm. Siberian merchants went to the Makaryev (Nizhny Novgorod) trade fair by two routes that linked Siberia with European Russia: the northern route through Verkhoturys and Solikamsk, and the southern route through Kungur and Kazan. Ural merchants transported goods to Moscow either through Vyatka (Kholynov) or through Kazan [Kafengauz, 1958, pp. 158, 197–198].

Kazan was located 'at the hub of major roads needed for travel to the most important towns and places, so that the roads to Vyatka, Tobolsk and all of Siberia, Orenburg, Ufa, Uralsk, and all the steppe areas and fortresses came from here' [Kazanskiye Izvestiya, 8 December 1814]. The oldest route passed through the town and linked the Russian capitals with the Urals and Siberia (Moscow—Kazan—Yekaterinburg—Tyumen). It began with the Moscow route that linked the Russian capital not only with the capital of Kazan guberniya but also with the uyezds of Sviyazhsk and Cheboksary; and all of them with Nizhny Novgorod. Via Kazan and

Irkutsk the Moscow route linked the capital of the country with Kyakhta, from which Chinese goods came to the European market. Probably the only land route from inner Russia to the Orenburg territory, and from there to Tashkent, Samarkand, and Bukhara, was the Orenburg route that, in addition to Kazan, passed through the governorate via Laishev and Chistopol. The Tsarevokokshaysk route led to the towns of the Vyatka Governorate, one of the main partners of Kazan; the Simbirsk and Spaso-Simbirsk routes were used by merchants to trade with towns of the Lower Volga. The Siberian highway passed through Kazan. Those roads marked with turnpikes at the town limits were managed by the Ministry of Transport and financed by the state.

Tatar entrepreneurs, who were bearers of religious, linguistic, ethnic, cultural, and economic traditions, played an important role in setting up trade and economic links with Eastern countries and contributed to the growth of Russian authority in the region and the strengthening of the Tatar merchants' trade capital in the markets of Central Asia.

Trade with Persia and the North Caucasus in the first half of the 19th century was carried out mainly through Astrakhan, which was a major port on the Caspian Sea. In addition to Russian merchants, Armenian ones, many of which took Russian citizenship, and the Tatars of Astrakhan participated in that trade actively.

Starting in the second half of the 18th century trade with Central Asia had been mainly carried out through the Orenburg and Troitsk fortress. Orenburg territory had become the centre of Russian—Central Asian trade.

Due to its favourable geographical location, governmental measures, and the activity of the Tatar trading class, Orenburg became the main stronghold of Russian interests in Central Asia. Before the Trans-Caspian Railway was built, trade fairs in the Orenburg exchange yard (from June to 1 November) and Troitsk Menovoj dvor [trading centre] (Orenburg guberniya, from 1 July to 1 October) were of great importance in trading local goods: wool, cattle, rawhide, camels, horses, cotton, and Asian fruits. From late August to early November three caravans prepared by Tatar merchants started out from Oren-

burg. The caravans headed to Khiva, Bukhara, and the goods that had not been sold there were sent further south to Kunduz, Kabul, and Badakhshan. Tatar merchants operating through Orenburg had also established permanent trade relations with Persia, India, Tibet, and Kashgar (Western China) [Kamsko-Volzhskeya gazeta, 16 September 1873].

Kazan Tatars bought Persian fabrics, shawls, and carpets at Central Asian trade fairs to send to Kazan, Russian fairs, and the capitals; they bought cotton robes, Tashkent viboyka (fabric), the best furs to process later at local enterprises, and spun cotton thread from Khiva and Bukhara merchants. This thread was partially mixed with English thread by Kazan manufacturers, thus producing Nankin. Tatar merchants bought large lots of beef and mutton fat, leather, sheepskins and livestock, mainly horses and sheep, from the Kazakhs [Nebolsin, part 1, 1835, pp. 170, 172, 173].

By all accounts, Kazan, Orenburg, and Ufa trade Tatars established the closest links with Bukhara, the centre for selling Russian goods

in Central Asia, where the authorities had a protectionist policy towards them. In the early 19th century merchants who traded with Central Asian countries were called 'bukhar yurtuchi' (a trader of Bukhara goods) [Istoriya Tatarii, 1937, p. 304]. Among them were the Malmyzh merchant Abdulla Utyamyshev, Arsk merchant of the 1st guild Ibragim Bayazitov, Kazan merchant's son Abdulkarim Yunusov, Chelyabinsk merchant of the 1st guild Ivan Akhmatov, Chelyabinsk merchant Murtaza Monasypov, and others. The following figures show the trade turnover of these merchants: in 1805 at Troitsk customs Chelyabinsk merchant of the first guild Ivan Akhmatov registered goods worth 61,410 rubles, and Chelyabinsk merchant Murtaza Monasypov registered goods worth 103,743 rubles. On returning from Bukhara, Akhmatov had goods worth 101,366 rubles, and the Malmyzh merchant Abdulla Utyamyshev had goods worth 123,592 silver rubles [Shkunov, 1997].

Not only guild merchants involved in wholesale and retail trade actively participated

in economic relations and trade fairs. A sizable group of trade fair participants was formed by trade Tatars, both peasants and bourgeois, who lived near the fair centre and were involved in petty travelling trade, and also by craftspeople who sold their products at the fairs. Trade fairs were served by a sizable group of 'trade people,' who can be considered as complimentary to the trading class: merchants' agents, cart and shop vendors, clerks of merchant companies and trading houses, partners and other persons, in addition to peasants involved in carrying and odd-job labourers, who did hard work at harbours, fairs, and in shops.

Russian Tatars, as intermediaries and at the same time active participants in Russian-Eastern trade, enlarged the sphere of Russian economic interests in the East, contributed to the spread of domestic goods in adjacent countries.

However, the development of trade with Central Asia was hindered by the lack of a legal framework (treaties); the difference in currencies, weights, and measures; the excessive customs duties collected by caravan routes; additional taxes owed by non-Muslim merchants; quarrels, strife, wars, and the arbitrariness of emirs, khans, and beys; and also frequent bandit attacks on caravans, whose victims included Muslim merchants as well. Thus, in 1804 the Tsar's special decree freed the Kazan merchants Shakhmuratovs from paying taxes for 20 years to compensate their losses from a bandit at-

tack and robbery of their trade caravan on the road to Bukhara and Khiva.

In the second quarter of the 19th century goods worth 5.5 million were exported to Central Asia along the Kazakh border, and 4 million worth were imported from there. In 1849–1853 trade with Asian countries in the total turnover of Eastern trade (taken as 100%) was distributed as follows: Kazakh steppes: exports: 16.8%, imports: 23.6%; Asian Turkey: 7.2%

and 5.2%, respectively; Khiva, Bukhara, Khokand: 4.2% and 6.0% [Istoriya trgovli, Vol. 1, Ed. 5, 1913, pp. 71, 72].

Contributing to further development of trade with Central Asian states, the Tsarist government cancelled the duty on goods imported to Bukhara. The Emir appreciated this and gave orders to tax Russian merchants equally with Muslims [Kazansky birzhevoy listok, 27 June 1871]. Now Russian merchants could trade in the East themselves; they put those they hired to trade on their behalf at Central Asian markets under strict control. In 1864–1865 a large part of Central Asia became part of Russia, and khanates of Khokand and Bukhara were then vassals to it. After that the Tatars lost their monopoly on Central Asian trade, although they were still among the main trading partners of the region.

The main Russian trade fair, Makaryev (since 1817, Nizhny Novgorod), operated from 15 July to 25 August. It played the role of an international fair, where the exchange of not only Russian but also of Western European, Asian, and Eastern goods took place. The geographical location of Nizhny Novgorod was favourable for it. P. I. Melnikov noted: 'The Volga and the Caspian Sea represent (Nizhny Novgorod.—*L. S.*) an open route to the Caucasus, Persia, Central Asia, and even India; the Volga and Dubovka Railway to the Don links Nizhny Novgorod and Nizhny Novgorod trade

Traders (Tatar and Kazakh) crossing the Volga in the winter time. Pic. of the second half of the 19th century

fair with Turkey, the Levant, Egypt, and Southern Europe. The Volga and the Kama bring this place closer to the Urals range and Siberia, through which the open road to China leads. On the other hand, the Volga and its channels link Nizhny Novgorod with the port of Saint Petersburg, the window from Russia to Europe, and also with the northern guberniyas of European Russia. The Volga links Nizhny Novgorod with inner Russia and its heart, Moscow [quoted from Senyutkina, 2006, p. 34].

The Nizhny Novgorod trade fair attracted Western European merchants as a market to sell goods and at the same time as a market to buy raw materials needed to produce those goods. Asian merchants brought oriental goods to the fair and were valued as major suppliers of raw materials to the Russian national market and wholesale buyers of Russian goods. In the 1840–1850s Western European merchants made up 5% of the total fair traders, and those from Asia and Transcaucasia made up 11% [Bogorodickaya, 1989, p. 16].

Kazan merchants transported traditional goods to Nizhny Novgorod. But by the middle of the 19th century grain, rye and groats flour, oats, various groats, and linseed were in first place. Supplies of cotton fabrics (nankin and red calico), felted footwear, sacks, matting, mats, expensive carriages and cheap carts, wheels, potash, and wood ash grew considerably. Kazan inhabitants bought everything at the fair that was in demand for trade in the Urals, Siberia, and Central Asia [Melnikov, 1846, pp. 31, 67, 87, 90, 99–100, etc.]. The ma-

jority of deals were made on credit, and only 10–20% of goods were bought with cash.

In 1804 there were 58 Muslim traders who had become members of the Muslim trade community at Makaryev fair—that is, 5.2% of all traders. They came from Kazan and Kazan Governorate (32 people), Arsk (5 people), Kasimov and Kasimov district (6 persons), Orenburg and Kargala (4 people), and Bukhara (2 people)²⁵.

In the late 1850s there were 300 Tatars, or 2% of the 15,000 merchants, registered at the fair [counted according to Bogorodickaya, 1989, p. 16].

There was a Tatar row at the fair where goods were sold by Asian and Tatar merchants. In 1812 the supply of 'various Bukhoro furs, red calico, Nankin and yuft' was 3,146,000 roubles, and sales reached 1,415,000 rubles—that is, 45% of the supply. Merchants sent goods left after the fair closed to Moscow and other Russian trading centres [counted according to the Makaryev-Nizhny Novgorod trade fair, 1997, p. 185].

Tatars also traded in the Soap Row. 'Soap in beautiful large and small boxes, white and yellow, is placed on the shelves in chess order; there is a lot of it on the counters. Kazan Tatars

²⁵ For 7 more merchants there is no indication of the places where they arrived from. In terms of social classes, half of them were guild merchants (28 people and a merchant's son), 9 'trading Tatars', 4 Serving Tatars, 4 peasants, and 2 commoners. The remaining 10 people were of unknown social origin [calculations based on Senyutkina, 2006, pp. 123–124].

Last quarter of the 18th century.

are the main participants here' [Pogodin, 2000, p. 91]. In 1812 the value of the soap brought to the fair was 352,000 rubles; and the amount sold was 233,000 rubles, or 62.2% of the supply [counted according to The Makaryev-Nizhny Novgorod trade fair, 1997, p. 186].

The Kazan merchants Abdulkarim Yunusov, Akhmet Zamanov, Yusup and Khusain Ap-anayev, and Muhammad and Yusup Shatunov supplied soap manufactured at their own enterprises in 1822 [Senyutkina, 2006, pp. 46–47].

'Kazan and Astrakhan Tatars,' wrote a contemporary in 1827, 'mainly bring soap here, of good quality and selling very well, along with fine morocco and various goods made of it, and finally, sheepskin and lambskin coats. The amount of soap reached 1,000 poods, and was sold for 7.75–8.25 rubles a pood' [Bogorodickaya, 2000, pp. 61–62].

The Tatars of Kazan, Nizhny Novgorod, and Simbirsk guberniyas made up a significant part of the service personnel at the Nizhny Novgorod fair. 'The Tatars do all the hard work at the fair,' a contemporary wrote in 1827. 'They carry heavy goods and serve in the display booths. They are industrious and do what they are told with no objections' [Senyutkina, 2006, p. 48]. In the early 20th century A.P. Melnikov noted: 'There are still a lot of Tatars among unskilled labourers and minor servants at the fair.

In ancient times there were almost exclusively Tatars here, crowds of them came here during the fair from the adjacent Kazan guberniya and Sergach uyezd of Nizhny Novgorod guberniya... They were very cheap and the sturdiest workers, pleased with a small income, living almost in the open air...' [Melnikov, 1993, p. 44].

By the 18th century, permanent economic relations were established with China; trade with

it mainly came through Kyakhta. The Kyakhta fair was dominated by exchange trade under state monopoly.

Merchants produced goods for 'exchange' at their enterprises, although they mainly bought them at various fairs. 'For the Kyakhta exchange... negotiators store up soft goods, which is why they buy at the fair (Nizhny Novgorod.—L. S.)squirrel, lambskin, cat, otter, and other furs. The amount of squirrel skins for sale reached 1,300,000, at 200–400 rubles for a thousand skins. The amount of silver fox skins reached 200,000, at 700–800 rubles; of lambskins, 100,000, at 0.75–0.90 rubles; of cats, 500,000, at 0.75–0.90 rubles; of otters, 10,000, at 20–30 rubles for a skin' [Bogorodickaya, 2000, pp. 61–62].

According to P. I. Melnikov, the Nizhny Novgorod fair started trading only after wholesale merchants agreed on prices for Kyakhta teas (which determined prices for leathers bought for sale at Chinese and Siberian markets), manufactured products, furs, and other goods [Melnikov, 1993, p. 249].

Trade at Kyakhta was carried out in autumn so that the goods could be transported to their destinations by winter roads. They were brought to the European part of the country by the Kyakhta—Irkutsk (a customs office operated here)—Tomsk—Tyumen—Kazan—Mos-

Plan of the Nizhny Novgorod market from the Oka River. Lithograph by V. Loginov. 1823.

cow route. Part of the goods were stored in Kazan until the opening of the Nizhny Novgorod trade fair.

The following goods were exported from China: sugar candy, fresh fruit, rice, 'ball' tobacco, cotton, raw silk, cotton and silk fabrics, faience and porcelain dishes, embroidered clothes, fans, and pictures. But tea was in first place. In exchange Russian merchants offered furs, leather (goat and sheepskins were especially valued), saiga horns, plate iron, metal dishes, paper, Nankin, mirrors, and tinsel [Zyablovsky, 1808, p. 138; *Istoriya trgovli*, Vol. 1, Ed. 5, 1913, p. 71]. The Kazan Tatars not only supplied their manufactured leather products and fabrics to the Chinese market but also exported the products of Russian, German, Asian enterprises to China.

Since 1782 trade with China had been under the control of the so-called companions. They were mainly aimed at annual price-setting equal for all Russian merchants, and the control over sticking to the prices. Merchants who came to Kyakhta were simultaneously dominated by 'companies of merchants... from Arkhangelsk, Vologda, Tula, Tobolsk, Irkutsk, Kazan, and Moscow' [Firsov, 1902, p. 31; Korsak, 1857, pp. 94, 95], which effectively monopolised the tea trade in Russia. Their representatives were members of the fair committee, they held negotiations with Chinese partners achieving advantageous exchange conditions, set prices on the Kyakhta tea market and thus on the Russian market. One of the companions' tacit goals was to restrict the amount of persons al-

lowed into the tea trade. The companions did not have common stocks, the 'companies' were established on the principle of an association of fellow countrymen and united merchants specialising in trade of similar goods. Both Russian and Tatar merchants belonged to the 'Kazan Company'. Among the latter, in the early 19th century, were the Apakov brothers, Yusup Kitaev, Musa Yakupov, Yusup Arsaev, Gubaydulla Yunusov, the major entrepreneurs of Kazan. In 1811, the Tatar merchant Yusup Kitaev brought goat leather worth more than 80,000 rubles to Kyakhta to exchange for Chinese goods [Agafonov, 1906, pp. 107–108].

The interaction of Tatar and Russian entrepreneurs and their mutual help was expressed in different ways. For example, if merchants transported goods to and from Kyakhta, they had to pay taxes at Irkutsk customs, but they were allowed to pay after selling the goods. The authorities asked other merchants to provide surety with their property as insurance in case of a trader's bankruptcy. Thus, in 1826 Gubaydulla Yunusov had to pay a huge duty of 100,000 rubles, and the richest Kazan merchants (who also participated in Kyakhta trade) L.F. Krupenikov, P. I. Kotelov, Musa Yakupov, and Yusup Arsaev vouched on his behalf. Yunusov was also a guarantor of Musa Yakupov [National Archives of the Republic of Tatarstan, f. 114, inv. 1, file 593, s. 13–14, 18–19].

In the 1840s Kazan was represented at Kyakhta, among others, by trading houses of the Kazan Tatar Apanayev brothers and Gubaydulla Yunusov [Korsak, 1857, p. 412].

Built in 1822. Photo from the early 20th century.

At a certain stage exchange trade, which developed at Kyakhta under the protectionism of the Russian government, became a kind of motivation to organise and enlarge factories that produced goods especially popular with Chinese entrepreneurs. Altogether, 53% of Russian exports of leather, goats and sheep, morocco and yuft went to the Chinese market [Pokrovsky, 1947, pp. 104, 105]. The main articles that Kazan entrepreneurs exchanged were morocco leather of the highest coloured types and goat leather, which was a traditional manufactured product of Kazan. Kazan inhabitants exported large amounts of their own Nankin to Kyakhta that appeared at the country fairs in 1823 and soon became popular due to its quality and durable colour.

Kyakhta 'companies' operated up to 1800—that is, until the government defined the rules of exchange and opened a customs office in Kyakhta. New rules of the tea trade confirmed its exchange character, retained the ban on credit, and as before did not allow foreign merchants into Kyakhta. From 1807 the right to trade on the border and in ports had been granted only to merchants of the 1st guild [Agafonov, 1906, pp. 107–108], which increased their turnover. Kazan inhabitants were in sixth place in turnover among the 19 towns that traded at Kyakhta

(532,856 rubles) but were in 13th place in turnover per enterprise (133,214 rubles). This shows that Kazan was represented by more tea traders than other cities, although they were not as large as Moscow traders, for example. Right up to the 1860s Kazan, along with the Moscow, Nizhny Novgorod, Irbit, and Menzelinsk trade fairs, was one of the country's largest tea markets.

In 1855 the government allowed the sale of tea for cash in Kyakhta, and six years later abolished the decision of 1822, that

banned tea imports by sea and opened all Russian ports. Sea logistics was twice as cheap, and goods were transported faster. The less expensive Canton tea (as it was called to distinguish it from Kyakhta tea) began rapidly conquering the Russian market.

In the 19th century Kazan was considered the capital of Siberian transit trade, and Kazan merchants played key roles at the main trade fair of Siberia—the Irbit trade fair—which was the centre of trade between the Urals and Siberia and a major transit point between Europe and Asia. In the early 19th century, the prosperity of the Irbit fair was connected with Central Asian trade, where 'caravans from Khiva and Bukhara brought in huge sacks of yarn, printed fabrics, wool, astrakhan, robes, spices, dried fruit...' and returned from Kyakhta with china, faience, silk, and various sorts of tea [Dmitriev, 2004, No.5 (542), p. 180]. Among Russian merchants, the majority were from the Volga and Moscow merchant class, entrepreneurs from Veliky Ustyug and Arkhangelsk²⁶.

²⁶ They brought fabrics, both produced at Russian factories and exported from Western Europe and the countries of Asia Minor, jewellery, colours, wine, sugar, and tobacco. Ural-Siberian merchants traded goods produced at Ural factories, but most goods were 'soft junk'.

Trade fairs flourished in the pre-reform period, at the turn of the 1830s and the 1840s. It was then that the Irbit trade fair came to be considered a Russia-wide event. This was connected to the scale of gold mining in Siberia. In 1812, goods worth 6 million rubles were brought to the fair, and in 1845, worth 20.2 million rubles [Dmitriev, *Ural*, No.5 (542), p. 180; *Kazanskiye Izvestiya*, 1815, 20 January]. The ascent of the Irbit trade fair was a consequence of the Russian market's expansion due to the intense development of the state economy as a whole and, first of all, in the Asian peripheries of the state.

A representative of Kazan merchants, as a rule, a major wholesale merchant, was always a member of the fair committee [National Archives of the Republic of Tatarstan, f. 98, inv. 1, file 68, s. 91 reverse–92 reverse, 116–117; *Kazanskiye Izvestiya*, 1812, 25 May; *Kazan-sky birzhevoy listok*, 1870, 27 July; *Kazansky birzhevoy listok*, 1891, 23 March; *Kazansky Telegraf*, 1894, 23 February]. Locally produced goods, handicraft, goods bought at the Kyakhta, Samara, Nizhny Novgorod, Menzelinsk, Laishev, Orenburg, and other fairs were brought from Kazan for trade. The inhabitants of Kazan were also valued as major wholesale buyers of fat (Iskhak Arslanov, Muhammadsafa Galikeev, Izmail Galansky), rawhide (Yunusovs), furs (G. Subayev, 'B. Subayev, I. Burnashev, and M. Sajdashev in Kazan'), and tea (Ahmetzyan Rakhmatullin, Ahmetzyan Saydashev), as those were traditional goods for Kazan Tatars.

Tatar national shoes and headwear were on high demand in Irbit.

The uyezd towns Yelabuga, Laishev, Chistopol, Kotelnich, Kozmodemyansk, Mamadysh, and Menzelinsk were 'trade and harbour centres' and 'trade and administrative fair centres' of the Middle Volga and Kama region²⁷.

²⁷ There were such fairs as those in Laishevo (Kazan guberniya, 27 May–11 June]: the Karavannaya fair, merchants traded in iron and cast iron, brought to the Laishev berth via the River Kama from mountain plants in Orenburg, Ufa, Vyatka and Perm governorates. In Chistopol there was the so-called 'millionth' bread fair, and in Mamadysh, the 'seasonal' fair. The turnover of

The oldest wholesale market in the eastern regions of the country was the Kazan trade fair which was called 'Tash ayak', 'Bulachnaya', but more often 'Spring Exchange'. The fair took place from 1 May to 1 June. Its turnover reached 1.5 million rubles, and the amount of traders was approximately three hundred²⁸.

The transit wholesale trade, which was conducted through Kazan during the period in question, propelled the city to be one of the major trade centres in Eastern Russia. Goods from the Lower and Middle Volga regions, the Kama River region, the Transcaucasia, Siberia, and the Urals were carried to Kazan. There they were stored and distributed among the cities and fairs of Russia to be exported then abroad. Kazan merchants led vigorous trading

the Alexeyevskaya Fair (Kotelnich, Vyatka governorates, 1–19 March) reached 1 million roubles. The Menzelinsk Fair (Ufa guberniya, 26 December–11 January) traded in fabrics (40%), tea, sugar, dyes, and leather. For the Kozmodemyansk Fair (Kazan guberniya, 15 May–1 July), rafts with timber were delivered from the Kostroma, Nizhny Novgorod, and other guberniyas; the turnover reached 1 million rubles [see Denisov, 1911; Kandelaki, 1914; Russia, 1900, etc.]. After the Nizhny Novgorod Fair, a lot of Kazan, Moscow, Orenburg, and Troitsk merchants hurried to the Vozdvizhenskaya fair in Bugulma (14–22 September), where they traded in 'low-grade paper goods', iron, and cast iron products [Kazansky birzhevoy listok, 1869, 30 October, 7 November].

²⁸ Sarpinka (Striped cotton, fabric with rare weaving) was delivered from Saratov guberniya; handicrafts were brought from Nizhny Novgorod and Vyatka consisting of mainly bowls made of wood; crafts were brought from Yekaterinburg which were made from Ural stones; ware, fancy goods and Moscow toys were brought from Moscow; and from Vladimir, icons and church utensils. Lemons and oranges were delivered from St. Petersburg, among other goods. They were quickly purchased by Tatar merchants, who traditionally controlled the sale of fruits imported to Kazan. Merchants from Persia, Central Asia, and Transcaucasia sold their goods at the fair. Tatar merchants brought their traditional products to 'Tash ayak': soap, tallow candles, tanned skin, red calico, cotton materials, such as blue or black cotton fabrics, national shoes, hats, clothes, and jewellery. Some local merchants transferred their trade to the fair in the spring, offering the products of Kazan industrial enterprises and crafts. After unloading at the fair berth, ships were loaded with bread, mat, fiber, rims, tallow candles, glassware, Russian leather, potash, oil, and canvas.

Market-place mosque of Tatar merchants in Irbit in the Perm Guberniya. Photo from the early 20th century.

and entrepreneurial activity in the eastern international market. States of Middle Asia, Western China, and Persia fell within the scope of their interests.

It was in the specificity of the transit trade that Kazan was used as a major transshipment terminal for warehousing goods until favourable conjunctual, weather, and road conditions occurred and the due time arrived, then they would be moved to their point of sale, which in our case meant to the capitals and northern ports, to fairs of the Volga and Urals, Siberia, and Central Asia.

In the early 19th century, Kazan merchants transported bread, Russian leather, beef and mutton tallow, wax and honey to Saint Petersburg's port. To Arkhangelsk they sent Russian leather, wax, tallow, wheat, peas, millet, and bristle hair. The following products were delivered to the Astrakhan market: bread, Russian leather, honey, wax, firewood, basts, resin, tar. Butter, rod tin, tinplate, incense, grape wine, dried plum and figs, fish, caviar, fabrics, and nuts. In Moscow, Kazan citizens sold fish, caviar, wax, honey, soap, 'Pan and Russian'

stockings, and in the towns of the Volga region they traded in 'bread of all kinds', tar, and resin. Among the products they purchased were golden and silver braids, brocade, silk and cotton fabrics, tinsel, tin utensils, sugar, and 'all sorts of manufactured goods'. In the first half of the 19th century, the trade turnover increased considerably in Kazan: from 10–12m at the beginning of the century up to 26m in 1823 and 58m roubles in 1852 [Zagoskin, 1895, p. 525; Kazansky birzhevoy listok, 1878, 22 February]. M. Rybushkin noted: 'Soap and tallow candles produced in Kazan are delivered for sale to, apart from the capitals, distant locations in Siberia and are highly valued for their quality there' [Chulkov, Vol. 6, Book 4, 1786, pp. 212, 213; Rybushkin, 1834, p. 93].

The Tatar merchant class did not exist separately: it was closely connected by business relations with Russian merchants, especially merchants of the major trade and industrial centres of Eastern Russia, the Urals, and Siberia, as well as with partners from Western Europe, but especially from Central Asia, Iran, and the western regions of China and Transcaucasia. Fairs in which Tatar businessmen were active participants played a mediating role in establishing these relations. In the first half of the 19th century, they actually controlled trade with the states of Central Asia, facilitated the development of trade with China, Siberia, and the Urals, played an important role in arranging the work of the Nizhny Novgorod fair, thus occupying their own niche in commercial transactions at Russian fairs. No wonder that contemporaries always emphasize the leading role of the Tatar businessmen in the development of trade with countries of the East.

§ 4. Regional and Local Trade

Lyudmila Sverdlova

The major activities of Tatar merchants throughout the 19th century were commerce, production, and to a lesser extent, providing services and the participation of merchants in banking and commercial transactions. Com-

merce, while being the oldest entrepreneur activity, prevailed among Tatar merchants both by the amount of current assets and by the number of businessmen employed.

Commerce is direct trade and trading and intermediary activity designed to ensure commodity circulation, the exchange of goods, the purchase and sale of goods, as well as customer service in the course of selling and supplying goods, during the storage of goods, and their preparation for sale. The goal is to ensure the maximum economic effect from the difference in the purchase and sale prices of goods.

The economic situation of the city in which the entrepreneur conducted business also greatly influenced the development of market relations and connections in the region, and as a result, also influenced the economic behaviour of the merchant. These factors included the level of development of land highways and roads, the availability of waterways, and their connection with the major thoroughfares of Russia, presence in the region of fertile soils, forests and mineral resources. All these determined the quantity of raw materials and goods supplied by traders to the international and domestic markets.

Kazan in the first half of the 19th century, while being an important economic centre of the empire, played an important role in the establishment and functioning of the Russian market, held great influence over the development of commercial activity in the eastern part of the country, neighbouring regions, and in uyezd towns of the guberniya itself. The geographic location of Kazan at significant land and waterway crossroads was very important in turning the city into a trading and intermediary centre.

The heart of the urban trade of Kazan was Gostiny Dvor, which accommodated about 1,000 shops. In 1818, 69 shops of Gostiny Dvor 'belonged to different landowners', and the major owner of shops was the merchant Abdul-Karim Yunusov (21 shops) [National Archives of the Republic of Tatarstan, f. 114, inv. 1, file 216, s. 138, 200–201 reverse].

Trade was also conducted by residents of the Old and New Tatar slobodas who were not enrolled in the guilds and were referred to as 'Serving Tatar traders' by the census of 1785. They were engaged in petty trading, transportation, inn and eatery keeping, renting out dwell-

ings, trading and warehousing premises and initiating handicraft industry.

In Semipalatinsk, Tatar merchants sold bread, furs, leather, carpets, fabrics, small wares, ready-made clothing, confectionery products, eastern herbs and spices, thus pushing out local traders from this marketplace. One of the major merchants of Russia in the 19th to the beginning of the 20th century were the Musins, who had established the basis of their well-being already in the 18th century. By the middle of the 19th century, they owned shops in Semipalatinsk, Ayagoz, Zaysan, and a flour milling plant [Semipalatinsk, 1984, p. 18].

A specific economic 'microcosm' was being created around the cities, and it had its own peculiarities. For example, the frontier town Petropavlovsk became one of the centres for conducting trade with 'the Kirghiz Steppe', with its 'endless stock of meat, fat, and leather goods'. A 'livestock alleyway' passed through the city, which led to the central governances of Russia [Petropavlovsk, 1985, pp. 22–23]. That was what defined the main trading specialisation of the Petropavlovsk businessmen who obtained total control over the regional market. There was Menovoj dvor [trading centre] there with a turnover of 3m silver rubles.

Active trade and business activities of the Tatar population contributed greatly to the growth of the national merchant class. It should be noted that usually the most wealthy representatives of the trading capital enrolled in the merchant class. In 1801, 32 Tatar families joined the guild merchant class; in 1809, 35 joined; and in 1837, 53 families joined. The 1st guild merchants appeared among the Tatars: the Yunusovs, the Apakovs, the Apanayevs, the Usmanovs, the Arsaevs, the Kitaevs, the Bayazitovs, the Akchurins, the Yakupovs, and others who, according to the law of 1832, were raised to the class of hereditary honorary freemen.

According to K. Fuchs, the Kazan merchants Iskhak Apakov, Husain Apanayev, Iskhak Yakupov, and some others owned capital which amounted to over 500,000 roubles, and Ibragim Yunusov possessed capital totalling 3m roubles [Fuchs, 1844, p. 140].

Former Apanayevskoe Podvorye [courtyard] in Kazan. Present day 60, Moskovskaya Street. Photo, 2010

The Tatar merchant class experienced not only quantitative but also qualitative development. Both the total amount of the capital reported by Tatar merchants and the individual capital of individual businessmen notably increased. For example, the 1st guild Simbirsk merchant Suleiman Akchurin possessed capital totalling 130,000 roubles, and K. Akchurin possessed 400,000 roubles of monetary capital alone [Romashin, 1956, pp. 340–341].

The fact that the national bourgeoisie had its own specific market, foremost in Central Asia, where Tatar merchants held strong positions and conducted trading activity while successfully avoiding competition on the part of more wealthy businessmen from the centre of Russia, was a very important factor in pushing trade to

the top in the process of original accumulation of capital by Tatars.

The entrepreneurial activity of Kazan Tatars had one specific feature, namely, the development of the publishing business, which allowed Kazan publishers almost exclusively throughout the 19th and the beginning of the 20th century to sell spiritual and secular literature in the Tatar language throughout Russia, which contributed to the education of the Tatars. Ch. Valikhanov noted that 'our Tatar

traders should be considered the main drivers of this [Islamic.—*L. S.*] education... [Valikhanov, 1985, p. 384]. Through them, the local Islamic population of the empire received access to spiritual and secular literature, particularly that which was published in Kazan.

Of course, only a small number of Tatar businessmen could afford to be involved in international trade. The majority of small, medium, and even large merchants were satisfied with doing business inside Russia. The major capital of Tatar businessmen was mostly concentrated in the trade involved in capitalist relations, which was inextricably associated with the changes in the forms of domestic trade. But fairs in cities gradually gave way to stationary trade, which was conducted in stores and shops.

Table 34

Number of shops in Kazan and their annual turnover according to domestic consumption in 1857
(compiled in accordance with: [Respublika Tatarstan, 2001, p. 191])

Commodity	Number of shops	Annual turnover, thousand roubles in silver
Tea	27	360
Silks, woollens, cottons, linen	69	750
Fur products	13	90
Leathers and leather goods	17	250

Urban layers of society also took an active part in trading activity, especially as tradespeople who later formed the lower middle class. Despite the fact that this was mainly small trading, there were cases when the annual turnover of a petty bourgeois was no less than that of a merchant.

In 1814, in Kazan 43 lower middle class Tatar traders were registered with an average sales turnover per one person amounting to 1281 roubles [counted according to

National Archives of the Republic of Tatarstan, f. 114, inv. 1, file 171, s. 123–123reverse].

The growth of commodity and money relations helped to remove obstacles in the way of the development of peasant trade. Beginning in 1801, peasants were allowed to conduct trade with 'overseas countries', and in 1814 representatives of all social stratas received the right to conduct trade in fairs. In 1818, state-owned, appanage, and manor peasants were permitted, subject to their supervisors' approval, to establish mills and factories, provided they paid duties. The 1824 Decree permitted 'state-owned,

Shops at the Hay Market in Kazan. Present-day view of the crossroads of Moskovskaya Street and Parizhskaya Kommuna Street. Photo, 2010

appanage, and manor peasants... to perform trading and industrial activities, as performed by merchants, and also to be engaged in sales, trades, and crafts, which are performed by petty bourgeois traders and tradesmen, provided they submit a license and pay a duty, and by no other way' [Complete Code of Laws of the Russian Empire—1, Vol. 39, No.30115].

In the first half of the 19th century, peasants received the opportunity to conduct wholesale trade and even sell imported goods [Complete Code of Laws of the Russian Empire—1, Vol. 39, No.22030]. Some other restrictions,

Table 35

Number of Tatar guild capitals in Kazan between 1785–1835

(calculated according to: [National Archives of the Republic of Tatarstan, f. 22, inv. 1, file 176, s. 88–100; fund 114, inv. 1, file 1142, sheet 14; fund 299, inv. 1, file 145, sheet 13; Rybushkin, 1834, p. 98])

Year	First guild			Second guild			Third guild			All guild funds		
	Muslims		total	Muslims		total	Muslims		total	Muslims		total
	male	female		male	female		male	female		male	female	
1785				10		10	3		3	13		13
1788	5		5							5		5
1793				9		9	14		14	23		23
1825	3		3	2		2	50	6	56	55	6	61
1837	3		3	2		2	49	4	53	54	4	58

which concerned the migration of state-owned peasants to cities, were also removed in the way of development of trade and industries. They were granted the right to open factories in settlements, etc. State-owned peasants and Tatar peasants, who, as is well-known, belonged to this category, were most of all connected with the market.

Among Tatar peasant buyers there were large merchants, although the majority of Tatar peasant traders allocated small capital and conducted business in the retail delivery trade by delivering industrial and agricultural products to farms and houses, by buying, but more often exchanging, raw materials (untreated skin, soda ash, canvases, etc.) and items of national handicrafts and trades from the population. This group of merchants connected their activity with local fairs and bazaars and served

the needs of the local market. In the mid-1850s, trading peasants made up nearly half of all salesmen in the cities. Trading peasants, who competed with merchants mostly in the local market, beat down prices, thus decreasing the merchants' profit. In order to save their capitals, merchants had to search for new ways of investment, including investments in industrial production.

During the period when the market economy was only beginning to develop and getting established as the main way of organization of the economic life of Russia, the active involvement of merchant-entrepreneurs in industrial activity became a specific feature of the development of trade capital. Through this activity, they developed their connection with manufacturing, which opened new sources of capital for them, which had not been available earlier.

§ 5. The Handicraft Industry and Manufacturing System

Lyudmila Sverdlova

In the first half of the 19th century, the process of separating industries from agriculture continued in Russia, and the social division of labour occurred on a wider scale. A greater number of the rural population was becoming involved in industrial production. At the same time, the economic specializations of individual regions of the country became more specific. All this resulted in the expansion of commodity production and the development of handicrafts. Accordingly, the domestic market was expanding as well. The growth of industrial production caused an increase in demand for agricultural products. The improvement of the marketability of arable farming in turn shaped the growing demand for industrial products. Meanwhile small handicraft commodity production continued to hold a high position in the economy.

As is well-known, the development of industries includes the following stages:

- 1) household peasant industry;
- 2) custom-made handicrafts;
- 3) market-oriented handicrafts, that is, small commodity production;

4) simple capitalist cooperation (workshop 'factory' using wage labour);

5) mill;

6) large-scale industry.

If during the first four stages Tatar businessmen were active participants of the capitalization process, then during the last stages, especially that concerning large-scale engineering, Russian businessmen dominated.

Article 1 of the 'Handicrafts Charter' stated: 'A craft is defined as the manufacture of items by hand'. A craftsman was prohibited by law to use machinery in production. Therefore, in order to survive in the competition, even with small manufacturers, a craftsman had to work 16–18 hours per day, though, according to the Charter, his working day was limited to 10 hours (from 6 a.m. until 6 p. m. with a 30 minute breakfast break and a 1.5 hour lunch break).

Tatar craftsmen were not in the handicrafts workshop structure of major cities. They were registered as petty bourgeoisie and were mostly engaged in traditional industries, such as leather treatment, the production of various

felt articles from wool, the production of high quality soap and candles. Usually the production of soap was combined with the production of tallow candles; therefore, it was considered to be most efficient to set up a tallow factory along with a soap enterprise, or, which was done more frequently, a small handicraft shop for tallow boiling.

Small manufacturers, who were getting more and more involved in the developing market relations, began to use hired labour. As a result, small and then large workshops appeared. They represented a higher form of organization of industrial production. That is where the gradual differentiation and cooperation of labour occurred, and labour efficiency rose significantly. The use of larger capitals, the growth of production outputs, close connection with the market, deepening of labour differentiation and cooperation processes in workshops turned them into capitalist places of production, often called 'factories'.

Labour organization could differ in each factory. There were places which carried out production in the owner's workshop. Such places were described as centralized. As a rule, Tatar craftsmen worked on request of the entrepreneur, who distributed raw materials among numerous day labourers. The owner paid them per item, and the wage was very low. Thus, women who stitched skull-caps and padded them or stuffed flax tow between stitches were paid 30 kopecks for 100 pieces, which was hardly enough for a family to make ends meet [Kazansky birzhevoy listok, 1888, 29 August]. The employer himself sold the goods in numerous shops or carried them to other cities and to fairs. This kind of production was called 'distributed manufacturing'.

In the regions with traditional household industries—primarily the treatment of grain, leather, wood, and national Tatar trades—the manufacturing system was established. The establishment of factories significantly ousted household industries, preventing them from competing with cheaper products of manufacturing. But handicraftsmen did not disappear completely. They transitioned to the produc-

tion of new products or lost their independence adjusting to larger production factories and becoming its constitutive element, which occurred when distributed manufacturing was created.

Tatars were engaged in buying up transactions and controlled many areas of this business by selling the products of local industry, agricultural raw materials and products, which they purchased directly from the producers. Thus, in 1826, 37 3rd guild merchants were engaged in the sale of untreated leather ('raw material products') in Kazan. All of them were Muslims [counted according to National Archives of the Republic of Tatarstan, f. 114, inv. 1, file 557, s. 30–30 reverse].

Kazan historically was considered to be the major trading centre for all of Russia in the production of national clothing, footwear, head wear, jewellery, etc.

During the pre-reform period, commerce remained the major activity of Tatar merchants and dominated other areas of investment. Besides, as early as in the 18th century, trade overran small commodity production. In Kazan and Orenburg this process had its own peculiarities. Both the local and regional markets the Tatar merchants were connected with were filled with high quality European and Asian industrial products as a result of the business activity of the merchants themselves. And this certainly did not stimulate the transfer of merchant capital from trading to industry, especially to its new sectors.

The businesses which supplied conventional products for Tatar entrepreneurship to the Russian and external (Eastern) markets began developing. These were namely the following: leather, soap, candle industries, manufacturing (production of woolen cloth, nankeen and red calico), flour-milling industry, and the processing of raw material. Products of these businesses were distinguished for 'both their finishing and the fineness of their artwork, and significant trade turnover' [Rybushkin, 1848–1849, p. 93].

In the late 18th century, the process of initial capital accrument was so successful for Tatar merchants that they became owners of 'factories', or industrial enterprises of the manu-

Former shops of Muhammadgarif Utyamyshev in Kazan.
Present-day 10/14, Profsoyuznaya Street. Photo, 2011

facturing type which used hired labour. These were production workshops which employed simple capitalist cooperation. '... mills, factories and plants differed from crafts: they had machinery in large buildings which craftsmen did not have, as they only had hand-held machines and tools' [Ustav Remeslenny'j, 1879, art. 2]. 'Factories' had larger business sizes, higher quality products, and a larger number of hired workers than craft workshops; also the production costs per production unit were notably lower in factories.

M. Laptev, who processed the information collected in the mid 1850s by officers of the General Staff, noted the peculiarities of the development of factory production in Kazan. 'Factories in agricultural life hold a double purpose: they help to sell local products and serve as a way for the population to earn money. As regards the first point, Kazan factories are not very important; they are founded not in the centre of extraction of the raw materials needed for them: except for distilleries and potash factories, raw materials for all the other factories are supplied mainly from other neighbouring guberniyas. Local products, for example, in leather production, which is most important as regards quantity and value, are not very numerous' [Laptev, 1861, p. 356].

The reasons which caused the fast growth in factory production were as follows: 'a) Kazan has very convenient transport routes to quite remote destinations and, as a result, large sales transactions; b) the population of Kazan guberniya consists primarily of Tatars, who have a passion for trade transactions; while traveling across the neighbouring guberniyas, they glean raw materials; consequently, the materials are delivered to Kazan factories after they had changed hands several times, their prices soaring

as a result; c) in addition to the trading spirit of the population, factory activity is supported by considerable local capital involved in Chinese trading activity; and d) finally, by the low cost of the workforce resulting from small parcels of land, the third of which is covered by forests, and the low efficiency of plough-land. All this causes a peasant to look for earnings' [Laptev, 1861, pp. 356–357].

According to the 1762 Manifesto issued by Peter III 'On the Freedoms of Nobles' and the Charter to the Gentry of 1785, this class, which dominated in Russia, apart from other property rights, was granted the right to establish industrial enterprises on their estates and later to establish factories and plants in cities and towns, and the right to carry out trading activity, but only wholesale. The role of workers in patrimonial factories was played by serfs, who did not receive money for their work. Such factories mainly specialized in the production of woollen cloth, the production of potash, and alcohol-distillation.

As far as Kazan Murzas are concerned, many of them not only carried on successful trading activity but also owned industrial enterprises using hired labour. Among the major businessmen of Kazan at the beginning of the 19th century, the descendants of Murza Ait Za-

manov can be found. His two elder sons were known under the surname Zamanov, which was followed by the definition of their class: 'Prince' or 'Murza', while the other six brothers used the surname Aitov. In the early half of the 19th century, the brothers Zamanovs-Aitovs owned a candle, soap, and five leather 'factories', which represented a type of capitalist production which used hired labour. The largest enterprise owned by the brothers had 26 employees who processed up to 18K pieces of leather per year.

According to data of the early 1790s, century, 87 'factories', including enterprises of the manufacturing type, were registered in Kazan, excluding suburbs (such as the villages of Yagodnoe, Igumnovo, Bishbalt, Podmonastyrskaya slobodka). Their owners were made up of 44 merchants, to whom a half of all 'factories' belonged to, while Serving Tatars owned nine plants; Russian petty bourgeoisie owned twelve; Serving Tatar traders owned seven. The social and national origins of the owners of the remaining 5 factories are not specified [counted according to National Archives of the Republic of Tatarstan, f. 114, inv. 1, file 2, s. 1–105].

There were 30 soap enterprises (19 belonged to Tatars, 11 to Russians), 30 leather and gantry enterprises (20 belonged to Tatars, 19 to Russians), 7 breweries and malt-houses (all of them belonged to Russians) functioning in the city. I. Osokin's woolen cloth factory, the state-owned leather factory, and 9 various production factories worked there as well, and 7 of them were owned by Tatars [counted according to National Archives of the Republic of Tatarstan, f. 114, inv. 1, file 2, s. 1–105]. Red calico production enterprises which belonged to Tatar businessmen were mostly established in villages; therefore, they are not listed in the city property inventory. A red calico production enterprise could contain up to three looms, as, for example, in the factory of the Kazan merchant Ibragim Yunusov.

Three enterprises were owned by each of the 2nd guild merchants Yusup Abdulov (gantry), Abdrashit Bikbov Galansky (2 leather and a potash factories); two enterprises were owned by each of the 3rd guild merchants Mazit Bashi-

Silver medal awarded to merchant-manufacturer
A. Zamanov. 1831.

rov (soap production), Serving Tatars Abdrashit Rakhmatullin (leather), Musa Shafееv (leather and soap), Murtaza Rakhmankulov (production specialization is not stated) and the Serving Tatar trader Murtaza Davydov (soap production and tallow boilery). Out of 45 'plants' belonging to Tatars, 25 were owned by 21 merchants, 12 by 9 Serving Tatars, and 8 by 7 Serving Tatar traders.

Based on the data of the area occupied by any given enterprise, it will appear that only 10 out of 45 Tatar plants had a territory from 1000 up to 2000 sq. fathoms (6000 to 12000 sq.ft.), all of which produced soap. Large enterprises were owned by the merchants Yusup Kitaev, Mazit Bashirov, Abdrashit Galansky, Yusup Izmaylov, Yusup Davydov, the Serving Tatar murza Isay Zamanov, the Serving Tatars trader Murtaza Davydov (2 enterprises), Sagit Belyaev and Mukhan Asanov [National Archives of the Republic of Tatarstan, f. 114, inv. 1, file 2, s. 61–63, 64 reverse–65 reverse]. The rest of the 'factories' occupied a smaller square area.

The soap and tallow melting 'factories' owned by the Serving Tatar trader Murtaza Davydov and soap 'factory' owned by the merchant Leonty Krupenikov were considered to be best equipped and were ranked among first class plants [National Archives of the Republic of Tatarstan, f. 114, inv. 1, file 2, s. 62].

In 1800 in Kazan, Tatars owned 8 soap 'factories', 4 footwear production enterprises, 9 leather 'factories', the largest of which belonged to Musa Apanayev, Yakub Gabbasov, Salikh Aitov, Khabibulla Yakhin, Mustafa Aitov, and Gabbas Belyaev [Gaziz, 1994, p. 181].

According to 'Vedomost' o manufakturax v Rossii za 1814 god' [1814 Journal on Manufacturers in Russia] the Kazan soap plants produced 133,260 poods (2,132,160 kilos) of soap, which made up 46% of overall Russian output [Tatrespublika, 1923, No.12, p. 30]. 13 soap factories out of 24 total belonged to Tatars. The largest plants were owned by Gadiba Kitaeva, merchant wife (annual production 10,000 poods (160,000 kilos)), murza Isay Zamanov (10,000 poods (160,000 kilos)), and the merchants Abdulkarim Yunusov (9,000 poods (144,000 kilos)), Musa Adamov (8,000 poods (128,000 kilos)), and Yakup Shatunov (8,000 poods (128,000 kilos)). The Tatar businessmen of Kazan kept playing an important role in the leather industry. In 1815, 111,000 various leather goods were treated in their enterprises. In the leather factory of Yakub Gabbasov, 20,000 leather goods were manufactured; in Musa Apanayev's factory, they produced 13,000 goods; in the plants of Bashir and Mustafa Aitovs, they produced 10,000 in each factory. Enterprises owned by Abdulkarim Yunusov, Mustafa Surerov, Khisamutdin Aitov, Makhmut Valitov, Musa Mukhametov, Bayazit Biktimirov, and Safiulla Khamitov operated in the city [Khasanov, 1977, p. 86].

In the last third of the 18th century, the production of red calico and tent cloth was basically concentrated in the hands of Tatar manufacturers. Tatar factories distinguished themselves by few complete units, the use of unemployed Muslims, and the location of a significant part of enterprises in rural areas. Only one factory was located in Kazan (which belonged to Yunusov), while the rest of the enterprises were situated in rural areas. These were red calico production factories which belonged to Usmanov (in the village of Kyshkar), to Burnaev (in the village of Verezki), to Mamashev (in the village of Urnash-Bash), to Bayazitov, and to others. Similar enter-

prises functioned in the villages of Ura, Sosna, Karelino, Nurma, etc.

In 1814, 9 weaving factories owned by Muslim businessmen functioned in Kazan guberniya, where about 592 Tatar workers worked on 319 looms set up there. During this period, Tatar manufacturers produced 75.2% of all red calico in the empire; 55.3% of looms were concentrated in their ownership in the domestic consumer industry.

Astrakhan at the beginning of the 19th century was singled out as one of the centres of development of the textile [red calico] industry. In 1816, Tatar businessmen owned 27 textile and 2 silk production factories, which produced about 100,000 arshins of various fabrics, including coarse calico, striped linen, nankeen, etc. The largest enterprise, which produced 20,000 arshins (280,000 inches) of coarse calico, belonged to Khajimurat Ayvazov.

The demand, consumer market, and availability of capital determined the focus area and dynamic pattern of industrial production. By the 1840s, the industry reached the peak of its development, and then it began to decline. Red calico factories in the Volga region, having had no chance of competing with enterprises in and around Moscow, switched to a great extent to the production of nankeen, thanks to the investments of merchants.

The 'factories' of the Astrakhan citizens Abubakir Sultanov, Ibrahim Kuramsheev, and Izmail Niyazov were considered large. The rest of the factories in Astrakhan, in comparison with the enterprises in the Kazan and Vyatka governorates, were small and supplied to the market 5,000–6,000 arshins (140,000–168,000 inches) of their product annually. These production facilities belonged to Abdrashit Mustaev, Murtaza Badamshin, Kanifa Abdullaev, and others [Khasanov, 1977, p. 85].

The nankeen which was manufactured in the enterprises of the Kazan merchants Gabelmazit Urazov and Iskhak Apakov was famous for its quality of embossing. There were cotton cloth factories functioning in Kazan, which belonged to Nazar Bayazitov (48,000 arshins (1,344,000 inches)), Murtaza Burnaev (48,000 arshins (1,344,000 inches)), Muham-

madrakhim Beritov (53,000 arshins (1,484,000 inches)), and Zyuleykha Abdullova (48,000 arshins (1,344,000 inches)) [Tatrespublika, 1923, No.12, p. 32].

In the first half of the 19th century, Arsk and its suburbs became a major centre of nankeen and red calico production. The factories of Nazir Usmanov, Khamza Gubayev, and Kurbangaley Burnaev functioned there. In Sviyazhsk uyezd, the production business of the Arsk merchant Prince Akhmet Usmanov was in operation.

The Arsk merchants Musa, Mustafa, Suleyman, Makhmut, and Mukhmikha Khozyaseitovs launched cotton cloth production on the River Ura in Tsarevokokshaysk uyezd of the Kazan guberniya. The annual production of fabrics at the Khozyaseitovs' four factories amounted to 375,000 arshins. The entrepreneurs also opened at this location a bast-fiber tackle factory [Tatrespublika 1923, No.12, p. 32, Istoriya Kazani, 2005, pp. 536, 544].

In 1818, Timerbulat Akchurin (1826–1906) opened a cloth manufacture in Syzran uyezd of Simbirsk guberniya. In 1825, he also built a factory in the village of Guryevka in Korsun uyezd. These two factories employed 1,300 free workers [Istoriya Kazani, 2005, p. 86].

In 1849, the successful merchant Suleyman Akchurin (1802–1864) built his first factory in the village of St. Timoshkino of Simbirsk guberniya. At first, it was a small factory. In 1853, the company employed 215 people; there were 60 handlooms, and the amount of production did not exceed 60,000 roubles per year [Romashin, 1956, p. 233]. The Crimean War and the increased demand for cloth, as well as government military orders, allowed businesses to expand their production significantly. Profits from the implementation of guaranteed government orders were used to develop enterprises. By the end of the 1860s, there were already 117 manual and 19 mechanical looms. Two steam engines with a total capacity of 60 hp appeared at the factory; their installation made it possible to organize uninterrupted year-round production, independent of the water regime of the River Sviyaga. Technical innovations made it possible to significantly

increase the volume of production. The factory manufactured 450,000 arshins of cloth totalling 400,000 roubles per year [Simbirskij sbornik, 1870, Vol. 2, p. 92].

In 1848, the Serving Tatar Akhmet Aleev opened a cloth factory in the village of Bobylevka of Simbirsk uyezd, employing more than 700 workers. The factory was equipped with steam boilers. In 2 years, together with his brother, he built another cloth factory in the village of Lyakhovka, Korsun uyezd, in the same guberniya, providing 300 jobs [Khasanov, 1977, p. 91].

The cloth factory of Hamid Aleev operated in the village of Mullovka of the Stavropol uyezd, Samara guberniya. In 1856, the industrialist Ishmuhammad Deberdeev opened a cloth factory in the village of Verkhozima of the Kuznetsk uyezd of the Saratov guberniya, which employed the most modern equipment, including that of foreign make. In 1858, Mustafa Deberdeev built a cloth factory in the village of Pendel in the Kuznetsk uyezd; the annual production of army cloth reached 350,000 roubles per year. Yakhya Deberdeev earned 300,000 roubles per year. 900 workers were employed at these two factories [Khasanov, 1977, p. 93].

Tatar entrepreneurs successfully mastered new types of manufacturing. In 1815, the Arsk merchant Mukmin Khozyaseitov opened a writing paper factory in the village of Unzha in the Tsarevokokshaisk uyezd of Kazan guberniya, making paper in the Bukhara style. The factory produced 4,000 stacks of writing paper and 2,000 stacks of wrapping paper [Istoriya Kazani, 2005, p. 544; Khasanov, 1977, p. 86]. In 1816, in the Urzhum uyezd of Vyatka Governorate there were two writing paper factories, owned by the female merchant Gagdibanu Mamatova and merchant Damin Mamatov [Khasanov, 1977, p. 86].

In the first half of the 19th century, the Tatar entrepreneurship in Kasimov was developing very rapidly. Crafts, such as leather and lamb-skin processing (coarse-wooled breeds), were well-developed there, as was jewelry making and brick production. Such merchant families

as the Shakulovs, Musaevs, Bostanovs, Ishimbaevs, Taneevs, Davletkildeevs, and Kastrovs came to the forefront. It should be noted that the hat makers of the village of Shemordan in the Mamadysh uyezd of Kazan guberniya carried out orders for a Kasimov-based merchant Davletkildeev.

In the 1840s, S. Kastrov owned a factory, employing 16 workers who processed 65,000 lambskins a year with 10 boilers. These raw materials went to make coats, hats, and collars at the entrepreneur's other companies [Khasanov, 1977, p. 86].

Kh. Shakulov and the Ishimbayvs, merchants from Kasimov, owned a major tannery. At the beginning of the 1830s, Shakulov's factory had 175 boilers for tanning, and 135 people were employed there. In 1833, the company made 38,000 different leathers totalling 346,500 roubles. 'Skins made at this factory, especially the soles, are comparable in quality to the best foreign analogues'. Products were sold at fairs in Moscow [Islam, 2009b, p. 285].

In the mid-1830s, tanneries were owned by Musa Usmanov (Kazan uyezd), Hasan Apanayev, Muhammad Apanayev with their brothers (Kazan), while national footwear and headgear were made by Mazit Abdullin (Kazan). The merchant family Alyshev in the middle of the 19th century owned a brick factory in the Kasimov uyezd [Islam, 2009, pp. 20, 286].

According to data for 1814, there was a plant for the production of potash (potassium carbonate) in Mamadysh, owned by Punafev Batyev [Tatrespublika 1923, No.12, p. 34]. In the Ufa guberniya, in Belebey Uyezd, there was a potash factory owned by Gubaydull Maksudov and the Kazan merchant Serov [Gaziz, 1994, p. 181]. In 1817, the number of potash factories owned by the Tatars grew to 40, while the main area of potash production was the Orenburg guberniya: 9 factories in Belebey Uyezd; 8 in Birsks Uyezd, 7 in Menzelinsk Uyezd, 2 in Ufa Uyezd, 1 in Sterlitamak Uyezd. The remaining 14 factories were located on the territory of Vyatka (7) and Kazan (6) governorates [Khasanov, 1977, p. 85].

During the war of 1812, the copper smelting factory of Asafulla Inozemtsev resumed

operations. It employed 445 workers and annually smelted 1,400 poods of copper, and in 1828, the company increased production up to 2,500 poods [Zablonsky, part 2, 1832, p. 72].

In the middle of the 19th century, the situation evolved into extremely unfavourable circumstances for Tatar entrepreneurs. In 1855, the government allowed the sale of tea in Kyakhta for money, as opposed to an exchange for goods as before, such as processed leather and fur, and cotton fabrics. That meant reducing production at tanneries and factories. A sharp decline in the demand for goat leather and cotton fabrics in Kyakhta coincided with a decrease in their use nationwide. Goat leather in the manufacture of footwear was replaced with upholstery, patented shagreen and dog leather, while nankeen was replaced with cheap cotton fabric. The production of cheaper textile products and the industrial revolution in the country's central commercial district led to a crisis in the manufacturing industry of the Middle Volga region. This was a significant blow to the production of Russian national crafts and industry. Few entrepreneurs managed to adapt to the new economic conditions of capitalist Russia.

The process of winding down Tatar handicraft and industrial production was accelerated by the fact that Kazan, Kasimov, and other cities were located outside the railway network. Trade continued to be the main occupation and investment area for local merchants. Tatar entrepreneurs actively participated in the development of handicrafts, creating small industrial enterprises, such as workshops in villages on the basis of national fisheries; they entrenched in those sectors where they had long dominated, but mechanization proceeded very slowly there, as steam engines were rare.

Industrial production was gaining and became a serious competitor to the old pre-capitalist forms of manufacture, quickly thrusting them out of economic life or promoting transformation into capitalist enterprises. The fast pace was characteristic of companies established in the 19th century.

CHAPTER 2

New Phenomena in the Socio-Economic Life of the Tatars in 1861–1905

§ 1. The Great Reforms and the Socio-Economic Development of the Region

Nailya Tagirova

The great reforms in the Volga-Ural Region were introduced simultaneously with the country's central regions—Novorossiia and Belarus. Along with the 29 Great Russian guberniyas, the Manifestation and Regulations of the 19 February 1861 were extended to the Volga-Ural lands (see: Appendix I, table 7) [Krest'yansaya reforma, 1954].

There then followed reforms in respect of the appanage (1863) and state (1866) peasants. The implementation and results of the reforms have been examined in detail in historical works, a significant reduction in the actual land-use by landowners' (see Appendix I, table 8) and appanage peasants is observed [Smykov, 1984; Savelyev, 1994; Usmanov, 1981],¹ and the process of the redemption operation has been analysed (see Appendix I, table 9) [Druzhinin, 1978; Kravtsova, 2011]. The picture was more diverse and complicated in the former state village: the Russian peasantry (in the southern steppe territories) appeared to be better supplied with lands in comparison with

the multinational peasantry of the northern forest and forest-steppe regions [Petrov, 2005]. The former state peasants were even able to increase their personal land ownership by purchasing neighbouring lands (in Kazan and Saratov guberniyas and the steppe uyezds of Samara guberniya). On average throughout the Volga Region they owned 51.8 dessiatins each (in the Samara Guberniya up to 139 dessiatins; according to the data of 1878, there were 2,619 of these self-employed peasants) [Savelyev, 1994, p. 253]. In Samara and Saratov guberniyas the latter owned on average 25–26 desyatins per farm. Such sizes of arable lands made farming a perfectly viable prospect.

Peasants working in mining and metallurgy were made equal to those of the landowners. In conditions of a significant decrease in allotments of arable lands (to 84%), it did not make any sense to them to continue working in agriculture. After their emancipation, their land allotment per capita amounted to 0.7 desyatins [Usmanov, 1981, p. 159].

'Beneficiary' peasants [those who were granted arable lands] constituted a special group of peasants after the reform of 1861.—These were peasants who refused to buy out their landowners' land [Burdina, 1996]. A 'donated' (quarter) land allotment was chosen by nearly 600 thousand peasants in the European part of the country (according to data from 1870), a third of whom were peasants from Saratov (107 thousand males, or 33% of all landowner peasants in the guberniya), Samara (39 thousand, or 35%), Simbirsk (40 thousand, or 18.4%), and Penza (36 thousand, or 14.1%) [Lyashchenko, Vol. 1, p. 581]. In some uyez-

¹ The size of plots of landlords and peasants had significantly decreased. According to the calculations of Yu. Smykov, the size of a peasant's plot in Kazan and Simbirsk guberniyas was reduced (by 11–16%), even though during the redemption operation they had paid 150–200% of the initial price of the land [Smykov, 1984, pp. 52–59]. Landlords' peasants, most of whom lived in the forest, forest-steppe zone of the Middle Volga Region and the north-western part of the Ufa Guberniya, ended up in the black-earth strip with minimum-sized plots. According to contemporaries and historians, they had lost rather than gained from the reform. In the south-east of the region, in the Ufa Guberniya, and a part of the Orenburg Guberniya plots of landlords' peasants were reduced by 14.4% [Usmanov, 1981, p. 331].

ds entire villages moved to the 'donated' land² allotments. The 'beneficiary' peasants were expecting to be able to lease the lands of the state land reserves cheaply. The destinies that awaited them were varied: 'miserable and not quite as miserable.' The black-earth [fertile] lands offered them the opportunity to lead a natural, agrarian way of life by producing simple handicrafts³. In territories where the land prices rose quickly owing to their proximity to railways, the peasants did not manage to expand their allotments and buy more lands, and their impoverishment began;⁴ in the uyezds of the southern steppes, the beneficiary peasants strengthened their farming operations, inter alia, by means of uniting into partnerships⁵.

The evolution of the landowners' economy has been studied in detail [Kabytov, 1981; Clein, 1982; Smykov, 1984; Savelyev, 1994; Rodnov, 2002, 2008; Usmanov, 1981], as have their connections with large state and commercial banks in the form of mortgages [Proskuryakova, 2003]. It is clear that in two decades over a third of all private possessions were mortgaged to them (see Appendix I, table 10).

The implementation of the agrarian reforms, 'the most complicated and dangerous in social terms' [Vlast' i reformy', 1996, p. 314], during

the course of 20 years was an attempt to equalise the class and intra-class differences in the peasant environment, create conditions for the economic management of both landowners and peasants on new contractual conditions. The implementation of the reforms aroused the dissatisfaction of parts of the population, including the overwhelming majority of the appanage peasants,⁶ who disagreed with the conditions of the land allotment. The difference in the land use of the former landowner, appanage, and state peasants, the unequal provision of agricultural equipment, the different conditions of resettlement, the presence or absence of handicrafts as additional sources of income—all of this shaped the agrarian Volga-Ural Region as an area of different paces and opportunities presented by the move towards a market evolution (with a gradual farmisation and agricultural entrepreneurship, or the conservation of traditional⁷ relations, the impoverishment of the peasantry and its further 'proletarianisation').

If the agrarian reforms tentatively constituted the first reform package, the land reform (1864) and urban reform (1870) may be regarded as 'the second package.' New institutions of self-government (zemstvos) were created in the countryside, and the City Dumas were given financial freedom. The new institutions utilised the potential of the most active part of the population. Research carried out in recent decades have identified the process of the development of the land reform and its implementation [Morozova, 2000], the important role of the guberniya and village institutions of self-government, and the social and cultural life of the region (L. Goncharenko, V. Tyurin, A. Konovalov, N. Arnoldov). This research has defined the economic mechanisms of the new public structures (zemstvo banks, volost saving banks, etc.), which require further study.

² In the Volsk Uyezd of Saratov guberniya, by 97%; in Saratov uyezd, by 58%; in Chistopol and Spassk uyezds of Kazan guberniya, by 50% (on average across the guberniya, by 30.3%); in Syzran uyezd of the Simbirsk Guberniya, by 40%.

³ Senator M. Kovalevsky, who in 1880 travelled around the Kazan Guberniya, noted that one-third of peasants 'are forced to rent land from their former landlords, and in most cases they pay for the land not by money but by farming and harvesting a certain amount of the landlord's land' [quote according to Druzhinin, 1987, p. 314].

⁴ In his report the senator I. Shamshin noted that in some uyezds of the Saratov Guberniya the amount of landless householders was up to 17%: here 'most of the peasants, who moved to gratuitous plots, became so poor that the zemstvos had to provide them with annual support, and the peasants themselves apply for resettlement onto state lands with government support' [Druzhinin, 1987, p. 304].

⁵ M. Kovalevsky, who had inspected also Ufa and Orenburg guberniyas, noted in his report that peasants 'for now have the opportunity to rent the required amount of adjacent land at a relatively reasonable price' [quote according to Druzhinin, 1987, p. 316].

⁶ 83–84% of the appanage peasants in Samara and Ufa Guberniyas refused to sign charters, so did a significant part of the peasants of Simbirsk, Saratov, Orenburg, Perm, and Vyatka governorates.

⁷ According to P. Savelyev, there were still opportunities for a non-capitalist evolution and the preservation of the labour-type peasant economy [Savelyev, 1994, p. 358].

The zemstvos were not set up everywhere or simultaneously. In 1864 they appeared in the Samara, Kazan, Simbirsk, and then the Ufa Guberniyas (1878). There were no zemstvos in Orenburg and Astrakhan guberniyas until the beginning of World War I (1913). US historian Charles Steinwede considers this to be a peculiar marker of the status of this territory as the European Russia [Steinwede, 2007, pp. 110–111]. This was reflected in the change in the perception of area: from 1900 the visual borders between Europe and Asia shifted from the Volga to the Urals in state cartography: the territory of the Ufa Guberniya was marked out on maps as a European, not Asian, part of the Russian Empire, in contrast with those territories without zemstvos [Steinwede, 2007, p. 95].

In different uyezds and guberniyas the zemstvos developed economic activities adapted to local conditions, trying to find a balance of interests between the territories and social groups [Samarskoe zemstvo, 2009, p. 6].

The 'Urban Provision' of 1870 formed a basis for the economic independence of the cities. The City Dumas were given the opportunity to establish municipal budgets and invited the local business elite to resolve the issues of city boundaries. This was also assisted by legislation on the liberalisation of trade: the 'Provision on the payment of duties for the right carry out trade and business' of 1863⁸ and peasant handicrafts⁹.

⁸ Depending on the degree of development of trade relations, the territory of the empire was divided into five regions with different annual levy for trading rights. Common rules for accounting, reporting, and auditing were established; local organisations of state supervision were created (supervision chambers). According to the 'Regulation,' all classes were allowed to be engaged in trade. For the Volga-Ural Region, whose territory fell into the 3rd and 4th groups, these circumstances eliminated the basis of conflicts and grievances between merchants and peasants trading in the region. The 'Regulation' established different levies for wholesale, retail, and peddling. Private trading and construction enterprises, the ownership and rent of trading vessels, offices, and storerooms, banking enterprises, expedition and commission brokerage operations were objects of taxation. Three merchant guilds were combined into two.

⁹ The laws of 21 March 1888 and 13 May 1891 created a legal framework for the handicraft industry.

The third block of reforms, which greatly affected the economic life of the Volga-Ural Region, concerned the cancellation of various features of the national economy and the unification of monetary (tax) revenues, which had been preserved since pre-reform times. The series of legislative regulations abolished the Bashkirs' canton system (1865) [Tagirova, 2011], the Tatars' quaternary landownership (1866), the tax privileges of the German Menonites (1871), the Bashkir owners of patrimonial estates, the Meshcheriaks and Teptyars were demoted to the rank of village residents (the civil class),¹⁰ and the military service of the Bashkir and Kalmyk troops and the Ural and Orenburg Cossacks was revoked. In the south-western areas, where it had not been possible to liquidate the nomadic economy,

This 'sphere of national labour gained support and development,' which corresponded to the state motto of creating a national industry [Kartashova, 2006, pp. 229–238].)

¹⁰ Upon the initiative of the governor of Ufa, the 'Regulation on the Demarcation of Lands of Bashkirs—landowners' was passed. This decision affected 203.7 thousand males [by 1858], including: 104.4 thousand in the Ufa Governorate, 86.7 thousand in the Orenburg Guberniya, 5.1 thousand in the Samara Guberniya, 5.7 thousand in the Perm Guberniya, and 1.6 thousand in the Vyatka Guberniya [Usmanov, 1981, pp. 35–36]. The number of pripushchennik (peasants of different nationalities who settled in Bashkir lands at various periods of time) in 1858 numbered a little more at 268.8 thousand people, most of them lived in the Ufa Guberniya [226.5 thousand, while the rest inhabited the Orenburg, Samara, Perm, and Vyatka governorates]. The history of the interaction between these population groups is complex and goes back to the early 18th century (the suppression of the Bashkir uprisings). On 10 February 1869 the State Council of the Russian Empire adopted the Regulations 'On Demarcation of the Bashkir Summer Houses for Allocation of the Land to Bashkir Landowners and Their Pripushchenniks and on the Procedure of Sale and Disposal of Bashkir Public Land for Quit-Rent Use' [Usmanov, 1981, pp. 35–38]. In 1865 military pripushchenniks were transformed into the civil class. The national land fund was made from half of their land, while the other half was used to make the civil fund, which was given to them as property. Similar to civil pripushchenniks, they used the land and were answerable to the Board of Agriculture and State Property. Civil and appanage pripushchenniks were forced to purchase land on the same conditions as other categories of appanage and state peasants.

Riverside quay in Syzran.
Postcard from early 20th century.

the traditional structure was legally preserved until 1892, when all Kalmyks were given the rank of state peasants [Ledzhinova, 2005].

The reforms changed a lot in the region, as features of marginality gradually disappeared, and administrative borders were shifted. In 1851 Samara Guberniya was formed, and 1865 saw the formation of Ufa Guberniya. The Volga-Ural guberniyas were made equal to Great Russian guberniyas (excluding Orenburg and Astrakhan). The structure and management of guberniyas granted a minimum level of independence to the different peoples inhabiting these areas. Decisions on key issues were made by the capital city, and 'in addition, the centre is to resolve issues of periphery development' [Bakhlov, 2009, p. 212].

Although contemporaries reacted to the reforms in different ways, the socio-economic environment of the Volga-Ural Region throughout the first two decades of the Great Reforms was undeniably altered. It quickly transformed from a marginal territory colonised from the inside into one of the economic centres of the European Part of the Russian Empire with a focus on agriculture, an orientation towards the market, and its own economic growth poles with the newest market infrastructure additions (roads, banks, and stock exchanges) [Povolzh'e, 2007, p. 327].

The main areas of growth and change of that time were cities. Their number did not change in the designated period, but the number of citizens and national heterogeneity significantly increased [Andreeva, 2006; Kononov, 2006; Petrov, 2005]. In the middle of the century, urban citizens constituted 3–8% of

the population (see Appendix I, Table 3a). But by the end of the century (1897) the number of Astrakhan inhabitants rose from 42.8 thousand to 113 thousand, in Kazan their quantity increased from 63 to 131.5 thousand, and in Saratov, from 84.4 to 137.1 thousand. They entered the category of one of the 19 largest cities of the Russian Empire (with populations of over 100 thousand). Populations was also increased in other Volga cities, but they did not clear the threshold of 100 thousand: in Tsaritsino the number of inhabitants rose from 8.5 thousand to 55.9 thousand, and in Samara, from 31.9 thousand to 91.7 thousand [Rossiya v konce XIX veka, 1900, pp. 61–62]. Cities mostly grew at the expense of migrant labour from villages.

The appeal of cities was related to more than just the proximity of administrative and educational institutions, which was important for the nobility. Cities also gained economic functions and became transport centres (water and rail) and creditors. At the same time, they also 'centred' [Remnev, 2000] adjacent territories, creating a type of economic gravitational field pulling business inwards.

The economic hierarchy of cities was anticipated by the construction of railroads. By the end of the 19th all the guberniya centres (besides Simbirsk and Astrakhan) had received year-round transport communication with the capitals and the Western parts of the Empire. The highest density of railways at the end of the 19th century could be found in Penza (10.2 versts of railways per square territorial verst) and Saratov (9.3) guberniyas (see Appendix I, Table 11). The lowest density of modern roads per 100 inhabitants could be observed in Simbirsk, Kazan, and Astrakhan guberniyas [Goncharenko, 1994, p. 21].

The migration deep into the country eastwards, into Siberia and Central Asia, was helped immensely by Samara, Ufa, and Orenburg. Each station formed its own zone of gravitation pull: Tsaritsin covered the whole Russian South and Don River Region, and Kazan handled the Volga-Kama Region as well as Vyatka and Arkhangelsk governorates. The route stretching from Syzran—Samara—

Ufa—Chelyabinsk—Zlatoust formed a 'corridor' in the Siberian direction. Before 1908 there were only railways connecting Europe with Far Asia and Siberia. Communications with Central Asia were carried out through Orenburg, which in 1893 was linked up with the Samara road. Water steamship routes were also developed actively [Tarkova, 2007].

The Alexandre (Syzran) Bridge over the Volga. Photo of 1880.

The 'weaving' together of the Volga and Ural territories into the general transport system of the empire at the same time altered the very foundations of economic life. Complex and multiple-sector economic operations were formed around hub-stations for the repair of rolling stock and maintenance of access roads, warehousing and storage of goods¹¹. New employment positions also

emerged, including jobs requiring professional knowledge.

Rail transportation required the centralisation of control, coordination and cooperation between a range of different services. The management of cargo traffic, documentation/marketing of goods, storage and insurance—all this formed a new culture around farming and trade. Special commercial services subsequently opened their doors road-side. Present-day researchers have noted a multiplier effect and the positive social impacts of railway construction in the Volga-Ural Region [Andreev, 2007; Mukhina, 2007; Tagirova, 1999; Khalin, 2006; Tselikov, 2006].

The immense public and private capital that had previously been of interest to the Volga-Ural Region continued to consolidate their positions here. The region appeared to be intertwined with the transport network of the country and the entire world economy in general. The former marginality of their existence was now a thing of the past.

At the same time, the system of new economic relations was forming on the basis of capitalistic credit and credit organisations establishing a general imperial capital flow. State savings banks operating since the 1840s as self-help organisations were passed in 1864 under the supervision of the State Bank and widened its circle of clients, including new

¹¹ Workshops (at the Moscow, Petrov, Alatyř stations), 44 powered elevators, and a freezer warehouse were built along the privately-owned Moscow-Kazan railway. The first road and rail bridge was built near Sviyazhsk. Consumer cooperative societies for workers and employees and cooperative stores (at Syzran, Kazan, Penza, Arzamas, Nizhny Novgorod stations) operated along the railway. Two ferries were acquired, a harbour was built (at Saratov), warehouses and access roads were constructed, and oil storage tanks and pumping equipment were installed in accordance with an agreement with The Nobel Brothers Partnership along the privately-owned Ryazan-Ural railway. 18 grain elevators were constructed to clean and store grain, and cargo insurance was set up (from 1902). At the stations it was possible raise a loan to buy grain from money earned on the railway. Grain was sold on commission in ports and major cities (Warsaw, Moscow, Saint Petersburg, Revel, Libava). A specially-constructed harbour for loading and processing grain (with a capacity of up to 15 million poods) was built in the Pokrovsky sloboda (now the city of Engels in the Saratov Region); a timber lifting device (up to 10 thousand pieces) was built in Kamyshin, and salt warehouses and mills were built at Kamyshin, Baskunchak, and Elton stations. The Ryazan-Ural railway possessed its own treating plant and sawmill. Schools (44) and vocational training colleges (in Kozlov, Inza, Saratov) were built along the railway. There were training courses for weighmen and locomotive engineers (at Saratov station). There were also eight working hospi-

tals, 28 feldsher's surgeries, 34 feldsher waiting rooms, and a summer camp for the children of the employees.

participants to the economy such as rail station and factory workers and employees of post, telegraph, and telephone points (see Appendix I, Table 12). The accumulated funds of savings banks were used to purchase government bonds and shares of private railroad companies [Morozan, 2007, pp. 122–123], and

the general movements of funds were determined by the State Bank via local branches. In 1864 these institutions were simultaneously opened in Astrakhan, Kazan, Penza, Samara, and Saratov (the volume and types of operations are presented in Appendix I, Tables 13–14). Through them the State Bank also accumulated available funds and redistributed them for the Empire's needs, as evidenced by the significant excess of deposits over issued loans (see Appendix I, Table 13). Starting in the 1880s there can be observed an increase of operations contributing to export trade, the development of solo-promissory note loans (in simplified form), and loans secured for grain and livestock products with a short term (up to 12 months). Among commercial banks, the only active ones were the Volga-Kama Commercial Bank, which in 1875 had 19 offices throughout the region (in the 1900–1960s), and the Russian Trade-Industrial Bank.

'Long-term money' eventually started to arrive in the region together with joint-stock land banks and mortgage state banks, but even then it was mostly to the agrarian sector of the Middle Volga and Trans-Volga territories, where over half of all private lands were in the pledge of mortgage banks (see Appendix I, Tables 15, 15a, 15b). The offices of state Noble and Peasant land banks started functioning in guberniya centres [Proskuryakova, 2003, Usatina, 2003].

Apart from the city bank capital flowing into the region through mortgages, merchant and city public banks started to appear in different places with their own market niche: urban households, small-scale agriculture, and processing [Kismina, 2006, p. 36; Orlov, 2000, p. 13; Saetgaraev, 2008, p. 95]. The operations of these bodies depended upon a variety of factors, including the presence of the State or other capital banks in the guberniya, the level

of demand, and the proactivity of local business circles¹². These loan companies set up accounts in the State Bank and established Mutal Credit Societies [Saetgaraev, 2008, p. 108]. Thus, local capital flowed into the general stream of Russia's general progressive movement. By the end of the century credit relations became widely spread not only in trade, which was in constant need of the quick turnover of funds, but also in industry and agriculture. It was almost impossible to develop a private business outside of any and all credit relations.

The acceleration of capital turnover contributed to the development of industry, yet the commercial appeal of various sectors differed, as the latest trends covered only businesses oriented towards large Russian and foreign consumers. Other structures of the Volga-Ural industry evolved on their own financial and technical bases, adapting—if it was at all possible—to the new realities. The conditions that formed in the sectors of Russian and local scale cast 'the speed of movement' in even higher contrast in the various territories of the Volga-Urals, such as in former state, landlord, or demesne villages, or in cities or industrial trade villages.

Meanwhile, the old sector searched for opportunities to work in these new conditions. Such opportunities were provided by government privileges and public orders companies had to compete to win¹³, changes of owners

¹² For instance, a merchant bank in the Samara Guberniya was opened only in 1908, while state and commercial banks appeared back in 1860–1870s. In the Vyatka Governorate there were systems for organising local capital well before state banks were founded [Ligenko, 2001].

¹³ In the early 20th century less than half the Ural region's 29 mining businesses were functioning: the Verkhutorsky copper factory owned by V. Pashkov's heirs; manganese and chrome iron mining in the Verkhneural'sk Uyezd of the Orenburg Guberniya, manganese and chrome iron mining enterprises; private plants owned by N. and P. Balashov in the Simsky mining region; the Yuryuzan-Ivanovsky and Katav-Ivanovsky plants owned by K. Beloselsky-Belozersky. The success of the latter two plants was based on significant government subsidies [Istoriya Bashkortostana, volume 2, pp. 112–115]. Factories in Izhevsk and Votkinsk fulfilled state orders for open-hearth furnace tool steel, rifles, pistols, hunting rifles, field shotguns,

General view of the Alafuzov Plant in Kazan. Photo late 19–beginning of the 20th century.

and/or corporatisation¹⁴, further reorientation¹⁵, and raising foreign capital.

Throughout the period under consideration, many Ural factories were closed [Samodelkin, 2003]. The industrial crisis brought about by the institution of serfdom lasted for decades, demonstrating the lack of mobility and variability of old plants. By the beginning of the 20th century the share of the Urals in the industrial development of the Russian Empire inevitably decreased (Appendix I, Table 16).

The foreign capital rushed to new fields like the production of construction materials¹⁶ and

rolled and sheet iron, and steel and iron mould casting. They built railway bridges and braces, locomotives, and vessels for the river fleet.

¹⁴ In 1879 the Omutninsk plant (in the Vyatka Governorate) and plants in the former Penza mining region were purchased by the Yaroslavl-based company belonging to the Pastukhovs. Later the plants were reincorporated as joint-stock companies.

¹⁵ The state-owned metallurgical plants were reshaped: the iron and steel businesses in Izhevsk and Votkinsk began to produce small arms.

¹⁶ New industries (producing construction materials, cement, and asphalt) responded to a growth in demand, especially in large cities, where business premises (banks, stock exchanges, railway company offices, etc.) were being built, and companies established with direct investment of capital from Moscow and abroad (this occurred in Volsk, Tsaritsyn, and Syzran) [Clein, 1981, p. 159; Cholakhyan, 2008, pp. 153–154]. Issues

the oil industry. Thus, the Paris-Netherlands, Petersburg International and Peterburgskij Uchyotnyj i Ssudnyj Bank [discount and lending bank] participated in the creation of JSC Ural-Volga (1898). The Volga steel company was funded by the French Anonymous Company [Cholyakhin, 2008, p. 154]. The main influx of foreign investment into the Volga Region's industries came about in the mid-1890s [Nazarov, 2010, p. 15].

The provision of transportation, creation of oil storage facilities, delivery of petrochemicals to rail stations and ferries, and financial support of oil businesses combined is what formed the basis of life in the Volga Region in the 1880–1890s. 'The partnership of the Nobel brothers' entering into partnership agreements with executive committees of railroad communities, steamship companies, and trade-transport companies indirectly contributed to the production of oil engines (developing since 1908 in Balakov, in which 180 people worked at three plants) [Clein, 1981, p. 159]. The capital stock accumulated by steamship firms cre-

relating to the establishment of foreign companies were the prerogative of city councils, who negotiated with representatives from business circles in the capital and abroad.

ated wide prospects for finalising the industrial revolution in water transport, and the region thus gradually turned into a powerful complex transport hub for the empire. We can acknowledge that the transport and manufacture enterprises established as dependent on the needs of the government and foreign partners appeared to be above the regional market and outside of the processes formed randomly within it. This meant that the manufacturing industry became integrated into global production and world financial flows, which

is also evidenced by such new phenomena of economic life as the placement of large company shares (the operations of which were connected to the region) on the stock exchanges of the capital cities of Saint Petersburg and Moscow. At the turn of the 19th–20th century, there were five such companies headquartered in capital cities [calculated according to Collection of data, 1911]¹⁷.

The second level of production, including traditional branches (textile, food), was preserved and developed, but it was directly dependent on the market conditions in the country and region (see Appendix I, Table 17). There were also other groups of factors, such as the search for new raw material bases, price fluctuations, changes in tariffs for the transportation of goods, etc. The technological transformation came about thanks to internal financial sources. All these conditions determined the operation of the cloth and food (flour, beef and dairy) industries.

The most vivid changes could be seen in the flour-milling industry with its increased

production, capitals, corporatisation, and transition to steam engines [Clein, 1981, p. 145]. The image of the Volga-Region flour-miller was formed by the famous companies of the Stakheyevs (the Vyatka Governorate), Borel, Schmidt (the Saratov Guberniya), the Shikhobalovs (the Samara Guberniya), the Deevs and Vidineevs (the Ufa Guberniya), etc. The widely spread expression 'flour-millers of nomadic camps' (K. Petrov-Vodkin) at the same time reflected the current situation and the recent past. Guberniya and uyezd centres (Saratov, Tsaritsyn, Balashov, and Syzran, with a total annual production volume amounting to 36–42 million poods) were not just large flour-milling centres but also railroad stations that gathered large parties from neighbouring villages. The flour-milling business depended exclusively upon the agricultural season [Clein, 1981, p. 145]. The number of water and wind mills in villages significantly exceeded the number of factories.

Changes in the cloth industry were similar, though public contracts indeed made it a less risky enterprise. Throughout the 19th the cloth enterprises of the region endured through all stages of the organisation of production, from manual production to manufacturing and factories [Clein, 1981; Laverychev, 1964]. At the same time, the majority of factory employees were peasants who left for the villages when it was harvest season. The main difficulties of that time were forced changes in the raw materials base (because of the reduction of production volumes) and the search for new partners in Central Asia. Simbirsk, Kazan, and Penza clothiers purchased raw materials at the Nizhny Novgorod Fair and formed new marketing strategies like the refusal of services from small buyers and the monopolisation of suppliers and sales¹⁸. In the 1890s a unique hub of the rough wool-cloth industry with a significance for all of Russia was being run in the Volga Region.

¹⁷ 'The Vyatka-Volga steamship line partnership' (1901), fixed assets totalling 3 million roubles, and 3,000 shares on the Saint Petersburg stock exchange; Inzer mining association, major shareholder S. P. von Derviz (1898), fixed assets totalling 400,000 roubles, and 9,600 shares on the Saint Petersburg stock exchange; joint-stock steamship company 'Oka' (1888), fixed assets totalling 1.5 million roubles, listed on the Moscow stock exchange; 'Russian on Bibi-Eybyat' oil industry and commercial company' (registered in Tsaritsyno) (1904), listed on the Saint Petersburg stock exchange, 3,200 shares; JSC Saratov textile factory 'Cotton factory in the village of Shakhmatov' (1899), listed on the Saint Petersburg stock exchange, 8,000 shares.

¹⁸ In 1907 wool trade businessmen in the Volga Region came together to form the 'Union of Simbirsk Wool Manufacturers' in order to distribute government orders. This monopolistic association was headed by I. Akchurin.

It had nearly 20 enterprises in Simbirsk Guberniya, 3 factories in the Kuznetsk Uyezd of Saratov Guberniya, and 1 in the Samara Guberniya, which the Penza Guberniya's factories gravitated towards.

The owners of stearic candle, soap, glycerine, and venison industries were suffering difficulties with raw materials and looking for a solution by widening the geography of their business and diversifying it¹⁹. The mechanisation and technical improvement of these branches was delayed partly due to their specifics. They remained at the production manufacture organisation level.

The third level of manufacture undergone by craft and semi-craft type enterprises suffered huge difficulties in the 1870–1880s, such as an increase in competition, including with enterprises of the central regions [Ocherki istorii, 2010, p. 225]. The new economic conditions, lack of financial means, and pressure from contemporary technology led to a cease of production²⁰. Nevertheless, a significant portion of locally oriented businesses remained in operation. The small-scale nature of their production (pre-capitalistic, peasant crafts, and small capitalistic production operations in workshops and enterprises with hired workers) guaranteed their vitality [Clein, 1972, p. 363]. At the turn of the 1880–1890 the term 'craft industry' was legalised, while the craft industry itself gained a legal structure and organisational management in the form of the Craft Committee in the department of agricultural economy of the Ministry of farming and state property [Kartashova, 2006, p. 228].

There were also other unique activities in the region, for example the preparation, and later the mass production, of kumys. At the

end of the century the Samara²¹ and Ufa guberniyas developed koumiss production and koumiss treatments at specialised hospitals (or health resorts). At the beginning of the 20th century Koumiss production remained only in the Ufa Guberniya (located along the Samara-Zlatoust railway). Thousands of people 'ill with tuberculosis in a blatant or latent form' arrived at the stations of Aksakovo, Shafranovo, and Glukhovskaya for treatment [Istoriya Bashkortostana, 2007, Vol. 2, p. 126].

Thus, the region's industries included enterprises with varying technological modes, each of which under new conditions used its own strategies oriented towards foreign, Russian, or local consumers. The differences could be spotted not only in the level of technology but also in the forms of labour use (including seasonal labour in agriculture) as well as in the organisation and geography of product distribution and methods of capital formation.

The technological and organisational reconstruction, occurring at the end of the industrial revolution, and the corporatisation of production, including with the help of foreign capital, encompassed the two first levels of the manufacturing industry (metallurgical and metal processing enterprises, railway and water transport, and textile and large food companies).

Opportunities were thus created for more active business development and entrepreneurship. The formation of new enterprises and the transformation of active companies into auction companies were accompanied by the vertical (the companies of P. Ushkov²² and

¹⁹ Merchants from Kasimov who traded pelts and fur coats began to keep flocks of karakul sheep in Middle Asia, while their plants for processing sheepskin and lambskin were located in the Kazan Guberniya. They also owned stores in almost every major city in the Volga Region (Maksyutov, Davletkildev, Kastrov) [Amirkhanov, 2005, p. 94].

²⁰ In the 1870s in the Kazan Guberniya more than 40 mills producing red calico and nankeen ceased production, as did over 20 wool mills in the Kuznetsk Uyezd in the Saratov Guberniya.

²¹ In Samara at the end of the 19th century businesses such as these were owned by Khamidov, Muhamedyarov, Ishukov, and Sagidov, more than 10 in total [Klassika, 2007, p. 312].

²² In the Yelabuga Uyezd in the Vyatka Governorate a local merchant K. Ushkov founded the Kokshansk chemical plant as long ago as 1850. In 1868 his son P. Ushkov opened the Bondyuzhsk plant (now the city of Mendeleyevsk, Republic of Tatarstan), the Syuginsk glass plant, and a sulphuric acid plant in Kazan [Ocherki istorii, 2010, pp. 226–288]. In 1883 on the Bondyuzhsk factory site a JSC called The Partnership of Chemical Plants of Petr Kapitonovich Ushkov and Co. was created. In the early 20th century the Partnership owned four chemical plants with 2,000

the Stakheyevs²³) and horizontal (The partnership of steam mills in Samara, JSC Soap-boiling plant in Saratov, JSC for currying and grain trade' in the Birsks Uyezd of the Ufa Guberniya) integration of production and capital. Capital growth was often carried out on the basis of family businesses that matured in the heart of trade: first the formation of the initial capital (the end of the 18th century.—trading wine, the manufacture of goods and food products, from the 19th, the cattle trade), then busi-

ness expansion (the grain trade, transportation of grain, flour production, and purchase and processing of wool). In the 3–4th generations the business ceased to be a family business and was split and transformed into stock capital that retained family shareholders.

The diversification of production and capitals (manufacture, trade, possession of movable (steamers, barges) and immovable (land) property, leases, and agriculture) was characteristic of large enterprises belonging to the local business elite, though on a daily basis it reproduced elements and norms from the lives of peasants. The search for comfort and improved life conditions in the city estates and manors of the guberniya and uyezd cities revealed itself as a phenomenon in the 19th century.

Entrepreneurs became a noticeable social group that influenced the social life of urban areas. They were active in local government bodies [Grankina, 2006; Isaeva, 2010; Tyurin, 2007], united into stock-exchange enterprises,²⁴ and gradually declared themselves 'masters of life.' There were also women among the entrepreneurs. According to G. Ulyanova's calculations, the share of female-owned businesses in the empire according to production volume (in monetary terms) constituted 4–4.8% at the end of the 1870–beginning of the 1880s. Women also played a consistently significant role in the textile and food industries [Ulyanova, 2009].

The role and significance of industries developing in the Ural and Volga Region guberniyas of the Russian Empire increased by the end of the century (see Appendix I, Table 16). At the same time, according to L. Kafengauz's estimates, the relative share of the old Ural manufacturing region unavoidably decreased (reduction in the share of employed workers, reduced cost of production), while the significance of the Volga Region industries increased.

employees in Vyatka, Kazan, and Samara governorates (annual productivity in 1908 was worth 3 million roubles), a chalk plant in Simbirsk guberniya, a brick and ceramics factory in Vyatka Governorate, a construction lime factory and limestone mine in the Samara Guberniya, and its own fleet consisting of 100 h.p. towing steamers, several dozen barges, and other small vessels. The partnership also owned 5,500 dessiatinas of land, in the form of forest summer houses, gold mines, factories, and wharves [Esieva, 2004; Ligenko, 2001].

²³ With origins in the wine and grain trade, by the end of the century it had its own integrated production operation, consisting of production, processing, and transportation of grain on its own vessels and barges. Grocery and drapery sales were an additional source of income. The Stakheyevs' joint-stock trade-industrial association was registered in 1904. When the association was formed, its turnover totalled roughly 80 million roubles, and its fixed assets were estimated at 4 million roubles [Maslova, 2000]. All organisations belonging to the Stakheyev family were independent legal entities but maintained financial and production ties. In the early 20th century grain trading, loading, and transport companies belonging to two Stakheyev brothers were known to operate in the Kama and Volga Regions as well as in the Southern Ural. In the Ufa Guberniya alone (according to M. Rodnov) the trading house of V. Stakheyev's heirs operated 35 barges on the Belaya River; I. Stakheyev's trading house operated 44 barges with load capacities ranging from 60–70 tons to 154,000 poods. Grain was loaded at 40 river wharves, including on the Kama (8 wharves), the Belaya (5), the Ufimka (1), the Vyatka (28). All but four of the wharves were equipped with driers for drying grain. Apart from wheat and rye, the Stakheyevs traded buckwheat, oats, and other cereals. The Stakheyevs aimed to incorporate all aspects of production and to control the entire production cycle (from source to the consumer). This was characteristic of their approach to their core grain business. They acquired and built flour mills, equipped wharves with warehouses, bought barges and towing steamers, and provided docks and repair shops for vessels in river backwaters. Their moves to penetrate distant markets from their native Yelabuga, regions such as Western Siberia, were accompanied by the opening of textile and grocery stores.

²⁴ In 1866 the Kazan exchange's charter was approved; in 1869, the Samara exchange; in 1870, the Saratov exchange, in 1900, the Tsaritsyn exchange; in 1901, the Simbirsk exchange; in 1904, the Balakovo exchange; in 1905, the Syzran exchange [Tagirova, 1999, pp. 160–162].

Although the number of workers in the Ural twice exceeded figures in the Volga Region, it was here where contemporary manufacture was successfully developed. In the Urals, the consequences of the abolition of serfhood had not been overcome even by the beginning of the 20th century. In general, the Volga-Ural

The building of the production facility of sulphuric acid at the Ushkov Chemical Plant at Bondyuzh. Photo from the late 19th century

territories were moderately developed against an All-Russian backdrop. Here the processing industries prevailed, and by the beginning of the 20th century 99% of the cost of all industrial production fell on the processing industries of the Volga Region. In the Urals the number was 84%.

Indeed, the changes of the 1860s influenced the development of agriculture all throughout the region. The ability to export goods by railway [Slepnev, 2000]²⁵ and take out a loan from state and commercial banks [Proskuryakova, 2003], the new directions of trading routes, and the advantages of processing agricultural products locally—all created a new economic environment for agricultural producers. The local market of agricultural production (at the price level) depended on the world price situation [Mironov, 1985], but the impact of these factors on different guberniyas of the region was uneven. The strongest influence was made by railroads [Slepnev, 2000, p. 62].

At the same time, the development of Volga-Ural agriculture was still influenced by peasant migration, which was especially intense in the South-Ural guberniyas [Petrov, 2005]. At the end of the 19th century 16.5% of European Russia's population lived in 10

guberniyas of the region²⁶. The density of the population (see Appendix I, Table 18) also increased. The government committee created in the Ministry of Internal Affairs to examine migration movements attempted to regulate this process, thus approving in 1882 'Temporary rules on peasant migrations.' Migration was allowed only along sections of the Siberian railroad, and unlimited use of the land was only an option after a temporary lease for 6–12 years [Usmanov, 1981, p. 83].

The external factors mentioned above gradually reformed the inner life of villages, the citizens of which never completely adapted to the conditions of the reforms carried out in the 1860s. The expansion of crop lands in Volga and Ural guberniyas was especially noticeable, and slight growth can be observed in the 1860–1880s in Orenburg (3.96 times), Samara (3.27), Astrakhan (2.19) and Saratov (2.13) guberniyas. Against the backdrop of decreasing tillage lands in the central and black-earth regions, the South-Eastern lands (the Southern steppe, Trans-Volga, and Lower Volga Regions) in the 1880s appeared to be undoubted leaders in the production of cash crops in European Russia [Slepnev, 2000, p. 63]. The trend that emerged was only con-

²⁵ Rail transportation was 6–10 times faster than cart, 4.5 times faster than steamer, and 15 times faster than hauled barge [Slepnev, 2000, p. 55].

²⁶ In the period from 1857 to 1897 the Russian Empire's population increased by 74% (from 74 to 129 million people). In the Volga-Ural Region the population increased by 332% (from 6.4 to 21.3 million people).

solidated in the following decades: between 1901–1910 cropland increased by 22.8% in the Samara Guberniya, added 14.6% in the Saratov Guberniya, 11.9% in the Simbirsk Guberniya, and 5.6% in the Kazan Guberniya. In the steppe uyezds of Ufa Krai, between 1890–1900 the size of cropland doubled. The region's significance in supplying the empire with crops continued to increase and advance into Siberia, which also had quite promising prospects.

But a more detailed examination of the consequences of changes shows a certain ambiguousness of the situation.

The growth of sowings, increased fees, and the possibility of transporting grain formed maximum demand for its export outside of the region. But in unfavourable circumstances, particularly during drought and crop failures, this resulted in a shortage of grain for people's own consumption, hunger (1871–1872, 1891, 1911), and further declines in output. (The situation in 1872–1873 in the Samara Guberniya is described in: [Druzhinin, 1978, p. 272; Slepnev, 2000, pp. 64–65]).

These consolidated relations with the world market were reflected in the impact world events had upon the region, in particular the world agrarian crisis of the mid-1870–1890s. A decline in global prices turned into lower purchasing prices in the region (the minimum was in 1887 and 1894–1895), and in grain regions they did not compensate the cost of growing grains²⁷. Following crop prices, in 1885 lease prices started to decline, after which prices for selling land began to as well.

The general decline of prices caused a decrease in the tax-paying capacity of the peasantry, which in the Middle Volga Region was catastrophic in those years [Mariskin, 2007, p. 442]. Against the backdrop of the crisis, later lean years (especially in 1891) were perceived by contemporaries perceived as a crisis [see Yegiazarova, 1959; Kitanina, 1978; Izmestyeva, 1911; Khamitbaeva, 2008]. By

the beginning of the 20th century the situation in villages gradually improved.

The extensive path of agricultural development (only through increased sowing) was not accompanied by any improvements in work-force productivity. The yield of grain crops throughout the century rose slightly, and the general level of crops since 1 December in the middle and south-eastern lands was the same as in the central black-earth regions of the country and amounted to a 3.5-fold–4-fold harvest (see Appendix I, Table 19). The dependence on climate fluctuations and unstable conditions of the agricultural year increased, and bad harvests and hunger (1871–1872, 1880, 1891, 1901, 1906) were the constant companions of agricultural life.

Moreover, the expansion of crop land did not cover the pace of population growth and was not accompanied by an increase in grain consumption by its main producers. This issue remains a matter of dispute among contemporary scientists, yet Volga Region and Ural historians share the view that the commodity weight of crops exported outside of the region at the beginning of the 20th century significantly exceeded possible surpluses, and a part of consumer grain was sent to the market [Kabytov, 1981, p. 81; Tagirova, 1999, p. 198; Rodnov, 2008, pp. 233–234].

The further expansion of areas under crops and the development of agriculture strengthened the region's crop specialty on the All-Russian market. The main arable crops remained winter rye, oats and spring wheat, and the share of other cultures was small. In the north and north-west of the region (Vyatka, Kazan, and Simbirsk governorates) the planting of rye and oats prevailed, which was aided by an optimal climate for growing these cultures as well as the increasing demand of the military office for brown bread in order to provide the army with food [Kitanina, 1978, p. 26].

The main sowed crop in the southern steppe and south-eastern steppe lands (the Samara, Orenburg, and south-western uyezds of the Ufa Guberniya) was spring wheat, in particular the hard varieties that were in high demand on the Russian and foreign markets.

²⁷ A fall in grain prices led to losses in cereal crop growing regions ranging from 3 to 11 roubles per desiatina [Yegiazarova, 1959, p. 79].

It occupied 50–65% of all arable lands, which produced high profits during the period of increasing market demand, but also led to soil exhaustion. The acreage of other grains (millet, buckwheat, rape, barley) and industrial crops that could improve soil fertility grew slowly.

One noticeable phenomenon alongside the development of farming became the development of the land market. It was mentioned earlier that its formation began in the 19th century, when the purchase of uninhabited lands was still allowed. Then, apart from the market factor, the administrative factor (state grants, the cheap sale of state lands to officials) was also quite influential. With the development of trade agriculture and the improvement of transport communications, land prices started to rise. Noblemen started selling lands more often, and mortgage loans developed. Lease and sublease relations became widely spread. In the Trans-Volga and Lower Volga Region professional intermediaries, called *baryshniks*, or secondhand dealers, were operating in many places. Mediation was also another usual matter when lending state-owned and demesial lands.

The development of the land market widened the circle of land owners through the addition of the members of other social groups and classes evidenced in 'The Statistics of Land Ownership in 1905' (see Appendix I, Table 21). By 1905 the state had lost its leading positions among land owners (19.8% of lands) in the region but maintained the priority of state and demesial lands in Simbirsk (31.2%) and Kazan (28.3) guberniyas, while its share in steppe regions did not exceed one-fifth. The demesial office [Maksimov, 2008; Yutkin, 2007] and the Ministry of state properties managing lands and organisations in the region [Markova, 2007] operated in market conditions, and as a consequence they had to look for methods that kept up to date with the times, similar to private possessors. In the early 19th century private owners (not nobles) owned more lands than in European Russia, where the percentage of landlords owning over 1,000 dessiatins of land was 80.8% (61.5% in European Russia).

According to researchers, agricultural growth was provided mainly by peasant households that accounted for 63.8% (the Simbirsk Guberniya) to 97% (the Ufa Guberniya) of all crops in the late 19th century (see Appendix I, Table 22). Over the course of time the percentage of crops sown by landlords (peasants, merchants) and separate communities started to increase, whereas those sown by nobles reduced [Kabytov, 1981, p. 1979].

One can clearly see two opposite trends here. The first is related to the farmisation and reinforcement of peasant farms on the land (the steppe and forest-steppe districts of the Volga-Ural Region where households with fields over 15 dessiatins were developed). The other (opposite) tendency showed itself in the north and north-west of Ufa Krai as well as in the Simbirsk, Kazan, Penza, and the forest regions of the Samara Guberniyas. There traditionalism prevailed, and this 'regressive metamorphose' (according to M. Rodnov) was due to small field sizes (2–4, 4–6 dessiatins), natural management based on consumer production, and primitive work. The capitalist economy of the region served as an outer shell for them, so peasants still stuck to their traditional way of life and world view [Rodnov, 2002, pp. 308–310]. The increasing poverty among peasants was caused by the dwindling size of community lands due to the doubling of the rural population.

The life of landlords in the North and South was different as well. In the northern and forest-steppes districts landlords took advantage of peasant land scarcities and hired them with their tools to sow or plough while underpaying them, which was equal to serfdom. The southern steppes districts used to hire people—and it was next to impossible to harvest crops without day-labourers. Along with farming, resourceful landlords also developed the animal breeding industry by rearing pedigree horses, fine-wool sheep, and other animals. Some landlords opened oil and kumis health facilities. Landlord economies supplied the market with not just crops but also meat, milk, wool, and locally processed products such as butter, cheese, sour cream, etc. Some landlords of

the northern districts were engaged in cutting down, processing, and selling trees. Nobles, who were in fact small in number, could no longer support the imperial power in the Volga and Ural Regions. The change in the strategic features of villages was related to peasants.

Trade also suffered significant changes both on a grassroots level and in large businesses. These changes refer to the democratisation of trade that showed itself in the growth of its elementary forms, for example fairs,²⁸ as well as in the rather large class of smaller intermediaries, or buyers and dealers (mostly on the corn market)²⁹. The system of grain public procurement was changing as well. In the 1890s public procurement was carried out by municipalities (*zemstvos*), and starting from 1905, by the commissariat [Kitanina, 1978, pp. 201–220; Clein, 1982, pp. 184–185]; the system of food stores was reorganised, and new participants such as State and later Commercial Banks appeared on the grain market [Korelin, 1981, p. 113]. Foreign capital also entered the grain market,³⁰ though Russian businessmen held all the key positions

²⁸ In the Volga Region (Kazan, Simbirsk, Samara, Saratov guberniyas) the number of markets increased from 419 to 673, and then, to 807 (according to the data for 1863, 1897, and 1903, respectively) [Tagirova, 1999, p. 289]. There were 40 markets in the Vyatka Governorate in 1868; 108, in 1883; and 161, in 1900 [Ligenko, 2001].

²⁹ Sometimes there were 5–6 steps in the supply chain before products reached the exporter.

³⁰ Large Russian and foreign companies had offices in the region: The Russian Association of Export Trade, representatives of the ports of Libava, Riga,

[Thompson, 2008, p. 400]. They were all participants on the stock market.

The Nizhny Novgorod fair gradually receded into the background, but it still maintained global recognition. In the 1860–1880s Russian merchants played the most important part. In the late 19th –beginning of the 20th centuries salesmen from Europe came over, including the Poles, Germans, Jews, and Swiss; the Persians, Armenians, Bokharans, Moscow merchant trading with Kyakhta also had its own significant role [Vybornov, 2004, p. 14].

Cities also saw the emergence of a type of constant retail establishment (i.e., stores). These 'beacons of capitalistic trade' practiced advertising, earned loyal customers, and won over the central streets of the Guberniya and district centres [Galanin, 2008, p. 177]. The 'malls' of the 19th century were not so many in number, most of them were housed in primitive buildings (shops, trade houses, inns, and taverns), but even so banks, shops, and stock exchanges together all formed the architectural image of cities. By the end of the 19th century stationary trade houses were making a major contribution to overall revenues. L. Goncharenko pointed out that guberniya cities of the late 19th century had three spheres of trade: 1) various agricultural products; 2) random trade ('without any certain definition') in all guberniya cities, except Samara where fabrics were sold; 3) fabrics and clothing (in Samara, selling crops 'without any certain definition') [counted according to the number of people engaged in trade: Goncharenko, 1994, p. 99].

The crop and animal specialisations of the region determined the structure of the local market where primary procurement and resale centres emerged, and the hierarchy of trade flows, and the local grain market was also formed [Rodnov, 2002; Tagirova, 1999]. As grain batches travelled and increased in size, the product became littered and mixed, which is why it was not always properly appraised during export shipments. There were a lot of participants on the corn market. Even

Tallinn, Novorossiysk, and Rostov, the Louis Dreyfus Company.

commission agents and companies from other cities 'always added to the main buyers' when putting together batches. The full chain of grain exports consisted without fail of 5 or 6 separate links: from producer to small-scale purchasers, city tradesmen, export companies or shipping agents, foreign agents, and finally foreign trade companies or factories (selling raw or semi-finished materials).

The process of the integration of the Volga and Ural territories in the economic body of the Russian Empire became more rapid over the course of the implementation of the Great Reforms and railway construction. The gradual abolition of serfdom of manor and later appanage and state peasants, the simultaneous elimination of the national and economic privileges, and the abolition of the various tax revenues—all made the Volga and the Ural people legally equal to peasants of Central Russia.

The capital, foreign capital, and monetary resources of local nobles accumulated in joint-stock companies made the region part of the empire's common financial interactions. Even the small funds of savings banks and city public banks took a part in this process. The geographical configuration of these institutions as well as transport, logistics, and trade relations were all defined by railway lines and branches. Of course, it took some time for these relations to be established and secure their own foothold. However, this was not always the case. New railway lines kept pushing further East. First Saratov and Tsaritsyn (1860-s), then Syzran, Samara, Orenburg (1870s), and Ufa (1880–1890s) scored the advantages of becoming part of the common railway network.

Different growth rates were typical of both industrial practices and the development of regions as well, where the industrial revolution in their main industries was complete. Local spaces that remained beyond the leading economic tendencies remained as they used to be.

However, they were not the areas that most influenced the overall development of the Volga-Ural Region.

Guberniya cities remained the poles of economic growth, but new trade and economic centres also emerged near railway stations and large quays. Business activities were more notable, and they showed themselves in self-organisation and stock exchange associations, and starting from the 1890s they contributed a lot to the development of these economic centres.

Agriculture gradually became dependent on world trends and the overall financial situation of the country. The expansion of cultivated fields, accelerated crop exports and growth of global and Russian demand, especially from the latter half of the 1890s, contributed to the atmosphere of market domination affecting both peasant settlements and private lands. The change in civilisation that had started in the early decades of the 19th century was already over by the beginning of the 20th century.

In general, the Volga-Ural Region in the 19th century shifted from being the internal outskirts of the Russian Empire to an economic region subject to the general cycles of capitalistic development. This region was specialised in farming and had its own uniting centers of economic development, a stable transport system, and credit institutions. In terms of economic prospects and due to the government strategy of a movement eastwards, several highly-advantageous routes were formed: Kazan—Vyatka, Samara—Ufa, Samara—Orenburg, and Saratov—Don.

The combination of economic, institutional, organisational, and spatial changes transformed social relations and formed new social groups that go on to take an active part in the mass movements and revolutions of the 20th century.

§ 2. Agricultural production

Nail Khalikov

Farming. During the post-reform period the Tatars of the Volga Region and Urals practiced different types of farming as a result of specific aspects of the environment, economic conditions, and traditions. As different as they were at their core and in all the variety of their details, farming was confined to three types that provided ways to restore and maintain the fertility of soil: fallow, fallow-shifting, and forest field (slash-and-burn) cultivation systems.

The fallow three-field system (winter crops—spring crops—fallow) was the most popular among Tatar peasants at that time. This agricultural tradition was altogether typical of the Volga Region: in Kazan and Simbirsk guberniyas the fallow system was used in 100% of fields; in Saratov, 92%; and in Samara, 87% [Statistika pozemel'noj, Ed. IV, p. VI]. The three-field system was the most rational (and in some cases the only possible) system of farming, though it also had some significant disadvantages. The short rests given to fields (a year long) to maintain fertility was always used to fertilise the soil with manure. But the latter was all but non-existent as in the middle Volga and Trans-Kama Region amid an acute land scarcity crisis all arable land was used for farming. And if the normal correlation between fields and hayfields was 1:1, it was just about 10:1 in the Kazan Guberniya [Materialy' dlya sravnitel'noj, No. 3, p. 52]. This is why there was a small number of cattle. The other reason, equal in importance, was the economic weakness of most peasant households. It is no coincidence that few baptised Tatars of the Mamadysh Uyezd were reported to have fertilised their fields, as horseless peasants had nothing to transport, nor any cattle for this purpose [Istoriko-statisticheskoe opisanie czerkvej, 1904, p. 377]. Frequent land partitions also prevented fields from being supplemented with manure [Materialy', 1936, p. 13].

In the 19th century and later farming in the eastern lands of the region was diverse and actively shifting from the cultivation system

to the fallow system (four-field, two-field, and random sowing); in the South Ural and Trans-Ural Regions there was a standard cultivation system practiced mostly by Tatars cossacks from Orenburg.

Slash-and-burn, or forest fallow systems, were practiced in Vyatka and Perm governorates where peasants still owned large plots of land in the mid-19th century. Moreover, any vegetation cut down was often burned in the 19th century. Forest fallows were used to farm for 3 to 4 years, and then they were kept fallow for a few years. After this system, either a three-field system was used, or the land was left to be overgrown by woods [Spisok naseleenny'x mest, XIV, p. XXIII].

Thus, the fallow system was the most widely used in the post-reform period. When a three-field system was properly fertilised, it was possible to harvest adequate crop volumes while keeping costs low. However, demographic, social, economic, and political conditions such as an increase in population density,³¹ distribution of lands in favour of the Treasury during the reforms of 1866, mass poverty among peasants, and other factors threw the fallow system into a less than enviable position in the latter half of the 19th century. During this time there was a crisis of the three-field system typified by a depletion of lands and a lack of fertilisation accompanied by a decrease in soil fertility, which in turn led to a reduction of yields. By the end of the 1860s there were reports that the fallow system in the Kazan Guberniya had already become outdated [Vecheslav, 1870, p. 2]. While earlier fertility had been maintained thanks to a rotation of crops, the last remaining fallows and rotations disappeared in the latter half of the 19th century. The only way out of this crisis was to increase the amount of cultivated acreage using other lands, including pastures

³¹ From the early 18th to the early 20th century the population density in the Kazan Guberniya increased fivefold.

and hay fields, which reduced the feed base of cattle with results that were easy to expect. The radical solution of introducing improved land and crop rotations, a many-field system, etc., was prevented by the forced division of plots into traditional three sections, as well as by the poor financial situation among most Tatar peasants house-

holds. Land scarcity and the three-field crisis had quite far-reaching effects. Peasant could not earn enough money to pay their taxes and have enough left over to live on, which is why they had to turn to other forms of economic activity, including handicrafts, seasonal work, etc.

Grains, beans, and technical crops were the main farming products. The structure and dynamics of planting winter and spring crops were different in different regions and depended on the soil, climate, biological characteristics of plants, farming systems, peasant economic situations, the state of the grain market, and other reasons.

In the mid-19–beginning of the 20th centuries Tatar peasants sowed the following feed and coarse grains: winter rye and wheat, spring rye, wheat, oats, barley, buckwheat, millet, emmer, peas, lentils, vetch; fiber-producing flax and hemp, as well as technical plants such as sunflowers, poppies, and feed plants, phleum, clover, sainfoins, etc.

In the winter fields of the forest and forest-steppe zone of the Volga Region and Urals peasants sowed only winter rye (*kozge arysh*), which corresponded to the prevailing three-field system. The winter rye harvested in the Vyatka Governorate was 53.9% of the total grain yield; in the Nizhny Novgorod Guberniya it was 58.7%, and in Kazan, 61%, which was the highest amount for European Russia [Kulyabko-Koretsky, 1903, p. 11]. Tatar peasants had the largest rye fields.

Tatar peasant huts. The Kazan Guberniya
Photo by V. Karrik. 2nd half of the 19th century

The main spring crop was oats (*soly*) on a significant scale: in 1900 oats occupied 35% of the acreage in the Vyatka Governorate, 35.1% of the Perm Guberniya, and 28.8 in the Kazan Guberniya [Mordvinkina, 1960, pp. 343–344]. Tatar peasants also preferred oats as a spring crop, and their spring fields were called '*soly basui*' ('oat fields'). The expansion of oats as a crop in the region in the middle of the 19–beginning of the 20th centuries was enabled by its special ability to adapt to any soil regardless of its fertility, which was quite a favourable characteristic when compared with many other cereal crops. The considerable volume of planted oats in the Volga and Ural Regions was also caused by its high demand as fodder for the Siberian Route with its many carts [Spisok naselenny'x mest, XXXI, p. CCXCIX], and Tatars were actively engaged in the cart service.

In the south-east uyezds of the region they cultivated wheat (*bodaj*) on a significant scale: in the late 19th century in the Orenburg Guberniya wheat amounted to 52.6% of the entire cereal crop [Kulyabko-Koretsky, 1903, p. 14], while the cultivated areas of this major Russian export crop grew steadily. But cultivation of the wheat actually in demand in agriculture was only within the bounds of mostly rich owners, who had quality sowing equipment and a sufficient number of cattle and workers. The peasants of the Middle Volga and Cisural Regions explained the absence of wheat in their own fields as resulting from primitive

ploughing with sokhas, the absence of available ploughland, and so on. That is why in Orenburg guberniya it was mostly the wealthy Tatar Cossacks who had their lands planted with wheat.

Barley (*arpa*) was more often cultivated in the northern forest areas: in 1913 in the Perm Guberniya it occupied 10.2% of spring crop acreage, and in Vyatka, 13.9% [Statistika Rossijskoj imperii, 1914. Our percentage recalculation.—*N. Kh.*]. And in the villages of the Krasnoufimsk Uyezd of the Perm Guberniya at the end of the 1880s barley fields occupied up to 20% of the entire area [Statistika Rossijskoj imperii, 1914].

Tatar ploughmen sowed buckwheat almost everywhere (*kara bodaj*).

Spelt wheat (*boraj*) was a crop the Tatars grew on a large scale in the Volga, South Kama, Trans-Kama, and Ural Regions. It is entirely justifiable to definitively state the commitment Tatars had to this cereal crop. In 1888 in the Yelabuga Uyezd the Tatars with this crop accounted for 11.3% of fields sown with spring crops, Russian peasants had 6.4%, and Udmurts, 4.6% [Materialy' po statistike, Vol. 4, p. 54]. It is also no coincidence that Mordovians called spelt wheat 'Tatar bread' [Yakubtsiner, 1965, p. 83]. Spelt wheat was an indispensable product for the ceremonial porridge of the Christianised Tatars, who retained certain archaic features in their culture.

Millet crops (*tara*) in the south-western and western regions were especially widespread: at the end of the 19th century in the Simbirsk Guberniya millet made up 6.5% of all collections; in Saratov, 6.8%; and in Penza, 8% [Kulyabko-Koretsky, 1903, p. 23]. Tatar peasants of the Yelatma Uyezd of the Tambov Guberniya or of the Petrovsk Uyezd of the Saratov Guberniya often had millet field sizes that exceeded the area of any other spring crop. Millet was distinguished by its high productivity, reaching 60–70-fold. But this crop required clean fields without weeds, a particular soil structure and was cultivated mainly on rotations and fallow land, which meant that by the end of the 19th century millet fields in many Tatar villages had been reduced in size.

Tatar peasants from certain villages of the Lower Volga Region on a very small scale also cultivated spring rye (*yazgy' ary'sh*). But it was significantly inferior to winter rye in terms of crop productivity, which led to its rather insignificant place in the crop distribution system. At the same time, spring rye was eagerly cultivated in the Ural and Transural Region, where the climatic conditions and terrain did not allow the cultivation of winter crops.

Peas (*borchak*) and lentils (*vasmy'k*) were sowed all throughout the region. Peas had a greater yield, but lentils are drought-resistant. By the beginning of the 20th century the area of pea, and especially lentil, cultivation reduced in size due to a total reduction of peasant plots and land degradation [Sel'skoxozyajstvennaya statistika, 1859, p. 163].

For a semi-substinance economy it was typical to also cultivate textile plants—flax (*zhiten*) and hemp (*kinder ash*). Flax crops were gravitating towards the northern forests and forest steppe uyezds, and cannabis, towards the southern and south-west regions. Fields of these plants often reached considerable sizes, but in the latter half of the 19–beginning of the 20th centuries flax and hemp crops were somewhat reduced because of the spread of manufactured fabrics among villages. Only for the Tatar-Kryashens, who mostly preserved their traditional everyday life and features of their natural economy, have these cropfields not lost their former relevance in the early 20th century.

Flax and hemp were also used by peasants as oil crops. However, they were significantly less in volume than sunflowers (*konbagysh*), which were cultivated in small amounts in many villages of the region (sunflower seeds for the purpose of consumption). And only the Tatars from the Chistopol Uyezd of the Kazan Guberniya, from the Sterlitamak Uyezd of the Ufa Guberniya, and from the Orsk Uyezd of the Orenburg Guberniya cultivated sunflowers for industrial purposes as a technical (oil) crop to ship to the neighbouring oil production plants. Tatar ploughmen had the most significantly-sized sunflower crops in the Saratov and the southern uyezds of the Samara Guberniyas.

Some attempts were also made to raise another industrial crop: poppy (*mek*). The baptised Tatars, in comparison to the Tatar-Muslims, cultivated tobacco, especially in the West Trans-Kama Region. At the beginning of the 20th century in rare cases the Tatars began to cultivate feed grasses as well, including phleum, sainfoins, medicago, and clover. This was handled almost exclusively by peasants, usually proprietors.

The Tatar peasants prepared the soil for cultivation with ploughs, sokhas, and their own variations on these tools, as well as harrows.

In the latter half of the 19–beginning of the 20th centuries the most commonly used plough among Tatar farmers in Volga Region guberniyas and in many uyezds of the Urals was the sokha (*suka*), as it corresponded in the most recognisable way to the previously cultivated soft crop land of the three-field system. It was universal (was used for plowing as is, plowing manure into soil, setting seeds, spudding, and so on), was manageable by low-power peasant horses, and was relatively cheap; but it also plowed only to a shallow depth, which led to weeds growing in the fields.

Heavy wooden ploughs—Sabans—had been used in the region since ancient times, and contemporaries rightly referred to them as 'Tatar' [Khalikov, 1995, pp. 50, 56]. The author of famous works on the ploughing equipment of his time G. Firstov noted: 'the saban was widely used mainly by the Tatar farmers of Orenburg, Simbirsk, Saratov, and Astrakhan guberniyas and a part of Kazan' [Firstov, 1854, p. 208]. This involved heavy equipment that demanded numerous (4–6) horses or oxen. As a result, in the middle of the 19–beginning of the 20th centuries *agach saban* was widespread mainly among Tatars in the Southern uyezds of the Ural and the Transural Regions, where the crop-rotation cultivation system still existed.

In the Cis- and Transurals during the 1860–1880s so-called half-sabans, or 'kole-sukha,' had also become widespread in use. Such equipment was known among the Transuralian Tatars under the name of '*agaç suka*'. They differed by their smaller size and more

sophisticated case construction and operational details.

At the turn of the 19–20th centuries, first in the Cisurals and then in the Volga Region, on the farms of Tatar-Cossacks and wealthy peasants makeshift and manufactured steel ploughs started to emerge [Alov, 1900, p. 53; Trudy', 1884, p. 110].

An additional type of ploughing tool widespread in the latter half of the 19th century in mainly the southern uyezds of the region were the roe and one-sided plough, which emerged as a result of the development of ploughs and sokhas and were designed to work with all soil types.

To smooth over the cropland and cover planted seeds after using ploughs and sokhas, they used harrows (*tirma*, *seberke*). Tatar ploughmen of the Kama Uyezds were still using a braided harrow. But in the middle of the 19–beginning of the 20th centuries wooden frame harrows started to appear all over the region.

It is important to note that not only soil conditions influenced territorial spread and the use of a greater number of more sophisticated tools but also the level of economic solvency among ploughmen: metal plough, harrows, and so on were mainly found in wealthy households [State Archive of Kirov Oblast, f.957, inv. 1, item 38b, Table].

Both Tatar men and women participated in harvesting wheat and mowing hay. They all harvested with sickles, but mainly the men mowed the wheat and hay. Tying sheaves was considered the work of women and teenagers.

In the middle of the 19th century during harvest time, and in some regions of Tatar settlements in the Volga Region, harvesting winter and spring crops with sickles was the main or only viable method. In addition, peas, lentils, and buckwheat were harvested often. A different picture could be seen in the southern and south-eastern guberniyas where crops were harvested with a sickle, but when there was a particularly large harvest or hardly any at all, they used a scythe, while the latter method was becoming more and more widespread. That is why in the late 19–beginning of

Repairing a scythe. A Tatar farm.
Late 19–beginning of the 20th century.

the 20th centuries a scythe was already being used for winter rye harvests in some uyezds of the Volga Region, and winter crop mowing became a common event in the Trans-Kama, Lower Trans-Volga, and Bashkirian Urals Regions. They had started to use scythes, but they were still much more widely used for the harvesting of spring crops, oats, barley, and wheat [Khalikov, 1995, maps 14–16].

At the beginning of the 20th century, along with more traditional manual harvesting methods, among wealthy farms of the south-eastern area of crop production development machine harvesting came into play. But in most Tatar villages up to 1917 different harvesters, reapers, workers, who tied sheaves and so on, were sporadic because of their high cost.

In view of the climatic features of the Volga and Ural Regions—frequent rains during harvest season, long wet autumns, and so on—sheaves had to be preliminarily dried out on the field. Crops were often harvested still slightly premature to avoid the release of seeds or because of a reduced harvesting schedule, thus they had to be left for post-ripening in the field. Finally, many peasants did not have the opportunity or need to thresh the harvest straightaway after harvest time was over. These and other reasons explain the tying of sheaves in various forms for storage in the field and in the barnyard on the estate.

One of the methods for drying crops in the field characteristic of the forest area (Tatars of the Vyatka and Perm governorates) was drying using a structure made out of poles or dried trees with a lot of knots. But much more often a special pole structure in the form of fencing or a tent was built and widely used, called a conical chum (*shesh*, *sheshe*). The same methods were used with the sheaves of any crops in wet weather, but they were most often used to dry millet, oats, beans, and also hay.

The climatic conditions of the Volga and Ural Regions in most cases required additional drying

with fire before the mill. Tatar ploughmen had ovin-shishs, log drying-barns, and occasionally a threshing barn for those purposes. Poor peasants also often dried sheaves in heated bath houses.

They dried grain first in the bath house, then in a hut under the sun, and finally in a special grain-drying enclosure. In particular, in a description of the Yelabuga Uyezd of the Vyatka Governorate at the end of the 19th century it was noted that the Tatars from Tersinskaya Volost dried grain on the furnaces in huts and bathhouses. These same methods were practiced throughout the region, with the exception of the population of the south-eastern areas of the region, where grain was usually dried under the sun on a spread rug, curtain, or mat. Starting at the end of the 19th century special grain-dryers started to emerge that resembled a log-drying barn. Inside of the grain-dryer a stove was constructed, over which a metal net was strung to dry the grain.

The Tatars had different types and techniques at their disposal for threshing sheaves, including manual threshing (with beaters, by whipping, hitting); threshing using horses (hooves stomping, threshing with cart wheels or beating plank); and machine threshing with either manual, horse, or steam threshers.

Among all the varieties of sheaf threshing in the latter half of the 19–beginning of the 20th

centuries, the Volga Tatars most of all preferred threshing with beaters (*chabagach belen sugu*). This method dominated in the settled forest and forest-steppe areas [Khalikov, 1995, maps 21, 22]. Only in the south-east steppe areas of the region did threshing with beaters give up its leading position to other sheaf-threshing methods. Thus, in the Khvalynsk Uyezd of the Saratov Guberniya in the latter half of the 19th century threshing with beaters was rarely used, as they usually accomplished this task using horses. The distribution of threshing methods in the Samara Guberniya, which stretched far and wide from the north to the south, started to become altered as they moved from the forest-steppe to the steppe zone. In the northern uyezds of the guberniya (Stavropol, Samara, and first of all Buguruslan) not only rye but also other crops were threshed with a manual beater, in many villages and households of Bugulma and Buzuluk uyezds they threshed rye and certain other spring crops with manual beaters, and in the southern, Nikolaev, and Novouzensk uyezds they almost did not use beaters at all.

Following a further movement to the east in the Orenburg and Orsk Uyezds of the Orenburg Guberniya, in many Tatar villages since the middle of the 19th century beaters began to fall out of use. At the turn of the 19–20th centuries threshing with beaters relinquished its leading position to other effective methods, including threshing with a roller and, in particular, mechanical threshing.

Tatar ploughmen widely used threshing with horses, otherwise known as *at basyp sugu*, *taptau* [Khalikov, 1995, maps 21, 22]. Thus, in the Kama Region and Oka-Sur interfluvial legumes and buckwheat were threshed with horse hooves. In the Trans-Kama, Lower Trans-Volga, and Cisural Regions they threshed with horse hooves not just pea and buckwheat but also oats, spelt, wheat, and further south-east in the region this took place on an even greater scale.

A mill in a Tatar village in the Ufa Guberniya.
Photo from the early 20th century.

In the early 20th century on the farms of wealthy Tatar ploughmen, especially in the Lower Volga, Perm Ural, and Transural Regions, mechanical threshers started to become available. Depending on the configuration of their gears, threshers were divided into manual, horse, and steam. But these threshers were also expensive (on average 65–100 roubles at the end of the 19th century), which interfered with their widespread circulation.

As a rule, in favourable circumstances (a sufficient amount of grain, economic solvency among the peasantry, and so on) they threshed in winter from February–March. That time was relatively free from any other household duties so the threshing was more successful, since on frosty days grain was separated from the ear more easily.

The main threshing methods observed in Tatar agriculture emerged at different times. We can say with certainty that Tatar ploughmen started to thresh with a roller mainly in the latter half of the 19th–beginning of the 20th centuries. Mechanical threshers then appeared on the scene at the beginning of the 20th century, mainly in 1910–1914. The formation time of other threshing methods can only be concluded tentatively. Threshing by hitting and whipping (ancient types of sheaf threshing characteristic of the early stages of agriculture of many peoples) existed among the predecessors of

Hand Mill. Ufa guberniya Photo, M. Krukovsky Early 20th century.

the Tatars, apparently in more ancient times. For example, N. Vorobyev believed that the beater adopted by the Tatars was from the Russians when speaking about beaters of the 'Russian type' [Vorobyev, 1930]. We have ample grounds to assert that sheaf-threshing methods using horse-hoof stomping were traditional for the Volga Tatars [Rychkov, 1767; Lipinsky, 1868, p. 377]. In general, the tradition of threshing methods using horse-hoof stomping can be traced back to the agriculture of many peoples from Central Asia, Kazakhstan, and the Caucasus.

Another important agro-technical operation following threshing was grain winnowing (*suy'ru*). They winnowed grain with a spade, bucket, sieve, and fanner for cleaning out weed seeds, chaffs, small dirt, and dust.

To process harvested crops into flour they used mills and scourers powered by hydro-power, wind power, steam, and other sources and put into motion by animals or people.

The main types of Tatar mills in the region were rotary watermills (*su tegermene*) and wind (*cil tegermäne*) mills; it was very uncommon to operate mills using steam power, fuel oil, or electricity. The majority of large mills had special adjustments for the processing of grain into groats. In addition to this, special

horse scourers were constructed and

wind mills were built where a lack of suitable rivers did not allow for the use of water mills. For example, in the Kazan Guberniya low-productivity windmills with 1–2 arrangements were only ever used in unforested and dry areas. The same type of mills dominated in the Urals because of the almost complete lack of rivers near Tatar villages

(lake-dwelling settlement type). In the Chelyabinsk, Troitsk, and Verkhneursalsk Uyezds of the Orenburg Guberniya in Tatar villages there were approximately three times more windmills than watermills. At the same time in the Shadrinsk Uyezd of the Perm Guberniya there were none because there was never any dominating hard winds [Khalikov, 1995, map 25]. Watermills were more characteristic of forest areas; Tatar peasants constructed them in Perm and Vyatka governorates, which are rich in rivers and lakes [Shestakov, 1859, p. 118; Kor, 1861, p. 525]. The expansion of watermills in the region behind the Volga and in Cisurals, apart from the rather rich river system, encouraged the evolution of crop production development and the need for more potent and productive mills [Obshhie svedeniya ob Orenburgskoj, 1891].

For threshing grain into flour or grinding into groats, almost in every household Tatars used manual mills (*kul tegermene*) and scourer-mortars (*kile*). Millstones were made of wood, but in the Cisurals they instead were made from stone.

The Tatars of the Volga and Urals kept grain, flour, and groats mainly in the logged storeroom (*kelet*) and regular storeroom (*ambar*), which is the same type but relatively

larger in sizes and with a wide, two-shuttered door.

Thus, in the middle of the 19–beginning of the 20th centuries Volga Tatar agriculture utilised a variety of farming methods. This phenomenon reflected the complicated socio-economic structure of the Tatar rural community in the period of the development and spread of capitalism in Russian villages, while numerous feudal remnants still remained. It was determined by the simultaneous existence of farming systems that were progressive for the time, valuable crops, targeted field crops, new agricultural tools and routine elements of the agricultural sector. The farming techniques and agricultural technology of the various social groups of the Tatar population differed significantly, such as those of former state peasants, smallholders, cossacks, and so on.

The Volga Tatar agriculture across the vast area of the Volga-Ural Region was characterised by the diversity of its components. One of the key reasons for this variety was the uneven development of capitalism in separate areas of the region as well as the capitalistic orientation of a variety of sectors of the economy (agriculture, cattle breeding, trade, and so on). This explains the intensive spread of trade and commercial agriculture in the south-east and east uyezds of the region and the standstill in the agricultural techniques of the west and north-west regions of Tatar settlements.

The other important reason for the variety of elements and the phenomena of a people's agriculture was the local features of the environment of the Urals and Volga Region. As a result of the intensive migrations of the last few centuries, peasants found themselves in new physical and geographical conditions that were noticeably different from their previous experience. Their agricultural skills and traditions adapted to the environment or underwent significant changes. The system of agriculture and entire range of cultivated crops were changing, traditional ploughs and methods of crop processing were being replaced by others that were more appropriate for the new soil and climate conditions. In this way the regional features of Tatar agriculture formed

over time. The differences between the agricultural and farming techniques in the forest and steppe areas of the Volga and Urals were especially noticeable; the forest area featured a great deal of contact between forest and steppe agricultural traditions.

The role innovations played in Tatar agriculture was great, especially the influence of the agricultural economy of Russian peasants. Centuries-old cohabitation in the region and active economic and cultural contacts contributed to Tatar agriculture's adoption of new ploughs (one-sided sokha, kosulya) and also tools and facilities for crop processing (scythe-litovka, beater, drying-barns, threshing barns, and others). In their turn, the farmers of other nationalities adopted many rational elements of Tatar agriculture.

Regardless of all the similarities between the farming culture of the peoples of the Middle Volga Region and Urals, the practices of the Tatars preserved a number of unique features, including a preference for eincorn and lentils, wooden ploughs, threshing using horses, and the establishment of such sheave tying methods as *chumele* or *kibens*. The widespread implementation of these and other agriculture developments from the various territorial or ethnic subdivisions of people along with the historical facts testifies to the ancient farming traditions of the Volga Tatars.

Gardening and Vegetable Cultivation.

Horticulture and vegetable cultivation in the Tatar villages in the middle of the 19–beginning of the 20th centuries was of secondary importance and intended, first and foremost, to meet the needs of individual peasant families. In some cases products were also grown to sell at markets. In general, gardening and vegetable cultivation among Tatar peasants, just like among other peoples of the Volga and Urals, did not fare very well [Istoriko-statisticheskij obzor, 1883, vol. 1, p. 7; Pashkevich, Ed. X, p. 206].

Thus, in the mid–19th century M. Laptev noted that the Tatars of the Kazan Guberniya did not like to cultivate vegetables [Laptev, 1861, p. 286]. Almost the same thing has also been said about the Tatars from Ufa and

Orenburg guberniyas [Voenno-statisticheskoe obozrenie, Vol.4, part 2, p. 53]. Another description of the late 19–beginning of the 20th centuries largely echoes this fact as well: '...It (potatos in the Kazan Guberniya—*N. Kh.*) is almost the only cultivated garden plant for the Tatars, except for onions, for which the most paltry sections were allotted' [Materialy' dlya sravnitel'noj, Ed. 6, p. 132]. The development of these industries were also greatly dependent on the economic solvency of land owners. Thus, A. Lipinsky stated that the Tatars '...especially wealthy individuals, were engaged in domestic cultivation with full vigour, and their vegetables are quite diverse' [Lipinsky, 1868, p. 423].

They grew vegetables in their household plots (*ındır, bakça*) and more rarely on their spring field. There were usually 2–3 different crops, but they were in far from all family farms of a specific settlement. Only in certain Tatar villages did vegetable cultivation grow to a significant size and occupy more than half of all farms, sometimes even servicing neighbouring markets. There was almost no vegetable cultivation in the Ural Uyezds. Here we can point out that only the Tatar-Nagaibaks of the Trans-Urals received all vegetables—carrots, beets, cabbage, radishes, onions—from their own gardens [Orenburgskij listok, 1878, No.45].

The most widespread cultivated vegetables were onions (*sugan*), cucumbers (*ky'yar*), and cabbage (*käbestä*). The latter was often canned (pickled, soured) for winter. Among other vegetables, mostly in the forest and forest-steppe areas, they cultivated carrots (*kişer*), red beets (*ky'zy'l chegender*), and less frequently white sugar beets (*ak chegender*), radish (*torma*), turnip (*gäränkä*), garlic (*sary'msak*). In the Cis and Transurals they also cultivated horseradish (*keren*). But in other districts this plant was considered a weed. The Molkeyev Kryashens in the Tsvil'sk Uyezd of the Kazan Guberniya cultivated hops (*kolmak*), which they used to brew beer; if necessary, wild hops were also used. In the Kransoufim'sk Uyezd in several villages of the Perm Guberniya beans could also be found (*kara borchak*). Occasionally they sowed poppies (*mek*).

Almost everywhere except for the northern and south-eastern regions of Tatar settlements they cultivated pumpkins (*kabak*). This gourd was often, with the exception of potatoes, the only vegetable garden plant grown.

Almost all Tatar villages of the forest and forest-steppe areas, and as much as possible in the fields but rarely in the vegetable garden, they cultivated radish (*shalkan*). This crop usually started off the crop rotation in plots from recently cleared forests (*y'shna zhire*). In the Osa Uyezd of the Perm Guberniya Tatars maintained their tradition of sowing this crop on accidental forest fire sites, which can be explained by radish's natural predilection to grow in the forest fallow. Only the wide spread of potatoes in the latter half of the 19th century pushed out the plating of radish.

Watermelons were cultivated in the steppe area (*karby'z*), as well as rockmelons (*kavy'n*), and in the southmost areas—the Nikolaev and Buzuluksk uyezds of the Samara Guberniya, and the Orenburg and Orsk Uyezds of the Orenburg Guberniya—'these crops replaced all other vegetables' [Debu, 1837, p. 172]. Melon cultivation was also often a source of income for the Tatar-Cossacks, and

Tatar ploughmen had their livelihood heavily connected to potatoes (*berenge*). Contemporaries noted that potatoes became the main source of nutrients for the impoverished population [Trudy', 1884, p. 151]. And since poor peasants made up a large part of the Tatar rural population, Tatar ploughmen in particular contributed to potato cultivation in the Volga Region [Materialy' dlya statistiki, Ed. IV, p. 19].

But even in the late 19–beginning of the 20th centuries the spread of potatoes did not cover the entire territory of the Tatar settlement in the region. It was mainly cultivated in the Oka-Sur interfluvium, and the Volga and West Trans-Kama Regions. In the uyezds to the North, East, and South of the first districts potatoes were cultivated on a small scale, where their area rarely exceeded 1–2 hundred square meters. For example, in the Orenburg Guberniya potatoes began to emerge in the latter half of the 19th century.

Fruit-farming was less widespread among Tatar peasants than vegetable cultivation. Fruit-farming has only been documented as occurring in the Kama Region [State Archive of Kirov Oblast, f. 957, inv. 1, item 38b, Table]. There were also gardens in the forest-steppe zone in somewhat larger sizes: in the Volga, West Trans-Kama Regions, and also in the Oka-Sur interfluvium. In certain cases, apples were offered for sale [Pashkevich, Ed. V, p. 164].

Based on the above, one can conclude that fruit-farming and vegetable cultivation, albeit on a small scale, existed amongst Tatar peasants.

Family farms and their beasts of burden.

Everything was interconnected on peasant family farms. The deficit and reduction of areas of grass acreage, pastures, and hayfields led to a lack of fodder for animal breeding. Land scarcity, cattle plague, the sale of livestock to pay taxes, cattle theft, and other reasons hindered the development of animal breeding [Sbornik statisticheskikh, Vol. 5, pp. 59, 60]. Fires and mass cattle mortality, which became almost a regular occurrence in a number of guberniyas, and other disasters turned yesterday's average peasant into a poorer version of himself, who was now facing deficits. One of the primary causes of the reduction in the number of livestock per capita were lean years with small harvests [Materialy' dlya izucheniya, 1880, pp. 100, 113]. The lack of fodder forced peasants to sell their cattle, sheep, and goats [Obshchij svod, 1896, pp. 473, 475]. During the post-reform period crop failures occurred every 6–7 years, and they often lasted as a rule for two years in a row, causing a high frequency of death by hunger among the population³². Af-

Tatar village. Nizhny Novgorod guberniya
Photo by M. Dmitriev. Late 19th century

ter each such year both time and money were needed to restore the number of livestock. In the latter quarter of the 19th –beginning of the 20th centuries weak farmsteads started to overcome crop failure consequences thanks only to territorial and governmental loans for food and seeds, and sometimes for horses.

The 1882 horse census data clearly demonstrate the supply of horses among former state serfs. The Tatars were ranked first (34.1% and 45.5%) in terms of the horseless and those possessing a single horse in the Kazan Guberniya. Thus, 79.6% of households were a part of the interlayer of 'low-incomers' (a territorial statistician term). Russians made up 54.6% of such households; Chuvash, 45.2%; and the Mari, 44.5%. The Tatars had twice less (15.1%) wealthy households (with 2 horses) than the populations of other nationalities. Wealthy peasants with 3 or more horses accounted for 5.3 of the 100 Tatar households, while Russian peasants had a figure of 12; Chuvash, 18; and the Mari, 22.1 [Obshchij svod, 1896, p. 480].

The situation for farmers from the underpopulated south-east guberniyas with fertile soil was relatively better. In 1900 in the Ufa

³² The worst crop failures occurred in 1872–1873 in Samara guberniya; in 1877, in Kazan guberniya; in

1880, in Samara and Simbirsk guberniyas; in 1883, in Kazan, Penza, and Simbirsk guberniyas; in 1885, in Penza guberniya; in 1891, in 30 guberniyas of European Russia; in 1892, 15; in 1897, 19; in 1898 12; in 1901, in 17 guberniyas, including guberniyas in the Volga-Ural Region [Mariskin, 2004, p. 75].

Guberniya 18% of the population were horseless, 38% of households had one horse, and 11% of estates had 4 or more draft horses. The supply of draft animals in the peasant homesteads of the Orenburg Guberniya was somehow better than in the Ufa Guberniya: 40% of all homesteads were horseless or had just one horse in 1891. Landowners had more horses than other peasant groups [Usmanov, 1981, pp. 263, 266, 286–292].

The rural Tatar population of the Volga-Kama Region sought to use their plots of land most productively. The supply of horses on homesteads had a tremendous influence on the level of land production. Horseless ploughmen cultivated their plots and sowed them later, hiring for that purpose pulling power for payment, and were deprived of fertilizers. They needed two horses for plowing their plots in many places, and in areas with wet and viscous ground Tatars, who had just one horse, might as well have been horseless [Yevtikheyev, 1890, p. 51].

The difficult economic and social situation of the Tatar ploughmen was often explained away by the authorities as 'the low level of interest Tatars have in agriculture.' In this respect, the results of household surveys in zemstvos are quite fascinating. In the late 1880s in the Malmyzh Uyezd of the Vyatka Governorate 44% of Tatar homesteads were horseless, but Tatars, who did not maintain domestic farmsteads among them, accounted for only 3.3% [Materialy' po statistike, Vol.1, pp. 22, 23]. In the Kazan Guberniya 95.5% of Tatar peasant farmsteads were engaged in agriculture, and 79.6% cultivated their entire allotment, despite the fact that 36.6% among them were horseless. Horseless ploughmen, although they hired beasts of burden, did not have the opportunity to cultivate their entire allotment. 'The low interest of Tatars in agriculture' was explained, first of all, by the lack of beasts of burden on farmsteads [Zagidullin, 1992, pp. 63–65].

Animal breeding. Another important branch of Tatar peasant agriculture, second in importance after agriculture, in the middle of the 19–beginning of the 20th centuries was animal breeding (cattle breeding, in particular).

Domestic animals were both a source of food (meat, milk, bird egg) and raw material for different crafts (skins, wool, feather, leather, bone). Horses were the main beasts of burden for ploughs and transport and also served in other respects on Tatar farmsteads. Livestock products, just like the animals themselves, had significant market value. Livestock breeding, especially in the forest and forest-steppe areas of the region, was a source of manure and an important method for the support of soil fertility. These and other reasons explain the value behind animal breeding on peasant farmsteads.

The composition of herds was typical for settled animal breeders, and cattle, sheep, goats and horses occupied their own important places in them in the Volga and Kama Regions. The number of horses and sheep in the south-east areas of the region was increased slightly. In some cases the Tatars had camels in the southern uyezds of Samara and Orenburg guberniyas.

Animal breeding among the Volga Tatars was in a satisfactory condition until the mid-19th century, inclusive. But during the latter half of the 19–beginning of the 20th centuries animal farming for the majority of Volga Tatars was an occupation of great changes, most of which were for the worse (reduction of livestock and so on). The reasons for this situation varied in nature. First, it was the result of the meagre feed base for animal breeding. S. Palitsyn wrote about the Tatars of the Laishevo Uyezd of the Kazan Guberniya that the lack of cattle in this region was due mainly to a lack of food [Palitsyn, 1890, p. 56]. This situation, however, was the same for peasant households of all nationalities. Thus, given that the supply standard of meadows and pastures in relation to arable land was 1:2, in the Kazan Guberniya at the end of the 19th century this ratio was 17.6 dessiatins to 100 dessiatins of arable land, and in certain uyezds even less [Popov, 1898, p. 9]. The Tatars worked on hayfields and pastures that were worse than what was allotted to other peasants [Materialy' dlya sravnitel'noj, Ed. 6, p. 133; Ed. 7, pp. 175–176]. In the Menzelinsk Uyezd of the Ufa guberniya at the end of the 19th century up to 40% of peasant com-

munities produced almost no hay [Biryukovich, 1903, p. 9].

Most land-poor Tatar rural communities in the western and central areas of the region grazed their cattle during summer on unfavourable, rough lands with stubble and so on [Materialy' dlya sravnitel'noj, Ed. 1, p. 38]. In winter the cattle had to be satisfied mainly with straw, but even then it was not always enough because in the circumstances of a wood shortage in peasant huts straw was used as a heating material: in the Sviyazhsk Uyezd of the Kazan guberniya, for example, they used straw for heating in 49.1% of peasant communities; in Mamadysh, 60.1%; in Kazan, 64.1%; and in Tetyushi, 91.5% of communities [Popov, 1898, pp. 11, 12]. It was the meagre feed base that had a negative impact on livestock numbers and its overall quality. Moreover, the impoverished finances of the majority of Tatar peasant farmsteads did not allow them to rent pastures or purchase hay and coarse grains, which led to animal breeding being in a worse condition than among peasants of other nationalities. A direct correlation between feed availability and livestock numbers in the Malmyzh Uyezd could also be clearly traced in the national aspect: each Tatar farmstead had 1.1 dessiatins of hayfields; and Russians, 1.8 dessiatins; Udmurts and Mari people, 2.5 dessiatins. As a result, the first farmsteads had 1.9 heads of livestock (in terms of cattle); the Russians and Mari, more than 3 heads of livestock; and Udmurts, 6.1 heads [Materialy' po statistike, Vol. 1, p. 96].

The shortage of food during the winter period along with the need to pay taxes and debts caused an event characteristic for Tatar villages known as the mass autumn livestock sale, where first and foremost it was working animals that were bought again in spring [Biryukovich, 1903, p. 14; Steinfeld, 1893, pp. 297–298]. This same reason—the shortage of food—also caused another phenomenon typical for the Tatars of neighbouring Kazan villages—that is, labour in cities during the winter as draymen—'barabuses'—solely for the purpose to feed their horses [Vorobyev, 1953, pp. 63–64].

Apart from this, the development of capitalism in post-reform Russia was followed by the disintegration of natural consumer cattle breeding, the formation of specialisations in certain areas, and the development of elements, branches, and later also entire districts of commercial cattle-breeding [Smykov, 1978, p. 100]. Thus, in the Perm Guberniya the livestock of sheep grew rapidly, which was determined by the development of the local wool industry. The wealthy Tatars of the Kasimov Uyezd had many cattle, but commercial animal breeding was most considerably developed in the south-eastern regions of the territory as well as in the south of Samara and Orenburg guberniyas. One of the main reasons for this was the markedly better supply of pastures and hayfields [Voenno-statisticheskoe obozrenie, Vol. XIV, part 2, p. 57].

The main method of livestock breeding among Tatar ploughmen in the western and central guberniyas and also in many uyezds of the Urals was grazing-stall: from spring to autumn cattle grazed under the control of the shepherds, and for winter it was kept in the barns. In Perm and Ufa guberniyas as well as in several villages of the Kama Region a version of free summer cattle pasturing can also be found. In the southern foothills of the Urals and Trans-Urals they practiced the grazing-stall method of livestock breeding with elements of semi-nomadic livestock breeding and in some cases also utilised a year-round pasture type of grazing on pasture feed.

The stall type of grazing in winter practiced by the Tatars differed significantly depending on the various environmental zones they lived in. In the forest and forest-steppe areas animals wintered in enclosed spaces: horses were kept in log, wicker, stone, and other types of stables (*aran*); cows, sheep, and goats, in pens made from poles and wicker fence (*abzar*). Goats and sheep were also often held surrounded by a fence under a tent (*lapas, kalda*). The lack of construction timber and its need among the population caused animal accommodation, including cattle, to be mostly provided in dugout shelters. Often during cold winters poor peasants fed cows with their calves, matrons and

their young stock inside, and during times of the most bitter colds even their entire livestock could be fed and kept in the house. In the uyezds of the steppe zone livestock was typically penned up in the yard without any shelter, and less commonly, in wicker or adobe pens.

The main winter forage for cattle in most Tatar villages was straw. Before field work and long routes hay and, as far as possible, oats were given as feed to horses [Popov, 1893, pp. 5–6; 1898, pp. 31–35, 61].

The lack of food, extremely poor conditions, and an overwhelming workload often caused diseases and cattle plagues. To a large extent this was also caused by the lack of quality watering holes. Other serious consequences for peasant animal breeding were epizootic outbreaks, which most frequently occurred in the eastern guberniyas of the region. The lack of quality veterinary help also stimulated the development of popular ways and methods for the treatment of livestock. Horse doctors, mainly Russian peasants, travelled around the villages of the region. But this type of work developed among the Tatars of the Alatyr and Kurmysh Uyezds of the Simbirsk Guberniya as well, and entire villages became involved in it [Mukhametshin, 1977].

The strip settlement of peoples and close economic contacts led to Tatar livestock breeds having hardly any difference from the peasant livestock of the region as a whole. Domestic animals were united by a single quality that was reflected in the statistical descriptions of the mid-20th century: horses and livestock were of a simple breed [Spisok naselenny'kh mest, XXXI, p. CCCXVIII]. Little or no reproductive work was ever undertaken. The scarcity of food and bad conditions all but destroyed any possible breeding activities [State Archive of Kirov Oblast, f. 869, inv. 1, item 39, s. 56].

The horses (*at*, *alasha*) of Tatars, especially in the western and central guberniyas, were mainly of the forest type [Petrenko, 1984]. In the 19th century their small stature and weak power set them apart from other breeds [Gulyaev, 1876, p. 21]. In the south-east of the region, particularly in the Orenburg Guberniya, Mongol or Asian horse breeds dominated

in Tatar herds (known in European Russia as Bashkir, Kyrghyz, or Kalmyk) [Raspopov, 1884, p. 82].

In general, the lack of food, overwhelming workloads from an early age, premature transition from milk to fodder, and other reasons had a negative impact on the quality of Tatar horses. I. Popov described horses he observed in the Kazan Guberniya in the following way: 'Local horse could barely plough a half or three-fourths or a dessiatin per day even in light soils, and the breaking of virgin sod is out of the question: horses would just stop, breathing heavily, and shake their heads. And no urging on or even whipping could get them to do anything more [Popov, 1894, p. 3].

There were few breeds of cattle on Tatar farmsteads (*sy'er*, *ugez*). Thus, Russian and Ukrainian milk breeds dominated in the western and central parts of the region. Kalmyk or Kyrghyz cattle breeds raised for meat were prevalent in the south-east, in the steppe zone [Popov, 1891, pp. 16–60; 1909, p. 45; Sabaneyev, 1873, p. 102; Smykov, 1984, p. 180].

Tatar peasants of the southern uyezds of Samara and Orenburg guberniyas used as part of their farmsteads bulls and oxen (*ugez*), and also camels (*doya*). However, there were not many of the latter. Camel's milk, the same as horse milk, was used to make kumis, and the wool was used to produce blankets and broadcloth-armyachins.

The Tatars mainly bred sheep (*sarik* of the so-called 'Russian' village breed, which were unique in their small body weight and sparse wool coats, which were also a result of bad feeding conditions. Tatar peasants of the Penza Guberniya bred finely-fibred sheep of the 'Silesian breed.' Along with Russian sheep they bred Horde and Bashkir fat-tailed sheep in the Saratov and, particularly, in the southern uyezds of Samara and Orenburg guberniyas. The Tatars differed in their penchant for lamb, which is why sheep livestock on Tatar farmsteads were always larger in number compared to other peoples of the region [Vorobyev, 1953, p. 73].

Goats (*kezhe*) were also typically of the 'Russian' breed. Orenburg Cossacks, where the manufacture of head scarves was devel-

oped, along with typical goats also bred goats for wool in small numbers. Poor peasants of all peoples of the region replaced their cows with them as they did not have the opportunity to breed the latter ('goats are the cows of the poor'). But there were goats on wealthy farmsteads as well since goat milk (not without good reason) was considered to be healthy, especially for children [Vorobyev, 1953, p. 95].

Almost every Tatar household had chickens, and less frequently, geese, ducks, and turkeys. Contemporaries pointed directly to the special Tatar commitment to poultry breeding [Lindgren, p. 11].

Non-agricultural activities. In the late 19–beginning of the 20th centuries such agricultural branches as beekeeping, hunting, and fishing already played an almost insignificant role on traditional peasant farmsteads, although they were also preserved in many Tatar villages.

The maximum spread of *beekeeping* among the Tatars in the period under review was in Ufa and Kazan guberniyas. By the beginning of the 20th century these guberniyas occupied second and third place, respectively, in European Russia in terms of the numbers of beehives and apiaries [Khabachev, 1911, p. 12]. Thus, at the end of the 19th century in the Ufa Guberniya 78% of villages were involved in beekeeping, and in the Menzelinsk Uyezd, where Tatars made up the significant part of the population, the figure was 85% [Obzor Ufimskoj, Ed. I, pp. 31–34]. Beekeeping was also widespread among Tatars, in the Osa and Kungur Uyezds of the Perm Guberniya, and in the West regions of settlement of the Tatars [Sbornik statisticheskix, vol. 7; Sbornik statisticheskix, Vol. 7, Ed. 1, pp. 202–289].

In some very rare cases beekeeping was done on a commercial scale with apiaries that became quite large (up to 500 beehives) [Khabachev, p. 12].

Fishing among the Tatars of the Volga Region existed in multiple industrial forms and types that utilised different tools and methods.

Amateur fishing was practiced in the many Tatar villages of the region where there were suitable water reservoirs. And it only existed on a noticeable scale in just the eastern part of

the region, in the numerous rivers of the Ural Region and lakes of the Transurals. Fishing in the Urals and its inflows—the Ilek, Sakmara, and others—held an important significance for Orenburg Cossacks-Tatars, albeit it was much smaller in terms of volume than among the Ural Cossacks. On the Ilek River the annual catch reached a thousand poods, mainly sturgeon and ship sturgeon, and was purchased by non-local merchants. Fishing in the basin of the Ural River was often done on an industrial scale. Unlike the Ural Cossacks, fishing in the possession of the Orenburg stanichniks was free and unregulated [Issledovaniya o sostoyanii, pp. 88, 93].

Hunting in the middle of the 19–beginning of the 20th centuries was still practiced in many Tatar villages of the region. There was a relatively large number of Tatar hunters in the Cis and Transurals [Materialy' dlya, Ed. IV, pp. 18, 19]. At that time the main targets were bear (*ayu*), elk (*poshi*), reindeer (*ky'r kezhes*), wolf (*bure*), fox (*tolke*), hare (*kuyan*), marten (*susar*), ferret (*kozen*), badger (*bursy'k*), squirrel (*tien*), wild goose (*ky'r kazy'*), wild duck (*ky'r urdege*), grouse (*kortlek*), wood grouse (*suer*), quail (*bedzhe*), and other animals and birds.

During this period in the Cisurals ancient methods of hunting, such as falconry and [Akhmarov, 1903, p. 63] bear hunting with spears, still remained (*senek*).

Firearms began to appear among Tatar hunters only in the late 19th century. However, they used them more often than, say, Mari hunters, who at that time still mainly used the bow and arrow [Kryukova, 1956, p. 34]; by the end of the century Tatars had almost completely stopped using the latter.

The Tatar peasant economy of the Volga-Ural Region in the mid-19–beginning of the 20th centuries was a combination of interrelated branches, the basis of which was farming. There were also different types of trade and crafts that were part of the economy. Animal breeding was important, although not a primary occupation, and gardening, vegetable cultivation, beekeeping, hunting, and fishing were less developed.

Tatar peasants at the bazaar. Photo from the early 20th century.

Starting in the middle of the 19th century a number of important socio-economic changes began taking place in Tatar villages. Income inequality and the social polarisation of Tatar villages became increasingly pronounced. Its small wealthy half became a part of the system of trade and commercial and agricultural entrepreneurship in a more intensive way, concentrating on their farmsteads those few tools and machines, improved methods of agricultural technology, and commercial field crops that were widespread in pre-revolutionary Tatar villages. Capitalist relations developed especially actively in the agricultural sector of the south-eastern and eastern uyezds of the region, which can be observed in the growth of marketable grain production and the intensification of animal breeding in the households of wealthy peasants and Tatar-Cossacks. The other (larger) part of the Tatar village population was made up of land-poor and landless, horseless, impoverished, and bankrupt peasants. In the central and western guberniyas of the region the extremely poor condition of agriculture, which was the basis of a peasant's existence, worsened the 'crisis of the three-field system.' This is why the workforce of a significant portion of the poorest peasants relied not so much on farming per se but on routine agricultural work

and non-agricultural types of crafts and handicrafts. Medium-income peasants, who strove to preserve a customary farming economy at all costs, also with just the slightest possibility practiced various additional sources of income on the side.

In the middle of the 19–beginning of the 20th centuries plough farming was prevalent in the economy of the Volga and Ural Tatars. In the western and central guberniyas of the region this was based on the farrow three-field system of agriculture cor-

responding to a typical group of field crops, whereas winter rye made up about half of all crops. Sokha and wooden harrow dominated among tillage tools.

Animal breeding for Tatars, although it indeed played a subordinate role in comparison to farming, held a great significance for them as a source of food, raw materials for handicraft industries, beasts of burden, and suppliers of fertilizer. Everywhere in the herd, in accordance with the pasture-and-stable type of animal breeding, cattle, sheep, goats, and horses dominated. At the same time, in the large south-east regions of the steppe cattle-breeding preserved semi-nomadic features among wealthy peasants and Cossacks, in particular, herds of horses and sheep continued to graze in the winter. Fruit-farming among the Tatars was localised mainly in the Volga Region, vegetable cultivation was prevalent in the central uyezds of the region, and the south-east districts were specialised in melon cultivation. Beekeeping was also practiced in the Cisurals in the form of apiculture. Hunting and fishing were preserved in the region wherever there were suitable conditions.

In the middle of the 19–beginning of the 20th centuries changes took place on Tatar peasant farmsteads. Archaic agricultural tools

and equipment were gradually replaced by steel plough, croppers, threshers, and marketable grains became more readily available, especially in the south-east regions, which is indicative of the development of capitalism in agriculture. The deepening of socio-economic divides in villages, the development of entrepreneurial competencies among the rural bourgeoisie, the growth of the all-Russian market,

and other reasons—all edged out traditional domestic crafts with the handicraft industry and manufacturing, and in some cases even with a factory.

During the period under review and despite extremely difficult economic conditions, the Tatar peasant economy slowly but steadily progressed, which was characteristic for post-reform Russia in general.

§ 3. Seasonal work

Nail Khalikov

The most widespread—quantitatively and territorially—form of Tatar peasant allotments was seasonal work. It came in different forms, including an agrarian departure for summer field work (harvesting, hay mowing) in the south-east regions of European Russia to the areas where crops were grown; to the neighbouring landlords' households; the non-agricultural movement to cities of unskilled labourers, such as loaders, bath attendants, etc., or stevedores and cart drivers, or to the fishing waters of Astrakhan and timber harvesting industry of the Urals and Siberia. P. Znamensky noted: 'Because of the decline of arable farming in Tatar villages, thousands of rural dwellers travel to nearby villages in the Volga Region for seasonal work. Poor Tatars in Kazan cleaned streets and worked as porters on quays, watchmen, day labourers, and watermen...' [Znamensky, 1910, p. 16]. It was considered a short-term departure, when a peasant did not break ties with his plot and farming and went to work mainly from autumn till spring, when they were free from traditional agricultural work. The exact number engaged in seasonal work depended on the condition of the harvest [E'konomicheskie zapiski, 1861, No. 40, pp. 319]. But it was not just bad harvests that had an influence on the growth of crafts: in 1896 in the Vyatka Governorate the prices for agricultural products dropped because of the good harvest, which caused a noticeable revival in crafts [Kalendar'... na 1898 god, p. 17].

The correlation between land supply and the portion of the population engaged in activities other than agricultural crafts can be seen in the case of the peasants of the Bugulma Uyezd of the Samara Guberniya. In volosts with large land lots (19 dessiatins per capita of males in the Nizhnye Chershily Volost; 30,4 dessiatins in the Ivanovo Volost) 3.2–21.5% of Tatar households resorted to seeking additional income sources, and in land-poor communities (5.4 dessiatins in the Kuzaykino Volost, 6.8 dessiatins in the Alkeyevo Volost) more than half of all households were involved in commercial activities [Sbornik statisticheskix, Vol. 5, p. 31]. Often the scale of withdrawal from the agricultural economy was of a considerable size: for example, in the Novo-Kakerlinsk Volost of the Buinsk Uyezd of the Simbirsk Guberniya, which had a majority Tatar population, up to 80% of families practiced handicrafts at the beginning of the 20th century [Podvornaya perepis', Ed. 4, Table 1].

According to the number of seasonal workers, long-term seasonal work prevailed: In the Yelabuga Uyezd in the Vyatka Governorate in 1894, where a particularly large group of Tatars resided, for example, 10.9% received year-long passports, half-year passports were obtained by 27.8%, and one-month tickets, 59% [Golubev, 1896, pp. 50, 54]. It can also be noted that the largest number of tickets were obtained during summer time [Sbornik statisticheskix, Vol. 5, pp. 86, 87].

Tatar loaders in the Kazan river port. Photo from the late 19–beginning of the 20th century.

The main districts of short-term departures were areas where work force supply for various reasons exceeded demand: Penza, Simbirsk, Ufa guberniyas, and the uyezds of the nearest guberniyas. Departures from here were often large in scale: in the mid-19th century it was noted that temporary recruitment for reaping and harvesting in landlord economies was quite well developed among Tatars of the Buinsk, Korsun, and Alatyr Uyezds of the Simbirsk Guberniya [Lipinsky, 1868, p. 381]. In the Samara Guberniya 70% of men left to harvest from the village of Balykly of the Buguruslan Uyezd, and the entire labour population departed from the village of Karkali of the Bugulma Uyezd (late 19–beginning of the 20th centuries). They went to harvest to mow hay in the south districts of the regions: for example, they travelled from the Bugulma Uyezd to the Bugurslan, Buzuluk, Samara Uyezds of the Samara Guberniya, and to the Orenburg Uyezd [Sbornik statisticheskix, Vol. 5, pp. 103].

A significant number of peasants during winter were recruited, especially in the forest volosts and uyezds of the Oka-Sura interfluvium, Pre-Kama, Urals and Middle Urals Regions, to practice tree cutting and timber rafting. Local beys who purchased forest plots often were

the ones to establish industries on their land. Peasants in the Perm Cisural were contracted to cut and drive lumber in factory dachas. The Tatars of the Kuznetsk Uyezd of the Saratov Guberniya during winter chopped and hauled timber for lumbermen and in summer drove up to 200 rafts ('ends') of 300–500 logs each along the Kadada and Sura Rivers [Chekalin, 1876, p. 24].

The Tatars also worked in the surrounding factories and plants where local industry existed: from the villages near Kazan to the factories of Alafuzov in Kazan, in the Kungur Uyezd of the Perm Guberniya at the Ivanovo and Pozhapovo plants, in the Simbirsk Uyezd of the Simbirsk Guberniya, at the cloth factory in Ishevo, in the Kuznetsk Uyezd, at the distillery, and so on. K. Fuchs as early as in the middle of the 19th century noticed precisely that '...if near their (Tatar *N. Kh.*) villages there are distilleries or potash factories, then the Tatars are always in action; they contract to chop wood and gather ovin and stove cinder' [Fuchs, 1840, p. 28]. Peasants were hired for factory work usually for the period from September to March.

Another type of seasonal work was the quite long non-agricultural departure to the factories and mines of the Urals, Donbass, oil fields of

Baku, and major cities such as Moscow, Saint Petersburg, Kiev, Tashkent, and others. This type of departure, which lasted a year or longer, in fact meant the withdrawal of a peasant from the agricultural economy and their transition into the ranks of the proletariat (although usually peasants did not legally break ties with their estate when leasing out their plot or paying imposed taxes and payments). N. Steinfeld stated that the Tatars from Kazan and Vyatka guberniyas moved to the cities of Orenburg guberniya, where they engaged in trade and worked as carpenters and unskilled labourers, etc., and were almost entirely uninvolved in farming [Steinfeld, 1893, p. 295, notes.I]. Many peasants of the Yelatma Uyezd of the Tambov Guberniya made secondary income, mainly as workers and prikazchiks, and often without returning home for six or more years. Several hundred people went to the south from there, to the Black Sea, and dozens to Saint Petersburg, Moscow, Orenburg, Bukhara, to the Kuban, Caucasus, and Siberia [Sbornik statisticheskix, Vol. 7, p. 94]. Seasonal work was especially developed among the Tatars of the Kasimov Uyezd, where 40% of the male population went to work, while 80.5% of them worked in the service sector as servants, lackeys, bartenders, waiters, and so on [Sbornik statisticheskix, Ed. of Russia, p. 496].

The number of seasonal workers in the period under consideration was not constant. Thus, the number of peasant passports and leave tickets increased 1.7–2 times in the Yelabuga and Malmyzh Uyezds of the Vyatka Guberniya from 1875 to 1894 [Golubev, 1896, pp. 50, 54]. In the first post-reform decade in Kazan there were around 152,6 thousand seasonal workers, and from 1891–1900, 1,478.1 thousand were registered [Smykov, 1962, p. 214], while their number, including people without passports, was in fact much larger.

One specific type of seasonal work in the Volga and Ural Regions, considering the large volume of freight transport that maintained the local market and transit trade, was the cart service. It was written about Kazan guberniya that '...many people were engaged in the cart service; Tatars accounted for half of all

cart drivers (mainly draymen) and coachmen' [Znamensky, 1910, p. 16].

Many Tatars worked as burlaks and loaders. One contemporary wrote about the Tatars: '...they could be seen at many wharves as rowers—ferryman, loaders, and stevedores, and at the same time they were the best workers in terms of what they were tasked with' [Tarapyggin, pp. 163–164]. In the early 20th century the total number of loaders in the Volga-Kama basin was 30–50 thousand [Rodin, 1975, p. 184; Shubin, 1927, p. 792], while it was more or less the majority of Tatars in Kazan and a portion in Nizhny and other cities.

Yet another widely spread type of Tatar short-term seasonal work was the industrial departure of peasant craftsmen. Tailors, wool-makers, furriers, sheepskin coat makers, jewellers from the Kazan Guberniya and fewer from Simbirsk, Penza, and Tambov guberniyas travelled to the Urals and Cisural Region, up to Shadrinsk uyezd of the Perm Guberniya, inclusive. Another option for short-term seasonal work that was common among Tatars all across the region, but typically within a single province, was carpentry. There were horse doctors among the Tatars who travelled all over Russia practicing their trade. In certain cases craft output acquired significant volumes: in the village of Lomaty of the Ardatov Uyezd at the beginning of the 20th century, 438 out of 1,122 men were engaged in this type of work [Podvornaya perepis', Ed. 3, Table 1].

The scale of departure among peasants for crafts depended on the degree of how developed the local craft industries were. Contemporaries noted that seasonal work was pursued as a result of the poor condition (because the lack of raw material, competition, and so on) of local domestic handicrafts. It is this reason why the most significant departure was from the Oka-Sura interfluvium, Volga, and Eastern Trans-Kama regions. Thus, at the beginning of the 20th century in the Menzelinsk Uyezd of the Ufa Guberniya, as a result of the insufficiency of raw material for local crafts (the forests had all been felled) and the unsatisfactory state of farming, including among the Tatars, the main source of income came from

non-agricultural industries [Mironova, 1907, pp. 72–73]. Vice versa, relatively few peasants left for work from the Kama Region, where local handicrafts were rather well-developed [Statisticheskij vremennik, Vol. 2, Ed. 3]. It is revealing that the peasants from the village of Memdel of the Kazan Uyezd, for example, who were in general wealthy and practiced numerous crafts, not only did not go to work but in the opposite manner attracted residents from surrounding villages to work there as well. Poor peasants were mainly involved in hunting.

Thus, agricultural departures prevailed among Tatar uyezds and guberniyas, especially at the turn of the 19–20th centuries to work on the harvest, hay mowing, and threshing for landlord economies and in steppe regions; as concerns non-agricultural pursuits, Tatars travelled to the plants and factories, mines and trade areas, timber harvesting and driving industries, and to the rivers, railways, and cities. Tatar peasants were also actively employed

practicing the cart service. Handicrafts were unpopular, but the common types included wood, leather and sheepskin processing, tailoring, carpentry, jewellery, locksmithing, etc. However, a concentration of manufacturing activities can be observed in certain districts, such as gold-embroidery and making ichigs near Kazan, felt and fur and furriery, and tailoring in Trans-Kazan; furriery in the Kasimov Uyezd of the Ryazan Guberniya, downy shawl weaving in the Orenburg and Orsk Uyezds of the Orenburg Guberniya, and so on.

The ethnic differences among the peoples were vivid: the Tatars of the Middle Volga and Kama Regions preferred handicraft production; and the Tatars of the Oka-Sura interfluvium gravitated towards seasonal, including long-term, craft work. Generally, among the Volga Tatars who were in a worse economic state (in terms of land and livestock supply), the scale of seasonal work development took the lead over other peoples of the Volga and Urals.

§ 4. Handcrafting

Nail Khalikov

In a socio-economic context, handicrafts were a broader concept that meant the achievement, the 'finding' of some financial, food, or other personal, economic gain. In the remote past such traditional activities as hunting, fishing, honey-hunting, gathering, and other pursuits could be considered as crafts. In the 19th century for peasants this could mainly be seen in 'trading' for commercial benefits and monetary funds. Contemporaries noted that a peasant in a Tatar aul who did not trade was the exception [Trudy', 1884, p. 145]. While peasant crafts, seasonal agricultural and non-agricultural (workforce trade) work, and handicrafts were often a source of extra income, for the burghers and other town residents of tribute-paying classes crafts were often a source of providing for themselves.

During this period crafts and the art of making crafts existed mainly as a home pursuit more appropriate to natural production of the

feudal type or in the form of handicrafts in the capitalist formation era and market relations.

Home crafts involve the production of items in their own household with the help of family members, usually using their own material for personal usage and consumption. At the turn of the 19–20th centuries home crafts and items almost disappeared and were being forced out by cheap industrial manufacturing products. In some very rare cases home crafts were preserved, for example, weaving by the christened Tatars who continued to follow their old economic traditions for a long time.

Handcrafting meant the manufacture of smaller batches of goods within one's own household at all stages of the production cycle. Home-made or, more often, purchased raw materials were used as the base, and the goods were sold at local markets or made to order. The handicraft industry was seasonal: crafting in the winter was usually combined with ag-

ricultural work on one's allotment in the summer.

In the middle-latter half of the 19th century, and in some cases in the 18th century as well, handicrafts of the Kama and Middle Volga Regions (Trans-Kazan within the Kazan Guberniya and the southern uyezds of the Vyatka Guberniya) were characterised by a cooperative style of production that later evolved into manufacturing.

Production of ropes. Early 20th century.

Initially this took the form of dispersed manufacturing. People worked on certain details of final products on their farmsteads using their own inventory and equipment. Raw materials and parts were provided by contractor herdsmen, who also carried out payments and sold the produce. Examples of such handicrafts are the weaving of hessian fabric and sacks, construction of carriages, making ichigs, and certain other types of manufacturing as well. Centralised manufacturing meant that work was done in specialised facilities with equipment provided by the owner. This could be seen in the textile and fur production sites of the Kama and Volga Regions. The workers were hired employees rather than individual craftsmen who worked

10–12 hours a day and more. Craftsmen often worked in izbas or in poorly-adapted spaces, and in unsanitary conditions. Payment was low; and women and children, who were often involved, received even less.

Handicraft production sites could be either local and seasonal. In the first case the site (space, often residential, equipment, etc.) was located in the same village or sloboda. Craftsmen supplied their neighbours and the nearest area by selling their products at local markets. Examples of local production were hessian and sack weaving, fur and leather processing, woodworking, carriage building, and many other types. Woolmakers, dyers, jewellers,

and tailors went to seasonal production sites that were often far away in the Lower Volga and Ural Regions, Siberia, and Central Asia. There were many Christian Tatars among the tailors.

Regional and sub-ethnic differences could be clearly observed in manufacturing. Local handicraft production sites of all types were especially advanced among the Tatars of the Volga-Kama Region. The highest concentration of Tatars fell on the Kama Region uyezds of the Kazan Guberniya and the southern uyezds of the Vyatka Guberniya. Such phenomena as the high density of the Tatar population and the shortage of land for peasants were the defining aspects of these regions. Tatars of the Oka-Sura interfluvium preferred seasonal production sites that did not have anything to do with handicrafting. Crafts were less developed in the Southern Ural, eastwards of the Volga and Kama. This was caused by partial loss of time-honoured crafting traditions during migrations as well as by the lack of raw materials. Local peasants often practiced side work as well: they harvested for their well-off countrymen, drove horse-drawn carts, dug for gold, worked in mines, etc. Tatar-Cossacks, who owned large areas of land and the peasants of the southern uyezds of the Orenburg Guberniya, almost never engaged in handicrafting; their farms were based more on entrepreneurial agriculture. The majority of necessary work

Embroideress in Gold.
Photo from the beginning of the 20th century.

here was completed by Tatar craftsmen that came from Kazan and Vyatka guberniyas.

Handicrafts differed in the types of raw materials used. This included processing wood (wood chemistry, sack and hessin weaving, rope-making, carpentering, lathing, coopering, carriage building, and other crafts); livestock products (processing fur, leather, wool, making felt, etc.); metal (jewellery, processing copper, metalworking) and minerals (producing bricks, carving stone).

A lot of Christian Tatars were employed in forestry and the wood chemical industry or participated in wood processing. This correlated with the role of wood in agriculture and the rural everyday life of the time.

Charring and making resin, tar, turpentine, and potassium were quite well advanced everywhere except the unforested steppe uyezds of Astrakhan, Orenburg, and Samara guberniyas. In the Kazan Guberniya in the 1880s there were 300 resinous wood distilleries that belonged to Russians and Tatars. Charcoal,

which was essential to the numerous Ural metallurgical plants, was charred in especially large quantities by the Tatars and Bashkirs of the eastern uyezds of the region. But by the turn of the 20th century the wood chemical industry fell into decline due to competition with the increase of coal mining, oil extraction, etc. [Khalikov, 1998].

Large amounts of bark, cork, and bast fibre were stocked up. Oak bark was used to process budge and leather; cork was used for roofing; ropes were made out of bast fibre; and inner bark was used for weaving sacks and bast shoes.

The production of hassian fabric and sacks was especially typical among Kazan Guberniya peasants. At the end of the 19th century in the Kazan Uyezd there were 1,500 such craftsmen in volosts with a predominantly Tatar population, and there were 1,600 craftsmen in the Tsarevokokshaysk Uyezd. In the middle of the century 200,000 sacks and hessins made almost entirely by Tatar craftsmen were delivered annually for sale from the Kazan Uyezd to its central city alone [Keppen, 1841, p. 38]. It is not a coincidence that these were referred to as 'Tatar crafted' goods in the Lower Volga Region.

These production sites were typically designed for handcrafting. However, in the Kama Region and in the uyezds of Kazan and Vyatka guberniyas production adopted a cooperative nature and transformed into dispersed manufacturing by the middle of the 19th century. Craftsmen found themselves in complete, almost slave-like dependence on intermediary buyers: they delivered the products directly to them and received raw materials from them as well. They were basically becoming hired workers with personal allotments.

Tatar craftsmen of the Kazan Guberniya practically monopolised all rope production (from lime tree bast). The manufacturing centre was located in the Kazan and Mamadysh Uyezds, but at the end of the 19th century production fell due to competition with more durable hemp rope manufacturing.

A significant portion of village craftsmanship was made up of weaving the most popular shoes of the time—bast shoes. Bast shoes were made in almost every peasant home, while

in the Kazan and Tsarevokokshaysk Uyezds of the Kazan Guberniya and in the Belebey Uyezd of the Ufa Guberniya bast shoes were made for sale as well. Easy to make, cheap and comfortable 'Tatar'³³ bast shoes were very popular in Ural factories and mines, at the fisheries of the Caspian Sea, etc. Weaving baskets of different sizes, furniture, and housekeeping objects from bast, willow rods, and bird-cherry twigs was well-developed in the region. Several thousand people of the Kazan Guberniya, including Tatars, were engaged in the weaving process [Melkaya promyshlennost', 1911, pp. 37–38; Khalikov, 1998].

Professional carpenters, especially Kazan Tatars, were well-known and respected among the peoples of the area. One contemporary noted: '...I often saw Tatar men building houses in Russian villages' [Fuchs, 1844, p. 9]. They were also the people responsible for building izbas in the Tobolsk Guberniya in Siberia. Tatar carpenters from the Kazan Guberniya played a major role in producing textile equipment, including spindles, shuttles, and reeds; they also delivered equipment for the entire population of the area [Vorobyev, 1953, pp. 129–130]. They also built simple furniture, doors, window frames, shovels, and other items. For example, up to a thousand 'Kirghiz doors' for yurts were produced annually in certain Christian Tatar villages of the Mamadysh Uyezd [Mukhametshin, 1977, p. 53]. Lathing production of dishware was well-developed in the Chistopolsk and Tsivilsk Uyezds, and especially in the Mamadysh Uyezd of the Kazan Guberniya, where the '...foreign population, primarily Tatars, was engaged in manufacturing cups' [Kosolapov, 1905, p. 35].

One of the most well-developed crafts in the area was carriage building. The demand

for carts and sleighs first came about in the 18th century for use on roads from Siberia to European Russia. Up to a thousand households of craftsmen, both Tatars and Russians, were found in the Kazan, Mamadysh, and Laishev Uyezds at the end of the 19th century [Ponomarev, 1895, p. 25]. Production was characterised by cooperation and dispersed manufacturing: some craftsmen manufactured the bodies, and others made the wheel-pairs for carts and tarantasses, the skids for sleighs, or shaft bows for harnesses. In the villages of Verkhny and Nizhny Temerlik of the Laishev Uyezd alone there were up to 120,000 shaft bows built annually.

Tatar craftsmen were almost entirely uninvolved in the production of agricultural equipment. The widespread fur processing production sites played a significant role in the handicraft industry. Wool and felt production, predominantly at seasonal sites, were popular among craftsmen all throughout the Volga-Ural Region, including in the Simbirsk Guberniya, in the Menzelinsk Uyezd of the Ufa Guberniya, and in the Shadrinsk Uyezd of the Perm Guberniya. In the Tobolsk Guberniya it was mostly Tatar settlers from the Middle Volga Region who were engaged in this trade. There were centres of concentrated production, such as the village of Shatrashany of the Buinsk Uyezd in the Simbirsk Guberniya, where felt hats and felt 'boots' (valenki) had been being produced since the middle of the 19th century. Trade was especially advanced in the Kazan Guberniya. At the end of the century there were around 250 households of Tatar woolmakers in the Kazan Uyezd and about 600 such households in the Mamadysh Uyezd. In the Malmyzh Uyezd of the Vyatka Guberniya there were such notable places as the Koshkino, Sardykbash, and Sizner Volosts, where 400 people worked in the manufacture of valenki [State Archives of Kirov Oblast, f. 1280, s. 133; Tekushhaya statistika, 1898, pp. 351, 371–373]. During this time in the villages of the Mamadysh and Malmyzh Uyezds there were also large felt-making workhouses, which started as cooperatives and evolved into manufacturing sites and even factories with up

³³ They were known Tatar because they featured a right-angle weave (Russian or Mordvinic straw shoes were made using an angled weave, technically more complex). Another advantage was that 'Tatar' straw shoes were the same for both the right and left foot. This meant that when only one shoe was worn through, only it had to be replaced. With 'Russian' straw shoes, both the right and left foot had to be replaced at the same time.

to 60 employees [Ponomarev, 1895, p. 33]. Tatar craftsmen reached complete perfection in the production of valenki.

A variety of fabrics and textile goods (clothes, interior design items, etc.) were of the utmost importance in everyday life and housekeeping. That is why textile manufacturing among Tatars existed in multiple forms, especially in the middle to latter half of the 19th century, from home-made to manufactured at sites and factories. For example, one observer mentioned that the Tatars of the Saratov Guberniya 'weave red calico or simple cotton fabric at home for personal use...' [Beznosikov, p. 146]. However, by the tail end of the 19th century homespun fabric had almost disappeared completely, being forced out by cheap industrial produce. Domestic fabric weaving was practiced for a longer time only among the Christian Tatars, whose way of living preserved the traits of a subsistence economy.

The tailor trade was a widespread craft that existed predominantly as a seasonal form of labour. Tailors sewed sheepskin coats and other outer clothing in the villages of Vyatka, Ufa, and Orenburg guberniyas. Tatar tailors were everywhere in the uyezds and guberniyas of the Oka-Sura interfluvium, Volga Region, and Ural Region, but there was a particularly large concentration in the Kama uyezds of Kazan guberniya. In Kazan the Christian Tatars of the Mamadysh and Laishev Uyezds were especially active in the tailor trade.

Processing animal products and preparing raw materials for agriculture were indeed well-developed, as goods made of fur, leather, and wool were frequently used in everyday life for farming and manufacturing purposes.

Almost every village had furriers who supplied their neighbours by processing skins on demand or for local market sales, sometimes working for a secondary income on a seasonal basis. In the Kazan Guberniya alone in the 1880s there were around 2,000 craftsmen in this industry, both Tatar and Russian [Tekushhaya statistika, 1898, p. 373]. Another centre was in the Kasimov Uyezd of the Ryazan Guberniya, where karakul and merlushka lamb skins imported from Central Asia were processed.

Tatar craftsmen were widely regarded as one of the most prominent peoples in the leather processing industry. This craft was mainly practiced in the Trans-Kazan uyezds, and to a lesser extent in the Spassk and Chistopol uyezds of Kazan guberniya, as well as in Vyatka, Samara, and Simbirsk guberniyas. Artisans worked for the local markets and less often on demand or for intermediaries. They attained particular perfection in the production of high quality yuft and morocco, which were well-known far beyond the region as 'al-bulgari.'

Dyeing was also widespread among Tatars. Before the existence of aniline chemical dye and indigo, which appeared at the end of the 19th century, natural substances and their decoctions were used for dyeing purposes.

The production of sun-dried earth bricks for ovens and burnt bricks for house building was also rather developed as well.

In the history of the craft and trade activities of the Tatar people there were also other trades as well, mostly small and local, including mining chalk and stone in Ural uyezds and erecting stone buildings; collecting sphagnum moss, which was essential for calking seams on log houses; mining and selling salt in the Astrakhan and Orenburg guberniyas, and other pursuits.

Some crafts disappeared in the 16th century with the destruction of the urban culture of the people. Some examples of this are glassmaking and bone carving. Traditional stone architecture and crafts involving work with stone almost disappeared as well. They were preserved only in a few religious buildings, some residential houses in the Kazan, Kasimov, and Kasimov Uyezds, in the Tatar slobodas of other cities, and on lavishly ornamented tombstones.

In the Kazan Guberniya during the 70s the Tatars held second place after Russians in the number of their population practicing crafts. The majority of Tatars worked in sack and hessian weaving, leather-working, tailoring, and other forms of production. The Maris and Chuvashs outdid the Russians and Tatars only in terms of wood processing. Handicraft techniques and technology were similar among the

peoples of Kazan guberniya and its neighbouring areas [Busygin, 1966, p. 178].

Crafts among the Tatars of the Volga Region developed unevenly. As a result of economic reasons, market conditions, the development of different industries, and other reasons some crafts fell into decline and even disappeared (wood chemical production, sack and hessian weaving, jewellery), some remained stable (carpentry, joinery, brick production), while still others were developing (felt-making, leather-processing, ichig-making, tailoring). The geographical areas of concentration for crafts were quite distinguishable as the Kama Region within

the northern uyezds of the Kazan Guberniya and the southern uyezds of the Vyatka Guberniya. The Kazan craft-industrial region started to first form here in the 18th century with numerous manufacturing sites, and by the middle of the 19th century there were already factories. Handicrafts were slightly less developed in the Volga uyezds of Kazan guberniya, in the northern uyezds of Simbirsk guberniya, in the Western Kama Region (Spassk, Chistopol, Bugulma, Ufa Uyezds), and in Kasimov uyezd. Seasonal production sites that were not associated with crafts were predominant throughout the remainder of the Tatar's settlement area.

§ 5. Tatar entrepreneurs and the Russian market

Lyudmila Sverdlova, Marat Gibadullin

The market reforms of the middle of the 19th century encouraged the growth of entrepreneurial activities among broad layers of Russian society. As a result, the involvement of the Tatar population of Russia in entrepreneurial activities rose significantly.

The results of the first Russian Imperial Census prove that trade was widespread among the Tatars of the Volga-Ural Region, who became especially active in internal commerce. According to our data, there were 13,892 Tatar people employed in various kinds of trade in the region. It should be noted that Tatars comprised 7.7% of the region's general population, while the percentage of Tatar trade enterprises was 9.4% of the total number. However, if we take a closer look at each separate guberniya, it becomes obvious that those involved in trade were allocated unevenly. As can be seen in Table 36, Tatar merchants were the most active in the Ural Region, especially in the Orenburg, Ufa, and Vyatka guberniyas. The percentage of Tatars employed in trade here was quite significant in comparison to the total Tatar population. The situation was different in the Volga Region. Astrakhan Tatars were the most outstanding in terms of trade activities, and there were much fewer Tatars

engaged in trade in the Samara, Saratov, and Penza guberniyas.

The largest trading capitals in Chistopol were owned by the Tatar merchant and entrepreneur S. Vagapov (grain purchases, turnover of 191,000 roubles); the 'K. Khabibullin and Son' trading house (bread and grocery trading with a combined turnover of 163,000 roubles); and the 'Iskhakov Brothers' trading house (grain sales, 5 enterprises with a combined turnover of 145,000 roubles).

One particularly important centre of national entrepreneurship outside the Kazan Guberniya was the Menzelinsk Uyezd of the Ufa Guberniya. Tatar merchants and grain manufacturers owned around 20,000 commercial establishments and several steam mills (48%), and their combined turnover exceeded 3.3 million roubles (43%). The most significant trading capital belonged to the 'Khalfin Brothers' trading house (bread sales, turnover of over 1 million roubles). G. Zaynetdinov, another entrepreneur, had 4 establishments, including a steam mill with a total turnover of 1 million roubles, while the merchant M. Saitbatalov traded for a total of 678,000 roubles [National Archives of the Republic of Tatarstan, fund 551, inv. 1, file 65].

Table 36

The allocation of the Tatar population engaged in trade, by guberniyas, 1897

[Pervaya vseobshchaya, Vols. 2, 5, 10, 14, 28, 30, 31, 36, 38, 45, table 22; Mendeleyev, 1907, pp. 18–19, 88–89].

Guberniyas	Tatar population by guberniya, in %	Engaged in trade	
		total	of those engaged in trade by guberniya, in %
Astrakhan	5.2	2,036	19.8
Kazan	31.1	2,818	20.1
Penza	6.0	926	4.6
Samara	3.9	539	2.0
Saratov	8.7	564	6.2
Simbirsk	3.9	202	2.5
Total:	10.4	7,089	7.9
Vyatka	4.1	1,171	10.6
Orenburg	5.8	2,988	19.8
Perm	1.5	1,559	6.4
Ufa	8.4	1,089	12.1
Total:	4.5	6,807	11.7
Total across 10 guberniyas	7.7	13,892	9.4

The majority of Tatar entrepreneurs were included in the circle of trading industrial bourgeoisie who actively participated in the development of national crafts. They created industrial enterprises based on these crafts in an attempt to strengthen their positions in areas they had been dominating for a long time.

In the late 19–beginning of the 20th centuries internal trade was quickly developing in Russia. The growth of the domestic market, which acted as a catalyst for injecting life into state trade, had fertile grounds to develop on: railway services and the manufacturing industry were developing quickly, urban farms were expanding, and the urban population was increasing.

As there is no clear information on the size of turnovers in post-reform Russia, the majority of authors use circumstantial data, in particular records of the incoming state trading taxes that helped to fill in some of the gaps in the national statistics of this period. Thus, according to G. Dikhtyar, from 1860–1869 there was 7.7 million roubles paid in taxes, from 1870–1879, 13.3 million roubles; and from 1880–1889 there was 21.5 million roubles paid [Dikhtyar, 1960, p. 24]. In other words, taxes grew by a factor of 2.7 during the given period.

A fast trading tempo was also in full swing in the Volga Region as well. The growth of freight service volumes can be linked to the expansion of local markets and the scale of entrepreneurial activities in the guberniyas of the region. While in 1897 there were 678,929 thousand poods of various goods transported down the rivers of the Volga basin [Rossiya, 1901, Vol. 6, p. 278], in 1909 it was already 9,686,000 poods of goods [Istoriya trgovli, 1913, Vol. 2, Ed. 7, p. 10], meaning that cargo turnover grew by 42% in 12 years. The main trading centres of the Volga Region were the following cities: Rybinsk, Kazan, Samara, Saratov, and Astrakhan.

During the post-reform period Kazan remained one of the major trading points for all of the eastern part of European Russia, even though it lost its value as the industrial capital of the region. The main reason for the decline in the economic importance of Kazan was that the intensive railway construction, which overwhelmed the Volga and Ural Regions at the end of the century, did not have much of an effect on the Kazan Guberniya. In 1897 the extension of the railway here was only 159 versts, or 4.6% of the total length of the railway net-

Table 37

Distribution of trade certificates issued to Tatar entrepreneurs in Kazan in 1901

[National Archives of the Republic of Tatarstan, fund 98, inv. 4, files 378, 380, 381].

Type of trade	Certificates issued to Tatar entrepreneurs	
	Total, in %	of the total number for Kazan, in %
Textiles, cloth	15.4	60.6
Primary products, leathers, furs	9.5	63.7
Clothes, footwear, hats	12.1	37.0
Bread, groceries	34.0	16.9
Haberdashery	7.0	58.6
Fruits, eggs, fish, fowl	8.0	21.0
Tea, sugar	2.0	29.6
Other	12.0	7.6

work of the Volga Region [Rossiya, 1901, Vol. 6, p. 292]. Naturally, this undermined the position of Kazan entrepreneurs on the local market and put them in a less advantageous situation compared to their competitors.

However, the trading capital of the city was growing and consolidating its strengths. This can be seen in the growth of the city's turnover during the post-reform period. If during the 1860s there were 4,8 million roubles worth of goods in circulation [Pamyatnaya knizhka, 1869, p. 32], and in 1893 and 1897 city turnover was 33,7 and 36,8 million roubles accordingly [Ivanovsky, 1899, p. 32], which means it increased by a factor of 11 in 30 years.

Kazan was also the central concentration point for the Tatar merchant bourgeoisie, whose members played a significant role in the economic life of the city.

As mentioned in the calculations provided (table 37), the most active Tatar merchants dominated in the grain, grocery, clothing, shoe, and textile trade. Up to 68% of all the trading right certificates were issued for these types of trade. For comparison, the majority of entrepreneurs in Kazan dealt with grain and grocery trading (41% of issued certificates), while trading right certificates for other types of goods were also issued in relatively smaller numbers.

It should also be pointed out that in some trading fields national trading capital predominated as it centralised the majority of trading

enterprises. For example, Tatar merchants owned 60% of the enterprises that sold manufactured goods, including 3 out of the 6 first-grade trading enterprises. They also owned 63% of all raw material and leather trading enterprises, 3 of which were included in the 7 first-guild enterprises.

Tatar entrepreneurs regulated almost all trade that dealt with raw skins, which made them the suppliers of raw materials for many leather-processing factories of the city, and they also controlled the market for ready-made shoes and carpets.

The absolute majority of trading enterprises owned by Tatar merchants were classified as small or medium-sized. Thus, 65% of third-grade trading certificates were issued (69% in Kazan), and 33% of second grade certificates (28% in Kazan).

Members of the middle class national bourgeoisie were becoming more and more active in trade activities, which is explained by the fact that the national capital was slowly being pushed out of the sphere of industrial manufacturing, where the process of concentrating and monopolising had reached an impressive scale by the beginning of the 20th century. Without the opportunity to compete with the large capitalists who settled in Kazan, Tatar entrepreneurs preferred to invest in trade and were quite successful in doing so. Also, one would only need minimal capital to start trading, which made this field of entrepreneurship

more accessible to the numerous small and medium capitalists.

But among Tatar merchants there was quite an impressive number of large tradesmen whose turnover reached 1 million roubles and more. In Kazan such merchants as Muhammad-Sadyk Galikeev and Muhammad-Batret-din Apanayev, Suleyman Aitov, Aytuganov, et al., were remarkable for the scale of their operations. Makhmud Khusainov, an Orenburg merchant, had his own trade delegates not only in Russia but abroad as well: in Berlin, Constantinople, and Kabul. The Musins, merchants, and manufacturers from Semipalatinsk managed cargo and passenger traffic along the Irtysh River and developed gold-mining in Altai and Eastern Kazakhstan. In Semipalatinsk, Zmeinogorsk, and Ust-Kamenogorsk they owned jewellery shops and also transported grains to Russia. In 1900 the Musins owned 2.5 million US dollars kept in Russian banks.

Tatar merchants of other guberniyas of the Volga-Ural Region and beyond also developed large-scale trade and manufacturing operations. Thus, in 1910 in Astrakhan 292 among 1,268 trade establishments (23%) were run by the Tatar bourgeoisie of the city. The majority of them dealt with selling bread and groceries (36%), fish, meat, fruit (around 30%), and leather (6%) [Vsya Astrakhan', 1911]. Here merchants of Tatar descent also owned a major portion of the establishments that sold raw materials, Asian goods, manufactured products, and carpets. They controlled 40–60% of the sales market.

But in order to get a full picture of the structure of the national trade capital and the main tendencies and aspects of its development during the post-reform period, it is necessary to study the information on the types of capital Tatar entrepreneurs had in circulation. Information on the size of the turnover of all establishments owned by Tatar merchants at the beginning of the 20th century is especially valuable.

The main form of trade-industrial capital functioning during the second half of the 19th–beginning of the 20th centuries was individual private enterprises based on the private or

familial property of manufacturers and merchants. This comprised the majority of the capitals functioning in industrial manufacturing and trade. For example, in 1901 in Kazan 93% of all the certificates issued to entrepreneurs were issued to private individuals.

Business practices also included collective forms of entrepreneurship. The unification of capitalists was extremely important for the deployment of financial resources and formation of large capital.

Two main reasons can be highlighted as being behind the necessity to consolidate the resources of disjointed entrepreneurs. First, such associations were formed when the individual capital of the majority of entrepreneurs was too small to enable each of them to separately launch their own production as individuals. Second, the creation of companies was determined by the rules of market competition and the necessity of capitalists to expand, maintain, and retain markets.

The main form of collective entrepreneurship, in which trading capital existed at the turn of the century, was trading houses (partnerships). There were two types of them: both full (open) partnerships and limited partnerships.

Full partnerships were formed on the basis of making a contract with its members to carry out business in the conditions of full and shared responsibility. This meant that members of the partnership were responsible for obligations arising in connection with its operation with all their property, regardless of whether it was invested in the company capital or not. In addition, full partnership was based on the principle of collective responsibility, according to which each member was entirely responsible for all transactions made by any of their partners [Chuprov, 1892, pp. 181–182].

In limited partnerships capitalists were united under uneven conditions. Some members of such an association were full partners and thus responsible for the results of business operations with all of their property, while other members and investors limited their risk to the amount of invested capital. At the same time, only full partners had the right to vote on

company affairs, while investors were in fact unable to manage the enterprise at all [Chuprova, 1892, pp. 181–182].

Trading houses were actively formed by Tatar entrepreneurs, businessmen, and industrialists. The national bourgeoisie saw them as an opportunity to strengthen its position on the internal market, a tool allowing them to successfully withstand severe competition and compete with more mature and robust, in terms of economics, bourgeoisie of the industrially developed centres of the country. At the same time, the creation of partnerships contributed to the consolidation of economic relations among Tatar entrepreneurs with business circles from other regions of the country (and with foreign countries as well) and to the closer integration of national capital into the Russian economy, as many trading houses were created by Tatar entrepreneurs together with the capitalists of other nationalities.

The first associations of Tatar capitalists in the Volga Region appeared back in the middle of the century. One of them was the 'Mishkin Brothers' trading house, which was founded in 1877 by merchants of the second guild from Kazan, two Tatars named Muhammadalim and Aynedin Mishkin. The trading house had a capital of 30 thousand roubles and was mainly engaged in industrial activities. In Kazan it rented out the Osokin cloth factory, which was in complete and utter decline at that time. In a short time the facility was fully reconstructed. A steam engine was installed along with 38 machines and 139 looms. The factory resumed operations, and in 1877 it produced 251 thousand arshins of different cloths in the amount of 248 thousand roubles. At that time, a total of approximately 500 people were working at the factory. Later the trading house began renting out another cloth factory, this one in the Samara Guberniya [National Archives of the Republic of Tatarstan, f. 2, inv. 3, file 318 a, s. 448–449].

The trading house 'A. and I. Rakhmetullin,' founded in 1888 as a 'limited partnership,' had charter capital in the amount of 150 thousand roubles and specialised in the production and sale of kerosene and mineral oils. The company

also owned the property of a limited partnership called Trading House Subayev, Rakhmetullin and Co., and also the 'Cotton, mechanical and weaving factory of Kazan merchants Galim Subayev and Ahmetzyan Rakhmetullin' [Salikhov, 2002, p. 235]. In the Kazan Guberniya the company also owned two industrial plants. Its manufacturing plant was producing up to 184 thousand pood of different grade paper yarn and cotton to the total amount of 121 thousand roubles annually. The factory was equipped with a 40 h.p. steam engine, 35 looms, 3 steam boilers, and 37 machines for various purposes. The factory total headcount was 215 employees [National Archives of the Republic of Tatarstan, f. 2, inv. 3, file 912, s. 142]. This trading house also owned an oil refinery on the outskirts of Chistopol equipped with a steam engine and other equipment, which could produce up to 200 thousand pood of kerosene that was sold for 200 thousand roubles annually [Orlov, 1887, p. 630].

One of the largest trading houses in the region was 'B. Subayev, I. Burnaev, and M. Saydashev,' which had capital of 300 thousand roubles and was structured as a full partnership since 1888. This company specialised in the production and sale of furs. The skinners belonging to the trading house in Kazan produced a variety of products to the amount of 300 thousand roubles annually [Katalog, 1890, pp. 43–44]. On its basis in 1895 the 'Ahmetzyan Sajdashev & Sons and Baky Subayev' trade and industrial co-partnership was registered with a capital of 500 thousand roubles, specialising in the trade of sugar, tea, fur, and other products and also owning glass work facilities.

The Kazan Guberniya was marked by the operation of trade and industrial companies founded by entrepreneurs from different cities. For instance, 'Ishmuratov and Co. Nurmyn Manufactory' was founded in 1884 by the Arsk merchants of the second guild Akhmet Ishmuratov and Abdrakhman Ishmuratov, the Kazan merchant of the second guild Muhammadgarif Utyamyshev, and Sterlitamak merchant of the second guild Muhammadzarif Utyamyshev with a charter capital totalling 20 thousand roubles. This organisation was a trust partner-

ship specialising in the production and sale of calico, nankeen, and other products.

Some of the trading houses were founded by people living in various cities of the empire, which indicated the presence of close trade and economic ties between entrepreneurs and the formation of a national market. For instance, in 1889 Kazan merchant Muhammadsadyk Burnaev and Irkutsk merchant Zagidulla Shafigullin established a full partnership in the 'Burnaev and Shafigullin trading house' with share capital in the amount of 60 thousand roubles. The 'H. Tagirov and A. Nasyrov and Co. trading house,' founded in 1893 as a trust partnership, was owned by the Kazan merchant of the second guild Hasan Tagirov and Simbirsk merchant of the second guild Ahmetzyan Nasyrov. The trading house charter capital was established at 20 thousand roubles. The company was engaged in the

trade of haberdashery, manufacturing goods, and other products.

In 1891 the 'Abdrakhman Ibragimov and Sons trading house' was established as a full partnership, but the family had been known in Kazan since the 80s. In 1886 F. Ibragimova, a widow of a Tashkent merchant, was part of the tea trade in Kazan on Moskovskaya Street (in Yunusov's house) and Tatarskaya street (in Shamsutdinov's house) (with a turnover of over 100 thousand roubles) [National Archives of the Republic of Tatarstan, f. 3, inv. 1, file 812, s. 17–18]. The trading house was founded by her sons Musa (Tashkent), Shakir, Zakir (Bukhara), and Murtaza Ibragimov. The company did not have a severely limited scope of business operations and was engaged in the trading of 'various products, but it was so successful that it increased its initial capital from 40 thousand to 120 thousand roubles' [Svedeniya, 1893, p. 87].

Table 38

Trading houses of Tatar merchants in 1892 [Svedeniya, 1893].

Guberniya	Total number of trading houses	Capital, thousand roubles
Kazan	3	442
Perm	3	50
Orenburg	1	100
Other guberniyas	2	241

By 1892 throughout the country there were 10 trading houses belonging to Tatar merchants with an authorised total capital of 833 thousand roubles. The majority of them functioned within the bounds of the Volga and Ural Region [Svedeniya, 1893].

Some trading houses were founded with a combination of Russians, Tatars, and the capitalists of other nationalities. The development of domestic entrepreneurship in the post-reform era was marked by the internationalisation of capital. For instance, in 1892 in Orenburg the 'D. Myakinkov and G. Davletshin' company was founded (with charter capital totalling 100 thousand roubles), which specialised in the building timber trade. It was founded by Orenburg merchants D. Myakinkov, G. Davletshin, N. Yadgarov, and S.

Nazarov [Svedeniya, 1893, p. 108]. In 1901 in Kazan the Petrovsko-Alekseyevsky Partnership of Glass Factories also began operations (with charter capital totalling 60 thousand roubles). Among its founders were p. p. citizen A. Sergeev, merchant Ahmetzyan Saydashev, and peasant Z. Tagirov. The company produced and sold glass and glass products [National Archives of the Republic of Tatarstan, f. 98, inv. 4, file 8387, s. 8–14, 25–25].

In the period from 1877 to 1905 there were 20 trade and commercial industrial companies belonging to Tatars in the Kazan Guberniya. Their charter capital ranged from 6 thousand to 500 thousand roubles, with authorised capital in the amount of 1,273,620 roubles. On average the charter capital of one company was equal to 63,681 roubles, meaning that the

companies of Tatar entrepreneurs were quite small. Half of them were formed as trust partnerships, 5 of them as full partnerships, and 5 were registered as trade and industrial companies based on shares—that is, joint-stock companies [Galeev, 2000, pp. 251–259].

However, trading houses were not limited to only commercial activities. Many of them, even though they were founded at the expense of large commercial capital, were organised specifically for the construction of new or the expansion of already existing industrial enterprises. Some of them were technically well equipped. Considerable investment was required to equip the plant (factory) with steam engines and other machines. Only large capitalists, mainly from among the merchant class, could afford such substantial investments. However, even they were not always able to afford it. For this reason, the establishment of trading houses by Tatar entrepreneurs can be considered as just one method of national commercial capital penetrating into production.

The richest Tatar entrepreneurs, or the Yunusovs, Apanayevs, Khusainovs, Aitovs, Muhammadzyan Galeev, Salikh Gubaydullin, Gaynutdin Sabitov, the Azmetyevs, Arslanovs, Utyamyshevs, Usmanovs, Utyaganovs, and others represented the core of the trade and industrial bourgeoisie. The number of joint-stock enterprises in the Tatar business world at the end of the 19th century was insignificant: traditional Tatar capital took the form of family companies that desired to preserve their narrow group of capital owners.

Leather, soap production, raw material processing, partial sewing, woodworking, and other branches of industry specific to Tatar entrepreneurship even at the end of the 19th century were considered labour-intensive industries, and they had long been developing on the basis of crafts. The mechanisation of these branches of industry contributed to multiple increases of labour productivity, but the expansion of production required significant additional costs not only for the purchase of equipment and rental or construction of production facilities but also for the procurement of raw

material and parts for the manufacturing process and hiring of labour. It should be noted that the sale of products from these enterprises did not reach beyond the local but more often the regional market. One exception were Tatar national crafts, which were oriented towards the Russian and other external markets. However, these businesses never grew into large industrial plants.

The specific nature of the transit trade can be found in the use of Kazan as a major shipping terminal for storing products in the anticipation of favourable commercial, weather, and road conditions as well as the time for the further advancement of products to their sales locations, in our case to Nizhny Novgorod, Irbit, Menzelinsk, Orenburg, and other markets in the Volga-Ural, Siberian, and Middle Asian Regions. In Kazan traders could perform singular wholesale operations on the resale of goods both through exchange and agreement to larger enterprises that shipped large batches of goods to fairs. Such operations did not require the entry of businessmen into the Kazan merchant guild, and traders were recorded in the documents at their place of permanent residence. In the documents found in the National Archive of the Republic of Tatarstan [National Archives of the Republic of Tatarstan, fund 98, inv. 7, file 59], the entry was often partial and might indicate only the name of the guberniya the trader came from (see Appendix I, Table 23).

In 1871 Kazan businessmen maintained close trade connections with entrepreneurs from the Vyatka Guberniya, who were the main trading partners of Kazan businessmen. Out of 105 businessmen from this guberniya, 19 were from Urzhum, 15 from Yaransk; the business communities of Vyatka, Malmyzh, and Sarapul were represented by 12 people each, 11 came from Yelabuga; 9, from Nolin; 7, from Slobodsky; other cities of the Vyatka Guberniya were also represented by 2–4 entrepreneurs.

The second most important trading partners of Kazan merchants were entrepreneurs from the Ufa Guberniya, with a total of 90 people. Birsik (37 people) and Ufa (22 people) were the most highly represented cities.

The third largest group of people who traded through Kazan was one from Saratov guberniya (54 people), and those merchants were followed by traders from Moscow guberniya (45 people), in particular Moscow (33 people), Samara (44 people), Simbirsk (43 people), Nizhny Novgorod (42 people), Orenburg (39 people), Perm (38 people), Yaroslavl (29 people), and other guberniyas.

As for Muslim traders, besides the cities and uyezds of Kazan guberniya, most of them arrived from Ufa (20,2%), Orenburg (14,6%) and Vyatka (11,3%) guberniyas (see Appendix I, Table 24).

Wholesale trade required a considerable amount of investment, including the cost of the wholesale purchase and transportation of products, in addition to large temporary costs. For this reason merchants constituted the vast majority of traders with 566 people, or 83.8% of those engaged in the transit trade; among them were members of the lower middle class at 81 people, or 12%, and peasants at 28 people, or 4.2%. A total of 3.3% (22) of traders were women, 21 (95.5%) of them were merchants and one peasant (4.5%), which was obviously connected with both the labour intensity of wholesale trade and the need to be frequently absent from home.

Therefore, the major main trade flows went through Kazan from the Volga-Ural Region, which was connected to the city by convenient river and transport routes along the main routes of Russia.

Besides the major lines that comprised the Kazan guberniya and its capital, the territory of the guberniya featured a widespread domestic and local transport network that was part of the country's general transport network. Kazan was interconnected by 18 trade and country roads that linked the uyezd cities to one another and the latter to Kazan, and in the 1860s the zemstvos were responsible for looking after their condition. By the law of 1 June 1895 expenses related to the payment of benefits for the upkeep of judicial and administrative institutions established according to the law of 12 July 1889 and the costs of upkeep for justice and peasant affairs institutions and provincial

administrative committees were transferred over to the treasury. The sums of money freed up in zemstvo budgets were invested into road capitals, which in 1895 throughout the entire guberniya constituted 9.2% of all zemstvo costs. In 1894 rural communities spent an average of 34,911 rubles for the upkeep of roads, bridges, and river crossings from the common sums of each of the 34 zemstvo guberniyas. We would like to emphasise that the labour and material costs of rural communities were not taken into consideration.

In 1871, during the navigation period, 355 inhabitants of Kazan guberniya transported goods through Kazan, which equates to 34.4% of all total recorded participants of the transit trade through the capital of the guberniya. A total of 1.7% of traders were women, 187 (52.7%) came from cities and posads, and 168 (47.3%) came from settlements and villages. There was a small difference between the townspeople and country people engaged in transit trade in the form of 9 more (5.4%) townspeople. The majority of traders bought and sold grains, cereals, hay, and other agricultural products, including skin, fat, and wax, for further resale at markets.

Out of 355 traders and residents of the Kazan Guberniya, 303 (85.4%) were Christians, including 6 women, and 52 (14.6%) were Muslims. While Christians besides Russians were represented by other nationalities residing in the Kazan Guberniya, Muslims were represented exclusively by Tatars.

Out of 187 townspeople 174 (93%) were Christian traders, including 2 women, while 13 (7%) were Muslims. Out of 167 villagers 129 (76.8%) were Christians, including 4 female peasants, while 39 (23.3%) were Muslims.

Therefore, out of 303 Christian traders 174 (57.4%) were natives of the cities and posads of the Kazan Guberniya, while 129 (42.6%) were country people. Christian townspeople were 45 (14.6%) more than those from the localities and villages of the guberniya.

Out of 52 Muslim traders 13 were townspeople (25%), and 39 were country people (75%), meaning that the number of country people was twice as large as the number of

townspeople. This can be explained by the fact that the main portion of Tatars beyond Kazan lived in the countryside.

The largest number of traders came from the cities connected to Kazan by waterways. This included the people of Arsk, Sviyazhsk, Chistopol, Laishevo, Cheboksar, Mariinsky Posad, and Tsarevokokshaysk, who annually enrolled on both temporary and permanent merchant conditions in Kazan [National Archives of the Republic of Tatarstan, f. 299, inv. 1, file 62, s. 1–205]. The confessional distribution reflects the resettlement of indigenous people in the Kazan Guberniya.

Merchants paid social class taxes equal to one, and later to 4% of 'honestly' declared capital; 10% from every tribute-paying rouble was charged for 'water and land transport,' and merchants also paid one-quarter of a percent of their entire capital for the duties imposed by zemstvos and towns. But contributions to the treasury and local needs were continuously growing. For instance, by an Imperial Decree from 25 October 1816 a new tax was to be introduced at the beginning of the next year to fund the construction of 'big roads,' and from each registered soul, generally from all villagers, free people, and lower middle class, 25 kopecks, from merchants, 5% of each rouble that they pay to the treasury as duties [National Archives of the Republic of Tatarstan, f. 3, inv. 1, file 12804, s. 128–128 reverse].

In order to reduce guild duties, because they determined the amount of other payments, every single merchant declared capital at the minimum rate for this guild, being careful not to disclose his financial capabilities. 'To ask a Russian merchant about how much capital he actually has and what is the size of his turnover, is, according to our merchants, the most indiscreet and tactless question, that is why he will never answer it,' stated the 'Kazan Stock List' [Kazansky birzhevoy listok, 1833, 6 February]. In order to replenish the treasury, by the decree of 1 January 1863 a single license fee in the amount of 265 roubles was introduced for merchants who wanted to be registered in either of two guilds.

Apart from that, merchants paid customs duties, estate tax, bank operations fees, documents drafting fee [passport, powers of attorney, etc.], 'the fair duty,' rent, and (if hired) a shopping premise from the city administration or a private party ['a shop duty']). The amount of this duty depended on the size of the shopping premise. For instance, the trade license fee for a shop with two entrances was twice as big as the price for a single door premise. Each shop was paid for separately, and there could be a few dozen of them. Merchants had to display a document confirming the payment of the sales tax for the specific place, and its availability was controlled by the Commerce Deputation and by the authorities.

Merchants paid a 'weight' tax during the loading and unloading of goods at the docks or customs, payed for branding their trading tools at the Chamber of Measures and Weights, or simply rented them.

If merchants hired salesclerks or, as they were called, 'inmates to the shops,' they also bought licenses for the salesclerks according to one of four classes, again depending on the volume of trade and size of the shopping premise.

A merchant, who opened a business in another city, paid the guild tax one more time to become a member of the merchant society of this city if they had a real estate or rented a shopping premise, warehouse, etc., in the city and did not owe any debts for town taxes. For instance, merchants of the first and second guilds from Moscow, Saint Petersburg, Samara, Saratov, Nizhny Novgorod, Yaroslavl, Rybinsk, Vyatka, and other cities traded in Kazan up to 1865, but they were registered here as merchants of the third guild. It was cheaper that way, and they dealt retail instead of wholesale trade.

Industrialists were entirely a different story. Their choice of guild was determined by the way they organised their business, and how they traded products of their enterprises, such as wholesale [from warehouses] or retail [in shops and markets], or construction and upkeep of an industrial enterprise in the city. For instance, merchants of the first guild, the Kre-

stovnikov brothers from Moscow, having the biggest industrial enterprise in Kazan, were members of the first guild local merchantry. Many big entrepreneurs were registered as temporary merchants in several towns, paying the required duties in each of them.

It was difficult to track the transportation of goods by road, and official statistics does not provide accurate information on this question. However, roads served as access to river wharves and railway stations. These roads were used to transport goods from urban and rural areas, located away from railway and river routes. Cartage was used to transport goods over short distances, which headed in meridional directions, and over long distances, which headed in latitudinal directions. In comparison with river transportation, cartage characterised by high costs, low carrying capacity, and slow speed. Benefits of this method can be the delivery of goods 'from door to door' without additional costs for reloading.

With the establishment of sledge paths, carts with goods were transported over even longer distances, crossing railways. However, during the spring and autumn slush stopped most commercial traffic on the majority of roads as the scarcity of roads was the true scourge of the Russian national economy. Earthen roads were in poor condition, a significant part of peasants was engaged in cart service, and low price of winter transportation was explained by the poverty of peasants, forcing them to be content with a price that allowed them to feed themselves and their horses during the winter. It was calculated that 'if the highway transportation distance is increased by 22% against the earthen road transportation distance, the maximum cost of highway transportation was cheaper by more than half than earthen road transportation' [Rossiya, 1901, p. 355].

In the middle of the 19th century up to 9 million roubles worth of products was transported to Kazan overland, and four-fifths of goods accounted for the winter months over sledge paths and frozen rivers. The main bulk of grain, purchased at the local markets and uyezd fairs, was brought to Kazan by the sledge path. And here traders stocked

up fat, wool, skin, and other goods. In turn, flour, grain, salt, fish, tea, sugar, and industrial products were exported from Kazan. Wagon trains crossing Kazan roads consisted of up to 10, 50, 100, and even 200 carts. According to merchants, for every hundred verst a wagoner charged 6–8 kopecks per pood of goods [Materialy', p. 100]. In Kazan they were unloaded and reloaded with products to transport to Siberia, Irbit, Kyakhtinsk, Orenburg, Rostov, and other fairs, and in summer they waited for goods from the Nizhny Novgorod fair.

Merchants hired local wagoners to transport products within the Kazan Guberniya and to closely located uyezds and towns. 2066 wagoner signs were issued in 1888 [Laptev, 1861, 98]. Peasants mainly from the villages of Kovali, Salmachi, Dubyazi, Chepchugi, and Cheboksa were engaged in transportation. Tatar peasants made up the main part of wagoners, even though this type of work was never the only source of livelihood for them, as it was, for example, for those in Siberian.

Development of steam navigation resulted in the significant reduction of the overland delivery of products, especially in summer, but winter roads were used very actively, including over ice covered rivers. Delivery from cities in winter constituted about one-third of the total annual overland delivery, the rest of the goods were transported over water routes. When the railway was unavailable, delivery by wagon was the only option available to transport goods in winter, even though it cost more than half as much as transportation over water routes.

Judging by its amount of capital and grain trade turnover, Kazan was 'of primary importance for all of north-eastern Russia.' Nizhny Novgorod operated in direct connection with Kazan. The best variety of wheat was brought from Samara, Saratov, and Melekes. Rye, pea, buckwheat, flax, and hemp seed came in from upstream Volga towns, localities and villages of the Volga-Kama basin. The winter purchase constituted 70–80% of the total annual delivery [Kazansky birzhevoy listok, 5 April 1888]. Grains were taken to the Vyatsk, Vologodsk, and Saint Petersburg provinces, while grain and flax seed were taken to ports

Table 39

Sales of Commodity Traded by Tatar Entrepreneurs in Kazan in 1869
[Oboroty', 1870, pp. 11–12]

Commodity name	Poods	Amount, roubles in silver
Loose Kyakhta tea (5,000 containers, weighing 3 poods and 10 pounds)	16,250	500,000
Canton tea (25,000 containers, weighing 3 poods and 30 pounds)	93,750	3,000,000
Finely ground brick tea (10,000 containers for 64 bricks, weighing 3 poods and 20 pounds)	35,000	500,000
Coarsely ground brick tea (20,000 containers for 36 bricks, weighing 3 poods and 5 pounds)	62,500	1,000,000
Sugar (procured from Moscow and Saint Petersburg)	300,000	2,400,000
Dry goods: paper, wool, cloth, silk	63,000	3,000,000
Fur (except for fur to be processed into fur articles)	6,500	600,000
Raw, unprocessed hide	340,000	1,200,000
Glass procured from Kazan Province factories (10,000 containers, weighing 16 poods)	160,000	200,000
Glassware from the Zheltukhin Factory	29,720	47,750

for overseas shipment. And at the turn of the 18–19th centuries and 50 years later the same amount of grain, up to 50 million poods, was sold in Kazan. In monetary terms [in prices of the middle of the 19th century] the imported grain, flour, flax, and hemp seed were totalled at 2 million roubles, while exported goods, at 1.6 million roubles in silver [Zagoskin, 1895, p. 525; Kazansky birzhevoy listok, 22 February 1876; 3, 18, 26 July 1890; 26 November 1891]. With certain limitations we can conclude that only 20% of marketable grain was sold in Kazan. Commission agents from the Military Ministry came to Kazan in the winter and purchased grain, mainly for troops in the Caucasus. The winter retail prices for flour, crops, and grain depended on the size of their purchase, as the final prices for the products at local markets were set with the arrival of officials. Grain, purchased by the treasury, was stored right there at the granaries in the 'grain stores.'

In the latter half of the 19th century Kazan retained the position of the largest grain processing centre in the Volga River Region. There were five big mills in the city, and two of them were operated by steam engines. The 1870s were marked by an increase in the demand for flour as well as an increase in the price of flour, leading to the emergence of new mills in Saratov, Samara, and along the Orenburg branch of the railway. Deliveries of grain to Kazan and the volume of the flour-milling business decreased, even though flour milled in Kazan was very highly valued. According to the Exchange Committee, 28 million poods of grain [apart from semolina] were sold in Kazan for a total of more than 15 million roubles. In the late 19th century more than 4 million poods of wheat were sent from the Lower Volga Region to the Kazan Guberniya for processing into semolina, most of the imported rye was grounded, and all buckwheat was processed into crop at the hulling mills

Table 40

Number of fairs and their turnover in Kazan guberniya (1860–1900)
[Respublika Tatarstan, 2001, p. 193].

Year	Trade certificates issued	Number of fairs	Commodities delivered to the fair, in roubles.	Commodities sold at the fair, in roubles.
1860	976	28	628,146	229,807
1866	12,248	41	885,377	281,043
1870	18,155	62	1,759,685	486,342
1875	19,104	71	1,423,730	475,450
1880	22,157	76	6,278,950	1,533,920
1883	24,101	74	6,765,155	2,430,152
1886	20,038	73	7,283,485	2,634,466
1890	20,167	72	4,842,773	2,200,560
1900	30,006	80	6,536,733	2,955,200

in Kazan [Kazansky birzhevoy listok, 18 November 1890; 6 November 1896; Kazan calendar, 1872, p. 70].

Kazan was one of the most important Russian centres of the fish trade. According to data from the beginning of the 19th century, annually around 150 thousand poods of fish products were sold in Kazan, which constituted 6% of the 2.6 million poods of products coming to Kazan. Other products were shipped to Moscow, Saint Petersburg, to the north, north-east, and sometimes the south-east of the Volga-Kama Region [Skoroportyashhiesya produkty', 1913, pp. 38–39; Bochagov, 1891, p. 155].

As the main exporter of these products, Astrakhan annually shipped to the Kazan market up to 1.9 million poods of fish [Skoroportyashhiesya produkty', 1913, p. 39]. Kazan merchants established close ties with the fish capital of the Volga Region back in the middle of the 1850s, when broad exploitation of Astrakhan's fish resources began. Together with Moscow, Yaroslavl, and Nizhny Novgorod merchants, Kazan merchants occupied key positions in the Astrakhan fish trade up until 1917 [Laptev, 1861, pp. 440–441; Kazanskij kalendar', 1872, p. 71].

Mainly in winter, chum salmon, taimen, thorn, nelma, peled, and muksun were shipped from Siberia by cartage. Herring, canned fish, and expensive grades of fish were shipped from Moscow, Riga, Revel, while Aral fish

was shipped from Kazalinsk. Smoked and salted White Sea herring, Ustyug smelt, flounder, cod, Arkhangelsk and Nerchensk salmon were shipped from Arkhangelsk overland through Vyatka [Skoroportyashhiesya produkty', 1913, pp. 43–45]. Local fish was traded by peasants and those who leased out fishing. Seal and fish oil were produced in large batches for the industrial needs of Kazan. Isinglass, caviar, and viziga were shipped to the Volga-Kama market through Kazan.

The volume of the wholesale meat trade in Kazan was a lot less than wholesale fish trade. A total of 10 to 15 thousand poods was shipped from the city to Nizhny Novgorod and Moscow—that is, 20–25% of imported meat [Kazansky birzhevoy listok, 15 November 1879], while the rest was consumed locally. Live cattle, frozen carcasses, dead poultry, and salted and pickled goods of various variety were available at the Kazan market. Products were purchased from Vyatka, Ufa, Samara, Saratov guberniyas, the Orenburg Krai, and Siberia. In the early 19th century 50 thousand of Kyrgyz bred sheep as well as cattle, Kyrgyz, Bashkir, and Kalmyk horses were annually taken to Kazan from Orenburg and Troitsk fortress, cattle and sheep were shipped from Uralsk, undersized horses known as 'Vyatka' and cattle purchased at the local uyezd fairs were shipped from Vyatka to Kazan [Kazanskiye Izvestiya, 5, 12 December 1814].

In the 1880s, 40 thousand heads of cattle were brought to the Kazan market, half of them were small cattle. Apart from that, around 11 thousand poods of poultry were imported to the city from uyezds of Kazan, Vyatka, and Ufa guberniyas, 5 thousand poods were brought from the forest regions of Kazan, Vyatka, Perm guberniyas, from the northern Transurals and Siberia [Kazansky birzhevoy listok, 15 November 1879; Skoroportyashhiesya produkty', 1913, p. 24].

On the banks of the Volga, near the railway crossing, local meat traders opened offices of their plants for the purchasing and fattening of poultry. Annually around 50 thousand poods of dead poultry from the Sviyazhsk, Tetyushi, Yadra, and Cheboksar Uyezds of the Kazan Guberniya and from nearby uyezds of the Simbirsk Guberniya were exported to Saint Petersburg and abroad from this point. Additionally, 1.5 thousand poods of poultry and 1.2 poods of game were supplied from Kazan [Skoroportyashhiesya produkty', 1913, pp. 44–45].

Eggs were supplied to internal and external markets by Tatar merchants. Apart from local retail dealers, there were around 30 big companies in Kazan, which dealt solely with purchasing and shipping eggs outside of the guberniya. These companies also specialised in the wholesale poultry trade. 1,695,000 poods of eggs [1 pood = 250 eggs] were delivered to the Kazan market in 1910, and in some years

this figure was bigger than 2 million poods. Eggs were purchased from Kazan, Vyatka, Perm, Simbirsk, Samara, and Ufa guberniyas. Up to 100 thousand poods of eggs were sold in Kazan, the rest was exported to the capitals and abroad, mainly to German, English, Austrian-Hungarian, and Dutch markets [Skoroportyashhiesya produkty', 1913, pp. 13, 18; Kazansky birzhevoy listok, 29 August 1888].

During the navigation period of 1872 around 1,300 cargo ships of various sizes, 720 passenger ships, and 360 tow-boats were received at Kazan wharves. In winter up to 300 vessels stayed in the backwater near Kazan [Kazansky birzhevoy listok, 27 January 1872; Zagoskin, 1895, p. 525].

During the navigation period of 1868, which lasted for six and a half months, 41,065,500 poods of goods, including 32,800,500 poods of grain, the rest being fat, skins, wax, honey, soap, candles, fish, wool, sheepskin, lambskin, furs, and hair, went through the city's wharves. At the same time, such 'traditional articles of export' as resin, tar, bark, bast, fiber [approximately in the amount of 1 million silver] and Perm salt [up to 5 million poods] was not recorded. It should be noted that to the mentioned cargo turnover figure at the wharves in 1868, 2 million poods of grain should be added, which were imported and exported during the flood period on the Kazanka, and 19,680,000 poods of grain and flax seed, 2 million poods

of fat, potash, hair, wool, skins, alcohol, and other goods collected at the wharves on the Kama River closer to Sarapul, which were not shipped to Kazan [National Archives of the Republic of Tatarstan, f. 1, inv. 85, file 72, s. 5–7; Kazansky birzhevoy listok, 26 January 1869].

In the early 1880s, in the most difficult period for Kazan businessmen, up to 150 million poods of goods were transported annually from Astrakhan. Apart from 30 million poods unloaded in Tsaritsyno, 7 million poods unloaded in Saratov, and 2 million poods unloaded in Samara, around 110 million poods arrived in Kazan. 120 million poods of goods, transported over the Kama to 'Ustye,' waited for dispatch. Depending on the water level of the Volga, a part of the goods [from 30 to 100 million poods] was unloaded from big vessels to small ones at the wharf. Up to 230 million poods of goods, the main part of which was reserved for the Nizhny Novgorod fair, was dispatched upstream along the Volga. That is why fuel, timber, and construction, single-piece goods, which were not sold at the fair, had not been registered. In the navigation period up to 320 million poods of different goods in total were transported upstream and downstream along the Volga between Kazan and Nizhny Novgorod [Kazansky birzhevoy listok, 13 February 1883].

Even when the railway was put into operation, cheap transportation over water still shouldered much of the load. According to the Ministry of Railways, in 1908 over the Volga to Kazan 47,725,000 poods were transported, and 14,237,800 poods of goods were shipped from Kazan—that is, the total turnover of goods through Volga wharves reached 62 million poods, while at the 'Kazan' railway station around 10 million poods were loaded and unloaded [Znachenie, 1911, p. 16].

One of the results of development of railways in the country was the increase in the number of fairs of regional and especially local significance.

Fairs were held in Kazan, Sviyazhsk, Lai-shevo, Chistopol, Spassk, Tetyushi, and other cities.

Starting in the middle of the 19th century rapid development began in trading on the commodity exchange, which was created to carry out transactions. The overwhelming majority of transactions closed on the Kazan commodity exchange, which was opened in 1868, were grain related, which represented the focus of local merchants to expand the grain trade, providing rather stable revenue on the domestic and external markets. Deals of grain wharves along the Volga, Vyatka, Belaya, Sura, and Kama Rivers were concentrated here. Business contracts for the purchase of other types of goods, real estate, for chartering goods over water, land and railway routes were 'displayed' at the exchange. The sale of goods at the commodity exchange was permitted beginning in 1874 [Kazansky birzhevoy listok, 18 March 1873; 17 March 1874]. In 1882 the annual exchange turnover amounted to more than 8 million roubles [Kazansky birzhevoy listok, 18 January 1884]. In 1870 G. Akhtyamov was appointed as the exchange broker, and he was responsible for helping Tatar entrepreneurs establish business contacts with Russian merchants and industrialists, providing information on the state of the market and consulting on the conclusion of commercial treaties. But the majority of Tatar merchants ignored the Kazan exchange, meaning they did not enrol in the exchange, nor did they attend meetings.

This was due to many reasons. In particular, they were not happy with the focus of the exchange on operations with grain, flour, and crop, which were not traded by influential Tatar merchants. The Russian language, through which contracts were concluded, was alien to the Tatar entrepreneurs, and they did not trust people of other faiths and actually did business without drawing papers, basing on 'trust.' For this reason, Tatars preferred to conclude contracts between each other in hotels and tea houses at the Sennoy Market.

The Sennoy Market was one of the main sights of Kazan, the core of the Tatar part of the city, an island, where a prominent eastern flavour had been preserved, which had always attracted visitors. When in the middle of the 19th century at the corner of Sennaya Street

Table 41

**Capital of Tatar entrepreneurs in the various manufacturing sectors
of the Volga-Ural Region in 1884**

Type of production	Percentage of the actual number belonging to Tatar entrepreneurs		
	factories	number of workers	production volume in monetary terms

Soap	13.0	18.8	24.5
Paper weaving	6.6	8.0	59.2
Furriery and sheepskins	1.3	28.1	21.8
Tallow rendering	12.4	8.9	5.7
Matches	13.3	17.2	10.8
All manufacturing	1.1	7.6	2.3

and Market Square the Senno-market Cathedral Mosque was built, the appearance of the market was finally finished. Around the mosque caravan-serai was built, as well as commercial apartment buildings with built-in hotels and rooms, inns, pubs, tea houses, baths, craft shops, and, of course, market stands. Gradually, the trading square was built up with stone buildings, and the number of commercial establishments rapidly increased. In 1882 there were more than 200 shops at the Sennoy Market [Kuzmin, 1977, p. 138].

The Sennoy Market also served as a kind of 'Tatar exchange,' where closed trade transactions took place, and the careers of most Muslim merchants began [Prokofyev, 1910, p. 193]. On the left-hand side of Sennaya Square and the adjacent streets stood single-storey granaries, occupied by shops and warehouses with window-free vaults, 'with big double doors' [Khvostov, 1922, p. 192]. On the right-hand side, on the first floors of stone houses, stretching to two districts, were located shops. Shops, designed for wealthy customers, were located on Sennaya Street in the Usmanov's building [it was connected to the buildings of Gostiny Dvor]. The rich were willing to visit the shops that were built next to the cathedral mosque and located on the first floors of commercial apartment buildings.

In the latter half of the 19th century the famous Tatar merchantry, the Yunusov brothers [tea, skins, fat, candles, soap], Ahmetzyan

Sajdashev [tea, sugar], Izmail Apakov [manufacture] traded at the shops. Murtaza Usmanov had extensive economic ties with the cities of Central Asia and China, offered his customers a great variety of 'eastern goods,' just as the merchants-millionaires Muhammadvaley Toykich and Muhammadzyan Kazakov did. Apart from these goods, Murtaza Azimov sold products from his nankeen factory. The merchant Muhammadzyan Galeev sold traditional Tatar shoes, considered the best in Kazan. He had 92 modifications of products, 'extremely different in nature' [Kazansky birzhevoy listok, 21 April 1891]. Muhammadvafa Sabitov specialised in the sale of 'Asian' head-wear.

In the early 20th century the merchants Muhammadbatretidin Apanayev [raw material, furs, fat, wool], Salikh Gubaydullin [manufacture], Abdrakhman Ishmuratov and Muhammadgarif Utyamyshev [tea], Akhmet Khusainov [cloth, raw material, grain], Abdrakhman Galikeev [soap] possessed 1st grade commercial establishments at Sennoy Market with a revenue of more than 20 thousand roubles [Vsya Volga, 1907, p. 57; Adresnaya kniga, 1906, pp. 3–95]. Meat was sold in 20 shops at the market, they were rented from the city by Absalyamov, Fatkullin, Baksheev, Kargin, et al., and the biggest cellar for storing meat, located under the Yunusov mosque, was rented by the merchant Mikhmenev [Kazansky birzhevoy listok, 15 November 1879; 29 April 1890; 11 April 1892]. Together with the

Tatar merchants, Russians traded at the shops, so did Persians, who sold carpets, shawls, and fabrics [National Archives of the Republic of Tatarstan, f. 98, inv. 1, file 321, s. 350–350reverse; Kazansky birzhevoy listok, 24 January 1886; Vsyazhskaya, 1899, p. 239; Pinegin, 1890, p. 594].

The biggest turnover at Sennoy Market was recorded by livestock sale [especially horse sales], which took place every Monday.

By the end of the 19th century principles of the market economy were firmly established in the economic life of the Tatar nation, which was reflected in a number of facts. First, national industry and trade were almost entirely focused on the free market. Second, the market competition and the supply-demand ratio impacted the migration of capital and labour resources from one industry and region to another. Third, the development dynamics of trading

and industrial capital of the national bourgeoisie entirely depended on the condition of the market situation, clearly reflecting the unstable and cyclical nature of the market economy.

The penetration of market relations into the Tatar environment resulted in significant changes in the social structure of Tatars, which was marked by the commencement of institutionalisation of the main elements of the market social-economical system and, first of all, formation of national entrepreneurship.

Tatar entrepreneurs were represented mainly by industrialists and businessmen and, to a much lesser extent, by financiers and bankers. And in the post-reform period Tatar entrepreneurs managed to settle in a number of branches of industry and trade, strengthen their position on the domestic market, some of them

[Khusainovs, Akchurins, Deberdeevs, Saydashevs, Agishevs, Izhboldins, et al.] even became a part of the Russian economic elite.

§ 6. Craft and Industrial Production

Marat Gibadullin, Lyudmila Sverdlova

Abolition of serfdom in Russia resulted in the formation of favourable conditions for the expansion of the scope of industrial entrepreneurship. Manufacture and factory-plant type enterprises began to open across the entire country. Already in the early post-reform years Tatar merchants had invested considerable funds into material production. During that period national capital had completely consolidated in a number of fields of the processing industry in the Volga Region and the Urals. Tatar capitalists invested funds in various productions.

The methods used to involve the trading capital of the Tatar bourgeoisie into production were the same as those for employed across Russia. It was achieved through the establishment of the dominance of trade agents over individual manufacturers and led as a rule to the ruin of the latter, turning them into wage-workers working at home. Characteristic in this respect was the bast-matting trade.

The peculiarity of industrial development among the Tatars in that period was that the overwhelming majority of enterprises of Tatar entrepreneurs had established themselves at the expense of trading capital representatives. This was confirmed by official statistics. For instance, in 1862 in Kazan guberniya out of 63 manufacturing enterprises belonging to Tatar entrepreneurs 40 [63%] were concentrated in the hands of merchants, while the average figure across the guberniya was only 43% [Pamyatnaya knizhka, 1863, p. 132]. Paper weaving production had successfully developed among the Tatars in the post-reform period and was concentrated mainly in Kazan and Vyatka guberniyas. In the Kazan Guberniya one of the first paper weaving mills was founded by the thriving trader and merchant Muhammadsadyk Burnaev. At his manufactory in Tsarevokokshaysk were up to 300 people were employed, and it annually produced goods amounting to 50 thousand roubles [National Archives of the Republic of Tatarstan, f. 81, inv. 11, 1870, file 110a, s. 37, 218].

Table 42

**The influence of the economic crisis of 1890 on the development
of the Tatar bourgeoisie's capital**
[Orlov, 1894]

Production	Number of enterprises	Number of workers	Amount of production
	in % by 1884		
Textile	100.0	80.1	70.1
Soap	41.6	39.7	18.4
Paper weaving	100.0	43.2	61.7
Tallow rendering	75.0	57.1	56.6
Sheepskin-sewing and leather	33.3	169.5	143.5
Matches	150.0	302.5	450.0
All manufacturing	91.2	83.4	64.6

Soon similar enterprises were opened by other Tatar entrepreneurs, including representatives of trading capital, such as merchant of the first guild Muhammadgali Usmanov, merchant of the second guild Mustafa Yakupov, et al. [the Kazan Guberniya], the Utyamyshev merchants [the Vyatka Guberniya]. By the 1867 the Tatar merchants possessed 8 out of 12 paper weaving mills in the region with a total headcount of 353 people and annual production volume of more than 135 thousand roubles [Timeryazev, 1869, p. 1].

Th woolen industry rapidly developed among the Tatars. The first woolen mills were purchased by Tatar entrepreneurs back in the pre-reform period. By 1867 Tatar entrepreneurs possessed 6 woolen mills in the Volga Region, where more than 4 thousand people were employed with an annual production volume of 961 thousand roubles [Timeryazev, 1869, pp. 27–28].

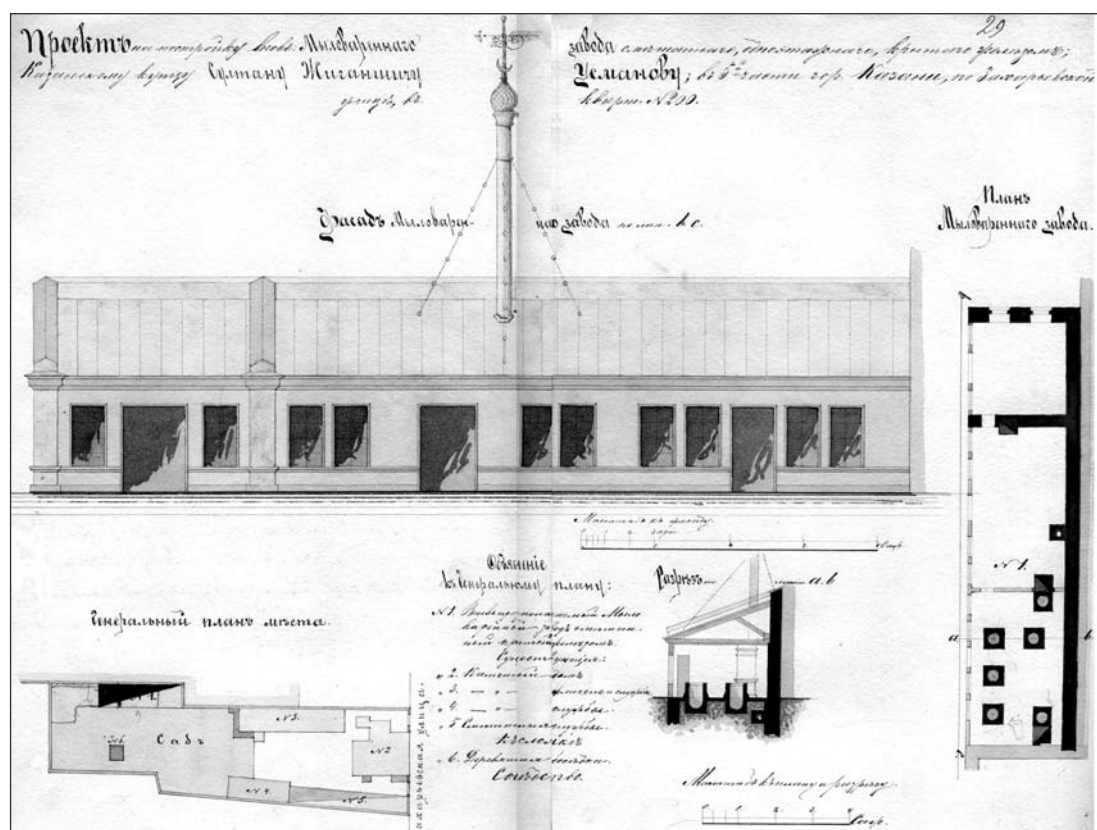

Tatar national capital still played a key role in its traditional sphere of production. Tatar capitalists built tanneries, soap, wool-scouring, fur, fat rendering plants, woolen and paper weaving plants, mills, woodworking plants and opened printing houses. National capital actively explored new industries, including glass, oil-refining, chemical, metal-processing, etc. But it did not have access to the branches of heavy industry, and Islam prohibited them from dealing with the production of wine and tobacco.

If we talk about development as a whole, it may be noted that in the post-reform period entrepreneurs from among the Tatars managed to occupy very strong positions in a number of branches of industrial production. Let's look at this process based on the material of the Volga-Ural Region.

Data from Table No.41, dating to 1884, points to the strong positions of Tatar industrialist in woolen production. They possessed 1/3 of all operating enterprises, which gave around 41% of total production volume, where more than half of the workforce of all enterprises of Tatar merchants was concentrated.

This process was also evident in the soap industry, where Tatar industrialists possessed 13% of all enterprises, employed up to 19% of the total workforce, and occupied around a quarter of the market of products of this industry. In the paper weaving and skinnery-sheepskin industries, in spite of the small number of enterprises belonging to Tatar industrialists, they occupied a considerable share of the number of employed people and production volume.

There were several reasons that allowed national industrial capital to consolidate in these spheres of industrial production. First, they were the traditional investment sectors for Tatar entrepreneurs. Second, in a fledging period of the market economy, in the period of industrial capitalism, large business could not

Construction Project. Soap Factory in Zakharyevskaya Street, Kazan.
Built on the orders of Kazan merchant Sultan Zhiganshin. 1898.

yet consolidate and monopolise production in these branches. Third, the level of capital saturation there was insufficient, and the Tatar entrepreneurs had a wide scope for investing and obtaining substantial profit.

It should be noted that if we take into account all branches of industry in the Volga Region and Urals, the share of Tatar bourgeoisie enterprises was small and constituted a bit more than 2%. This was the result of a lack of accumulated capital, because the process of initial accumulation in the Tatar community began considerably late and proceeded under less favourable conditions. It must be noted that by 1884 there was a clear picture of sectoral distribution of national industrial capital.

In the post-reform period the main role in Tatar entrepreneurship was played by the woolen industry, where the main bulk of the workforce was employed [77.7%] and which produced more than 55% of industrial

products of all the enterprises belonging to Tatars. The Tatar industrialists invested significant capital into paper weaving and soap production.

There was an uneven distribution of industrial enterprises across some provinces. By 1867 in the Volga Region, apart from the Kazan Guberniya, Tatar entrepreneurs possessed 6 woolen mills (those of the Akchurins, Diberdiyevs, Aleyevs, Agishevs, Bakhteevs, Kildeevs), with more than 4 thousand people employed and with an annual production volume of 961 thousand roubles [Counted according to: Timeryazev, 1869, issue No.1, pp. 27–28]. The biggest mills were located in the Simbirsk Guberniya, which was the main centre of the woolen industry in the Volga Region. The nankeen mills of Mustafa Azimov and Ismail Yakupov continued to produce cloth in Kazan, and the mill of Makhmut Abdryashitov operated in the Tsarevokokshaysk

Uyezd of the Kazan Guberniya. In the 1860s Simbirsk and Kazan guberniyas were the main centres of Tatar industrial capital. More than 67% of gross products were produced here, and more than 75% of the workforce employed at the enterprises of Tatar capitalists was concentrated here.

In 1861 in Kazan out of six leather processing factories two were possessed by Tatar merchants, Murtaza Azmetyev and the Yunusov brothers.

However, with the evolution of capitalist relations, the Kazan Guberniya gradually lost the status of the main centre of the national industrial bourgeoisie. This was due to the fact that in the traditional investment sectors of the national capital a number of large industrial enterprises had appeared, which were founded by representatives of large metropolitan business and foreign capitalists. With vast resources and massive opportunities at hand, they gradually monopolised production by displacing small and medium-scale entrepreneurs from the market. Lacking sufficient capital and being unable to compete with monopolists, the majority of Tatar industrialists related to that category rushed to those branches and regions where it was possible to capture the marketplace at the least cost.

It is no coincidence that in the 19th century Tatar industrial capital firmly was established in Simbirsk and Orenburg guberniyas, which economically were far from being the most advanced. This phenomenon was especially noticeable in the early 20th century.

In the late 19th –beginning of the 20th centuries fur production in Kasimov reached its highest prosperity peak³⁴.

The famous Moscow entrepreneur Arif Burnashev established an enterprise on goat's

wool scouring. He purchased raw material primarily in the Orenburg Guberniya, processed and scoured it in his native village of Azeyevo [the Ryazan Guberniya], and then sold it wholesale in Moscow [Islam, 2009b, pp. 13–14]. M. Deberdeev had a wool-scouring plant in the village of Baltin, in the Samara Guberniya, in the late 19th century in the same province the Deberdeevs owned two wool-scouring plants, and one was owned by F. Teregulov [Torgovo-promyshlennaya, 1899, pp. 63–64]. In the Orenburg Guberniya Makhmut Khusainov owned a wool processing and sheepskin-fur coat plant. It must be noted that the merchant owned 11 trade-industrial chambers in 8 cities of Russia and 3 chambers abroad: in Berlin, Constantinople, and Kabul.

The Tatar merchants Khusainovs, Yaushyevs, Abdrashitovs, and others opened fat rendering plants, tanneries, soap factories, slaughterhouses, warehouses, and trading houses on the territory of present-day Kazakhstan in Aktyube, Irgiz, Karabutak, Troitsk, Petropavlovsk, and Verny. Birushev, Muratov, Akchurins, Tyumenevs, Shamsutdinovs, Tabeev brothers, Valit Yanguzarov, and the Kaipovs should be mentioned among the Tatar entrepreneurs of Kazakhstan. Musins were the most successful entrepreneurs as they owned a flour mill in Semipalatinsk, 50 ships, and an extensive chain of shops.

Tatar entrepreneurs managed to penetrate into the gold-mining industry, which was once inaccessible to them. In the late 1860s in the Urals the Orenburg merchants Muhammadzakir and Muhammadshakir Ramievs and the Musins dealt with gold mining in the mines of Altai and Eastern Kazakhstan. According to the incomplete data of the Ural mining district, in 1897 Tatar entrepreneurs received at least 18 applications for gold mining [counted according to The Gold Mining Gazette, 1898, Nos. 3–4, 12].

It should be noted that the business recession observed in the empire during the years of economic crisis in 1866, 1873, 1882–1883, and 1890 also impacted Tatar industrial capital. Let's review the impact of industrial crises on national Tatar capital using data from 1890.

³⁴ For instance, in 1913 A. Kastrov's factory produced 1.5 million lambskins annually. H. Musaev's fur factory employed 60 workers, the entrepreneur's annual revenue totalled almost 50,000 roubles. Kh. Taneev, Kh. Akbulatov, M. Devishev, and the Vergazovs invested in fur production. In total, in the early 20th century in the Kasimov Uyezd in the Ryazan Guberniya there were nine large fur businesses belonging to Tatars, with a total turnover of 3,640,000 roubles [Islam, 2009b, p. 285–286].

Table 43

**Increase in power available per worker at Tatar-owned textile factories
between 1884–1890** [Data source: Orlov, 1887; 1894])

Power available	1884	1890
Per workplace	0.07	0.13
Per factory	20.8	48.4

Data from Table No.42 suggests that apart from leather and match all the other main industries of the national industry were affected by the economic crisis. The soap-making industry suffered the most: soap production fell by more than 80%. After the crisis Tatar industrial capital failed to recover its influence in this industry.

Wool, paper weaving mills, and fat rendering plants of Tatar entrepreneurs had also experienced a deep recession. Moreover, it was harder for national capital to adapt to the consequences of the crisis, and it took it longer to recover during the period of improvement. For instance, production volume across the main industries of the processing industry for the same period in Russia generally grew by 10%. Decline in production during this period was observed only in the wool (by 18.7%) and leather (by 28.8%) industries [counted according to: Strumilin, 1966, pp. 442, 445].

This feature of the development of national industrial capital was determined by the fact that Tatar entrepreneurs engaged in industrial activity primarily in the form of small- and middle-scale entrepreneurship, and it was considerably more susceptible to the harmful effects of crises than big capital.

In spite of the recession, the majority of enterprises of Tatar capitalists survived and continued operating. Industrial rise in the 1890s also affected the Volga-Ural Region. For instance, for the same period the industrial production volume in the Kazan Guberniya increased from 12.7 to 14.1 million roubles [Pamyatnaya knizhka, part 2, 1892, p. 62; Adresnaya kniga, part 3, 1900, p. 43].

The Tatar bourgeoisie did not fall behind the general trend. Turnover of the manufacturing enterprises of Tatar entrepreneurs showed steady growth. If in 1890 only across the Ka-

zan Guberniya it amounted to 592 thousand roubles; then in 1893, to 648 thousand roubles; and in 1896, to 943.5 thousand roubles [counted according to: Orlov, 1894; The National Archive of the Republic of Tatarstan, fund 1153, inventory 1, file 1a; fund 359, inventory 1, file 259]. That is in 6 years it increased by 59%.

Along with the growth of production, the structure of industrial activity of the organisation underwent significant changes. In 1893 the entrepreneurs T. Akchurin and Ya. Akchurin established The Partnership of Timurbulat Akchurin and The Partnership of the Staro-Timoshkinskaya Manufactory of the Akchurins in the Simbirsk Guberniya with fixed assets totalling 300 thousand roubles, divided into 300 shares of 1,000 roubles each. The company was headed by Suleyman Akchurin [Khasanov, 1977, p. 211].

In 1894 Kazan entrepreneur, merchant of the first guild Ahmetzyan Sajdashev founded the commercial and industrial joint-stock company A. Sajdashev and Sons in Kazan. Its fixed assets in the amount of 500 thousand roubles was divided into 500 shares of 1,000 roubles each. The main purpose of the partnership was proclaimed as the development of glass production and tea trade in Kazan and other cities of the empire [National Archives of the Republic of Tatarstan, f. 98, inv. 3, file 1133, s. 44]. However, its economic activity was funded mainly through borrowed assets. During the economic crisis which broke out in the late 1890s, four years after opening, the joint-stock company collapsed.

In 1895 The Commercial and Industrial Partnership of T. Akchurin was founded in the Simbirsk Guberniya, which comprised a local wool mill and a small timber mill. Fixed assets of the company amounted to 1 million roubles, and later this amount was doubled. By 1911

at the wool mills belonging to the partnership around 2.4 thousand people were employed, and different goods were manufactured, with the turnover amounting to 2 million roubles [Ioksimovich, 1912, Table No. 8].

One more joint-stock company was established in 1897 by the Deberdeev brothers in the Saratov Guberniya. It was also involved in the cloth industry. Fixed assets amounted to 500 thousand roubles and were divided between the founders [Khasanov, 1977, p. 212].

In the early 20th century Tatar capitalists continued to create joint-stock companies in different branches of industry.

In 1905 a commercial and industrial partnership belonging to a merchant M. Mansurov began to operate, which specialised in the processing of agricultural products. He owned two steam-operated mills and a malting plant in the Perm Guberniya (capital, 150 thousand roubles) [Khasanov, 1977, p. 216].

Beginning in 1912 The partnership of Teplovsky Wool Manufacturing of A. Agishev with fixed assets equaling 400 thousand roubles began active industrial activity in the Simbirsk Guberniya. In the very first year of its existence the company made a profit of 57 thousand roubles [Akcionerno-paevy'e, 1915, p. 271].

Apart from the creation of own joint-stock companies, Tatar capitalists invested their capital into other commercial and industrial companies.

The cloth industry was in the forefront of the Industrial Revolution among the Tatars, though in comparison to the overall Russian scale, it fell behind in the level of development, for instance, from the cotton industry. In 1884 enterprises of this branch accounted for 88.6% of the generating capacity of enterprises belonging to Tatar capitalists, while in 1890, 95.4%.

The most wealthy Tatar entrepreneurs acquired machines already in the late 1850s. And by the 1870s a significant part of the fixed assets of woolen industry enterprises in the Volga Region were concentrated in the hands of Tatar manufacturers. For instance, in the Simbirsk Guberniya out of 17 wool mills, 7

(41%) belonged to the Tatars. Their enterprises were equipped with 38% manual and 63% mechanical looms [counted according to: Simbirsk collection, 1870] of the total number of mechanisms utilised in cloth production in the guberniya. At Tatar-owned wool mills 8 (32%) steam engines, which concentrated 44% of the capacity of all wool mills, were installed [counted according to: Orlov, 1884].

A number of enterprises were marked by advanced technical equipment. The biggest mill was located in the village of St. Timoshkino, in the Simbirsk Guberniya, and was owned by the merchant Suleyman Akchurin³⁵. As was mentioned in one of the official publications, 'in terms of resources and working capital, this mill dominates other mills in the guberniya' [Lipinsky, part 2, 1868, p. 88].

At the mill of merchant A. Aleev in the village of Yekaterinovka in the same province 72 looms, 110 mechanisms, and a 20 h.p. steam engine operated [Simbirskij sbornik, Vol. 2, 1870, p. 90].

The merchant A. Aleev purchased a wool mill in the village of Mullovka of the Samara Guberniya and for manufacturing needs purchased 300 spindles, 70 looms, a steam engine, and a 37 h.p. steam boiler [Orlov, 1887, p. 18].

Fixed assets, utilised by the Tatar manufacturers in industrial production, had markedly increased in the years of the Industrial Revolution. This period was marked by the significant upgrade of the production and technical base of the majority of enterprises. Entrepreneurs continuously replenished fixed assets, purchased new equipment, reconstructed production facilities, replaced dilapidated wooden buildings with durable and sturdy stone buildings, supplied electrical light and water lines to enterprises. For instance, in the period from 1884 to 1890 at the factory of Timerbulat Akchurin, the number of second breakers increased from 19 to 43, spindles from 3,920 to 4,900, looms from 168 to 312, generating

³⁵ The factory was equipped with 4,443 spinning machines, 198 looms, including 19 mechanical and 143 bespoke machines. The machines were operated by two steam engines with a total power output of 60 h.p. [Simbirskij sbornik, 1870, p. 92].

capacity of the enterprise increased to 160 h.p. Technical reconstruction was also carried out at the plant belonging to H. Aliev. On the place of the former wooden building he built a stone building and concentrated the entire process of woolen production there. The equipment in the mills was also renewed: a more powerful steam engine (capacity 55 h.p.) was installed, equipment in the spinning shop was replaced [Sudarev, 1963, p. 32]. In 1894 the first 10 mechanical looms were installed at the mill [Sudarev, 1963, p. 138].

As can be seen from Table No. 43, the technical modernisation of production resulted in a significant increase of power availability at the enterprises of Tatar capitalists in the Volga Region in this branch of industry during the period of industrial capitalism: calculated per employee, by 85.7%, calculated per one mill, by 71%.

Apart from wool production, the mechanisation of labour had also affected some other branches of industry among the Tatars, although to a significantly lesser extent. The Tatar capitalists owned steam-operated mills, soap, and fat rendering plants. For instance, in 1888 a thriving local merchant Muham-madgarif Utyamyshev opened a paper weaving mill in Kazan. It was equipped with a 6 h.p. steam engine and other equipment. Around 50 people were employed at the mill with an annual production volume of up to 150

thousand roubles [Katalog, 1890, p. 27]. In the same years in Orenburg a merchant Akhmet Khusainov founded a small millet peeling plant. Annually it produced more than 3 thousand poods of millet, which were sent to Saint Petersburg, Moscow, and other cities [Katalog, 1890, p. 41].

However, in general the industrial revolution among the Tatar entrepreneurs took place at a slower pace and had not yet finished by the end of the 19th century.

One of the reasons behind such a gap was that the industrial revolution affected the primarily more developed, from an economic point of view, Moscow and Petersburg guberniya, the Baltic states, and the south of Russia. It came to the Volga-Ural Region much later. Here even in the early 20th century many trades were still at the stage of manufacturing production. Besides, national capital, which functioned primarily in small industrial centres, was behind competitors according to the scale of accumulated funds. The lack of working capital, which grew worse as a result of the industrial crisis in the early 1890s and the high cost of machinery, the main part of which was imported from abroad, held back the advancement in the technical reconstruction of production. Finally, a lack of qualified specialists, lack of awareness concerning the newest technical achievements and possibilities for their practical implementation did not allow Tatar entrepreneurs to expand the scope of application of machinery in a timely manner.

Section IV

The Tatars in the System of Russia's International Relations and in Sociopolitical Events

CHAPTER 1

The Tatars in Russia's Relationship with the East**§ 1. The Tatars in Trading and Economic Relations between Russia and the East***Vladimir Shkunov***Trade and Economic Relations in the Pre-Reform Period**

Despite the numerous trials that the Tatars had faced throughout their history, their commercial contacts with the peoples of the East, dating back to ancient times, laid a special foundation for national entrepreneurship and a commercial philosophy. Both Russian law and the basic principles of Sharia regulated Tatars' foreign trade activities. Islamic law was something that Tatar merchants shared with their commercial partners from the East. Islamic law determined the rules on Asian markets. Merchants referred to it to settle disputes and deal with reciprocal claims. This was especially important because the Russian Empire did not have any diplomatic and consular relations with some of the countries in the East.

Tatars in the East and the Problems of Developing Foreign Trade. Tatars, who usually knew Eastern languages and had a good knowledge of Asian social structures and customs, would often get jobs as public officials. Many of them had remarkable biographies. For instance, Abdulla Amirov, born in Sterlibashevo village, Orenburg Province, spent over twenty years in India before he came home in March 1806. Fluent in 'three Indian languages and Afghan', A. Amirov was appointed translator for the Orenburg Boundary Commission. A. Amirov co-authored a descriptive account with Kazan merchant Shakhmuratov (who had also lived in India), entitled 'On the Indian Realm and the People Who Inhabit It', [Shkunov, 2007, p. 354–355]. In particular, the work provides information on Russian-Indian commercial relations. Amirov and Shakhmuratov

mention that Russian leather, saffian, goat-skins, and other Russian goods were extremely popular in India. The work indicates that some articles came from Kazan and Orenburg guberniyas. Thus, Tatar merchants and travelers made a significant contribution to both extending the knowledge of India and developing Russo-Indian trade. Traditions dating back to the mid-18th century (in 1750, Tatar merchant Abdulla Seitov described a number of routes to India and Central Asian Khanates.—*V. Sh.*) were stepped up in the following decades.

In the first half of the 19th century, the Tatar population of the Russian frontier grew. For instance, a fifth census in 1795 reported 14.6 thousand Tatars in the Orenburg Uyezd, whilst the 1834 estimate was as high as 25.7 thousand, reaching 46.9 thousand in 1858 [Zobov, 1997]. The number of Tatars in adjacent Eastern countries grew as well. This was reported, in particular, by Russian ambassadors visiting Asian states for diplomatic or other purposes. For instance, Praporshchik [junior officer rank] A. Subkhankulov reported in a 1808 letter to the Russian Tsar, that 130 fugitive Russian Muslims has asked permission to return home [State Archive of Orenburg Region, f. 6, inv. 10, file 291, s. 131]. He estimated the total number of fugitives in Bukhara, Khiva, Samarkand, Shahrissabz, and other Central Asian cities to be up to 5,000 [State Archive of Orenburg Region, f. 6, inv. 10, file 291, s. 137]. When in Bukhara, another ambassador, translator from the Orenburg Border Commission, P. Demezov, noted that 'Bukharian opinions are largely influenced by Tatar subjects of Russia, who live on the outskirts of the city and trade with

the Kyrgyz people and Turkestani states' [Zapiski, 1983, p. 21]. Demezov mentions in the report that Tatars were so influential in Central Asian Khanates that Tatar merchants enjoyed 'the good favour of the Bukharian government'. Russian ambassadors reported that the number of Tatar merchants was increasing year on year in the first third of the 19th century. For instance, several caravansaries in Bukhara were occupied by Tatar merchants, their salesmen and workers. Those included Sarayi Nugai, Sarayi Kulüta, Sarayi Ayöz, and so on. Moreover, many Russian Tatars lived in Bukhara and other major Central Asian cities. They went to local madrassas, which suggests that the Kazan Region and other Tatar-populated areas of the Russian Empire had stable cultural and religious relations with Central Asia.

State and Legal Passport Regulations and Crossing Borders for Trade. In 1807, an imperial decree established a passport regime regulating the border crossing procedure for Russian subjects and in particular, for merchants. The provincial government could not issue passports, which created certain difficulties. This is why provisions of the decree were often violated in practice in the first years after its adoption. For instance, Orenburg Military Governor, Prince G. Volkonsky, reprimanded the Commander of the 30th Division in Tomsk, General G. Glazenap for allowing merchants who had passports to cross the border unimpeded. The general justified his actions as follows: '... we are not entitled to prevent Mohammedan Russian subjects to cross the border because they are permitted to do so under the Tsar's Edict for the purposes of trade even with such remote provinces as Chinese frontier cities, Kashmir, and Tashkinia. This would put an end to important trade, which is only beneficial to the state, because Russian merchants, who do not speak Tatar and are unacquainted with Tatar customs rarely go abroad alone and always employ Mohammedan clerks and workers [State Archive of Orenburg Region, f. 6, inv. 10, file 402, s. 89 reverse]. It is noteworthy that formal correspondences and legislative acts dating back to the period in question remain valuable sources of information about

the history of Russia's foreign trade in general and that of Tatar merchants in particular. For instance, in relation to the regulations regarding Russians travelling abroad and the issuing of foreign travel passports.

Merchants registered in guilds as well as pilgrims taking part in the Hajj to Mecca were exempt from the passport fee, except for a form costing 50 kopeks. The law also established a procedure for receiving passports. For instance, Siberian Tatars trading in the East were to receive passports directly at district police departments. According to the Treaty of Qulja of 21 July 1851, those wishing to enter Xinjiang, in addition to having a passport, had to obtain a special ticket issued to the head of each merchant caravan at the customs offices of Semipalatinsk, Petropavlovsk, or Troitsk, as well as at the Ust-Kamnegorsk Frontier Post [Nikonov, 1869, p. 554]. Moreover, the customs administration had to report each caravan departing to Qulja or Qoqek to the consulate in Xinjiang, providing a list of merchants and a brief customs inspection report. The same procedure applied to caravans heading from Xinjiang to Russia.

Tatar merchants leaving for Mongolia on business were supposed to obtain certificates in Russian, Chinese and Mongol from the border authorities, stating the merchant's name, amount and quality of the goods and the number of packages, camels, oxen and horses. Trading in Mongolia without such certificates was forbidden. It was the responsibility of the Russian consul in Mongolia to prevent this.

To enter Tianjin, merchants obtained tickets which were issued by the zarguchei in Maicheng. The ticket was issued in Russian and Chinese. It stated the name of the caravan head, those of the merchants, amount and type of goods, and the number of packages. Moreover, caravans heading for Tianjin could not deviate from the route via Kalgan, Dun Ba, and Tun Zhou [Nikonov, 1869, p. 555].

Tatar merchants' trips to the East often took months and years. Russian law at this time permitted merchants trading in Eastern countries to stay there for up to 7 years. They had to pay interest on capital and guild fees in advance

for the first year only; the rest of the payments could be made after the merchant had returned to Russia. Some Tatar merchants spent a long time not only in Central Asian Khanates but in Turkey and Iran. According to the law, Tatar merchants staying in Turkey beyond the expiration of the period specified in their passport had the right to ask the administration of the Russian Region in which they resided for new passports. They were sent to the merchants with the help of Russian missions. It is worth noting that the law clearly states that many Russian merchants 'stay in foreign countries for decades' [Nikonov, 1869, p. 558].

Thus, by the middle of the 19th century, basic legal procedures had been adopted in the Russian Empire for travelling and staying abroad, as well as the renewal of citizenship, which directly affected the to the foreign trade activities of Tatar traders.

The Kazan Region in the System of the Russian-Eastern Trade. In the 1815, the newspaper *Severnaya Pochta* (Northern Post), writing on the progress of Russian industrial manufacturing, stated that, 'This development has also been reflected on the other end of European Russia, namely Kazan, where commerce has grown to such a large scale that the city, situated on the Volga River, near the Kama, and having access to the nearby Sura, Vetluga, and Vyatka Rivers, has become a mediator between Europe and Asia [Severnaya Pochta, 1815, No. 8]. Eastern markets also attracted Tatar merchants from other cities of the Kazan Region. Whilst in the Khanates, the merchants not only bought Central Asian commodities but also contacted traders from other Eastern countries and regions, who came to Bukhara, Khiva, Tashkent, Samarkand, and other cities to trade. Such contacts enabled merchants from Arsk to procure goods imported from Afghanistan, Bengal, and other Indian regions [Spravochny'j, 1847, p. 451], which they consequently sold at the Nizhny Novgorod Fair, in Moscow and Saint Petersburg. Products from Kazan factories sold well in China, while Kazan-made saffian and goatskins were, to quote an expert in Russian foreign trade, 1st Guild

Merchant of Fredrikshamn I. Vavilov, 'one of the key goods' [Vavilov, 1846, p. 169].

Archive data suggests many fair cities in the Russian Empire to had so-called 'Bukharian rows' from the 18th to–19th centuries. 'Bukharian goods' was the term for articles imported from Central Asian Khanates.

By the middle of the 19th century, industry had expanded greatly in the Kazan region, affecting trade positively. The 'Military and Statistical Review of the Russian Empire' for 1850 reads, 'Many merchants, mostly Tatar, are trading with Kyakhta, Bukhara, and the Kyr-gyz Horde, where they obtained by purchase or more often by exchange, various Asian commodities: robes, silk fabrics, cotton, Kyr-gyz sheep, felt, prunes, dried apricots, and so on. Some Tatars trade in Petersburg, Moscow, Kiev, Orenburg, Siberia, and other localities' [Romishevsky, 1850, p. 103]. Merchants from Kazan, Chistopol, Kozmodemyansk, Spassk, Sviyazhsk, Cheboksary, Mamadysh, etc. were outstanding in terms of trading capital and the geographical span of their activities. Such merchants either participated in the Eastern trade directly or made profits on the transit and sale of Eastern goods at the Empire's major fairs.

Prince L. Ukhtomsky believed that 'Kazan... can be called the capital of the Volga in spite of Nizhny's commercial importance' [Ukhtomsky, 1863, p. 65]. A high significance was attached to the city not only due to its geographic position but because it played a special part in Russia's domestic and foreign trade. In the early 1860s, 19th Kazan merchants' turnover was estimated to be 6 million roubles in silver [Ukhtomsky, 1863, p. 65]. In his essay 'From Petersburg to Astrakhan', L. Ukhtomsky wrote, '... some Kazan merchants conduct large-scale direct trade with China, Persia, Bukharia, and Khiva' [Ukhtomsky, 1863, p. 65]. For instance, a large quantity of goatskins were exported to China which were produced in two factories in Yunusov, two factories in Apanayev, and the Usmanov factory [Fuchs, 1844, p. 124]. In some years, the total output was as high as 150,000 goatskins. Kazan merchants Apakov, Azimov, Urazov, Abdulin, and Bikmagometov

sold nankeen articles to Central Asian Khanates via the Orenburg Region. Kazan ichig boots, which were produced in two factories owned by merchants Abdulin and Faysulin, were popular in the East [Fuchs, 1844, p. 125]. These were unique items embroidered with silk and gold. In the mid-1840s 19th several Kazan merchants had amassed fortunes of hundreds of thousands or even millions roubles [Fuchs, 1844, p. 127].

The commercial and economic connections between Kazan merchants and Eastern states and peoples grew stronger due to the development of education amongst the region's Muslim population. It goes without saying that knowledge of Eastern languages was an advantage in trade as it allowed for a greater understanding of Asian culture, traditions, and custom. Religious affinity definitely played an important role in the close interaction between Tatar merchants and peoples of the East. It was not uncommon for young Kazan citizens to receive an education (in particular, a religious education) in leading Islamic centres of learning in Central Asia and countries of the Near East. Moreover, Kazan merchants had an opportunity to communicate with traders from Central Asian Khanates, who spent two winter months in Kazan every year before they left for the Nizhny Novgorod Fair. Merchants came to know each other and established business contacts. Therefore, the religious connection of the Tatar people to the Sunni Muslims of the East favored mutual understanding, intense commercial and economic cooperation and cultural rapprochement. Tatar merchants played an extremely important part in extending dialogues between Russia and the East and implementing Russia's Eastern policy in that period. By the early 1860s 19th, Kazan merchants already had close commercial contacts with China, Iran, Bukhara, Khiva, and other Asian countries and regions. Tatar trading companies dominated Eastern trade [Pinegin, 1890, p. 492]. The Kazan merchant community was a unique world with its own traditions, rules and decorums. Tatar merchants from Kazan even had a distinctive appearance: 'Tatar merchants from Kazan usually wear a nankeen or cloth kaftan styled

like that of Russian merchants over a zilan; they always have a silk kerchief in their bosom... However, they wear a lot of expensive jewelry, including diamond rings, thick gold chains, belts with massive silver buckles of various shapes... On his shaved head, the Tatar wears a yarmolka, sometimes decorated with gold and pearls, and a hat which rich people have trimmed with beaver fur [Evropejskaya Rossiya, 1906, p. 334]. Thus, Kazan merchants emphasized their affinity to the East even in their appearance. As in Asian countries, Kazan Tatars were keen and successful traders. The famous Russian scholar V. Rogozin noted in 1906 that trade was 'in the nature' of the Tatar people [Rogozin, 1906, p. 337]. It was through trade with Oriental countries that many rich Tatars made their profits. Other scholars in pre-revolutionary Russia also mentioned Tatars having an inclination for commerce. To quote A. Rittich, 'The Prophet's sermons went hand in hand with Tatar trade, as it had been Arabs, attracting Tatars spiritually to Mecca, Baghdad, and Bukhara...' [Rittich, 1870, p. 24]. General Staff Officer M. Laptev emphasized the importance of Kazan in Russian-Oriental trade, 'Relatively large capital, trade houses that dealt with Kyakhta and the capital cities since ancient times, and, finally, the city's location on three major water routes, place it far in advance of not only uyezd centres, but in advance of all cities in the east of Russia in terms of trade activities' [Laptev, 1861, p. 399].

Tatar merchants sometimes invested in producing plants of their own and commercial and industrial capital thus merged. Some entrepreneurs from the Simbirsk guberniya were outstanding in this regard. For instance, the Tatar village of Timoshkino had up to 100 wool-scouring plants. Timoshkino dwellers bought wool in Astrakhan, Orenburg, and Troitsk from Oriental merchants, Kazaks or locals. Washed wool was supplied to cloth factories in Simbirsk and Penza guberniyas, Moscow, etc. Some Tatar entrepreneurs (the Akchurins, the Yunusovs, and others) enjoyed considerable annual profits from such operations [Lipinsky, 1868, p. 90].

Tatar Merchants in the Irbit Fair and Oriental Commodity Trade. Tatar merchants

were essential to the Irbit market, which was of great importance to the Russian-Oriental trade [Khitrov, 1872, p. 59, 60]. It was there that wholesale batches of goods imported from the East (primarily China, Middle Asian Khanates, Mongolia, India, Kashmir, Afghanistan, etc.) were sold and domestically-produced/European commodities were purchased to be re-sold to Asian states. Aside from that, the Irbit market absorbed a large number of articles made at plants and factories that belonged to Tatar merchants as well as exported to Oriental countries. For instance, nankeen (a fabric made of Middle Asian cotton), goatskins, cotton fabrics, sheepskin coats (made in the village of Shamordan and the Laishev Uyezd), and other commodities were supplied to Siberia's largest markets. Tatar merchants in the Irbit market bought large batches of peltry to later exchange them for tea in Kyakhta.

Tatar Merchants in the Development of Russia's Trade with Middle Asia. In the early 19th century, the Senate, the Department for Foreign Trade, and other governmental institutions received numerous reports, 'opinions', 'memorandums', and suggestions by customs authorities in borderline territories, governorates, and other public officials that dealt with the expansion of the Russian-Oriental trade. For instance, Director of the Orenburg Customs, P. Velichko provided an opinion on improving trade with Asian countries. In his report, dated 3 March 1808, he wrote, 'The only group of Russian subjects that goes to Bukharia for trade now is the Tatars, to whom Russian merchants properly entrust their goods' [State Archive of Orenburg Region, f. 6, inv. 10, file 402, s. 45]. The hope to attract Russian merchants to Middle Asian trade failed even when the government approved a project under which a large trade company was to be established and promised all kinds of support to the merchants. In particular, a dedicated military convoy was to be formed in order to protect merchants and their goods on the way to Middle Asian Khanates. The project failed because Russian merchants refused to participate. P. Velichko noted, 'Due to their appearance and law, Tatars are re-

ceived in Bukharia just like any other Asians are. That is, they enjoy governmental protection, complete freedom in their operations, and the friendly attitude of the public. They can even trade with foreign Asians directly at village bazaars. This yields a profit of at least 60% higher to our Tatars coming back to Russia than that of Russian merchants who trade with Asians at the border or at Menovoj dvors [trading houses]' [State Archive of Orenburg Region, f. 6, inv. 10, file 394a, s. 12 reverse]. Of course, Russian merchants were aware of the reception of Russian Tatars in Middle Asian Khanates. The few Russians who ventured to go there for commercial activities had to resort to cunning methods. For instance, Russian merchants trading in the Khanate of Kokand wore Tatar clothes.

Tatar merchants clearly dominated the Middle Asian sector of Russia's foreign trade not only due to cultural, linguistic, and confessional affinity between Russian Muslims and the peoples of Middle Asia but specific commercial practices in the Khanates. According to local law, Russian Muslims were to pay a duty of 1 chervonets per 40. It was twice as large for 'infidels' and 5 chervonets per 100 for Armenians and Indians. Lack of guarantee in the security of life and property, constant robbery on the way, the lawless practices of local authorities, poor linguistic skills and knowledge of local traditions and customs, commercial Sharia regulations, frequent wars in the region, and the fear of being caught and sold as a slave must have been the main reasons for the suppression of the Russian-Oriental trade in Middle Asia and explains Tatar merchants' domination of the region.

Tatar merchants benefited from the fact that foreigners were forbidden from entering Russia's far inland for retail trade because it enabled them to become leaders in Russian-Oriental trade. They raised considerable profit by importing goods from adjacent Oriental countries or purchasing them in bulk in borderline areas. In the Orenburg Region and along the Siberian Line, Tatar merchants practiced exchange trade with their Oriental counterparts,

which was all the more beneficial because the range of commodities imported was always wide. For instance, a lot of cotton and silk articles were imported from Bukhara, Khiva, Kokand, and China; woolen shawls and kerchiefs were brought by Indians, Iranians, and Bukharians from Kashmir and Tibet. Tatar merchants going to the remote Tibet, Kashmir, and India were also engaged in the import of the above-listed goods. Bukharian, Khivian,

and Kokand caravans also brought carpets from Iran and India as well as 'lazurite from the mountains of Badakhshan' [Nebolsin, part 1, 1835, p. 170–171]. Tatar merchants (from Kazan and Kasimov) bought large batches of lamb pelts that was used in the production of sheepskin known as Kalmyk in Russia. The Kazan guberniya consumed a lot of cotton yarn. English yarn was added to it to make kumach or nankeen. Finally, Tatar merchants benefited greatly from selling fat and livestock, which they bought in exchange for goods from the Kazakhs. Kazan, Shadrinsk, and Yekaterinburg imported fat to deliver large batches of it to the ports of Arkhangelsk and Saint Petersburg, from where it was then exported to the countries of Europe.

By the middle of the 19th century, Tatar merchants had essentially monopolized Russia's trade with Central Asia. Every attempt by Russian merchants and representatives of other peoples in the Russian Empire at establishing direct trade contacts with Middle Asian Khanates, East Turkestan, Afghanistan, Kashmir, and other Asian regions failed. Merchants not only lost their goods to robbers on their way and became slaves, but occasionally lost their lives. The Governor General of Orenburg, A. Katenin, wrote in his report to the Minister of Foreign Affairs, dated 30 November 1857, '... our merchants have ceased to visit Bukhara and Khiva. There are two reasons behind it. Firstly, a duty

A bazaar in Samarkand. Woodcut, early 20th century.

twice or four times as large as that imposed on Mohammedan traders is imposed on Christian merchants in Khiva and Bukhara, so the latter cannot compete. Secondly, Russian traders suffer exactions and oppression by Central Asian merchants, with whom they cannot hold any council [Yudin, 1902, p. 4]. The Governor General of Orenburg complained that Russian merchants had not attempted to establish any direct trade with Khiva and Bukhara since 1852, entrusting it completely to mediators, namely to the Tatars of Kazan and other Muslim agents [Yudin, 1902, p. 11]. The situation remained the same in the following years.

The Russian government proved unable to draw any concessions from the khans' governments regarding customs duties and merchant security. When receiving Russian ambassadors, the rulers of the Khanates would agree to Saint Petersburg's requests and demands. However, trade would resume its previous course as soon as the mission departed.

Russia's trade with Middle Asian Khanates was special for a number of reasons. Firstly, it was characterized predominantly by caravan and exchange. Secondly, there were seasonal patterns to it. Namely, merchants set off for the Khanates in early autumn (August to early November), which was tied to Kazakh migration from the north to the south. They gathered together to join the Kazakhs, moving 'in a single detachment, crossing the steppes as

an enormous chain of camel threads, which sometimes were as long as twenty versts' [Yudin, 1902, p. 22].

It was not uncommon for Tatar merchants who went to the Khanates of Middle Asia on business to fulfill important missions for the government, like handing it diplomatic messages, letters to the khans, etc. This is attributed to the lack of any formal diplomatic relations between Russia and the adjacent Middle Asian countries. There weren't even Russian consulates in the Khanates' capitals. Moreover, upon returning home, Tatar merchants informed their governing authorities of the Khanates' affairs, essential events, trade, prices, and foreign trade relations between Bukhara/Khiva/Kokand and China/India/Afghanistan/Tibet/Punjab/Xinjiang/Kashmir/other countries and regions in Asia. Such inquiries became common practice with time. Having returned to the Orenburg or Simbirsk Border line, Tatar merchants provided detailed reports on whatever they saw during their long trips to representatives of the local governing administrations.

M. Yudin, one of the leading experts on the history of the Orenburg Region, wrote, 'The typical Asian suspicion and morose manner prevented Russia from establishing better and more stable relations with the neighbouring Khanates. Thus, the regular departure and arrival of caravans was the only thing that preserved the relations [Yudin, 1902, p. 24]. Archive documents suggest that the Russian Empire maintained trade relations with the adjacent Middle Asian countries even when international conflicts in the region escalated. Tatar merchants contributed to the extremely lucrative international trade by finding efficient solutions to the difficulties.

Trade Operations in the Kazakh Zhuzes. It was not only in Middle Asia but in the Kazakh Steppe where Tatar merchants traded. For instance, Tatar merchants or their salesmen went to the steppe to buy fox, wolf, and other skins from Kazakhs for the very low price from 10 kopeks to 3 roubles [Kolmogorov, 1855, p. 7]. In the meantime, the actual cost of a good fox skin had gone up to 20 roubles in silver. Hav-

ing bought a large number of skins, merchants supplied them to Middle Asian Khanates and China. Large batches of fur were delivered to the Irbit Market too. This trade involved Tatar merchants from Petropavlovsk, Semipalatinsk, Ust-Kamnegorsk, and Troitsk. For instance, in the early 19th they supplied 25–30 thousand fox and wolf skins and up to 50 thousand hare skins a year [Kolmogorov, 1855, p. 7]. The price difference ensured high profit for the merchants. In spring, after the Irbit Market Tatar merchants brought a large amount of dry goods to the Kazakh steppes. The Kazakh market of the 1850's was generally viewed as a 'wide field for Russian industry in general and trade in particular' [Kolmogorov, 1855, p. 24]. As expert in Kazakh steppe trade G. Kolmogorov noted in 1855, 'a Tatar merchant would receive a net profit of 150 roubles in silver in 4 years for an assumed spent capital of 10 roubles in silver invested in 1850, that is, in May 1854—in which country, in what kind trade, in which plants and mines, without any hard work, worries, and failures? [Kolmogorov, 1855, p. 24]. Merchants ensured such high profits by giving commodities to Kazakhs on credit. In May–July, when Tatar merchants were collecting livestock from Kazakhs, huge flocks would be divided into four parts. One was meant for local exchange for Middle Asian fabrics, daba, printed linen, rice, dried fruit, and other merchants that caravans would have brought from Bukhara, Kokand, and Tashkent by that time. Merchants drove the second part of the flock to Qulja and Qoqek to exchange it for Chinese tea and other Chinese commodities. The third part of the flock as well as bovine cattle and camels were driven to Bukhara, Tashkent, and Kokand. Tatar merchants brought along domestically made factory products. The fourth and largest part of the flock was driven to Semipalatinsk, Petropavlovsk, and Ust-Kamnegorsk to be consequently sold for cash, on credit, and in the Irbit Market [Kolmogorov, 1855, p. 25]. The following data is suggestive of the volume of the trade. The Siberian Kazakh area alone supplied up to 150,000 horses, 100,000 bulls, 3 million sheep and rams, having a total val-

ue of up to 8 million roubles in silver per yer [Kolmogorov, 1855, p. 26]. If we were to add the several thousand camels that were sold to China and Middle Asian Khanates, rawhide, sheepskin, and astrakhan (up to 500,000 pieces of the latter were supplied to the Irbit Market alone each year), fur, goat hair, saiga horns, and other commodities, this would yield another 2 million roubles in silver [Kolmogorov, 1855, p. 26]. Livestock trade was even larger along the Orenburg line. This is why Tatar merchants raised huge capital in this particular area trade and were able to remain leaders therein.

In Xinjiang Markets. The example below is illustrative of how resourceful and intuitively enterprising Tatar merchants were. In his storehouses, a Tatar merchant from Semipalatinsk kept up to 200 thousand bricks of Chinese tea and a large number of loose tea hanks, having a total value of 1 million roubles in silver. The goods were customs-cleared. However, he took his time. Even though large batches of tea were idle and the money was out of circulation, his trade followed its natural course with his sons and salesmen driving livestock to Qulja and Qoqek, from where they brought tea and fabrics. The Tatar merchant even purchased daba and printed linen from Bukhara and Kokand. This suggests that he had enough spare money to trade in China and in the Central Asian Khanates. Internecine wars soon broke out in Xinjiang, causing tea prices to skyrocket: brick tea from 60 to 80 kopeks per brick, loose tea from 1 rouble 20 kopeks to 1 rouble 80 kopeks and even 2 roubles per pound [Kolmogorov, 1855, p. 29–30]. In 1852 and 1853, the resourceful merchant put his tea on sale, which ensured enormous profit for him. This is not the only example of how canny merchants could be. It is beyond doubt that merchants who had been trading in the adjacent Oriental countries for years were well aware of their affairs, for which they relied on their agents and trade partners. From previous Russian foreign trade, they knew such information to be valuable.

Exchange trade in borderline areas was extremely lucrative as Tatar merchants received goods first-hand from Oriental caravans that came to the Orenburg Region and the Siberian

line in caravans. Some caravans consisted of as many as 2–2.5 thousand camels. They brought merchants from Bukhara, Kokand, Khiva, and India [Kolmogorov, 1855, p. 32]. Exchanging domestically-made fabrics for Oriental commodities, merchants raised profit by re-selling them in Russia's inland, where the prices for them were much higher.

Tatar merchants were important for trade in the Ili Region. Russian merchants' commercial relations with East Turkestan broke down many times in the 18th century as the situation was extremely unstable in the region. When order was restored, trade resumed its course. The Chinese government made great efforts to develop trade and economic relations between Xinjiang and all the neighbouring states. The Russian Empire was no exception. In the 19th century, most Russian merchants maintained commercial relations with Xinjiang through Qoqek, Qulja, and Kashgar. Russian-Chinese commercial relations developed rapidly until the early 1880's, to which Russian merchants contributed in the form of large silver export from Xinjiang. While in Xinjiang silver cost 960–970 roubles per pood, in Moscow and Kyakhta it sold at 1100–1200 roubles per pood [Fyodorov, part 2, 1903, p. 46]. The benefit was obvious. Tatar merchants largely monopolized this important channel of Russian foreign trade. For instance, the total number of merchants in Qulja in 1897 was 232, of whom 22 were Tatar and only 3 were Russian [Fyodorov, part 2, 1903, p. 47]. In the same year, the total turnover of merchants from the Russian Empire in Qulja, Qoqek, and Kashgar amounted to 8,270,070 (our estimate.—*V. Sh.*) [Fyodorov, part 2, 1903, p. 52]. It is noteworthy that manufactured finished goods dominated Russian export to Xinjiang throughout the period. This included cotton and woolen articles, clothes and footwear, sugar, sweets, biscuits, matches, kerosene, lamps, sewing machines, dishware, writing and wrapping paper, dressed leather, threads, iron, copper, cast iron, and steel articles, etc. [Fyodorov, part 2, 1903, p. 52–53]. The commodities were mostly bought to the Nizhny Novgorod Market, Moscow, and other cities of the empire. Tatar merchants delivered

leather, fur, horse hair, wool, goat hair, dried fruit, livestock, etc. from Xinjiang to Russia. To sum up, Russia benefited greatly from trading with this region of Asia. It should be noted that a number of international agreements¹ regulated trade. In the late 19th century to the early 20th century, the following Tatar merchants who continued trade in the Ili area were notable for their sizable capital: Sadyk Musin, who had offices in Semipalatinsk, Verny, Kapal, and Jarkent (the annual turnover in Kulja was 100,000 roubles); Abduvali Yaushev (100,000 roubles, offices in Troitsk, Orenburg, Semipalatinsk; Gainutdin Fakhretdinov (100,000 roubles) who traded in textiles, iron and haberdashery; Idris Rakhmetdin (50 000 roubles) and others [Fedorov, part 2, 1903, p. 68].

His memories of his stay in Xinjiang in the 19th were left by a Kazan merchant Murtaza Feyzullin [Beitrag, 1846, p. 80–82, 95–101]. Tatars from the Russian cities of Verny and Kopal, who delivered prints, nankeen, calico, velveteen, cloth and hardware to Xinjiang, figured considerably in Kulija [Kostenko, 1872, pp. 189–190]. Some Orenburg Tatars had large trade turnover in Chuguchak. For example, Abduvali Abu-Bakirov, a Troitsk merchant of the second guild, would repeatedly visit this major commercial city, where he bought floral, black and brick tea and other Chinese goods in large quantities. From Chuguchak to Troitsk, the goods were delivered in summer within a period of two months, and in autumn, in the span of 80 days [Nebolsin, 1850, p. 28]. To deliver goods from Xinjiang to Nizhny Novgorod, a merchant paid 2 silver roubles per pood—the same price as merchants paid to deliver goods from Semipalatinsk to Kazan. Abubakirov would send Russian goods to Chuguchak 2–3 times a year. What is more, he dispatched caravans from various places.² Commercial proj-

ects of this Troitsk merchant extended beyond Xinjiang: he dreamt of direct trade with Tibet, Kashmir, Afghanistan and Badakhshan. In his 'account', Abubakirov showed his excellent knowledge of the markets in these regions of the East [Nebolsin, 1850, pp. 33–38]. According to V. Razgon, a Russian researcher of the history of the Siberian merchant class, Tatar merchants trading along the Trans-Siberian Line often played a dominant role: Generally speaking, before 1861 the total share of Muslim (those of Kazan, Qasim and Siberian Tatars, Siberian and 'newcoming' Bukhara Tatars, etc.) members of the merchant class was: 83% (63 families out of 76) in Semipalatinsk, 67% (28 families out of 42) in Ust-Kamenogorsk, 35% (17 families out of 48) in Petropavlovsk [Razgon, 1998, p. 195]. Among them were merchants from Semipalatinsk, such as the Salikhovs, the Rafikovs, the Usmanovs, the Gabitovs, the Ishterekovs, the Maksyutovs, the Sutyushevs; merchants from Petropavlovsk, such as the Bayazitovs, the Maksyutovs, the Sutyushevs, the Bekhtemirovs, the Devletkildeevs, the Zabiroyevs, Toimatovs and others [Razgon, 1998, p. 208].

Tatar merchants in Kyakhta and Russian-Chinese trade. During the period under consideration, Tatar merchants figured considerably into Russian-Chinese trade with Kyakhta remaining as its main centre. The scope of this trade can be judged by the following figures: while in the early 60s the Nizhegorodsky Market registered about 15 thousand places, at the same time in Kazan there were about 8 thousand places [Subbotin, 1892, p. 574]. Thus, Kazan swallowed half of the bulk of tea that was exported to the largest market of the Russian empire. Tea was delivered to Kazan from

¹ Article 4 of the Treatise of Kyakhta of 1872, Articles 2–15 of the Treatise of Qulja of 1851, Articles 4–14 of the additional Treaty of Beijing of 1860, and Articles 12–18 of the Treaty of Saint Petersburg of 1881 [Fedorov, part 2, 1903, p. 63].

² After purchasing goods at the Irbit Fair, he divided them into two batches: he sent the first one by way of

Petropavlovsk on 1 May, and the second one, via Semipalatinsk at the same time. The last caravan left the city of Troitsk in September. Goods from Xinjiang were dispatched to Troitsk and arrived there at the end of June—beginning of July and then in October. To Tacheng the merchant from Troitsk exported camlet, drap-de-dames, nankeen from the Kazan Guberniya, as well as Moscow chintz. Saffron purchased at the Irbit Fair was also in high demand in China.

both the Kykhta and Irbit markets. The city had special wholesale warehouses from which tea was delivered to Nizhny Nobgorod and also to the different cities of Kazan and neighbouring regions. In pre-revolutionary books, one could read the following: 'In its value and amount, the tea market in Kazan plays a significant role. There are merchants' houses which have bartered with the Chinese for a long time; there are also bulk buyers, buying tea both in Kazan and at the Irbit and Nizhegorodsky marketplaces. Kazan merchants at the main tea market in Nizhny Novgorod are considered the most significant tea traders' [Laptev, 1861, p. 435].

Before 1861, Kyakhta remained the main supplier of tea to Russia. From 1851 to 1863, Tatar merchants also delivered tea from Xinjiang, and from 1862, it was brought through the European border. The tea trade was beneficial to Tatar merchants, as the consumption of this drink in Russia grew with every year. The growth of tea imports can be illustrated by these average annual figures: 'in 1801–1810—75 thousand poods, in 1811–1820—96 thousand poods, in 1821–1830—143 thousand poods, in 1831–1840—190 thousand poods, in 1841–1850—271 thousand poods, in 1851–1860—372 thousand poods [Laptev, 1861, p. 605]. In 1861, caravan trade with China was reestablished, which grabbed the Tatar merchants' attention regarding Kyakhta. Trade in Kyakhta was exceptionally beneficial for a number of reasons. First of all, the Xin Empire consumed a considerable number of finished domestic products made at plants and factories that belonged to Tatar merchants. In particular, it concerned the enterprises producing morocco and coach-boxes in the Kazan region, yuft at Siberian factories, and others. Secondly, the raw materials brought by Chinese merchants from Shanxi Province and other regions of the Xin Empire were used by domestic factories and plants. Generally speaking, despite the fact Kyakhta was far away and there were problems of transporting goods, this course of Russian-Eastern trade was undoubtedly of interest to Tatar merchants during the entire period under consideration.

Tatar merchants in Mongolia. Some Tatar merchants took an active part in trading operations in Mongolia. These were major wholesale merchants, who bought goods in Moscow, Nizhny Novgorod and at Irbit Market and delivered them via Biysk to the territory of Mongolia. In the early 20th century, in Biysk uyezd (district), Tomsk Oblast, there were 1,700 Muslims [Steinfeld, 1910, p. 33]. A good dirt road, 577 versts long, led from Biysk to Mongolia. From Mongolia to Russia, along the Chuisk Trakt, they delivered brick and long leaf Chinese tea, camel's hair and fleece, rough leather, etc. Russian export comprised of hardware, flax, woolen and cotton fabrics, dressed leather etc. In order to protect the interests of domestic merchants, Russian consulates were established in Mongolia (in Uliastai, the general consulate in Urga). The Russian-Mongolian border, which, in practice was unguarded, made it possible for Tatar merchants to smuggle goods both into remote Khalka nomads' camps and to Urga. It earned the merchants enormous profits. Mongolia consumed a considerable number of Russian products (made of metal, leather, cloth, etc.). In turn, Tatar merchants bought cattle, raw materials and smuggled goods brought from the Xin Empire.

Tatar merchants and Russian-Persian trade. During the entire period under consideration, Russian-Oriental trade developed, moving in the direction of Astrakhan. Tatar merchants played a special role here. In particular, trade with Turkmens living on the eastern shores of the Caspian Sea was on their hands. The merchants owned sea-fishing ships, which were used to deliver to different wares from Bukhara and Khiva to Astrakhan. The famous Russian foreign trade researcher, G. Nebolsin wrote: 'This industry actually belongs to the Tatars only, because Turkmens and the Kyrghyz allow to approach the land only those who are their brothers-in-faith' [Nebolsin, 1835, part 1, p. 150]. Fishing in the Astrabad Gulf brought considerable profits. Here trade was done on schooners built in Kazan [Blaramberg, 1852, p. 173–174]. Lieutenant-colonel I. Blaramberg, an expert on Iran, noted that: 'In all respects, the Astrabad Gulf can be

honored as the most important harbor in the Caspian Sea; by its geographical position and natural benefits, it contributes to the extension of Russian trade more than any other place' [Blaramberg, 1852, p. 176].

Russian-Afghani trade. Tatar merchants began to show interest in Afghanistan as far back as in the latter half of the 18th century. At the turn of the 18th –19th century, merchant caravans from Kazan, Semipalatinsk, Orenburg and Astrakhan repeatedly went to distant Afghanistan, where they brought ready-made domestic manufactured goods, as well as hardware, iron, glass, china, mirrors, sugar and other commodities [Grigoryev, Kharatishvili, 2002, p. 433]. From Afghanistan, they exported indigo, Marengo, cochineal, Kashmir shawls, Badakhshan lazurite, precious stones, wool, etc. Furthermore, Russian Tatar-merchants bought Afghani goods at the markets of the Central Asian khanates, where caravans from Afghanistan occasionally arrived. For example, in 1818, Kashmiri shawls delivered exclusively to Troitsk were worth 378,360 roubles [State Archive of Orenburg Region, f. 339, inv. 1, file 29, s. 27]. The fact that Russian Tatars and Afghani merchants often stayed in the same caravans in Bukhara (Sarayi Ayöz) is also indicative of their direct trade links. Indigo brought from Afghanistan was delivered in large quantities to Kazan and other central guberniyas. This pigment was sold daily, worth considerable sums of money at the Nizhny Novgorod Market, the Irbit Market and the Combined Simbirsk Market and other markets of Russia. By the middle of the 19th century, direct journeys of Tatar merchants had virtually discontinued. It was due to the domestic situation in the country and the English-Russian trade as well as to economic competition in Middle Eastern markets, which had increased. However, it did not mean that trade which was exceptionally advantageous had ceased: its vector had shifted towards the markets of Central Asia. But in general, over the entire period under consideration, Afghanistan consumed a great number of Russian goods, while Afghani goods delivered by Tatar merchants from the

Central Asian Khanates sold well at the Russian Empire's largest fairs. The imported Afghani raw materials met the requirements of plants and factories producing cotton, silk, leather, cloth and other products.

Black Sea-Azov route of Russian-Eastern trade. Some Tatar merchants traded in Odessa, Crimean ports and Taganrog, where goods from Asian and African countries were delivered in great quantities. Some of them went to Turkey and Egypt in person, others bought eastern goods delivered to Russian ports, and others brought domestic goods to be exported to Eastern states. For example, in 1858, a Tatar from Kazan, Ksainov by name, brought Caucasian silk, haberdashery, and other commodities worth 12 thousand roubles to the Odessa Holy Cross Fair [Oboroty', 1858, p. 40]. A great number of English articles, as well as simple cotton fabrics, which were in demand among Crimean Tatars and people of Caucasia, were brought from Turkey [Semenov, 1859, part 3, p. 150]. By the middle of the 19th century, Turkish raw materials imported to Russia had multiplied: such as silk, cotton, pigments, etc. At the same time, a considerable amount of wool, which had been bought by Kasimov and Simbirsk Tatars, was exported from Russia to Turkey via Black sea ports, 'Plain Russian wool also made its way abroad long ago. Odessa, Rostov-on-Don and almost all Black sea ports send Cherkessk wool abroad, that is, Donskoy, Bitrug and beaver lamb wool which was obtained from the native southern breeds of sheep' [Vasilyev, 1862, p. 210].

The Tatar pilgrimage to Mecca and Medina and trade. In the early 19th century, Tatar merchants' capital became firmly established not only in the neighbouring Eastern countries, but it began to penetrate deep into Asia. For example, Tatar pilgrims, making a hajj to Mecca, simultaneously traded in Palestine, Lebanon, Syria and Turkey. On their way back, they bought local goods, which they sold profitably in Russia. Namely, the goods were bought in Syria (in Aleppo and Damascus) [Bazili, 1991, p. 277]. The pilgrimage to distant Arabia was in itself expensive. Therefore, 'almost all large

caravans with pilgrims heading for Mecca, are also joined by merchant caravans' [O Mekke i Medine, 1807, p. 251]. The Hajj to Mecca from the Crimean Peninsula lasted almost a year and a half and was fraught with enormous costs' [Radde, 1856, p. 296]. It is no accident that Crimean Tatars always sought 'to cover travelling expenses'. The Tatars of the Volga-Ural region who made Hajj to Mecca often bought Islamic literature written in Arabic, including manuscripts. In this way, a considerable number of books published in Cairo and Constantinople were brought to Russia. On returning home, Tatar merchants brought these books to fairs and sometimes sent their salesclerks to sell them in Tatar villages where 'the books are sold not only for cash, but are also exchanged for different agricultural products' [Ilminsky, 1866, p. 78]. To determine the number of Russian pilgrims arriving in Mecca from the Russian Empire in general during the period under consideration is difficult. For example, from 1827 to 1836, 875 people made Hajj from Crimea to Mecca. [Brosse and Reppen, 1841, p. 200]. If we take into consideration the fact that in 1828 and 1829, due to the war with Turkey, there was no pilgrimage, then, on average, annual Hajj was made by nearly 100 Crimean Tatars. Rich Tatars from the Kazan region also traveled to Mecca; their Hajj cost them about 1 thousand silver roubles [Laptev, 1861, p. 229]. In general, several hundred Russian Muslims travelled to Mecca every year.

On the issue of terminology in the history of Russia's foreign trade. Taking into consideration Tatar merchants' special role, as well as that of representatives of other nationalities (Greeks, Armenians and others), we think that the use of the notion 'Russian-Oriental trade (and on analogy 'Russian-Eastern, Russian-Iranian, etc.) which is customary for domestic (and quite often for foreign) historiography, is incorrect, taking into account the national composition of the merchants who dominated particular channels of this trade. We have previously justified the expedience of using the notion 'Russian-Oriental trade' which, in our view, reflects the nature of trade relations be-

tween the Russian Empire with the countries of the East [Shkunov, 2007, p. 16].

Thus, during the pre-Reform period, Tatar merchants played a special role in the Russian-Eastern trade, especially on its Crimea-Black Sea, Central-Asian and Xinjiang routes. During this time period, Tatar trading profit not only penetrated into the markets of the neighbouring Eastern countries, but also deep into Asia. In an article published in the magazine, 'A Library for Reading' in 1838 about a work by A. Humboldt, an anonymous writer remarked that merchants reached the regions of the East which are difficult to access earlier than researchers did: '... while very learned geographers talk nonsense or indulge in speculations about certain parts of inner Asia, which they call 'visited by nobody', you will find merchants and common Tatars in Siberia who know these countries perfectly well, where they have been more than once without asking European professors' permission [Kriticheskoe, 1838, p. 33]. This remark fully concerns Tatar merchants who, for centuries, had been the earliest explorers and pioneers in different regions of Asia, and contributed remarkably to the development of Russian-Eastern trade.

Trade relations in 1861–1905.

The post-Reform period opened up new perspectives for Tatar merchants. By the end of the 19th century, Tatar merchant capital had reached new regions of Asia. For example, the Tatars of Karsunsky uyezd and the Simbirsk region not only visited China, but also Japan, whence they brought carpets and Oriental fabrics which were very expensive in Russia [Akhmerov, 1903, p. 114]. The sphere of the distribution of Tatar merchant capital began to embrace not only neighbouring countries, but also distant regions of Asia and North Africa.

By the end of the 19th century. Semipalatinsk had become one of Russia's largest trading centres with Central Asia, as well as with Xinjiang. As pre-Revolutionary books noted, 'trade is a source of the city's well-being and attracts quite a few Russians, Tatars and Bukharans here' [Dolgorukov, 1898, p. 85]. Every spring, Semipalatinsk merchants sent their Tatar trade salesclerks on business to

Chuguchak, Kulja and Kashgar, while in the city itself they exchanged cattle, skins, furs, felts and lambskin with Kazakhs for yuft, tobacco, hardware, cotton cloths, brocade, velvet, cloth, chests, medicine and bread. In 1895, all of the Semipalatinsk fairs sold goods worth of 2,888,731 roubles; goods worth of 607,554 roubles were delivered to West China and the goods brought back from China totaled to the value of 565,346 roubles [Dolgorukov, 1898, p. 86, 87].

The construction of railroads that connected different regions of the Russian Empire created incentives for the promotion of Tatar merchant capital to the countries of the East. In the latter quarter of the 19th century to the early 20th century, railway transportation made cargo transit shorter and contributed to a more rapid profit turnover. It fully applied to the Central Asian, Chinese and Japanese routes of domestic foreign trade. But even if there was no railway communication, foreign trade links in some regions of Russia considerably expanded. For example, busy trade relations linked Amur Krai with Manchuria, where manufactured goods, copper and iron articles, furs, luxury goods and placer gold were delivered [Volsky, 1908, p. 404]. After the Chinese Eastern Railway (CER) had fully been put into operation, Tatar merchants trading in tea and other Chinese goods didn't have to deliver them by land in carts or by river transport. After direct tariffs were imposed from the ports of Hankou, Shanghai and Colombo, tea transportation straight to Kazan, Simbirsk, Orenburg, Moscow, Warsaw and other cities of European Part of the Russian Empire became possible. In 1903, as compared to 1902, the volume of Chinese tea delivered along the CER increased to 1,999,000 poods, that is by 614%. It was possible to pay for the delivery of tea from Shanghai to Kazan for instance. As far as the terms of delivery and transportation costs were concerned, merchants found it much more profitable. For example, one pood of tea delivered from Hankow to Moscow by paying a direct tariff, would cost 4 roubles and 86 kopeks [Volsky, 1908, p. 436]. The signifi-

cance of the tea trade can be judged by the fact that in 1897, customs income from tea made 20% of all customs charges in the state, or 3% of all state revenues [Ozerov, 1905, p. 53].

In this way, Tatar merchant capital also penetrated into China. In Harbin, for example, manufactured goods shops owned by the Agishev brothers and their sons were set up. They also owned haberdashery shops and luxury goods shops, shops selling ready-made clothes, shoes, and leather goods, furs, jewelry, groceries and colonial goods, wine and delicatessen shops, etc. [Ozerov, 1905, p. 570]. Foreign trade expansion was facilitated by the use of river steamers on the Amur and Ussuri rivers and on Lake Khanka.

The development of communication lines and transportation in the vast expanses of Siberia and the Far East gradually diminished the role of trade fairs where Tatar merchants had traditionally figured prominently. It even concerned the largest marketplaces of the Empire such as the Irbit fair: from the middle of the 1890s, the trade turnover was steadily falling. In 1896, the import of goods to the Irbit fair was worth 47 million roubles, in 1897, it was 47 million roubles, in 1898—38 million roubles, in 1900—37 million roubles, in 1891—35 million, in 1902—32 million, in 1903—32 million roubles [Ozerov, 1905, p. 413]. Thus, in less than 10 years' time, the volume of imports to the largest Siberian marketplace decreased by over 10 million roubles.

In some border areas in the late 19th to the early 20th century, the positions of foreign merchants strengthened. For example, in Primorsky Krai, the Chinese, Koreans and Japanese offered competition to the local merchants. The sales of valuable furs via the Pacific ports to America, European countries and China were concentrated in the hands of Chinese buyers-up, who derived great profits, for, as a pre-Revolutionary monograph wrote, they 'accustom non-Russians to hard drinking and thereby get valuable furs from them almost free of charge' [Volsky, 1908, p. 427]. The rise of the Chinese on Russia's borders in the Far East caused concern, not only for domestic merchants, but

also for bodies of state administration and researchers. For example, professor Ozerov wrote in 1905: 'So, Russia is threatened with Chinese invasion... The living standards of our working population are very low, and Chinese invasion may consolidate them if due measures are not taken against it. At present they are already talking about the competition that the Chinese offer the Russian worker in the East Siberia regions bordering China' [Ozerov, 1905, p. 39–40].

Some Tatar merchants successfully combined trade business and production activity. For example, K. Akchurin owned a tannery at Petropavlovskaya station in Akmola Oblast and O. Khamitov owned a tannery in Semipalatinsk. Manufactured goods shops were run in Omsk by Aimameldinov, Abdulmanov, Gabibulin, Sirozittidinov, Savbyanov, Khabobulin; in Petropavlovsk these shops were run by Yu. Usmanov, I. Faizulin; in Kokchetav they were run by Usmanov and Khalitov, in Zaysan—by Yu. Seyfullin, A. Abrakhmanov, Devletkildeev, Urmanov; in Pavlodar—by S. Vakhitov, I. Khalimov, G. Vakhitov; in Kurgan—by Mukhametzyanov; in Barnaul—by Kh. Yusupov; in Tomsk—by S. Bairtudinov; in Minusinsk—by A. Mansurov, G. Uzunov; in Nizhneudinsk—by Mansurov; in Stretensk—by Abdul Mezid Akchurin [Volsky, 1908, p. 518–523]. Tatars also owned haberdasheries, commercial facilities selling furs, wool, tea, etc. Thus, practically everywhere in the expanses of Siberia and the Far East, there was a wide network of commercial facilities belonging to Tatar merchants. Imported goods from the East were sold here.

During the period under consideration, the geography of Tatar merchants' foreign trade links expanded. It was partly facilitated by the development of transport facilities as well as the integration of merchants' capital and the establishment of trade and other companies. For example, by 1899, a joint-stock Russian East Asian steamship company was established with the aim of carrying cargoes and passengers between Russian ports and those of Japan, China, Korea, Siam and other Eastern countries (the

A caravan on the banks of Irtysh.
Lithography, early 20th century.

governing body was based in Riga) [Volsky, 1908, p. 449].

Russia's advance into Central Asia and Tatar merchants' trade. The establishment of Turkestan Oblast, the seizure of Tashkent, the subordination of the Emirate of Bukhara and the Khanate of Khiva, the affiliation of Turkmenistan to Russia are the links on the same chain of Russia's colonial policy, which changed the economic life in the entirety of Central Asia. Already by the 70s–80s of the 19th century, the participation of new settlers in trading activities, first of all those who didn't practice Islam, became noticeably more active. The membership of the leading merchant centres in Central Asia substantially changed: the share of Russians and people from European countries increased. Nevertheless, the role of Tatar merchants didn't diminish. On the contrary, as the competition increased, they changed their trading tactics and channeled their capital into new spheres, developing the most promising sectors which were not typical of the traditional economies of the former Khanates. Practically all cities of the Turkistan Governor-Generalship had Tatar quarters and trade remained the leading occupation for many families. By the end of the century, the forms of trade organization had changed: they were acquiring a distinctive European style. For example, in Tashkent and other cities of the

Governor-Generalship, there were large Tatar trade companies which were widely known. Wholesale purchase became possible in the largest commercial centres of Central Asia due to the development of transport routes and delivery vehicles. A study carried out at the time noted: 'The richest Tatar firms, permanently based in Tashkent, which carry on trade in the steppe regions, send printed cotton, iron and other goods before they receive them in Tashkent [Obzor, 1897, p. 40].

In the last decades of the 19th century, changes in the industrial production of the Russian empire, the emergence of new branches, and higher consumer demand found its reflection on the state of Russian-Eastern trade. Tatar merchants were more and more attracted by the goods that were in greater demand in Russia's domestic market. For example, if they had earlier obtained carpets, thoroughbreds, salts and some other goods from the domains of Turkmen tribes, by the end of the century, it was oil and 'neftagil' (ozorketrite.—*V. Sh.*) [Nashisosed, 1873, p. 34–35]. Direct trade contacts between Tatar merchants and Turkmens took place in Ashūradeh on the island of Cheleken and in the Aleksandrovsy fort. In return, Turkmens received bread, iron, cast-iron cauldrons, fishing gear, sugar, tea, etc.

During this period, close trade relations were still maintained with Khiva. From there, cotton, silk, leathers, robes and fruits were delivered to Astrakhan, Kazan, Nizhny Novgorod, Orenburg and other cities of the Russian Empire. Ready-made Russian products were delivered to Khiva, such as cauldrons, cast-iron utensils, printed cotton, sugar, iron, small wares, rifles, etc. [Nashisosed, 1873, p. 128].

Starting in 1888, Tatar merchants' trading activity in Tashkent intensified. Large wholesale stores were built here. For example, the trading activity of the Yaushevs and the Bakirovs—merchants from Troitsk—was well known in the city; by the early 20th century, the volume of their business was worth 1,200,000 roubles for the former and 700,000 roubles for the latter [Dobrosmyslov, 1912a, p. 372–373]. In 1905, the trade turnover of Latif Gaisov-

ich Yaushev and his heirs reached 800,000 roubles. Troitsk Tatar merchants dealing in trade allocated considerable sums for the cotton business and raw cotton trade. At the same time, many Tatar merchants began to curtail their trading activities in Tashkent, gradually passing the torch to merchants of Uzbek and the Jewish heritage. The money was allocated to promising branches and types of trade connected with them.

Railroad construction and the expansion of Tatar merchants' trade links with the peoples of the East. On 1 May 1899, railroad traffic from Tashkent to Krasnovodsk was officially opened up on the Central Asian railway, and on 1 January 1906, the Tashkent Railway from Tashkent to Orenburg was launched. It positively resulted in the development of Tatar merchants' trade. Since there were quite large Tatar diasporas in Central Asian cities, the issue of providing education for Tatar children arose. In 1873, the first Tatar school was opened at the Mosque at Tashkent's Voskresensky Market. 100 children studied there. All in all, in 1887, 1,386 Tatars lived in the city (out of 130,304 people) [Dobrosmyslov, 1912a, p. 79]. Clusters of Tatar merchants also formed in Aralsk, the city of Turkestan, and others. In some populated areas which were also important trading centres, Tatar merchants played a key role. For example, in the city of Chimkent: 'Trade is mainly in the hands of Kazan Tatars' [Masalsky, 1913, p. 605]. Shorter time necessary to deliver goods from the banks of the Volga River, central guberniyas, as well as from the Southern Ural range with the help of the existing railway, facilitated the expansion of Tatar merchants' trade activity into the vast expanses of Kazakhstan and Central Asia.

The connection of the Trans-Caspian railway with the Samarkand-Adijan railway and, as a result, the creation of the Central Asian Railway (its operation started on May 1st, 1899) also had a positive influence on Tatar merchants' activities. They expanded their trade turnover, namely, in Ashgabat where there were about 40 caravans. 'In terms of trade, Askhabad is a major centre and transit point of

domestic and foreign trade; trade relations with Persia are quite brisk and are maintained by means of caravans' [Masalsky, 1913, p. 630]. A similar situation existed in Merv, from which raw cotton, cotton seeds, wool, hides, carpets, and rice were exported and where metal and manufactured goods as well as timber materials were imported. Their influence also became noticeable in Panj, a centre of trade with Afghanistan. From the neighbouring country, they imported fruits, nuts (pistachios), raisins, hides, raw cotton, etc. and imported Russian industrial goods, sugar, etc. Tatars also settled in the farthest regions of Central Asia, including the Pamirs. Namely, they could be found in the city of Przhevalsk (the former Karakol— *V. Sh.*) and Przhevalsk uyezd, where they were busy trading with China. Different industrial goods from Russia were imported into China (worth nearly 80 thousand rubles)—raw cotton, dried fruits, coarse calico, mata, etc. (worth nearly 688 thousand rubles) were exported [Masalsky, 1913, p. 766]. Tatar merchants also played a significant role in the trade business of Jarkent, a city bordering China. In the Asiatic part of the city, there was a large marketplace with Chinese stores and Dungan dining halls. From Jarkent, the merchants brought kerosene, sugar, cotton cloths, metals, matches, etc. to China and imported hides, leathers, wool, felt, and drove cattle. Tatar merchants had a considerable amount of money in the city of Verny (Almaty.— *V. Sh.*), in Kopal (they traded with Kulja) etc.

The books describing the period under consideration emphasise the special role of Tatar merchants at the markets of Central Asia. For example, Tatar merchants' capital was very strong in the entire Trans-Caspian Oblast: 'In this oblast, trade has so far been in the hands of the migrant population, mainly, Armenians and Tatars, as well as the Jews, Persians, and people of Khiva and Bukhara; Russians who deal in the trade business are relatively few here' [Masalsky, 1913, pp. 545]. Turkmens themselves, living on the expanses of Trans-Caspian Oblast, were less engaged in the trade business. The most important trade centres of this part were the ports of Krasnovodsk, Ashga-

bat and Merv. Ashgabat maintained close trade ties with Khiva and Iran, and Merv played a significant role in trade with Bukhara, Khiva and Afghanistan. From Khiva, hides, robes, lambskin, butter and other goods were brought through the Karakum Desert, while felt mats, tea, sugar, and various Russian manufactured goods were imported into Khiva. Of course, the largest flow of goods into the Trans-Caspian Oblast was from European Russia. From here Tatar merchants brought metal and industrial wares, flour, and sugar to Kislovodsk by sea, and green tea came through the Caucasus. From the Turkmen steppe, fish, raw cotton, wool, hides, etc. were imported.

In general, Tatar merchants took an active part in Russian-Central Asian trade. Only in Russian Turkestan were trade turnovers worth some 320 million rubles. In 1894, when the Emirate of Bukhara was integrated into the customs area of the Russian Empire, it revitalised trade relations with Afghanistan and India. For example, the export of these industrial products from Russia to Afghanistan increased: cotton fabrics, china and metal wares, sugar, etc., while imports from Russia were raw materials: raw cotton, wool, hides, etc. As before, Bukhara remained the leading centre of the Russian-Indian and the Russian-Afghani trade; there were customs houses, offices of branch banks (Russian National Bank, Russian-Chinese Bank and others), warehouses, and offices of foreign and domestic companies. The turnover of trade relations between the Russian Empire and neighbouring countries of the East lying along the Turkestan border, such as Iran, Afghanistan, India and China, had considerably grown by the early 20th century and reached 31.8 million rubles by 1908: import was worth nearly 15.7 million rubles while export was worth nearly 16 million rubles [Masalsky, 1913, p. 552]. The assortment of goods was well-established: with a trade surplus for the Russian side in general, exports from the Empire to neighbouring Asian countries was mostly made of finished industrial products, while imports mainly included raw materials and foodstuffs, which were in firm demand in the domestic market (for example, they import-

A departing caravan in Troitsk. Photo from the early 19th century.

ed fruits, nuts, sesame, etc. from Afghanistan worth considerable sums of money).

Kazan Tatars appeared during the construction of the Chinese Eastern Railway. They were primarily merchants and petty traders who successfully utilised all the advantages of being pioneers. Their trading activity covered a considerable part of Manchuria: Russian Tatars could be found in Khailar, Bukhed, Mukden, Hungutlu, Chan Chun, Yakeshi, Jilin, etc. In 1904, a large Tatar diaspora settled in Harbin [Kashapov, 2010]. Tatar merchants' active participation in trade operations in Manchuria caused changes in trade flows and reorientation in the flow of goods. In particular, the price of meat has sharply increased in Harbin and Vladivostok. To provide for the demand of meat in Vladivostok, it was imported from Australia [Kharbinsky, 1908, p. 43].

Trading activity of Tatar merchants in the Kazakh steppe. The lack of competition in the Steppe earned enormous profits. The Kazakhs exchanged cattle for Russian industrial products. Quite often, Tatar merchants who left for the Steppe returned to Troitsk, Orenburg, Omsk, Orsk and Petropavlovsk with large herds of horses, loaded with different cattle-breeding products (hides, fat, intestines, etc.) and herds of cattle. Then the cattle or the raw materials were delivered to Moscow, Saint Petersburg, to the Vladimir Governorate, to Revel, Libava, and from there even to Berlin. 'Kazan consumed quite a lot of mutton fat' [Belonogov, 1903, p. 291]. Tatar merchants also played

a significant role at the large local markets of Kirghiz Krai: Konstantinovskaya in Akmolinsk, Petrovskaya in Atbasar, Tainchinskaya in Petropavlovsk Uyezd, Botovskaya in Karkarlinsky Uyezd, Char-skaya in Semipalatinsk Uyezd, in Aktyubinsk, Kustanai, Turgai, Irghiz, Guryevsk and others. To transport cargo, Tatar merchants used river and land transport, but more often cargo was delivered through a

combined method: on camels or horses, they were then transferred to river boats and eventually continued by rail and so on. The development of trade in this area was facilitated by enormous railway construction. Putting the West Siberian railway into operation and the construction of Orenburg-Tashkent railway facilitated a larger trade turnover and broader geography of trade.

Other trading conditions existed in Semirechenskaya Oblast. Here 'the market of cattle and cattle-breeding products ... was in the hands of Tatars and Sarts'. Small trade in the steppe and at local markets was also mostly conducted by Tatar merchants: '...when autumn comes, these merchants, provided with the stocks of goods which the Kirghiz need in everyday life, make their appearance in the winter nomad camps and, staying there for the whole winter, they exchange their goods for cattle, wool, hides and other steppe products, which are then exported to the north, to Siberia or to the south to Turkestan (cattle)' [Belonogov, 1903, p. 546]. The most important trade route in Tatar merchants' foreign trade in Semipalatinsk Oblast was the Chinese route. From Xinjiang to Semipalatinsk they delivered wool, hides, other cattle-breeding products, live cattle, cotton fabrics, raw cotton, china, brick tea, etc. In turn, they imported the following goods from China to Russia: cloth, cotton fabrics, utensils, candles, sugar, kerosene, matches, metal wares and others. Thus, by the early 20th century, Tatar merchants' foreign trade links

with the peoples of the East had considerably extended. This was facilitated by the development of communication, by Russia's trade agreements with almost all neighbouring states, by the implementation of large-scale projects on Russia's borders and on the territories of the neighbouring Asiatic countries, by the wide use of banking loans, by using insurance, and by the active creation of trading houses, companies and joint-stock societies. The rich experience of trade interaction with the peoples

of Asia which had been accumulated by the preceding generations made it possible for the Tatar commercial class to subtly feel the pulse of the East, to quickly adjust themselves to the rapidly changing conditions of both domestic and foreign markets. The prestige of Tatar merchants in the East contributed to more reliable partnership trade and economic relations between the Russian Empire and the peoples of Asia, and served as a kind of visiting card for the northern country.

§ 2. Russia's Central Asiatic policy and Tatar interpreters

Gulmira Sultangalieva

To develop strategy and tactics of attitude towards Khiva, Kokand, and as well as to find out what kind of plans the British had for Central Asia, the government needed to receive reliable information on a regular basis.

The customs house in Orenburg was one of the largest in the empire; Orenburg's *Menovoj dvor* [trading centre] gathered representatives coming not only from the steppe and Central Asia, but also from Afghanistan, Persia, China, etc. From the 1860s Orenburg rose in prominence, especially due to the infiltration of English intelligence missions into Central Asia and its neighbouring countries, whose territories, according to strategic plans of the British government, were regarded as potentially lucrative markets for English industrial goods and a convenient springboard for further military and political activities in this region [Rozhkova, 1949, pp. 152–180]; 1958, pp. 109, 111; Mikhaleva, 1982; Erofeyeva, 2000, p. 358,–362].

Since even geographical data and information on natural and climatic conditions were scanty, it is no wonder that this information was also provided by interpreters with official embassies and trade caravans arriving in Orenburg from Khiva, Kokand and Bukhara. Communicating with their retinues made it possible to receive 'the needed information' about the nature and mission of the embassies, about influential officials, and about the strength and combat readiness of the armies of neighbour-

ing countries [State Archive Orenburg Region, f. 167, inv. 1, file 2428, s. 1–28 reverse].

Dragomans were mainly engaged for oral translation, while interpreters' activities were determined by the role the Orenburg region played in the empire's eastern policy; they were required to have a command of oriental languages. The character, content of work, duties and powers of interpreters and dragomans depended on the policies of the regional authorities in the multi-ethnic region at the given stage.

Furthermore, the administration of Orenburg included Tatar translators in diplomatic missions, which were sent to Central Asian Khanates or appointed them as *pristavs* [official representatives] accompanying Khiva or Bukhara ambassadors who arrived in Orenburg. One of the first Tatar interpreters for the regional administration, who joined Russian diplomatic missions sent to Central Asian khanates, was interpreter Mendiir Bekchurin. On two occasions (in 1771 and 1780) he was sent with a diplomatic mission to Bukhara.

Lieutenant Abdulnasyr Subkhankulov arrived in Bukhara in 1810 on an important mission, namely, to present a letter from the Russian emperor to the Emir of Bukhara in order to establish diplomatic relations between the countries. In addition, he was given special assignments: to identify those who were counterfeiting Russian bank notes, in particular, the

counterfeiter Kh. Valitov;³ to gather information about the number of Russian prisoners and Kara-Kalpaks in the Khanate of Bukhara; to clarify the position of the British in Afghanistan and the Central Asian Khanates; to study the state of trade and the economic interests of the merchants and government of Bukhara; and, finally, to plan the routes of Russian trade caravans to Central Asia [Galiev, 1994, p. 51].

In 1818, Subkhankulov was sent on a new secret mission, this time to another Central Asian khanate, to Khiva. The official reason for sending the expedition was Russia's desire to reach an agreement with the Khan of Khiva on mutual protection of trade and, if possible, to have him pay damages to Russian merchants who had been robbed by Khivans. The aim of the mission was also intelligence. In general, Lieutenant Subkhankulov's missions helped the Russian authorities gain a better understanding of the events taking place in the neighbouring countries of Central Asia and find solutions to specific issues connected with the development of Russia's trade ties with her southern neighbours. [Shkunov, 1997, pp. 17–23; Vneshnyaya politika, 1952, pp. 332–337].

The Khanate of Khiva had a special role in the strategic plans of the Russian Empire. The proximity of Khiva to trade routes leading to the neighbouring Central Asian khanates made it very important for Russian-Central Asian trade.

In the first half of the 19th century the relations between Russia and Khiva, despite the development of trade contacts, were strained. One of the reasons was the delineation of spheres of influence in the Kazakh steppe. Despite the fact that the Kazakh lands bordering on the Khiva Khanate had been a part of the Russian Empire for nearly a century, the rulers of Khiva claimed control over the Kazakh

clans that camped along the Caspian Sea coast [Rozhkova, 1949, pp. 46–48].

In order to regulate relations, an expedition was sent to Khiva in 1819 with interpreter M. Bekchurin, who was supposed to convey a letter to the vizier of Khiva from the head of the Collegium of Foreign Affairs, K. Nesselrode. However, his mission was unsuccessful because Bekchurin was sent back without an official response.

Relations between the countries were greatly complicated by the question of the Russian prisoners of war in Khiva and the mechanism of their release. After unsuccessful negotiations, which took place in 1837–1838, the government decided to enforce its claims by force of arms; thus, a project for a military campaign against Khiva was supported.

Because of limited financial support for the Khiva expedition, it was decided to hire camels from the Kazakhs in the western part of the Orenburg Department instead of buying them. In early November 1839 Cornet Muhammad-Sharif Aitov was sent to the steppe 'for the delivery of 2,000 camels' [Ivanin, 1874]. However, Aitov collected only 500 camels; due to a lack of funds, he failed to repay the Kazakhs for 'hiring the camels' and he was taken captive by the Adai Kazakhs and sold to merchants from Khiva [State Archive of Orenburg Region, fund 167, inv. 1, file 24, s. 5].

While Aitov, an interpreter of the Orenburg Border Commission, was in Khiva as a captive (until August 1840), he met twice with the Khivan Khan Allakuli (1826–1842). The conversations with Aitov gave the Khan the ability to define the subsequent vector of relations with the Russian Empire. The Khan allowed Aitov to make a list of Russian prisoners who wanted to return to Russia. In August 1840 Aitov brought a letter from the Khan of Khiva Allakuli to military governor V. Perovsky and a personalised gift—a silver knife with a handle made of ivory—to Orenburg as a symbol of the resolution of the conflict [State Archive of Orenburg Region, fund 167, inv. 1, file 24, s. 22].

The information gathered by Aitov about the inner life of the Khanate of Khiva was of

³ A native of the village of Ishteryapova (Ashitovskaya) in the Ufa District of the Kazan Guberniya illegally left for Bukhara via the Troitsk fortress and set up the production of counterfeit Russian money, producing 8,000 roubles in assignats a week, which greatly worried the Russian authorities.

interest to the government; in September 1840, the interpreter 'was promoted to lieutenant for excellent actions while in captivity' [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 2786, s. 3 reverse.].

In May 1841 Aitov was part of the diplomatic mission of Captain Nikiforov, who went to Khiva in order to achieve recognition of Russia's rights to the entire eastern shore of the Caspian Sea [Sbornik, 1912]. However, the Khan of Khiva cautiously accepted the mission of Nikiforov and did not agree to reside Aitov in his court as a 'Russian public servant'⁴. In 1844 Aitov escorted Khivan ambassadors to St. Petersburg [Central State Archive of the Republic of Kazakhstan, fund 4, inv. 1, file 414, s. 67–72].

Interpreter Suleiman Batyrshin also made a certain contribution to the development of Russia's relations with the Central Asian khanates. He was sent by governor V. Perovsky to the Steppe in 1853 'for the speedy hiring of camels' from the Horde 'to transfer state food supplies' in the course of preparation for the Khiva expedition in 1853. For efficiency and on-time delivery of animal transport, Batyrshin was made a titular counsellor with seniority in 1854. In 1854–1859 he repeatedly accompanied embassies from Bukhara and Khiva to St. Petersburg as a *pristav* [official representative] and accompanied Russian embassies to Khiva and Bukhara as a *dragoman* [Central State Archive of the Republic of Kazakhstan, f. 25, inv. 5, file 245, s. 46].

In addition, Tatar interpreters made detailed 'Notes' about the Central Asian khanates, which contained information on the socio-political development of the state and recommendations for developing areas of the empire's policy not only in relation to the neighbouring Khanates, but also in relation to the Kazakhs of the Syrdar region [Zapiska, 2007, p. 300–318].

Interpreter Suleyman Batyrshin. Photo, 1858.

For active assistance in the Central Asian policy of the empire, some Tatar interpreters were promoted and decorated: On 23 March 1811, Abdulnasyr Subkhankulov was awarded a gold medal on a red ribbon and a one-time payment of 750 rubles 'for diligent performance' of his duties during his time in Bukhara; S. Batyrshin received the rank of court counsellor in 1862 [Central State Archive of the Republic of Kazakhstan, f. 25, inv. 5, file 245, s. 47].

In summing up our analysis of this aspect of the activities of Tatar interpreters and translators, let us note that the collection of various information and data about the persons who came from Central Asia as caravan leaders, merchants or salesmen to the market in Orenburg was a mandatory rule for Tatar officials. This can be seen in their messages and reports, where they notified local authorities about what they heard 'from the Kyrgyz and Tashkentians coming to the market' [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 4910, s. 1–5; file 2467, s. 165]. It was merchants and caravanners, who provided the administration with the first information

⁴ The negotiations begun by Nikiforov on the conclusion of a peace treaty between Russia and Khiva were continued in 1842 by Lieutenant-Colonel G. Danilevsky. His mission was more successful. He concluded an act, according to which the Khivin Khan Rakhimkul (1842–1845) pledged not to undertake hostile actions against Russia, not to condone the looting of trade caravans, and not to keep Russian prisoners in Khiva.

about the upcoming arrival of envoys and diplomatic missions from neighbouring countries and military and strategic information.

Tatar interpreters performed a wider range of functions than was provided for by their actual positions. They played the role of intermediaries in establishing contacts between the regional authorities and representatives of indigenous peoples; when receiving diplomatic missions from neighbouring countries and when sending Russian embassies; and in trade between Russia, the Steppe and Central Asia;

and they collected information on the history and culture of the peoples, on the natural and geographical conditions of the region, etc.

Thus, the activities of Tatar interpreters and translators in the agencies administering the Kazakhs in the first half of the 20th century was complex and multifaceted. Their work in governmental institutions and their participation in diplomatic missions and negotiations objectively met the government's purposes for advancement into the territory of South Kazakhstan and Central Asia.

§ 3. The North Caucasus

Ildus Zagidullin

During the reign of Catherine II the Russian Empire began to implement the so-called Greek project, which called for the complete conquest and subsequent partition of the Ottoman Empire. Part of the implementation of the Greek project was the accession of Crimea in 1783, the creation of the Black Sea Fleet, and the conquest of the Caucasus. In 1805–1806 all the major Khanates of Northern Azerbaijan were merged into the Russian Empire [Smirnov, 1958, p. 174].

The autocracy tried to use its experience in strengthening its political influence in the Kazakh steppe with regard to the Caucasian peoples as well. In the early 19th century, Orenburg mufti M. Khusainov was sent on a mission to the Caucasus, where he received Russian prisoners from the Kabardians and organised their tribal courts and the procedure for taking an oath of loyalty to the Russian Emperor [Azamatov, 1996, p. 47].

According to the literal meaning of the Decree dated 22 September 1788 on the establishment of the Assembly of Mohammedan Law, all the Eurasian space of the Empire came under its religious and administrative jurisdiction, especially considering that three years before that, in 1785, the Caucasian vicegerency (1785–1795) had been created, com-

prised of the Caucasus and Astrakhan regions⁵. In 1860, after the abolition of the Caucasian military lines, the Kuban, Terek and Dagestan oblasts were formed [Tsutsiev, 2006, p. 16, 20]. The Orenburg Muslim Spiritual Assembly, because the question of administration of the spiritual affairs of the Russian Ummah was poorly elaborated in legislation, took nearly every opportunity to isolate itself from the North Caucasus (the Kuban and Terek regions and Stavropol province), stating that they were not officially under its jurisdiction. However, the Ministry of Internal Affairs and the local administration, due to the absence of religious administration in these regions, systematically sought an expert opinion in Ufa when it was necessary. The State Council, having considered in 1894 the program of the War Ministry on the reform of the administration of Muslim spiritual affairs in the North

⁵ In 1790 the Kazan Guberniya was abolished, after which it gained the status of a district within the Astrakhan Guberniya; in 1802 it was restored; in 1822 it was reorganised into a district with its centre in the city of Stavropol; and in 1847 it was renamed the Stavropol Guberniya. The territory occupied by the Nogais was divided into four administrative units, which led to a split between their tribal groups. All Nogai administrative units were included in Stavropol guberniya. In 1888 the Karanogai unit and Kizlyar uyezd were ceded to the Terskaya Oblast.

Caucasus, acknowledged that the powers of the OMSA did not extend to the Terek and Kuban regions and Stavropol province. But this opinion of the supreme authority was not properly codified in legal documents [Zagidullin, 2007, p. 6].

By 1830 the conquest of Transcaucasia has been completed. by that time an imamat had taken shape in the North Caucasus—an Islamic state with a strong ideology that united mountain dwellers who were 'totally hostile to Russia', which soon was headed by Shamil. An 'era of state-organised opposition to Russia on the part of a considerable part of the mountain communities of Dagestan and Chechnya' had began [Tsutsiev, 2006, p. 18]. The government was concerned about the spread of the anti-Russian ideology of the mountain dwellers among their brothers-in-faith in the Volga-Ural Region. In order to prevent any contact between them, in 1833 assignment of Tatar recruits (Muslims) to the Separate Caucasian Corps was prohibited [Svod voenny'x, 1838, Part 2, Book 1, Article 271].

At the same time, the government decided to use the Islamic religious institution under its control as an ideological countermeasure: it established the office of mufti of the Sunni Muslims of the Caucasus in 1834 in Tiflis. Of the two candidates recommended by Orenburg mufti G. Gabdrakhimov for this responsible position, the government chose Mustafa Tadzhetdin, who had studied in Dagestan and was one of the most educated clergymen in Kazan. It is known that Tadzhetdin appealed to the mountain dwellers in 1837, calling on them to submit to the Russian government. However, the mufti was not popular among the mountain dwellers of Dagestan. According to Ş. Märcani, the reason for his resignation and departure to Kazan⁶ was complaints against him from his enemies and the envious [Märcani, 1989, b. 302–303]. According to other sources, in 1840 M. Tadzhetdin went to Kazan on the pretext of family affairs, and made receipt of a salary equal to that of the Orenburg mufti a condition

of his return to the Caucasus. Tadzhetdin was replaced by Kazakh qadi Osman Effendi at the previous salary of 250 silver rubles.

When M. Vorontsov was the governor of the Caucasus (served 1844–1854), a Crimean Tatar qadi-esker and his four assistants were invited in 1845 with a salary of 400 rubles each in order to intensify the ideological influence on the mountain dwellers. Qadi-esker Sayyid Halil Effendi was active in preaching and was awarded the Order of St. Anna, 3rd class, and the members of his entourage were made officials of the 14th rank [Smirnov, 1963, p. 95–97; Avksentiev, 1973, p. 60–61]. In 1852 Vorontsov invited 10 ulamas from OMSA 'to counter the preachers of jihad' [Severnoy'j Kavkaz, 2007, p. 105].

Another important area in the government's activity to create a docile clergy was the foundation of eight Muslim religious schools in 1849—three for Sunnis (in Tiflis, Derbent and Shemakha) and five for Shiites (in Tiflis, Elisabethpol, Shusha, Shamakhi and Baku) [Smirnov, 1963, p. 98]. This step indicated the unwillingness of the authorities to involve Tatar mullahs in solving political problems in the Caucasus and an emphasis on creating a loyal local clergy.

Another step of the government aimed at forming aristocratic strata of the Caucasian peoples that were loyal to Russia should be noted. In 1828, as a part of His Imperial Majesty's Own Escort in St. Petersburg the Caucasian Mountain Half-Squadron of Life Guards was formed from among the elite of the Muslim mountain dwellers⁷. In May 1837, in order to incline the mountain dwellers to 'voluntary submission', a delegation from the emperor was sent to the Caucasus, headed by the commander of the Caucasian Mountain Half-Squadron of the Life Guards, Colonel Khan Giray. Meetings with chiefs of the mountain dwellers were held at certain points on the cordon line, where

⁶ M. Tadjedin then travelled to Mecca, but on his journey home in 1845 he died, aged 57.

⁷ At the height of the Caucasian war (in 1836) a group of Lezgians formed part of the Leib Guard of the Caucasian mountain half-squadron of His Imperial Majesty's Own Convoy (before 1882). Between 1839–1882 His Imperial Majesty's Own Convoy also included a team of Muslims from amongst the Azerbaijani troops.

they were invited to choose representatives from among themselves to express their loyalty to the Emperor. In August, Nicholas I arrived in the Caucasus. However, hopes for the peaceful accession of the North Caucasus proved vain [Petin, 1899, pp. 90–104].

In the early 1830s the soldiers of the Caucasian Mountain Half-Squadron of the Life Guards of His Imperial Majesty's Own Escort appealed to the Emperor with a request to enroll their children and relatives in military schools; as a result, 40 young mountain dwellers from 25 princely families were assigned to the Dvoryansky Regiment and the Alexandrovsky, Pavlovsky and the 2nd Cadet Corps. In 1830–1840 315 mountain dwellers were being educated in the cadet corps, and in 1845, 128 mountain dwellers studied there. In 1834 came an imperial decree on the summoning of the children of honored Muslims of the Caucasus Krai to the Page Corps. To teach Muslim cadets the basics of Islam, mugalim positions were originally provided for in the staff schedule of the capital's schools (since 1865—for a fee). Tatar civilians and military mullahs of St. Petersburg were invited to take these positions. Along with teaching the basics of Islam in the Page Corps, the imam G. Suleymanov (the future Orenburg mufti) conducted educa-

tional work among them in order to 'instill trust in the government'. In 1831 he was awarded the title of Tarkhan for his successful teaching activities in line with the government policy. In 1822–1846 Imam Muhammadalim Khan-temirov taught the Muslim mountain dwellers, and in the 1850s his son Imam Muhammaddin Khantemirov did the same. Then military akhund of the Special Guard Corps Hamidullah Khalitov started his teaching career.

On the eve of the end of the Caucasian War, by a decree dated 11 October 1858, the assignment of the children of honoured mountain chiefs to the cadet corps was terminated, and it was ordered that they should be given a 'local education'. The only exception was for children 'from honourable and rich families'.

Thus, the active participation of the Tatars in Russian relations with the countries of the East were in the pre-reform period, and it was largely initiated by the government to address specific foreign policy and economic objectives. The main areas of Tatar activity were establishing and developing trade and economic relations with Asian markets; service in border administrations as translators and interpreters and as escorts of diplomatic missions; and gathering information on the situation in neighbouring countries.

§ 4. The Tatars and the Ottoman State

Alfina Sibgatullina, Ismail Turkoglu

The Volga Tatars, as representatives of Turkic peoples and Sunni Muslims living in the Russian Empire, held Ottoman Turkey and the sultan-caliph in respect and awe, as the guarantor of Turkic brotherhood and the unity of the faith for all Muslims in the world. One important means of establishing regular contacts between Russian Muslims and brothers-in-faith in the Ottoman State was the hadj. In addition to the performance of religious duties, the hadj contributed to establishing cultural, interpersonal and trade and economic relations between Muslims of both countries. Hejaz, the region where Mecca and Medina, cities sacred

to Muslims around the world, are located, was at that time part of the Ottoman Empire. Therefore, Russian Muslims performing the hadj, regardless of the route, would in any case enter the domain of the Turkish sultan-caliph.

Performing the hadj was a difficult, time-consuming and costly undertaking. Rich Tatars, in order to create the conditions for rest on their way to Mecca, established waqfs on the route of pilgrims. A document of 1791 tells of a Suleiman Chelebi from Kazan, who created a waqf in Istanbul. In 1837 one such waqf was established by Suleyman-aga from Kazan [Osmanskij arxiv pri prem'er-ministre Turecz-

koj Respubliki, fund C, HR, file 714]. In 1847 Muhammadjan Effendi created a tekke—a Sufi institution—in Mecca. At the turn of the century the purchase of various types of real estate in Istanbul, Mecca and Medina by rich Muslims from the Volga Region was noted. Pilgrims from the Volga Region were accommodated in the 'Uzbek' Naqshbandi tekkes in Istanbul and other cities of the Empire. Shakirds who had come to Turkey to study in madrassas organised communities and societies. Students and pilgrims brought books of various content to the Volga Region, including textbooks, which explains, in particular, the influence of Ottoman language on many writers and publicists of the early twentieth century. The Tatar intelligentsia also became acquainted with French novels through Turkish translations.

The capital of the Ottoman Empire was the main transit point for pilgrims en route to Mecca and Medina, and Russian Muslims did not miss the opportunity to visit Istanbul, speak with the local sheikhs, imams and ulemams, and purchase new books on Islam. A vivid example of this is the pilgrimage of Şihabetdin Märcani, who was in Istanbul for 12 days in 1880. Like other pilgrims from Russia, Märcani visited the main mosques and libraries of the city. He not only bought books, but presented his own books to the Hamidiye Library. Märcani was received in Istanbul by such famous people as Mufti Shaykh ul-Islam Ahmad Esad-Efendi, Minister of Justice Jevdet-Pasha, Minister of Foreign Affairs Asim-Pasha, Sheikh Muhammad-Effendi al-Edirnevi, Sayyid Salman al-Baghdadi, Darwish b. Ibrahim al-Kurdi al-Baghdadi and others. When Märcani spoke with them, he was pleasantly surprised that they heard of his essay 'Nazurat al-haqq'. They asked his opinion about the length of the day and night and about the sunrise and sunset in the Volga-Ural region, and about scholars and the Muslims of Russia in general; they were interested in spreading the European system of education among the Tatar people [Yuzeev, 2003, pp. 54–75].

The pilgrimage of Sufi ishan Zainulla Rasulev is an example of the acquisition of new religious movements by 'Russian Muslims' in the

Ottoman Empire. Thanks to his meeting with sheikh Ahmed Ziyaeddin Gyumyushhanevi in Istanbul in 1869, a new branch of the Naqshbandi tariqat, Khalidiyya, became widespread in the Volga-Ural region.

The attitude of the government of the Russian Empire to performance of the hadj by Russian subjects was mixed. The authorities often saw it as a way for alien ideology to penetrate; that is why in the mid-1860s (under the influence of the mass 'apostasy' of baptised Tatars to Islam in the Middle Volga Region) [Materialy', 1936, p. 449] and at the turn of the century (to counter the migration of Tatars to Turkey) the pilgrimage of Russian Muslims was prohibited under various pretexts.

In the late 19–early 20th century the number of Russian Muslims making the pilgrimage to Hejaz grew steadily and amounted to 8–10 million people per year. Some poor pilgrims staying in the territory of the Ottoman Empire could rely on the financial assistance of the Sultan, which was expressed in the allocation of free tickets for ships going to Jidda, the possibility to join the Sultan's caravan which brought gifts to Mecca every year during the hadj season, etc.; this meant full coverage of travel expenses and free food, as well as a guarantee of safety on the road.

In the late 18–first half of the 19th century, pilgrims played an important role in the resettlement of the Tatars. The Crimean War caused a new wave of migration from Russia. For this reason, in 1859 in Istanbul a state commission on displaced persons (muhajirs) from the Russian regions was created, the keeping of records about them was organised, and information about arrivals was gathered. Data about migrants up to that time was recorded in the archives only if material assistance was requested [Osmanskij arxiv pri prem'er-ministre Tureczkoj Respubliki, fund C. MF, file 3222; fund C. ML, file 8575]. We know that not all migrants made such applications. From 1876 to 1914 500,000 people moved from Russia to the Ottoman Empire. Most of them were representatives of the Caucasian Muslim peoples from Crimea and the Caucasus, while a small part were migrants from the Volga-Ural region.

At that time there was a resettlement agreement between the two countries. Each side had its own interest: Russia sought to liberate the Black Sea coast from Muslims (the imperial authorities at the same time prohibited resettlement from the interior guberniyas of the country), while the Ottoman Empire sought to settle its unoccupied land. Each side put forward its own terms: Russia's condition was that the migrants not be settled on the border with Russia, and the Ottomans' condition was that the muhajirs not leave the land that they received from the state. A common condition was that they not return. In this situation the only victims were the migrants, as in the course of migration many Muslims died. Among the muhajirs there were those who did not want to become Ottoman subjects so that they could return to Russia after a time.

There were periods when the Ottoman authorities prohibited the arrival of muhajirs from Russia due to the spread of the plague and cholera among them. A quarantine area was established not far from Istanbul on the shore of the Black Sea. In such years muhajirs were allowed to enter the city only after a medical quarantine. In the second half of the 19th century the number of migrants from the Volga-Ural region increased. Part of the Volga Tatars, for religious, economic, military and political reasons (forced Christianisation and Russification, famine in 1891–1892, the census of 1897, the Stolypin reforms, the reaction after the revolution of 1905, etc.), were forced to move to Turkey. The main reasons for the resettlement of Tatar migrants were the pressure of the autocracy in the sphere of Muslim religious education, the compulsory teaching of the Russian language and restrictions on book printing, social and economic problems, widespread famine in 1891–1892, the results of the Russo-Turkish wars, and the desire to live freely, to get a religious education, to live together with brothers-in-faith, etc. [Ibrahim, 1908; 1911]. In 1892, 51 ulama scholars from Mecca and Medina wrote a special appeal to the Caliph, Sultan Abdulhamid II, where they highlighted the increased activity of mission-

aries among Russian Muslims and the moral and material support of the missionary work of the Russian Church by imperial authorities. The ulama scholars asked the caliph to support brothers-in-faith at the public policy level [Osmanskij arxiv pri prem'er-ministre Tureczkoj Respubliki, fund Y, MTV, inv. 57, file 50].

The Ottoman authorities were forced to develop a specific policy on the placement of immigrants from the Volga-Ural region. There was a special commission for muhajirs, which kept records of them and monitored them, and also placed migrants throughout Anatolia. At the same time, the wishes of the migrants were taken into account when it was possible.

The Ottoman government allowed wealthy muhajirs to settle in Istanbul; others were placed in the interior areas of the Empire. The bulk of the migrants from the Volga-Ural region and Crimea were sent to Anatolia, an economically undeveloped region of the country. They received free plots of land (not less than 20 acres per man, and they were freed from taxes for 10 years and from military service for 25 years), free lots for building houses, and building materials. For a whole year the migrants were provided with free food. In addition to this, there was a rule that the migrants were not allowed to return to their native land⁸. Despite this, conflicts occasionally arose between the locals and the muhajirs; in this case they were sent to other areas or provided with protection.

Usually muhajirs were required to have official permission for resettlement issued by the Russian authorities. Those who obtained

⁸ For example, in 1894 a group of muhajiruns from the Kazan Guberniya arrived in Trabzon in order to return to Russia. But the Ottoman authorities did not allow them to leave and allocated special lands to them. In 1899 sixteen families (111 people) of Tatars from the Kazan Guberniya were dispatched to the town of Malatya. However, they refused to settle in the lands they had been granted because of their low fertility and 'barren landscape.' As a result, they returned to the city of Samsun, from where they would depart for Russia. The government then offered them new territories close to the coastal areas of Samsun (the present-day village of Hilmiya) [Osmanskij arxiv pri prem'er-ministre Tureczkoj Respubliki, fund I. DH, inv. 1318, file Ca/5; OATR, fund MV, inv. 97, file 87].

such permission were issued a Russian passport. Those who wanted to migrate from Russia appealed to the Sultan through special agents dealing with the resettlement of Muslims to the Ottoman Empire. Information about the route and the number of migrants was reported in advance to Turkey, whose authorities took measures for their reception and temporary accommodation. The Turkish Ministry of Internal Affairs allocated a certain amount for their transportation and accommodation, and gave long-term loans for construction of houses. However, some settlers came to the Ottoman Empire unofficially, without the consent of the parties and without passports. The Turkish side accepted them as refugees. The total number of Tatar migrants is unknown. On the average there were 4 people in each family. Tatars from the Kazan, Ufa, Saratov, Samara, Simbirsk, and Astrakhan guberniyas lived in Anatolia near the cities of Istanbul, Izmir, Bursa, Ankara, Eskişehir, Kütahya, Samsun, Amasya, Malatya, Adana, Yozgat, and Izmit, on the Balkan Peninsula in Dobruja, and in Mecca, Medina, Jidda, and Damascus. Tatar villages were organised, which were named Osmania, Mesudiya, Hilmiya, Hamidiya, Hamidabad, Ertugrul, etc. Some muhajirs did not like the place they were settled in, and they expressed their desire to return to Russia⁹. The Ottoman side tried to prevent these attempts, offering fertile land and building materials to those who were dissatisfied. The Tatars usually got along with the local population, although sometimes there were problems with land partition. The Tatars engaged in farming and livestock breeding. Those who settled in the city kept teahouses or coffeehouses with the consent of the authorities.

There were attempts to create their own diaspora and societies, but the Tatars gradually

adapted to the Turkish environment and assimilated. Subsequently Volga muhajirs and their descendants have played a significant role in the socio-political and cultural life of the Ottoman Empire, in particular, holding very high positions in state administrative structures, as well as gaining wide reknown in science, literature and art.

The Minister of State of the Ottoman Empire Mehmed Kani Pasha (1805–1885), who was a Tatar born in Penza Province, played a major role in the improvement of immigrants' life. He started his career as a translator and gradually became an influential figure under Sultan Abdulaziz (1861–1878) and Abdulhamid II (1876–1909). He successfully dealt with the financial and economic affairs at the palace and with the customs service, served as Minister of Finance (1864–1865, 1879–1879) and Minister of Public Works (1873), and was a member of the Meclis (National Assembly). He facilitated political relations with Russia and France, and was awarded the Order of Stanislaus 1st class and the Order of the Legion of Honour 2nd class [Osmanskij arxiv pri prem'er-ministre Tureczkoj Respubliki, fund DH, SAID, inv. 1, file 244]. Mehmed Kani Pasha was the highest governmental and political figure from among the immigrants from the Russian Empire. He was buried in Topkapı at the Merkez-Efendi cemetery. The descendants of Mehmed Kani Pasha also became prominent figures in the Ottoman Empire [Osmanskij arxiv pri prem'er-ministre Tureczkoj Respubliki, A. MKT. MHM, 335/6].

Tatar Miftahetdin bin Abdulgani, a native of Belebey Uyezd, Ufa Province and a graduate of the Sterlibashevo madrasa, may be named among the representatives of the administrative staff of various court services. In Istanbul he was presented to the Sultan by Mukhtar Pasha, and for thirty years Captain Miftahetdin served in security in the palace of the Sultan. Abdul Hamid II named him Mustafa, and appointed him as a manager of his palace. It is known that Mustafa-Efendi provided great assistance to Russian pilgrims [Gabdreshit Ibrahim, 1911, b. 3].

Gabderashit Ibragimov was the most active among Tatar theologists in Turkey at the end of

⁹ It is a known fact that the poem by G. Tukay 'Kitmibez!' ('We Shall Not Leave!') is written in protest against the policy making of the Russian authorities, who forced Muslims to abandon their motherland. It became a response to agitators calling upon the Tatars to migrate to Turkey. In his novel 'Muhadjiri' (1934) Makhmut Galyau (1886–1938) describes the depressing circumstances of the resettlement and accommodation of the Tatars in Anatolia.

the century. In 1895 in Istanbul he published the books 'Livaul Hamd' and 'The Morning Star', which were banned in Russia for severe criticism of Orthodox missionary activities and the Russification policy of the autocracy. Having made a journey through Europe and Asia in 1897–1900, G. Ibragimov began to preach the idea of reforming Islam and modernising the lives of Muslims among the Turkic Muslims of the Russian and Ottoman empires. In his first book he urged Tatars to migrate to Turkey. The book quickly became popular among Russian Muslims, and largely prevented the conducting of the census in 1897.

The migration of Russian Muslims to the Ottoman Empire had a positive impact on its economy: the bank investments and gold reserves of the country increased.

Muhajirs significantly strengthened the intellectual power of the Ottoman Empire. Among them were many intelligent and cultured people; their children were educated in Turkey, Germany, and France, and later formed a new generation of Turkish scientists, politicians, and artists. It was immigrants from the Muslim Turkic peoples of Russia (Y. Akçura, M. Rasulzade, A. Ağaoğlu and others) who contributed to the development of political movements such as Islamism, Turanism, and Turkism, which after 1908 became the dominant ideology in Turkey.

In the second half of the 19th century the priorities of the foreign education of the Volga-Ural Tatars changed. The eyes of Tatar youth who were eager for knowledge turned to the educational institutions of the Ottoman state. At the end of the century, secular higher education institutions drew the attention of Tatar youth: Istanbul's Darülfünûn (University), Dârul-muallimîn (Pedagogical Institute), Military College (Harbiye Mektebi) and 'Mülkiye' (Mekteb-i Mülkiye-i Şahane), the highest secular school where government officials were trained. But they officially began to accept foreign students only after 1905. Among the first Kazan Tatars who studied in 'Mülkiye' were Musa Akyegetzade (1884–1923) and Fatikh Karimi (1870–1937). Akyegetzade, the author

of the first Tatar realistic novel 'Hisametdin Menla', remained in Turkey after graduating from 'Mülkiye' (1891), wrote works on economics, and published the newspaper 'Metin' and various materials about the life of Russian Muslims.

Fatikh Karimi, while he was in Turkey in 1892–1894, carefully studied the culture and history of the Ottoman people. When he returned to Russia, he became active in journalism and was the long-time editor of the Orenburg newspaper 'Vakit', which regularly covered the lives of Turkic peoples not only in Russia, but also in the Ottoman Empire.

A graduate of the second level (Ida-diya) of 'Mülkiye' was Gubaydulla Bubi (1865–1938), the head and mudarris of the Izh-Bubi madrasah. Zakir Ramiev (the poet Derdmend) and Galimdzhana Idrisi got their education in Istanbul. An Ufa Muslim charity sent Ziya Kamali to study in Istanbul; he soon transferred to Al-Azhar University in Cairo, which was also located in the territory of the Ottoman Empire.

In the early twentieth century, many of the highly educated Muslim intellectuals working in the teaching collectives of the madrasahs 'Galiya', 'Husain', Izh-Bubi, etc., were graduates of educational institutions in the Ottoman Empire. For example, the founder of the madrasa 'Galiya', Z. Kamali (1873–1942), graduated from the famous 'Al-Azhar' University in Cairo (1904). Habibullah Zayni, a teacher in this madrasa, was a graduate of the Faculty of Biology and Geography at the Istanbul Pedagogical Institute; Gubaydulla Sattar was a graduate of Istanbul Teachers' Institute, and Gabdulla Sataev was a graduate of the Faculty of Physics and Biology of Istanbul University. Zakir Kadyri studied at the universities of Beirut and Cairo, Fakhri Gabdulla—in Istanbul, Zakir Ayukhanov—at Cairo University, Taki Badygi—in Hejaz. Khatmulla Fazylov and Lutfulla Baychurin perfected their knowledge during long stays in Egypt and Arabia. Nouri Ahmed and Abdullah Shepasov received their education in Istanbul and Beirut [Medrese, 2010, pp. 344–345]. In the madrasa 'Husainiya', special attention also was paid to the training of teachers and the ed-

education of graduates in universities at the expense of scholarships created by A. Khusainov. Shakirds of madrassas continued their studies at 'Al-Azhar', Istanbul and Beirut universities [Medrese, 2010, p. 377]. A part of Tatar madrassa graduates headed to Istanbul to study at the expense of the Ramievs, owners of gold mines.

Gubaydulla Bubi (sitting in the centre) among Tatar students. Istanbul. Photo, 1896.

Among Tatar students who came to study in Istanbul and decided to devote themselves to serving Turkish culture and education (and did not return to their homeland), the most prominent are Musa Akyegetzade, Halim Sabit Shibay, Ahmed Tajeddin and others [see.: Devlet, 1996, pp. 161–173].

One of the most popular and honoured guests in student societies of Russian Muslims was Turkish writer Ahmed Midhat (1845–1912). Many of those who arrived in Istanbul from Russia visited him. A descendant of Caucasus Muslims, A. Midhat was very interested in the problems of people from Russia and rendered assistance to his countrymen who arrived in Turkey. Midhat had close ties with pilgrims from Russia through his work, as he held an important position at the Ministry of Health. He taught at various educational institutions in Istanbul and communicated with students from Russia. Working as the head of publishing affairs, he had the opportunity to meet with journalists and booksellers from Russia. The Muslim Tatar-language periodical press ('Vakit' ('Time'), 'Terjeman', 'Idel', 'Siberia', 'Koyash' ('Sun'), 'Yoldyz' ('Star'), Şura ('Advice') expressed love and respect toward this most famous Turk in Russia.

A. Midhat considered Fatikh Karimi his 'spiritual son'. Even before his arrival in Istanbul, Karimi got acquainted with his works. In

1892, before entering the university, he consulted with Midhat. The latter approved his choice of 'Mülkiye', but warned that the young man must return home after graduation to serve his people [Gökçek Fazıl, 1999, pp. 315–323]. After graduating from the Higher School in 1894, Karimi taught in Yalta and actively corresponded with his tutor. In his letters, Midhat advised that Karimi not engage in politics, but educate his people, and maintain close contact and friendship with I. Gasprinsky [see.: Bargan Hüseyin, 2002, pp. 30–31]. Their friendship lasted until the death of Midhat.

It should also be noted that the descendants of Russian Turks were awarded state awards and rewards from the Ottoman Empire for their services: for example, mufti Muhammedyar Sultanov was awarded the Order of Osmaniye in 1893, and qadi Hasangata Gabashi, imam Galimdzhana Baroudi and others were given various awards of the Ottoman government.

The interest of the Muslims of both empires in each other was mutual and mutually beneficial. While Russian Muslims in Turkey strengthened their faith in conversations with sheikhs and well-known Muslim theological scholars, visited holy places, and received education, the Turkish intellectuals, who had seen firsthand the decline of the great empire of the Ottomans, were interested in the Russian mod-

el of development. While the Ottoman Turks had a strong state tradition, the Tatars were making clear progress in economic, social and cultural life, and some elements of civil society were appearing.

The heightened rivalry between Russia and the Ottoman Empire in the 19th century forced both sides to study each other better. It prompted Ottoman diplomacy to be actively interested in the condition of Russian Muslims. Ottoman diplomacy in Russia especially intensified during the reign of Abdul Hamid II, who, as it is known, was interested in the condition for Muslims in different parts of the world.

This is demonstrated by the reports of employees of the Ottoman Embassy in Russia and documents of the Ottoman Ministry of Foreign Affairs from the late 19–early 20th century. Eleven documents from 1883–1897 relate to certain aspects of the Russian government's policy toward the Muslims of the Volga region. In particular, the officials of the Ottoman Embassy in St. Petersburg kept a close watch on the life of the Muslim community in St. Petersburg, mainly composed of representatives of the Volga Tatars. Two descriptions of the holiday *namaz* performed by Tatars living in St. Petersburg on the occasion of *Kurban-Bairam* in 1890 and 1891 are of great interest. The descriptions are given by officials of the Embassy in St. Petersburg who were present at the worship service; they provide not only historical information, but ethnographic information as well [Ibragimov, 2006].

French scholar François Georgeon believes that 'it was not so much the Russian Turks, who had been on the path of modernisation since the middle of the nineteenth century, who were in need of the Ottoman Empire as it was the

Ottomans themselves trying to imitate them' [Georgeon, 1997, p. 191]. Numerous Turkish intellectuals—natives of Russia who had settled in Turkey—acted as intermediaries between these two societies.

From among the Ottoman intellectuals at the turn of 19–20th centuries, the Volga Region was visited by Suleiman Kami (1887), Suleiman Karchynzade (early 20th century), former Grand Vizier Hüseyin Hilmi Pasha (1910), writer and journalist Jelal Nouri Ilyari (1912), director of the Department of Inventories Mahmud Esad-Efendi (1913) and owner of the newspaper 'Ikdam' Akhmed Jevdet (1914). After visiting the main areas densely inhabited by Tatars (Kazan, Ufa, Orenburg, St. Petersburg, Moscow, Samara, Nizhny Novgorod, Penza, etc.), they wrote their own observations as separate works or newspaper articles which became available both for the Turks and Russian Muslims. After the emergence of the Tatar periodical press, the visits of Turkish guests were covered in detail in Kazan, Orenburg, and even central Russian newspapers and magazines [see.: Sibgatullina, 2010, pp. 152–187].

Thus, by the end of 19–early 20th century, Volga Tatars were able to establish quite close contacts with the Ottoman Empire, which is most clearly manifested in the religious, cultural and educational spheres. The relations of Tatar Muslims with the Ottoman Turks in the field of culture and secular education were expressed more in personal contacts, while in the field of religious life they were expressed in the strengthening of the pilgrimage movement from Russia in this period, in Tatar *shakirds* receiving their education in Ottoman *madrassas*, and in closer communication between religious figures of the two empires.

CHAPTER 2

Tatars in Sociopolitical Events and Military Campaigns

§ 1. Tatars in the administration of Kazakhstan

Gulmira Sultangalieva

The accession of Kazakhs from the Junior Zhuz and part of the Middle Zhuz to the Russian Empire in the 1730s presented the central government with the problem of including a population with a different economic and cultural type (nomadic pastoralism), language (Kipchak group of Turkic languages), and religion (Sunni Islam) in the overall legal and administrative system. Under these circumstances, the government was forced to look for the optimal way to integrate them into the organism of the empire as a whole.

The activities of Russian translators and interpreters in the Steppe. The creation in 1782 of a special administration 'for border affairs' concerning the Kazakhs, and of the Orenburg Border Commission (1799–1859), originally called the Collegium of Border Affairs, 17 years later on the basis of this body,—defined the scope of activities of Tatar translators and interpreters. The Commission was a kind of branch of the Asian Department of the Ministry of Foreign Affairs in this region and was in charge of diplomatic relations with the Steppe and Central Asian Khanates, monitored events taking place there, and collected and studied materials on the history, geography, economics, and ethnography of these countries. By the mid-19th century, the staff of the Orenburg Border Commission included two translators and three interpreters, all of whom were Tatars from the Volga-Ural region [Vasilyev, 1898, p. 4].

In the first half of the 19th century, such interpreters and translators as Salih Biglov (from among the murzas), Muhammadsharif Aitov (from the nobility of the Orenburg province),

brothers Iskander and Suleiman Batyrshiny (from the nobility of the Orenburg province), Mirsalikh Bekchurin (from the murzas of the Ufa district), Kutlugmuhammad Bikmaev (from the nobility of the Orenburg guberniya), Temirbulat Enikeev (from the nobility of the Ufa uyezd), and Abdulkadyr Subkhankulov served in the Orenburg Boundary Commission, and Muhammad-rahim Chanyshiev (a prince from the Orenburg province), Araslanbek Biglov (from the nobility of the Orenburg guberniya) and others worked in the staff of the West Siberian Governorate General.

Tatar translators were an important factor in the implementation of Imperial policy in the Steppe: they repeatedly visited Kazakh nomadic camps to collect data about the location of Kazakh auls and the dispositions of the Kazakh nobility; escorted Russian expeditions in the region; acted as arbitrators in conflict situations and when resolving land disputes between tribes or between the Cossacks and the Kazakh population; conducted audits of the payment of tent taxes; and were part of various commissions as experts on the creation of new territorial-administrative structures,¹⁰ the regulation of

¹⁰ In the 40–60s of the 19th century the commissions for the implementation of administrative bodies in the Steppes and the regulation of land disputes between the Kazakhs and the Cossacks, created by both the regional and central authorities, included the 'Tatars' as a matter of course, not only as translators and interpreters but also as experts. Amongst the members of the different commissions were M. Aitov (the commission for the revision of payment of the tent tax of the Adai, Shimekey, and Tabyn clans, 1845); Salikh Biglov (the commission for the administrative arrangement and division of Asian Russia and the Orenburg

relations between the Russian administration and rebellious Cossacks, etc. [Central State Archive of the Republic of Kazakhstan, f. 25, inv. 5, file 245, pp. 1–62, 186; *Istoriya Bukeevskogo xanstva*, 2002, pp. 478–479, 501–504].

In the 1840s, Tatar civil servants constantly accompanied Cossack detachments building war fortifications in the Steppe: Orenburgskoe on the Turgay River, Uralskoe on the Ir-giz River (1845), Raimskoe (1847) and fort Karabutak (1848).

The range of their activities demanded that they have a proper education, the ability to analyse information, a broad mind and a memory enabling them to remember detailed information of a political, economic, military or other nature which was extremely important to the government in St. Petersburg and the regional administration.

Almost all of them were graduates of the 'Tatar school' at the Orenburg expedition or the Orenburg or Omsk military academies, which were subsequently renamed cadet corps.

The regional administration prioritised activities of translators and interpreters¹¹.

They were to translate Imperial laws for the Kazakh population, which required a knowledge of legal vocabulary and special political culture. The importance of these translations lay in the need to accurately communicate the laws of the Russian Empire.

Region (1866); S. Batyrshin (the commission for the distribution of lands along the left bank of the Ural River between the Ural Cossacks and Kazakhs (1866) [Central State Archive of the Republic of Kazakhstan, f. 25, inv. 5, file 245, s. 1–62, 186–192; f. 4, inv. 1, file 2786; file 2728].

¹¹ Thus, in 1823 graduate of the Omsk Asian School Urazali Kurbanakov was sent to the Kazan Gymnasium to gain a more in-depth knowledge of the Oriental languages. In 1839 he took up service as a translator in the military section of the secretariat of the Boundary Management of the Siberian Kirghizes, specialising in the 'Tatar, Persian, and Arabic languages' [Central State Archive of the Republic of Kazakhstan, f. 374, inv. 1, file 465, s. 1–8]. Translator at the Orenburg Boundary Commission Gaisa Bikmaev, well known in the first half of the 19th century, also received an education at the Omsk Asian School and then at the Kazan Gymnasium and Kazan University [State Archive of Orenburg Region, fund 4, inv. 1, file 2526].

From the late 18th century to the first half of the 19th century, dynasties of Tatar translators and interpreters who served at regional administrations for governing the Kazakh steppe took shape, which indicated a clear tendency toward the formation of a specific professional group of translators. Moreover, a new social category of clerks 'from among translators' children' was distinguished [Gvozdkova, 1999, p. 44]. An analysis of service records showed that marriages were contracted within this social group, which was characterised by a certain level of education, lifestyle and system of values [Central State Archive of the Republic of Kazakhstan, f. 25, inv. 2, file 290, s. 1–7]. According to the theory set forth by American professor G. Freeze, these new social strata, having adapted to the existing order, took the form of traditional hereditary classes [Frize, 2000, p. 162].

With changes in the system of the administrative management of the Kazakh population, namely, with the creation of the Western Siberian Governorate-General, the Omsk Region and the inner and outer districts, the demand for Tatar translators and interpreters increased. Thus, a translator and a dragoman or interpreter were assigned to each outer district administration which was formed on the territory of the Kazakhs of the Western Siberian department [Central State Archive of the Republic of Kazakhstan, f. 374, inv. 1, file 254a, s. 1–3].

By the mid-1860s, when the position of the Steppe changed within the Empire and it appeared to be sufficiently integrated, the highest state authorities of Russia and their regional representatives radically revised their views on the role and place of 'Tatars' in the Kazakh environment. This move on the part of the government was related to a range of foreign policy factors.

With the introduction of the 'Temporary regulation on the administration of the Orenburg and Western Siberian Governorate General' dated 21 October 1868, Tatar translators who worked in the Orenburg and Western Siberian Governorate General were transferred to regional administrations. The logical con-

clusion of this policy was the government decree 'On the replacement of Tatar translators with native Kirghizes' (Kazakhs.— G.S.), issued in 1876.

The service of Tatars on the territory of the Junior Zhuz. In the last quarter of the 18th century, the first administrative offices in the form of border councils existed on the territory of the Junior Zhuz. The number of councils created corresponded to the number of large tribal unions of the Junior Zhuz (alimuts, bayuls, zhetyru). At every council, paperwork was done by Tatars who received a salary of 100 rubles and 15 rubles for travel expenses. However, the reform introduced by O. Igelström fell short of expectations, because the created administrative bodies (the Border Court and Councils) proved not to be viable. With the abolishment of the councils, after the new khan was appointed in 1795, correspondence clerks were appointed as confidants¹² 'for sending to the steppe' at the Orenburg Border Commission at a salary of 120 rubles per annum [State Archive of Orenburg Region, f. 6, inv. 10, file 105, s. 1 reverse].

Correspondence clerks and mullahs under the khans and sultans of the Junior Zhuz in the first quarter of the 19th century were still Tatars: Nigmatulla Fayzullin (from the Orenburg Province) and Ishmuhammad Mustafin (from the Kazan Province) under Khan Jantor (1805–1809); and Gabdulsamat Bulyakov and Abdulsatar Suleimanov under Khan Sergazy (1810–1822) [State Archive of Orenburg Region, f. 6, inv. 10, file 2060, s. 83; file 2096a, s. 262].

In 1824 a new administrative order was introduced in the Junior Zhuz: its territory was divided into three parts—Eastern, Middle and Western—governed by sultans, while the power of the khan was abolished. In essence, the sultan governors became officials of the Orenburg Border Commission, which included the chairman, four counselors and four representatives from among the wealthy Kazakhs. The committee fulfilled functions of the provincial

government. The sultan governor was given the rank of major of the Russian service (a rank of the 8th class) and was considered to be an official appointed as the head of the local government [Dobrosmyslov, 1912, p. 324]. Due to the introduction of the new administrative reform, Tatar mullahs and confidants were sent to the sultan governors and the Kazakh population to receive their oath¹³. Their activities proved to be fruitful: 113 sultans, 188 foremen, and 2922 ordinary nomads were administered the oath [State Archive of Orenburg Region, f. 6, inv. 10, file 3238, s. 27–30].

Every sultan governor had a correspondence clerk (with a salary of 300 rubles per annum) and a scribe (100 rubles) on his staff who were not only to manage paperwork, but at the same time were to provide information about internal political events in the Kazakh nomadic camps and keep track of the disposition of the Kazakh elite and the behaviour of the sultan governor. The responsibilities of correspondence clerks under sultan governors and volost sultans were mostly carried out by Tatars [State Archive of Orenburg Region, f. 6, inv. 10, file 3238, s. 27–30].

The institute of pristavs [official representatives] introduced by the government in the Kazakh steppe in 1820 was maintained even after the abolishment of the khan's power. In the 1920s–1960s, pristavs served under sultan governors of the Eastern, Western and Middle parts of the Junior Zhuz. Often pristavs had confidants at their command whom they sent to the Steppe to gather information. One famous pristav [representative] under the sultan governor of the Eastern part of the Junior Zhuz, Colonel A. Dzhantyurin, was cavalry staff captain M.S. Aitov¹⁴. In 1844 six protectorships were created. Interpreter M.S. Aitov

¹² A confidant is a secret agent, an authorised representative.

¹³ This experience of the Tatar mullahs has its origins in the 18th century, when the act of taking an oath of allegiance amongst the Kazakh elite (1738, 1740, 1742) and official receptions of the Kazakh khans and sultans by the regional authorities would be carried out strictly in the presence of a Tatar mullah.

¹⁴ A pristav was an official representative of the Russian government, an advisor to the ruler-sultan and an observer.

in 1849 was appointed to the position of protector of the Kazakhs at the Orenburg division (he served in this position over 7 years) [State Archive of Orenburg Region, f. 167, inv. 1, file 24, s. 25].

The next step Russia took to subdue the Kazakhs of the Junior Zhuz was the introduction in 1831 of more subdivided territorial and administrative structures, namely, the border and steppe divisions (administrative areas between two fortresses) headed by 'division chiefs' from among influential Kazakhs [Nacional'ny'e okrainy', 1997, pp. 210–215]. The position of correspondence clerks under division chiefs was usually given to Bashkirs living at the border with Kazakh nomadic camps.

The 'Regulation on the Governance of the Orenburg Kirghizes' of 1844 defined for the first time the necessary number of correspondence clerks under sultan governors and division chiefs and the amount of their salary. Every sultan governor was to have a correspondence clerk at his command with a salary of 300 rubles a year. The salary of correspondence clerks under division chiefs depended upon the rank of the division.

Therefore, in connection with the expansion of the government apparatus and the gradual political and administrative integration of the Junior Zhuz into the Russian Empire, the role of Tatar mullahs and correspondence clerks in the Steppe increased.

Tatars in the governance of the Kazakhs of the Middle Zhuz. In the Middle Zhuz, after the death of Khans Bukey (1817) and Vali (1819), the imperial authorities considered the election of new khans undesirable. In 1822 a new administrative governance system and a new administrative and territorial principle for subdividing the Kazakh nomadic population into districts in accordance with the 'Statute on the Siberian Kirghizes' was introduced; these districts, in turn, were divided into volosts (10–12 auls) and auls (50–70 nomad tents). The implementation of these important measures contributed to the advance of the border lines deeper into the steppe, the spread of the

influence of Russian power over all Kazakh clans and, finally, the organisation of a stable administration, which enabled the preparation of conditions for completing the annexation of Kazakhstan to Russia.

The Statute was translated into the Tatar¹⁵ language and sent to the most influential individuals of the auls. According to documents, Tatars took an active part in creating the districts and explaining the articles of the new Regulation to the Kazakh population.

In 1822 Usman Mavlyutov (from the Tobolsk guberniya) was sent on a mission with Russian civil servants to Kazakh nomadic camps to explain the content of the 'Statute' [Central State Archive of the Republic of Kazakhstan, f. 338, inv. 1, file 834, s. 1–3]. In 1824 mullah Muhammad-Sharif Abdrakhimov visited the Kazakh steppe in order to announce the 'Statute' to the public,¹⁶ and so on [Central State Archive of the Republic of Kazakhstan, f. 338, inv. 1, file 436, s. 24, 56, 111–112 reverse].

The district administration was made up of the senior sultan (the chairman), two Russian representatives, and two representatives from the 'honoured Kazakhs', as well as the secretariat and interpreters. The oath ceremony at district administrations was held in the presence of Tatar mullahs.

Officers sent on a mission to open external districts in the Steppe were given instructions requiring them to invite mullahs to the created district administrations 'to conduct prayers for the Kazakhs and teach them the rules of goodness'. Mullahs' salary was set at 100 rubles per annum and was paid from the amount designated for charitable purposes. They were supposed to rent a yurt which would be the place of the mullahs' residence and at the same time served as a prayer house [Central State Ar-

¹⁵ The Old Tatar language was 'Turki,' which was used in diplomatic correspondence with the Kazakh steppes and was taught at educational institutions of this region in the 8th–19th centuries [see: Khisamova, 1999].

¹⁶ He was a native of the village of Tashka in the Menzelinsk Uyezd.

chive of the Republic of Kazakhstan, f. 338, inv. 1, file 184, s. 6–7].

However, it was difficult to supply district administrations with mullahs. By 1835 it was clear that the taking of the oath among representatives of the Kazakh nobility and the population was in many cases conducted not by edict mullahs, but by 'Asians, Tatars and even Russian dragomen'. This likely can be explained by the fact that the salary of edict mullahs at district administrations was below the subsistence line. Another reason lay in the fact that those Tatars who wanted to occupy this position did not have an edict of the Orenburg Muslim Spiritual Assembly [Central State Archive of the Republic of Kazakhstan, f. 338, inv. 1, file 184, s. 22–23, 41].

Archives still retain petitions of Tatar edict mullahs for transfer to the position of correspondence clerks with volost sultans for the reading and sending of correspondence. This is explained by the amount of the salary, which came to 300 rubles per annum [Central State Archive of the Republic of Kazakhstan, f. 338, inv. 1, file 767, s. 93].

It is noteworthy that often one and the same person bore the functions of a correspondence clerk and a mullah. Tatars who worked as mullahs were not paid a separate salary. In this case, everything depended on the sultan's material capabilities. At the same time, the Russian administration was not financially able to supply representatives of the Kazakh nobility with correspondence clerks and mullahs. On the other hand, the Russian authorities did not see the need for the 'separate appointment of correspondence clerks' [State Archive of Orenburg Region, f. 6, inv. 10, file 105, s. 1 reverse]. In the minds of the Kazakh elite, a mullah was needed not only as a clergyman, but also for 'reading orders on various matters sent from the border administration and writing responses to them', and, moreover, for teaching their children 'Tatar literacy and Mohammedan law'.

Constant communication between the Tatars and the representatives of the Kazakh nobility contributed to the establishment of close, trusting relations between them. This was fa-

cilitated by the long terms of their stay in the service of the same sultan families, and often after the death of their original employers, they did not return home, but served their heirs, and even became members of their family.

Correspondence clerks or mullahs were appointed to serve under volost governors mostly at the request of sultans. However, a negative verdict usually awaited petitions directed by Tatars themselves for appointment as clerks or mullahs in the Steppe. Here lay the contradiction in the regional administration's policy. Governor of the Omsk Oblast S. Bronevsky (1786–1858) allowed sultans to accept Tatars into their service, but at the same time in letters marked as 'Confidential Information', he wrote to Russian representatives of the Karakalinsk district administration that, if possible, they should remove Tatars from service in the Steppe and 'politely' decline Kazakhs' requests to appoint mullahs and teachers for them and, if possible, fill the deficit of translators and scribes with Russians and not give Tatars the right to settle in the Steppe [Central State Archive of the Republic of Kazakhstan, f. 338, inv. 1, file 396, s. 86–87].

Officials reported that Tatars attempted to settle in the Kazakh steppe with only one aim—in order to 'be rid of state and public duties'. The most important thing, in their opinion, was to prohibit Tatars from engaging in trade of any kind (as salesmen, traders, etc.). So that the Tatars could not spread 'false views causing harm to the state', officials of the district administration must be required 'not to relax supervision over them' [Central State Archive of the Republic of Kazakhstan, f. 338, inv. 1, file 396, s. 88–88 reverse.].

In 1838, the Omsk Oblast was abolished and its former internal districts were annexed to the neighbouring Siberian guberniyas: The Petropavlovsk district was annexed to the Ishimsk uyezd of the Tobolsk guberniya, while the Semipalatinsky and Ust-Kamenogorsky districts were annexed to the Biysk uyezd of the Tomsk guberniya. The outer districts were transferred to the competence of the special body for the administration of the Kazakhs of

A Kazakh Khan with his wife.
Photo from the middle of the 19th century

the Middle Zhuz—the Boundary Management of the Siberian Kirghizes.

In 1854, the Oblast of the Siberian Kirghizes and the Semipalatinsk Oblast were created on the basis of the outer districts and part of the inner districts of the neighbouring northern territories. In 1856, the Alatau district, headed by a district chief, was formed in the area of Semirechye, where the Kazakhs of the Senior Zhuz camped.

The Tatars' participation in the government of the Inner Horde. By the degree of influence and the role of Tatar mullahs,¹⁷ the

¹⁷ In 1853 Orenburg's General-Governor V. Perovsky wrote: 'The greatest harm to Russia was inflicted by Jahangir's policy on the spread of Mohammedanism. There is an entire phalanx of mullahs, the most zealous instigators of disobedience to the Russian authorities and the Russian law. These mullahs, numbering 127, were appointed by Jahangir's personal power.' Indeed, by the mid-19th century the number of the Tatars amounted to over 50% of the population of the Khan's main camp, Novaya Kazanka, and Talovka. In A. Alektorov's opinion, these were the 'unspoken mul-

lahs' who settled throughout the Inner Horde [Russian State Historical Archive, f. 1294, inv. 84, file 5, s. 3–3 reverse; f. 1291, inv. 82, file 6, s. 2; Alektorov, 1890].

Inner Horde was distinguished among other regions.¹⁸ It was formed in 1801 when Bukey, the sultan of the Junior Zhuz, and a group of Kazakh families subject to him resettled from the Ural steppe to the right bank of the Ural. A decade later, in 1812, the Russian throne granted Sultan Bukey the status of khan. With the enthronement of Bukey's son Jahangir after the former's death, the process of the centralisation of power and the formation of a new governing structure began in the khanate. In 1827 Zhangir Khan (1824–1845)¹⁹ created a deliberative body, the Khan's council, which included one foreman from each large clan (12 people). They became the khan's advisors. Upon his initiative, the positions of kazyi [qadi] and akhun were created. The position of akhun was occupied by Zahir Khametov (1790–1875),²⁰ a peasant from the Kazan Province. Zhangir Khan wrote that qadi Zahir made a great contribution 'to softening of customs' of the Kazakh people and 'instilling obedience to the administration and loyalty to the Russian government'. In 1840, Z. Khametov²¹ was awarded a golden medal on St. Andrew's ribbon and was awarded the title of tarkhan [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 2126, s. 6–9]. Gradu-

lahs' who settled throughout the Inner Horde [Russian State Historical Archive, f. 1294, inv. 84, file 5, s. 3–3 reverse; f. 1291, inv. 82, file 6, s. 2; Alektorov, 1890].

¹⁸ The term 'Bukey Horde' was used in official documentation for the first time in 1819, and five years later the term 'Inner Horde' appeared. In the first decade of the 19th century the term 'the Kazakhs subordinate to Sultan Bukey' was in use.

¹⁹ In 1824 Zhangir Khan married Fatima, the daughter of Orenburg's Mufti M. Khusainov [State Archive of Orenburg Region, f. 6, inv. 10, file 3717, s. 1].

²⁰ In 1805 he started serving in the Steppes as a mullah to the Junior Zhuz's khan Jantore.

²¹ Akhun received a salary of 1,650 roubles in assignats from charitable donations of zakāt and sogum, which he collected from the Tyulengut tribe [Central State Archive of the Republic of Kazakhstan, fund 4, inv. 1, file 2703, sheets 7–10 reverse], took advantage of gifts from the khan amounting to 4 thousand roubles and fertile lands, which brought in an income of up to 3 thousand roubles per annum [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 5440, s. 51].

ally the akhun turned into a major landowner in the Inner Horde²².

In order to introduce document management, Zhangir Khan created a special secretariat consisting of Tatar and Russian departments. The former was responsible for correspondence between the khan and his subordinate sultans and foremen within the clan, while the latter was responsible for correspondence—with the Russian administration. Ensign Muhammadkarim Galikeev (a Meshcheriak from the Orenburg guberniya), Abdusattar Iskhakov (from the Kazan guberniya) and Shiratdin Mansurov (from the Sterlitamak uyezd) served as correspondence clerks under the khan at the Tatar secretariat [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 5450, s. 10–11].

Correspondence clerks under sultans who governed clans in the khanate were mostly Meshcheriaks of the 2nd Meshcheriak canton [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 5450, s. 10–11; 56–57].

After the death of Zhangir Khan, the Inner Horde was governed by the so-called Temporary Council headed by sultan Adil Bukeikhanov (Jahangir's elder brother, 1804–1876). Between 1854 and 1860, the system of political governance in the Inner Horde underwent an essential re-organisation, as a result of which it was included in the administrative and territorial structure of the Russian Empire.

Thus, in the first half of the 19th century, the foundation for the further strengthening of Russian power and the system of administration of the Kazakhs of the Western Siberian and Orenburg departments was laid. This allowed the Russian government to stabilise its economic and political position in this region and pursue a more active Central Asian policy. The creation of a system of fortifications in the depths of the Kazakh steppe (Uralskoe, Oren-

burgskoe and Fort Karabutak) and the introduction of a military and administrative unit called the 'Syr Darya line' contributed to the fact that in the 1840s, the border between Russia and Central Asia went not along the Ural, as it used to in the 18th century, but along the 'Syr and Ustyurt'.

On the territory of the Junior Zhuz the role of mullahs and correspondence clerks was played mainly by trading Tatars from Seitov Posad and the Kazan Province and Bashkirs of the 7th, 9th and 12th Bashkir cantons located in zones bordering on the camping grounds of the Kazakh Tabyn, Zhagalbaily, Zhappas and Tama clans. In the Inner Horde, document management was mostly carried out by Tatars of different classes and Meshcheriaks; there were also isolated cases of the hiring of Bashkirs as correspondence clerks. On the territory of the Middle Zhuz, a certain role in the administration of the Kazakh people was played by the Tatars from Tobolsk and Simbirsk guberniyas and the Cossacks of the Tatar regiment of the Siberian Cossack army. Tatars from Kazan and Orenburg guberniyas were rarely hired here.

The Russian administration in the 18– and 19th centuries used such notions as 'Tatar mullah', 'teacher of Tatar literacy', 'translator of the Tatar language', 'Tatar correspondence clerk', and 'Tatar trader' in official correspondence. In this regard, questions about the ethnonym 'Tatars' naturally arise, because along with Volga Tatars, Meshcheriaks, Bashkirs and Teptyars were also assigned to the Kazakh steppe, but they were defined as 'Tatar' mullahs anyway, despite their different ethnic origin. As we see, the terminology of that period equated such notions as class, ethnicity and confession. Therefore, the Russian authorities used the term 'Tatars' as an ethnonym to denote a bearer of an alien faith, language, traditions and mentality, which appeared to be a real reflection of the Russian government's perception of Islamic nations.

The Russian authorities promised Tatar mullahs and correspondence clerks a system of benefits and privileges 'in accordance with their loyalty and diligence'. In general, it was

²² In 1842 Zhangir Khan granted Z. Khametov 12 thousand dessiatins [tithes] of land close to the khan's main camp for his lifetime use. Moreover, Z. Khametov was the owner of a postal station by Lake Elton and a hamlet located in these lands [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 5440, s. 54–55].

The interior of a Kazakh yurt.
Photo from the early
19th century

a mutually beneficial process, because the Tatars' interest in service in the Kazakh steppe was dictated by their domestic political situation: they could not hope for a successful and rapid career and wealth in the central guberniyas of the Russian Empire.

The activities of Tatar mullahs and correspondence clerks in the Kazakh steppe in the first half of the 19th century enables us to identify interesting peculiarities and trace a pattern which is consistent with the theory of 'mobile diasporas'. The essence of this theory is that governments of almost all polyethnic empires showed an inclination to collaborate with ethnic communities that focused on carrying out necessary and important functions for these states in their territories. The presence of communicative ties and knowledge of the Kazakh language allowed representatives of the Tatar nation to fulfill the role of intermediaries

when introducing various innovations in the Steppe, as well as in the spheres where the dominant ethnic group could not prove itself. No wonder A. Dobrosmyslov wrote that the Tatars and mosques were the bridge 'across which the Kirghizes (Kazakhs—G.S.) were to cross in order to come closer to the Russians'.

Later, when evaluating the results of this policy, he noted that the Tatars did in the Kazakh steppe what the Russians had not been able to do [Dobrosmyslov, 1912, p. 173]. Tatar dragomans and translators emphasised in their petitions that they had repeatedly 'put their lives in danger' when rescuing captives from the Kazakh steppe and during negotiations with rebellious Kazakhs and representatives of the Kazakh elite. On the other hand, because of their service, Tatar translators presented the image in the consciousness of their brothers-in-faith—the Kazakhs—of an official of the Russian government who wields influence and respect both among their tribesmen and with the authorities. Being in constant and close interaction with the Kazakhs, the Tatars helped to gradually change some value orientations and behavioral stereotypes the Kazakh elite adhered to.

§ 2. The Tatars' influence on the development of agriculture among the Kazakh population and the policy of the Russian authorities

Gulmira Sultangalieva

The Kazakhs' nomadic lifestyle contradicted the Russian authorities' idea of 'civilisation'; therefore, their transition to a settled lifestyle was aimed at accomplishing two tasks: keeping order and developing an agrarian culture

among the nomads. The government's enactments and regulations from the first half of the 19th century reflect the continued policy of encouraging the transition of the Kazakhs of the Junior and Middle Zhuzes to a settled life-

style. Starting in the mid-1830s, the policy of the central and local authorities aimed at transitioning nomads to a settled agricultural lifestyle changed, which was reflected in the transformation of the Orenburg administration's perception of the Kazakhs as future sedentary citizens of the Empire. The line of 'slowing down the Kazakhs' settlement' was suggested by Orenburg military governor P. Sukhtelen (1830–1833), while his successor, V. Perovsky (1833–1842 and 1851–1857), started to implement it [State Archive of Orenburg Region, f. 6, inv. 6, file 14017/1, s. 8–8 reverse].

Let us note that the policy of limiting agricultural development only concerned the Kazakhs of the Junior Zhuz. At that time, the Siberian administration encouraged Kazakhs of the Middle Zhuz involved in arable farming (awarded them caftans, golden rings, medals, etc). In the opinion of historian N. Appolova, this was linked not only to the internal state of the Zhuzes, but also to the fact that the government's main measures aimed at advancing into Central Asia were carried out along the Orenburg line; therefore, it was important to develop the region of the Kazakh steppe which was adjacent to this part of the borderline [Appolova, 1960, pp. 210–211].

Of special interest are petitions preserved in the collections of the central archives of Kazakhstan addressed to the regional administration from Kazakh sultans and foremen of the Middle Zhuz 'to invite Tatars' as representatives of a settled agricultural culture. They were to teach the Kazakh nomadic population the skills of arable farming and settled life. [Central State Archive of the Republic of Kazakhstan, f. 338, inv. 1, file 396, s. 155–156].

In essence, the Tatars were to show the Kazakhs a demonstrative example of peaceful inclusion into settled life. No wonder missionary N. Ilminsky noted that if a Kazakh 'decides to adopt the convenience of the settled lifestyle, he always adopts the lifestyle not of the Russians, but of the Tatars, or, more rarely, of the Central Asians' [Ilminsky, 1891, p. 166]. Thus, correspondence clerk A. Baykeev, who served under the administrator of the Kete clan, wrote in his report to the Orenburg border commit-

tee dated 1832 that 'apart from records management' he attempted to 'contribute to the improvement of the nomadic population's lifestyle'; to be more precise, he 'taught them to harvest hay in large amounts for the winter' and taught the Kazakhs benefits of a settled lifestyle by 'building a house of sun-dried brick with all household premises on the shore of the Caspian sea, 120 km from Astrakhan, near the Kenevskaya River', the result of which was that '135 houses of the same type were built'. Apart from household matters, he attempted to 'bring them closer to the Russians through persuasion and advice' and by acquainting them with the laws of the Russian Empire [Russian State Historical Archive, f. 1291, inv. 82, file 4, s. 1–3].

Despite the 1826 decision of the administration prohibiting the Tatars to settle on the territory of the outer districts of the Omsk Oblast, the Kazakh population raised the question of the 'usefulness' of the cohabitation of the Tatar and Kazakh peoples [Central State Archive of the Republic of Kazakhstan, f. 338, inv. 1, file 834, s. 1–58].

It is worth noting that a group of Tatars of the middle and peasant classes from the Kazan Province, invited by the Cossacks, lived in the Karaul volost of the Kokchetavsky outer district near Lake Imantaevsky starting in 1833; they built houses and set up farms there, and showed the Kazakhs examples of arable farming and everything necessary for settled agriculture. In 1840, these families (89 people of both genders) filed a petition for legal settlement in this area, believing that their activities are consistent with the government's objectives of accustoming the Kazakhs to agriculture and teaching them to read and write in Tatar [Central State Archive of the Republic of Kazakhstan, f. 374, inv. 1, file 688, s. 2–3].

When collecting data about Asians inhabiting the Steppe in 1840, the regional administration encountered the phenomenon of 'Tatar children' or Chala-Kazakhs²³, i.e., those born

²³ The Chala-Kazakhs (Shalakazakhs) also included children born from marriages between Kazakh men and Kirghiz or Kalmyk women or between Sart merchants and Kazakh women [see: Zhanayev, 2010, pp. 272–305].

from a Tatar man and a Kazakh woman or from a Tatar woman and a Kazakh man. Most of them were descendants of the first Tatar immigrants who had settled in the Steppe. Even before the creation of the outer districts, they, with the permission of the sultans or khans, lived in the Steppe, where they lived to a ripe old age, gave their daughters in marriage and created new families and dynasties. Now the Russian authorities were faced with the question: should they send them back to the Russian guberniyas or let them live in the Steppe?

The problem of 'Tatar children' was discussed at the meeting of the Council of the Omsk Border Administration in 1846. There were over 465 families of chala-Kazakhs who had been born in the Steppe. Of these, 155 families lived in the Ayagoz District, 167 in the Kokbektinsk District, 7 in the Bayanaul District, 40 in the Karakalinsk District, 9 in the Akmolinsk District, 3 in the Kokchetaksk District and 166 in the Kokbetinsk District. Their main occupations were trading Asian goods and agriculture. All of them wished to be counted among the Kazakhs in their districts, i.e., carry out all duties of the Kazakh people, namely, to pay the yasak to the State Treasury [Central State Archive of the Republic of Kazakhstan, f. 374, inv. 1, file 613, s. 190–192].

In the Ayagoz District in the mid- 19th century, the chala-Kazakhs founded the villages of Mechet and Bukon, which at the beginning of the 20th century were part of the Kuluzhensk Volost of the Ust-Kamenogorsky uyezd. According to the evidence of contemporaries, at the beginning of the 20th century, they, despite frequent marriages with Kazakhs, had '... preserved their Tatar appearance. Their houses, interior, clothes, customs and language are all Tatar' [Konshin, 1898, pp. 45–46; Zhanaev, 2010, p. 293].

One of the proofs of the Tatars' influence on the Kazakhs in the process of their transition to a settled lifestyle is the letter written by Zhangir Khan in 1842 in which he abolished the ban on marriages between Kazakh men and Bashkir and Tatar women. He explained this

by the fact that the decree dated 17 May 1747 [Russian State Historical Archive, f. 1291, inv. 81, file 178, s. 1] prohibiting the Bashkirs and Tatars, from both Kazan and Orenburg, from marrying Kazakhs had been issued when 'the majority of the Kazakhs were independent and camped far from the Russian borders'. Zhangir Khan emphasised that in spite of this, the inertia of marital relationships was not interrupted. This, in his opinion, was shown by the Kazakhs' repeated petitions to abolish the 1747 decree, and by the actions of Bukey Khan, who 'patronised marital unions between the Kazakhs and settled inhabitants adhering to Mohammedan law, in particular the Kundrovo Tatars living in Astrakhan guberniya, because of which some sultans and most honourable Kazakhs are in such unions.' Zhangir Khan believed that permitting marriages between the Kazakhs and settled brothers-in-faith would reinforce 'the former's ties with the Russians' and strengthen the Kazakhs' attachment to their lands, because every Kazakh who had a Tatar wife accustomed to a settled life 'will himself arrange a permanent winter camp and build a house for it in which his wife can run the household' [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 2236, s. 2–3].

However, in 1842 the Orenburg border committee reapproved the 1747 decree, explaining this by the fact that the Tatars 'could easily hide from mobilisation among their relatives in the steppe, who, in attempting to hide them, will bear responsibility for it along with their chiefs' [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 2236, s. 4 reverse]. The decree was in effect for a century and was abolished only in 1846 as 'a measure which is no longer necessary' [State Archive of Orenburg Region, f. 6, inv. 10, file 5280, s. 1].

Therefore, despite the view existing in the historical literature that the Kazakh population was introduced to arable farming through the Russian peasantry, archive documents dated from the first half of the 19th century are evidence of the Tatars' important role in this field.

In light of this, it is important to clearly define two important points. First of all, the Volga Tatars, as representatives of a settled agrarian culture, were the first to demonstrate to the Kazakhs the possibility of gradually becoming accustomed to the settled life and arable farming by providing a demonstrative example. This was the path of peaceful intercommunication between two nations who belonged to the same ethno-linguistic group (the Kipchak subgroup of the Turkic languages) and the same confessional system (Sunni Islam). At the same time, the mass resettlement of Russian peasants to

Kazakhstan (late 19–early 20th century) was associated with the seizure and plunder of the Kazakh lands. Second, the Tatars of the Volga-Ural region in the first half of the 19th century were in demand as an ethnos fulfilling intermediary functions in the course of the political integration of the Kazakh lands into the Russian Empire. The regional and central authorities believed that the Tatars could facilitate the introduction of the nomadic Kazakhs to what they considered to be a higher culture, i.e., a settled culture, which would make them 'more peaceful and manageable'.

§ 3. The contribution of Tatar public servants to the study of the history and culture of the peoples of Kazakhstan and Central Asia

Vil Galiev, Gulmira Sultangalieva

Tatar public servants, while serving as officials at regional administrations (the Orenburg border committee, Orenburg Province secretariat and, starting in the 1820s, the Omsk Oblast administration and the Western Siberian Province secretariat), kept official diaries and 'travel journals', and wrote reports in which they described features of the history and culture of the Kazakh people. Their knowledge of the Kazakh language, culture and lifestyle and lengthy missions (a year or more) contributed to higher-quality and more accurate gathering of various data about the Kazakh steppe, including the names and genealogy of representatives of the Kazakh elite, trade routes, locations of summer and winter nomadic camps, their customary law, peculiarities of intercommunication between the Kazakhs and neighbouring peoples, etc. These data are valuable because they were compiled by witnesses of events which occurred in the Kazakh steppe in the 18–19th centuries. Moreover, personal relations established between Tatar public servants and representatives of the Kazakh elite (khans, sultans, beys, foremen) and their personal observations increase the significance of the above-mentioned materials. These documents made a definite contribution to the accumulation of historical and ethnographic ma-

terial on the history of the Kazakh nation in the 18–and 19th centuries. On the other hand, based on their reports and recommendations, the regional authorities developed subsequent policy vectors aimed at expanding transit trade, developing administrative and political measures and changing the social life of the nomadic Kazakh society, etc.

While travelling across the Steppe, Tatar public servants gathered ethnographic materials about the nomads' way of life and questioned beys and foremen about the norms of customary law regulating the property and family and marital relationships of the Kazakhs. Their status as officials of the regional administration also required this. Thus, paragraph 64 of the 'Decree on Administration of the Orenburg Kirghizes' dated 14 July 1844 says that an official must 'gather and organise Kirghiz (Kazakh.—*V.G., G.S.*) customs which bear the force of law in the Horde'. The information presented by Tatar public servants were of great significance for the Russian authorities: with their help, it was possible to find out how the adaptation of new administrative reforms and the Russian justice system was proceeding in the Steppe in the 1820s–1840s and understand to what degree the norms of customary law influenced the life of the Kazakh nomadic society.

Ahmed Yesevi Mosque: General view. Photo by F. Orde, 1880

Based on the reports prepared by officials, a 'special code for the processing of cases which are to be heard and judged based on these customary laws' was developed [Complete Code of Laws of the Russian Empire–2, Vol. 19, No.17988]. The materials presented by Tatar translators reflected their understanding of the legal principles which regulated the lives of nomadic Kazakhs. The most valuable information about the norms of the customary law of the Kazakhs was contained in the materials gathered by Tatar dragomans of the Orenburg border committee M.S. Aitov and Salikh Biglov.

Aitov was of the view that crimes 'which by law should be heard and judged in the steppe according to customary law cannot be defined', because there is a fine line between the cases which 'would fall within the general laws of the empire or folk customs'. In his opinion, barymta was an example of this²⁴. He considered it 'useful to intercede for softening of punishment for barymta, which is not stopped by the severity of the punishment, but rather is strengthened by the collection of blood money for convicts and exiles' [Materialy, 1998, pp. 97–104]. M.S. Aitov's opinion about

the norms of the customary law of the Kazakhs in many ways coincided with the views expressed by Kazakh scholar C. Valikhanov (1835–1865) [Valikhanov, 1985, pp. 77–104].

The explanation of the term 'barymta' and the mechanism of its functioning in nomadic society must have been significant for the Russian authorities, who were not aware of this attribute of nomadic life.

In 1846, a detailed note about the norms of the Kazakhs' customary law was presented by collegiate secretary of the Orenburg border committee S. Biglov. It presented data about the court of beys and a sheet of punishments imposed by the beys. The value of his work lies in the fact that it contains the names of the Kazakh beys who were the best known 'for their intellect and experience', from the clans of Shomekey, Tortkara and Shekta, indicating their summer and winter camps. Moreover, he described the family customs and rituals of the Kazakhs who camped in the area of the Ural fortification [Materialy po kazaxskomu, 1998, pp. 107–112].

The work of Tatar translator of the Turkestan Governorate General Shagomardan Ibragimov (1841–1892) devoted to the barymta echoes the views expressed by M.S. Aitov and C. Valikhanov about this phenomenon of the nomadic life. In his works about the norms of the Kazakhs' customary law he gave an explanation of the term 'barymta'. In his opinion, this word does not denote a 'robbery', but is derived from the word 'bar', meaning 'there is', 'barym', meaning 'there is my/mine', and 'barymta', meaning 'there is something which belongs to me', i.e., a prefix which forms a noun, for example: balmakta, turmakta, yurmakta, etc.' [Ibragimov, 1873, p. 167]. For S. Ibragimov, the ethnography of the Kazakhs was a matter of constant interest, which was reflected in his numerous articles [Ibragimov,

²⁴ The barymta was the forced seizure of livestock, which was usually carried out on the order of the Beys' court for the purpose of compensating for losses or as a penalty for robbery, murder, or other crimes.

1876, Vol.III, pp. 51–63; 1878, pp. 233–257; 1872, pp. 120–152].

The next phenomenon that aroused the interest of the Russian administration was the *ushur*. Information about how it spread throughout Kazakh society was provided in 1848 by translator of the Orenburg Boundary Commission Abdulkadyr Subkhankulov. He defined the term '*ushur*' (a tax equivalent to one-tenth of the harvest) and noted that the *ushur* was only in use amongst the nomadic Kazakhs along the mainstream of the Syrdarya River [Central State Archive of the Republic of Kazakhstan, f. 4, inv. 1, file 3516, s. 2–3 reverse].

Tatar public servants gathered various kinds of ethnographic materials about the Kazakhs, in particular about rituals of marriage brokerage, burials, funeral feasts, etc. Thus, M. Aitov's extensive knowledge of the Kazakhs' customs and possibly a certain idealisation of the nomadic society were reflected in his collected materials on the rituals practised by the Kazakhs in their migrations and the burials of their deceased [State Archive of Orenburg Region, f. 167, inv. 1, file 24, s. 27 reverse].

Translator Mendiya Bekchurin (1780–1821) was an expert in the material and spiritual culture of the Kazakh people [Masanov, 1966, pp. 77–78; *Bibliograficheskij slovar'*, 1974, p. 120]. The Kazakh legend 'Barsa-Kelmes' is well known in his records (1817) [Sankt-Peterburgskije Vedomosti, 1839, No. 17].

The gathering of materials about the Kazakhs by the Tatar public servants was also helped by their cooperation with scientific communities, in particular the Russian Geographical Society (RGS). In 1850 Iskander Batyrshin (born 1819), a correspondent of the RGS, wrote the article 'Remarks on the Characteristic Differences of the Turkic Dialects in the Orenburg Krai,' which was reviewed by A. Kazembek. The RGS sent him an ethnographic programme and offered to gather information about the culture and way of life of the Kazakh and Bashkir peoples [Masanov, 1966, p. 136]. It is symbolic that one of the founders of the Orenburg section of the RGS (1867) was his brother Suleyman Batyrshin

(born 1821). In 1870 S. Batyrshin edited and corrected at the Orenburg section of the RGS I. Pokrovsky's work 'A Collection of Bashkir and Tatar Songs Presented in the Original to the Section by Full Member I. Pokrovsky.' Orientalist V. Grigoryev, who was sparing with his praise, wrote that he 'belongs to the best experts on the Eastern languages in this krai' [cited from: Veselovsky, 1887, p. 35].

Fayzulla Nogaev, who served on the Syr Darya line, collaborated with historian V. Velyaminov-Zernov [Yudin, 1912, pp. 78–79] and escorted P. Semenov-Tyan-Shansky and Ch. Valikhanov during expeditions to Semirechye.

Interpreters and translators visited the Chinese border, obtained information about the situation in neighbouring regions, and presented this to their chiefs [Central State Archive of the Republic of Kazakhstan, f. 374, inv. 1, file 166, s. 9–9 reverse]. An example of this is Musagat Muminov's (Syuk Ablaikhanov's correspondence clerk) message from 1825 about the situation in China [Central State Archive of the Republic of Kazakhstan, f. 338, inv. 1, file 637, s. 1–24].

The Tatar public servants made an important contribution to the historico-cultural study not only of the Kazakh steppes but also the adjacent Central Asian khanates [Galiev, 1994, pp. 24–25]. In 1780–1781 Mendiya Bekchurin made a journey from Orenburg to Bukhara as a member of the first Russian embassy to pass through the Kyzylkum. He described the results of the journey in his work 'A Journal Containing a Description of the Travel Notes made by Collegiate Registrar and Translator Mendiya Bekchurin during his Secret Expedition to Bukharia up to his Return to Orenburg' [Bekchurin, 1916]. He was the first to report that 'there is no outflow along the Zhanadarye' (a branch of the Syr Darya), 'and its estuary is sand-logged.' M. Bekchurin's merit was that he was the first to attempt to classify forms of sand relief in Russian publications.

The Tatar public servants made an important contribution to the study of routes linking Orenburg with the Central Asian khanates. The Tatar translator Mirsalikh Bekchurin (1820–1903) is famous for his work 'On the

Condition of Our Central Asian Trade,' in which he notes in particular: 'With the establishment of tighter and closer relations in Central Asia, we perceived it, with justification, as the most beneficial market for the sale of our products. Although the greatly elevated hopes for huge profits from trading campaigns in this country were not quite fulfilled at first, at least they were not disappointed, although we often received reports of price fluctuations.' He compiled a description of Ahmed Yesevi's mosque²⁵ [Bekchurin, 1866, pp. 209–217; 1872].

The 'Notes of the Junior Translator of the Orenburg Boundary Commission Iskander Batyrshin on the Khanate of Khiva and Khan of the Syr Darya Cossacks Yermuhamed (Ilikey) Kasymov,' compiled around March 1852, sheds some light upon the history of Kazakhstan and Central Asia. This document contains a whole host of historical facts: about the complex relationships between the Kazakh sultans and the Khivan Khan Muhammad Amin, about the possible transit route of the Russian regular forces from the Aral fortification to Khiva, about the toponymy of the Syr Darya Region, etc. [Istoriya Kazaxstana v russkix istochnikax, 2007, pp. 315–316].

An official of the Turkestan general-governorship Sh. Ibragimov was the founder of the first Turkic-language newspaper in Russia: 'Turkeston viloyatining gazetand' ('Newspaper of the Turkestan Region'), a supplement to the newspaper 'Turkestanskiye Vedomosti,' and was not replaced as its editor until 1878.²⁶ He used the newspaper to publish articles on the ethnography and folklore of the peoples of Middle Asia.

²⁵ In 1904 P. Akhmerov wrote the articles 'Description of Ahmed Yesevi's Seal' and 'Inscriptions of Ahmed Yesevi's Mosque' [Akhmerov, 1896, Ed. 16]. In 1899 one of owners of Tashkent's 'Trading House of the Yaushev Brothers' Muhammad-Sharif Yaushev spent 82 thousand roubles on the reparation of the mausoleum [Kazakhstanskaya Pravda, 2006, 4 April].

²⁶ In 1881 Sh. Ibragimov assumed the leadership of the Russian Embassy in Bukhara. He left the office in 1882 [Lunin, 1966, p. 41].

An important part of the activity of the Tatar translators was the preparation and also the publication of study aids and dictionaries for the Turkic-speaking peoples of theregion. Mendiya Bekchurin was one of the first Tatar translators to compile a 'Russian-Kazakh-Persian-Bukharian-Tatar Dictionary and Phrasebook' (1774).

An official of the Orenburg Boundary commission Salikh Kuklyashev was the author of several study aids on the Tatar and Persian languages [Kuklyashev, 1861, p. 106; Bibliograficheskij slovar', 1974, p. 201]. Following the example of 'The Tatar Chrestomathy' (1859), I. Altynsarin, an inspector of Kazakh schools in the Turgay Region and a pedagogue, compiled 'The Kirghiz Chrestomathy.' Mirsalikh Bekchurin [Bibliograficheskij slovar', 1974, p. 121], a teacher of Persian and Arabic at the Asian faculty of the Neplyuev Cadet Corps, wrote 'The Initial Guide' to the study of the Arabic, Persian, and Tatar languages [Bekchurin, 1859].

Hence, apart from compiling reports of an official character (for the local administration), the Tatar translators actively gathered information about the everyday culture, traditions, and customs of the Kazakh people and popularised the historical knowledge of the Kazakh nomadic society and of Central Asia. They collaborated with scientific societies, in particular the Russian Geographical Society (the Orenburg, Western Siberian, and Turkestan sections), the Association of History, Archaeology and Ethnography of the University of Kazan, the Free Economic Society, etc. It was these contacts with the representatives of the first generation of the Kazakh and Tatar intelligentsia that formed the basis for the development of the sociopolitical thought of related nations at the beginning of the 20th century.

§ 4. Participation of the Tatars of the Volga and Ural Regions in Military Campaigns

Ilshat Fayzrakhmanov

The Tatars' participation in Russian military campaigns was contingent on their class status and the national duty of military service imposed upon them. Since the epoch of Peter I and until 1874, the yasak and tax-paying groups of the Tatar population had been carrying out demanding conscription duties. From 1793 the period of military service was 25 years, and from 1834, 20 years. Conscription was implemented as and when necessary. At normal times 5–7 men per thousand were conscripted as recruits, while intensified recruitment increased the number of recruits to 7–10 men and emergency recruitment, up to 70 men per thousand. Intensified and emergency conscription was carried out on the eve of and during military campaigns. Thus, three conscriptions were carried out simultaneously in 1812: the 82nd (4 recruits per 1,000 registered men), the 83rd (20 per 1,000), and the 84th (16 per 1,000) [Complete Code of Laws of the Russian Empire–1, Vol. 32, No. 25198], and during the Crimean war: up to 70 per 1,000 [Bol'shaya Sovetskaya E'nciklopediya, Vol. 78, 1941, pp. 561–562].

The confessional factor was taken into consideration in the formation of regiments. Thus, during the Caucasian war (from 1833) the prohibition to assign Islamic recruits to a Separate Caucasian Corps became a rule, while Tatar convicts from Kazan, Simbirsk, and Orenburg guberniyas, instead of being banished to a penal colony in Siberia, were sent to battalions of convicted bonded peasants located in Finland [Svod voenny'x, 1838, part 2, book 1, art. 271, 272, 288]. Prior to 1874 many Islamic recruits were assigned to artillery troops on account of their 'Tatar-Arabic education' [Rittikh, 1875, p. 64].

In the regular army the lower ranks of the Tatars practically dissolved into the mass of Russian soldiers. The statistical data of the War Ministry for the period 1868–1873 confirms that in general Islamic recruits constitut-

ed 2.4% on average, or 2.6 thousand men were recruited annually [Zagidullin, 2006, p. 16].

In 1869 among the lower ranks of the ground forces Muslims amounted to 1.64%, while 164 (0.8%) men served in the Navy [Voenno-statisticheskij sbornik, Ed. 4, pp. 88, 89, 206, 207]. In the period between 1875 and 1893 an average of 8,125 Tatars were called up for military service, which accounted for 3.7% of the total number of new conscripts. In 1904 around 30 thousand low-ranking Muslims carried out their military service, with over a half of them serving in western²⁷ guberniyas. There were 45 settlements, with over 100 low-ranking Muslims serving in their garrisons [Russian State Historical Archive, f. 821, inv. 8, file 1064, s. 127, 129]. In these circumstances the Muslims' service in the Russian-Christian environment was undoubtedly made easier.

Amongst the Muslims the officers were mainly from amongst the Caucasian nationalities and Lithuanian-Polish Tatars. In 1869 Muslims constituted 1.13% of the Russian officer corps [Military-Statistical Collection, issue 4, pp. 86–87]. In 1904, 275 Muslim officers were in the service of the Russian Army [Russian State Historical Archive, f. 821, inv. 8, file 1064, s. 127].

The Tatars from the Middle Volga Region and the Trans-Urals took an active and varied part in the Russo-French war of 1812–1814. They participated in all the major battles of the Patriotic War of 1812 and the foreign campaigns of 1813–1814 and made their own contribution to the all-Russian victory. The largest

²⁷ 150 Muslim servicemen served in each of the military districts of Saint Petersburg and Finland, around 1,000 served in the Odessa, Kazan, Siberian, and Amur Districts, 1.5 thousand served in the Turkestan and Caucasian military districts each, around 2 thousand served in the Moscow District, around 3 thousand served in the Kiev District, around 8 thousand served in the Vilna District, and around 9 thousand served in the Warsaw military district.

group of Tatars participated in combat actions in the lower military ranks as part of the Russian regular army.

In September 1812 the formation of a militia was begun in the Kazan Guberniya, the numbers of which were to be made up of bonded peasants assigned by landowners on the Emperor's instructions (4 men per 100). State peasants were not affected by this law. Therefore, the militia from the guberniyas of the Volga-Ural Region mainly consisted of Russian bonded peasants. Unlike in the other Russian regions, which were included among the districts of the militia, the vast majority of the peasants in Kazan and Vyatka guberniyas (758,998 men) were assigned to the Treasury and were exempt from conscription to the militia. The landowners' dominions contained the lowest number of bonded peasants: 89,929 and 10,811 men, respectively. Therefore, the Vyatka soldiers were enrolled into the Kazan militia [Narodnoe opolchenie, 1961, p. 18]. Apart from bonded peasants, the militia in these guberniyas consisted of representatives of the tax-paying urban classes (the petit bourgeois and craftsmen) of different nationalities, including²⁸Tatars.

A huge number of refugees poured into Kazan from Moscow and Smolensk, which by the autumn of 1812 reached thirty thousand people—more than the population of Kazan itself at that time. The Kazan monasteries and ordinary citizens took it upon themselves to provide accommodation for the refugees. The Kazan Governor B. Mansurov was completely right to observe in one of his reports on the people who had abandoned their native lands that they had all 'found the warmest welcome and perfect tranquility in Kazan.'

At the beginning of the war a collection of donations was started for the benefit of the army, militia, and victims of the war. For example, by 15 August 1812 the Bashkirs, Teptyars, and

Meshcheriaks had already donated 500,000 roubles to the army, without taking other donations and expenses into account [Matvievsky, 1962, p. 118]. This is far greater than the total amount in donations collected throughout the entire Kazan Guberniya (346,000 roubles). A lot of gold and silver jewellery was donated by private individuals, and in addition, among silver items were a large number of breast adornments of Tatar women. The fund-raising for the needs of the army was formally voluntary but in actual fact obligatory. 4,100 roubles had been collected from the Tatar community of Kazan 'for the arrangement' of the 2nd Kostroma Infantry Regiment by 3 July 1812. On 21 August 1812 an order was made for the collection of 8,360 roubles from the merchants of all three guilds under the jurisdiction of the Tatar town hall (of this amount, 635 roubles, 10 copecks was still outstanding by the autumn of 1813). This was a significant amount considering that all the Russian lower middle class had collected around 10,000 roubles in cash [Valiullin, 2009, pp. 10–12]. By the beginning of the war with France the major part of the guild merchantry had left for the Makaryev Fair on business. Fund-raising was in progress here in support of the Nizhny Novgorod militia. Merchants from all corners of the country left their signatures in thick volumes containing lists of benefactors: Russian as well as²⁹Tatar.

Some of the Tatars took part in military actions as part of irregular military formations. Regiments made up of class groups of Bashkirs, Meshcheriaks, Teptyars, and Tatar-

²⁸ Petite bourgeoisie Nigabidullina, having sent her son to serve in the militia, went to the Tatar Guildhall in Kazan to ask for her younger son to be accepted on a voluntary basis too as a gesture of 'good will.' [Gorodchaninov, 2002]

²⁹ For example, there are receipts signed by Kazan merchant of the 1st guild Musa Apanayev (520 roubles), Malmyzh merchant of the 1st guild Musa Abdulloev Utyamyshev (500 roubles), Arsk merchants of the 2nd guild Muhammad-Rakhim Mameshev, Murtaza Aburnaev, Abdulkarim Bakarov (100 roubles each), etc. On 8 August 1812 an amount of 5,690 roubles was collected from the Tatar Soap Market at the Makaryev Fair alone, managed by Kazan merchant of the 1st guild Musa Apanayev from Tatar as well as Russian merchants. A total of 72,746 roubles was raised during the course of trading at the Makaryev Fair. By comparison, the total sum raised in the Nizhny Novgorod Guberniya during the war amounted to over 875 thousand roubles [Senyutkina, 2006, p. 30].

Medals for participation
in the Patriotic War of 1812
and the capture of Paris in 1814.
1812–1826. Silver, embossed.

Cossacks engaged in hostilities against the French as part of several armies (of generals P. Bagration, A. Tormasov, M. Barclay de Tolly). Three groups of military formations were distinguished here: the Bashkir-Meshcheriak troops, the Orenburg Cossack troops, and Teptyar Cossack regiments [Rakhimov, 2008, pp. 51–52].

By the beginning of the war the 1st and 2nd Bashkir Cavalry Regiments, the 1st Teptyar, the 1st and 2nd Ural Cossack Regiments, and the 1st and 2nd Orenburg Cossack Regiments had advanced as far as the western border.

Following an order made 25 July 1812, the 3rd, 4th, and 5th Bashkir Regiments were formed. In July of the same year an army ataman of the Orenburg Cossack Troops Colonel V. Ugletsky presented a proposal to organise additional cavalry regiments. In his opinion, there were 129,209 Bashkirs and 19,800 Meshcheriaks (males) living in the Orenburg krai (Region) in 1811. These peoples, apart from serving as cordon guards on the Orenburg border, were not on any other state duties, were perfectly capable of serving in the Cossack forces, and would have no trouble deploying from 10 to 30 and more cavalry regiments. V. Ugletsky's proposals were approved by Alexander I, and he was commissioned with the formation of the new regiments. In August–September of 1812 the 1st and 2nd Meshcheriak and 15 Bashkir Regiments (6–20th) were formed. The staff of each regiment consisted of 530 men (500 rank-and-file officers, a regiment commander, a sergeant major, 5 yesauls, 5 captains, 5 ensigns, 10 lieutenants, a quartermaster, a scribe, and a mullah) [Usmanov, 1964, p. 56].

Significant numbers of the contemporary Tatars' ancestors served with the Bashkir troops. Thus, the 5th Bashkir Regiment was formed from Muslims of the 10–12th cantons

(of the Menzelinsk, Bugulma, Birs, Belebey, Buguruslan uyezds), the 6–11th cantons (the Menzelinsk Uyezd), the 12th Regiment: the 7th and 12th cantons (the Sterlitamak and Belebey uyezds), the 13–12th cantons (the Bugulma Uyezd), etc. [Usmanov, 1964, pp. 74–76; Tagirova, 2011, pp. 71–73].

Between 1812 and 1814 the Bashkir and Meshcheriak Regiments did not have a specified military uniform. Soldiers were allowed to wear the uniform assigned the Cossack troops. However, the majority of the contingent wore their national dress, which consisted of a kافتan and trousers of thick fabric. Felt-pad chekmens [a male over-cloth somewhere between a kافتan and a gown], fur coats, and sheepskin coats served as winter outfits. The armaments consisted of a pike, sabres of random types, a bow and a quiver with twenty arrows. Only a small number of Bashkirs and Meshcheriaks had rifles and pistols.

The 1st, 2nd, 4th, and 5th Bashkir Regiments were involved in the military campaign of 1812 and in foreign campaigns. The 7th, 8th, 9th, 11th, 12th, 13th, 14th, 15th, and 16th Bashkir Regiments and the 2nd Meshcheriak Regiment, made up some time later, took part in foreign campaigns. The 8th, 12th, and 16th Bashkir Regiments and the 2nd Meshcheriak Regiment fought alongside the troops besieging the well-fortified stronghold of Głogów. The Bashkirs and Tatars participated in the famous 'Battle of the Nations' near Leipzig, which took place on 4–7th October 1813 [Bekmakhanova, 2002, p. 5]. On 15 August 1812 the 5th Bashkir Regi-

ment marched through the cities of Chistopol, Kazan, Sviyazhsk, and Cheboksary to Nizhny Novgorod and then proceeded to the city of Polotsk as part of the detachment of Adjutant-General Prince P. Volkonsky under the covering force of Toropets, Bely, and Sychovka. In November 1812 soldiers from this regiment took part in the military operation at Berezino as part of Count Wittgenstein's corps. In 1812 the 6th Bashkir Regiment secured the route from Saint Petersburg to Vologda and provided a guard service in the cities of Vitebsk (1813) and Borisov (1814). Between 1812–1814 the 1st Meshcheriak Regiment carried out their duty at the Moscow garrison.

The composition of the Orenburg Cossack troop was multinational. Along with the Tatar-Muslims, the Nağaybäks, a group of baptised Tatars, also took part in the military actions against the French army on the territory of Russia alongside the Orenburg Cossack regiments. On returning to their motherland, the Nağaybäks named their newly founded settlements after the glorious battles—of Parizh [Paris], Berlin, Fershampenuaz [Fère-Champenoise], Arsi [Arcis], and Kassel.

Since their creation at the end of the 18th century the Teptyar regiments, in terms of their status, came somewhere between the regular and irregular cavalry of the Russian Army. The presence of military equipment, unified weaponry, and a definite period of service (15 years) made them closer to the former. However, the irregular nature of the service was reflected in the composition of the regiment and its formation from the class of the Teptyar and landless peasants, the uniform, ranks, and the very process of its formation [Rakhimov, 2008, p. 188].

In the initial stage of the war the 1st Teptyar Regiment took part in the Battles of Vilno and Borodino as part of the 1st Western Army commanded by General M. Barclay de Tolly [Rakhimov, 2008, p. 54]. During the period when Napoleon's troops were expelled from the country, the 1st Teptyar Regiment formed part of the militia of District I, and the 2nd Teptyar Regiment was part of District III. In September 1812 it carried out offensives against the adver-

sary alongside the partisan troops led by Denis Davydov on the outskirts of the city of Vyazma and along the New Smolensk road. D. Davydov reported to his command on the feat of Tatar cavalymen: 'On the 18th day (of September) Major Timirov, whom I had sent to the detachment, along with the 1st Teptyar Regiment with whom he had been entrusted, attacked the enemy, capturing 125 men and one van with artillery shells' [Akhmetshin, 2006, p. 169]. The regiment then fought as part of a special corps consisting of militia men and irregular troops. Its task was to strike at the enemy's army in the Smolensk Guberniya. A large number of soldiers received the praise of their army commanders. For example, Yesaul of the 1st Teptyar Regiment Sagit Khalitov distinguished himself in the battles for Vyazma. He was awarded the Order of St. Anna of the 3rd degree [Bekmakhanova, 2002, p. 5]. For his bravery at Roslavl, the regiment's commander Major Timirov was awarded the order of St. Vladimir of the 4th degree, Praporshchik [junior officer rank] Munasypov, the order of St. Anna of the 3rd degree, and warrant officer Ibragimov was promoted to the position of ensign [Narodnoe opolchenie, 1962, pp. 161, 162].

In January–May 1813 the 1st Teptyar Cossack Regiment formed part of the Cossack detachment led by General of the Infantry M. Miloradovich, who fought on the territory of the Duchy of Warsaw and the Kingdom of Saxony. The regiment participated: on 27 January in the conquest of Warsaw; on 20 April in the battle of Grossgörschen; on 8–9 May in the battle of Bautzen; on 10 May in the battle of Reichenbach, on 4–7 October in the battle of Leipzig, on 10 October in the battle of Weimar, on 15 October in the battle of Ramsdorf, on 16 October of Fulda [Poxod russkoj armii, 1964, pp. 287, 305–306, 400, 408]. On 16 October 1812 the 2nd Teptyar Regiment arrived in Nizhny Novgorod from the Orenburg Guberniya and from December 1812 to March 1813 was on duty in the garrison of the city of Polotsk. From April to December 1813 it took part in the siege and storm of Danzig [Otechestvennyaya vojna, 2004, p. 698].

On 18 March 1814 the 4th and 5th Bashkir and the 1st and 2nd Teptyar Regiments, fighting alongside the Russian Army, victoriously entered Paris. Their achievements and feats were honoured. The soldiers in these regiments were awarded silver medals 'For conquering Paris on 19 March 1814' and other honours. The 1st Teptyar Regiment was taken under the command of Cavalry General Count M. Platov in May 1814, marched out of France back to Russia, and at the end of the year arrived in the Orenburg Guberniya.

Their command rightly evaluated the military potential of the Teptyar Regiments, which were hugely experienced in border service. They were widely invited to serve in guard forces, military patrols, and horse patrols. The Teptyars were equally good at participating in gun battles and cavalry attacks. All of this revealed the excellent combat skills of the Teptyar Regiments as a light cavalry, similar to mounted hunters.

Four mounted regiments of the Crimean Tatars also contributed to the victory over Napoleon's France: the Simferopol, Perekop, Yevpatoria, and Feodosia regiments (the staff of each regiment constituted 560 lower ranks: 10 non-commissioned officers and 550 Cossacks). Just before the war began the Simferopol and Perekop cavalry regiments had advanced as far as the Prussian border and actively participated in all battles as part of the corps led by military ataman Count M. Platov at Mir, Romanov, Dorogobuzh, Porechye, Dukhovshchina, Ruz, Mozhaysk, in the great Battle of Borodino, at the Borovitsk crossing [Mutizade, 1899, p. 10], etc. In the field of Borodino the Tatar cavalry troops took part in the raid by the corps of M. Platov and F. Uvarov from the enemy's rear, which prevented the French imperial guard from committing to action and predicted the battle's outcome [Masaev, 1998, p. 4]. The Crimean Tatar regiments also distinguished themselves in the foreign campaigns of the Russian Army in 1813–1814.³⁰

³⁰ Thus, the Simferopol Tatar Cavalry Regiment, forming part of the cavalry of Duke Alexander Vir-

A Cossack from the First Teptyar Mounted Cossack Regiment on a Foreign Campaign. 1813.
S. Petrov. Paper, pen. 2008.

In 1812 the Tatar Uhlan Regiment, which was made up of Polish-Lithuanian Muslims, fought on the side of the Russian regular army

tembergsy (Württemberg), fought at Tilsit, Rognid, Brandenburg, etc., and gained especial distinction during the siege of Danzig, for which the commander of the Kay Bey regiment Balatukov was promoted to the position of major-general (7 December 1813). At the beginning of 1812 the Eupatorian Tatar Cavalry Regiment advanced to the Vilna Guberniya, where it became part of the Western Army, led by General of the Infantry P. Bagration. To start with, the regiment occupied cordons along the Neman River and was then attached to the 3rd Army, commanded by General A. Tormasov. The regiment engaged in battles with the adversary's vanguard troops at Zhytomyr, at Lublin, in the expulsion of the French from Brest-Litovsk, at Kobryn (15 July), Gorodeczna (31 July), Pruzhany, Białystok, Zabłudów, Nesvizh, Minsk, the village of Gredino and Kaidanov, etc. Overseas, the Eupatorian Regiment participated in many battles, in particular, at Lucieñ, Kulma, Bautzen, Lichtenberg, Dresden, and Paris [Mutizade, 1899, p. 11].

(since 1807 it was called Uhlan). At the beginning of the war the Tatar Uhlan Regiment was in the vanguard of the 3rd Reserve Army of General A. Tormasov under the command of Colonel von Knorring. In the summer of 1812 the regiment participated in the battles of Kobrin, near the village of Horodecka in Lithuania. The Tatar Uhlan Regiment clashed with Napoleon's main forces in the Minsk Guberniya near the locality of Berezino, when the French were cutting across the Berezina River. The light and elusive Uhlans of the Tatar Regiment engaged in close-range combat with the adversary's flanks and then immediately pulled back. The Tatar Uhlan Regiment also took part in the foreign campaigns of the Russian Army, remaining in the vanguard of the Russian Army's right column led by Adjutant-General Wintzingerode. The regiment's military route passed through the cities of Kalisz and Bautzen. In the battle near the village of Kulm on 18 August 1813 nearly half of the regiment were taken out of action, after which it remained in reserve for the remaining battles [Akhmetshin, 2006, pp. 140–151].

Mention should also be made of the Lithuanian Tatars, who fought on Napoleon's side. In 1812 there were attempts in Lithuania to create a cavalry regiment of Lithuanian Tatars, but it was only possible to form one Tatar

squadron, which formed part of Napoleon's Army (the staff of which included one major, 4 captains, 7 lieutenants and second lieutenants, and 110 low-ranking officers). Its commander was Colonel Mustafa Akhmatovich. The commenced retreat from Moscow led to a sharp decrease in the number of volunteers joining the regiment. On 10 December 1812, during the defence of Vilno, the squadron suffered great losses (10 officers and 50 rank-and-file servicemen). As part of the French guard's regiment, the squadron fought near Budzishgin (on 5 May), Peterwald (6 July), Leipzig (30 October), and in spring 1814 in France on several occasions. In 1815 the squadron, consisting of Samuel Ulan, I. Yanushevsky, A. Assanovich, and 60 rank-and-file officers with weapons and standards, returned to their native country, where it was disbanded in March [Grishin, 2005, pp. 74–75].

Hence, 20 Bashkir (13 of which were involved in military actions), two Teptyar, and the 2nd Meshcheriak regiments (the 1st Meshcheriak Regiment served in the Moscow garrison between 1812–1814) participated in the foreign campaigns of 1813–1814. Together with the Ural and Orenburg Cossacks and the Stavropol (baptised) Kalmyks, they made up a considerable number of cavalrymen in the ranks of the Russian Army. Islamic clergymen

served in these regiments and provided worship services, inspiring soldiers of the same religion to perform heroic deeds. In the battles for the Fatherland the friendship between the nations of Russia was reinforced.

The exploits of the Tatar soldiers in the war against Napoleon's France are described in the Tatar folk songs 'Lyubizar' and 'Golubets, Molodets' [Tatar Folk Arts, 1988, pp. 44, 45]. The contribution of the Tatars of the Ural-Volga Region to the victory of the Russian Army is also reflected in the beits 'Rus-Frantsuz Sugişi Bāete' ['The Beits of the Russo-French War'], which is suffused with ideas of patriotism. Here is a fragment of one beit (word-for-word translation) [Tatar Folk Arts, 1983, pp. 39, 40]:

*[...] The French entered the city of Moscow,
When our troops advanced, they retreated
to the steppes [...]*

*The French horses do not obey their masters,
The French are defeated by the Bashkirs
and the Teptyars [...]*

*Napoleon's hat is bloodied,
When we returned home, the whole country
rejoiced [...].*

In the following decades the military command used the national irregular forces for carrying out military and punishment campaigns. Several regiments of the Bashkir-Meshcheriaks participated in the Russo-Turkish war of 1828–1829. In 1831 the 2nd Teptyar Cossack Regiment was sent to stifle a rebellion in Poland, it also carried out sentry and police duties in the guberniyas of Vilna and Minsk. The reorganised Teptyar regiments—that is, the 1st Orenburg Regular Cossack Regiment (1835–1841) and the Ufa Regular Cossack Regiment (1841–1845)—participated in battles with insurgent militia units led by Kenesara Kasyimov and Iset Kutebarov in the Kazakh steppes between 1840 and 1842. From 14 November 1839 to 22 February 1840 a division of the regiment participated in the Khivan campaign and in 1843 suppressed peasant disturbances in the Troitsk Uyezd of the Orenburg Guberniya. Forces of the Uraland Orenburg Cossack troops, the Bashkir-Meshcheriak troop, and part of the artillery troops also fought in the Khivan campaign [Rakhimov, 2008, p. 113].

Regimental mullahs, especially during the course of Russia's military campaigns against the Islamic countries, had to carry out active agitation work, to smash the idea of the brotherhood of all Islamic countries, and to issue reminders of the oath of loyalty to the Russian monarch and the Fatherland. In particular, during the Khivan campaign of 1839 and the military expedition against the State of Kokand, which took place in 1853, the irregular Islamic troops included around 10 mullahs [Azamatov, 2002, pp. 744–745].

By the efforts of the Cossacks, Bashkirs, and Meshcheriaks the authorities organised 15 punishment campaigns in the Kazakh steppes between 1825 and 1840. In the first half of the 19th century the irregular forces were enlisted to suppress mass unrest in the Trans-Urals. They also kept guard at the Makaryev and Nizhny Novgorod Fairs.

During the Crimean war of 1853–1856, 1% of males of military age were annually recruited from the Kazan Guberniya.

After the suppression of the Polish rebellion of 1864, 300 Muslims of low ranks served in Warsaw and elected the public mullah and the muezzin. At the request of the participants in the military events of 1863, the position of the military mullah was introduced at the army headquarters of the Duchy of Poland in 1865 [Naganava, 2011, p. 202].

After the Russo-Turkish war of 1877–1878 a participant of the military campaign A. Kuropatkin wrote the following about soldiers of non-Orthodox confessions: '...both the Tatars and the Jews have been able and will continue to be able to fight and die just as heroically as other Russian soldiers' [Akhun, 1929, p. 44].

At the very beginning of the Russo-Japanese war the Orenburg Mufti M. Sultanov approached to the War Ministry with the suggestion to send clerics serving in the active forces to those hospitals, ambulance detachments, and military units in which there would be large numbers of Islamic soldiers to enable them to express farewell words to the wounded and bury the deceased in accordance with the rules of Islam. For example, there were 4 hospitals in the city of Nikolsk-Ussuriysk, to

which wounded Muslim soldiers were brought every day, and where 2 or 3 who had died of injuries were buried every month [Naganava, 2011, p. 203].

In spring 1904 the command allowed two soldiers to be appointed to every military hospital so that they could give spiritual 'services' to the wounded Muslims. The next move in this cooperation between the clergy and military authorities was the creation of staff positions of mullahs at the headquarters of the 1st, 2nd, and 3rd Manchurian Armies and in the Amur River military district [Russian State Historical Archive, f. 821, inv. 8, file 1064, s. 71, 75, 100, 108–110]. Thanks to the influence of the military mullahs, Muslim soldiers did not take part in the disturbances organised by the troops, which occurred in Vladivostok in 1905 [Naganava, 2011, p. 205].

Of interest is the operational record of the senior navigation officer of the battleship 'Sevastopol' Iskhak Islyamov, who in 1904 participated in seven military campaigns, in the

defence of Port Arthur, and in the battle with the Japanese Navy in the Yellow Sea on 28 July 1904. In the second half of 1904 he was appointed as a staffnavigator,—the staff officer of the chief of the Pacific Ocean Squadron [Akhmetshin, 2005].

During the Russo-Japanese war of 1904–1905 the following approximate number of awards were granted to Muslims: 194 officers were awarded orders, 2,390 low-ranking officers were awarded distinctions of the war order and medals [Imperatorskaya, 2006, p. 439].

Hence, the Tatar troops, remaining loyal to their oath, did everything in their power to contribute to the victories of the Russian Army and took part in almost every military campaign. Their experience of military service was of benefit to them in their civil life: the former low ranks could speak Russian well, and a number of them had literacy skills in the language and thus, as a rule, they successfully found jobs, and some of them became traders.

Section V

Religious Traditions and Institutions

CHAPTER 1

Sufism as a Sociocultural Phenomenon

§ 1. Sufi Traditions in the First Half of the 19th Century.

Michael Kemper

Sufism is a mystical path within Islam; it involves bringing oneself closer to Allah by means of meditation, asceticism, and spiritual exercises. Thus, Sufism is an 'inner' aspect of Islam in which God, His oneness, might, and mercy are comprehended not only through the rational study of theological texts written by theologians and scholars of Muslim law but also through personal belief in his presence in this world. However, there is a widespread impression of Sufism as a solitary attempt to find the way to God, following only one's inner feelings without recognising the authority and laws of the Sharia. In the case of Tatarstan, this idea would be quite misleading for a number of reasons.

Firstly, Sufism is a complex Islamic discipline in which a *murid* (follower) is obliged to carefully follow the instructions of his sheikh or *murshid* (teacher) and in which the sheikh must theoretically possess absolute control over the actions and exercises of his pupil. Thus, Sufism is a strict school of thought and practice which first and foremost instills obedience to a teacher's guidelines. The sheikh decides when his pupil is ready to enter into *tariqa* (the Sufi path). Each Sufi school has a clear conception of this path, its phases, the tools one must use to move forward on the path, and benchmarks to establish whether a pupil has reached one level or another (often done by analysing his dreams and visions). The teacher also evaluates his *murid*'s level of development and his readiness to advance further along the path. Only the teacher can say whether the pupil has completed his education or not. After the course is completed, the sheikh gives his pupil a certificate called an *ijazah* which permits him to be a *khalifa* (dep-

uty) of the teacher and a full-fledged sheikh as well as to educate *murids* himself. This is the most important document in a Sufi's life; when a *khalifa* receives his powers, he becomes a part of the *silsilah* (spiritual chain) which links him up with his sheikh and all his other teachers and forebears, all the way down to the Prophet Muhammad. It is true that some Sufis were known to assert that they had received their visions directly from God or Muhammad or fallen sheikhs and saints. But Sufis who did not have an *ijazah* were highly vulnerable to criticism from official sheikhs.

Secondly, many Sufis did indeed cross swords with scholars of Islamic law and authorities. The most known example is Mansur al-Hallaj, who was executed in public in 922 in Baghdad for proclaiming, 'I am Truth' (that is, 'I am God'), which reflected Hallaj's belief that he had achieved full unity with Allah. As a result, Hallaj was accused of heresy and of not recognising God's supremacy over His creation and His distance from it. The concept of the 'unity of being' (*wahdat al-wujud*) in Sufism relates to the idea that a Sufi may become one with God at the final stage of his path. But this is only an extreme form of the monistic branch of Sufism. The majority of Sufis would characterise the final stage as the 'unity of evidence' (*wahdat al-shuhud*), meaning that the main purpose of a Sufi is to become a *witness* to God's oneness at the highest stage of meditation and not to actually become one with Him. The majority of Tatar Sufis in the 19th century adhered to this moderate trend in Sufism, which was not considered to exceed the limits of the Sharia.

Thirdly, the majority of Tatar Sufis in the 19th century did not see any discrepancy be-

tween Sufism and Islamic law. In fact, among their ranks was a number of imams from the mosques of the Volga-Ural region; they worked simultaneously as teachers in maktabas and madrasas, where students immersed themselves in Islamic law and theology for years and sometimes even decades. Sufism was offered as a complementary subject at madrasas; the classes were mainly home-based and outside of the curriculum. At the same time, stories about the classical Islamic saints and Sufis (without any discussion of the details of the Sufi doctrine) were used as materials for teaching Islamic ethics (*akhlak*) and morality more generally (*adab*) and were popular among schoolchildren, students, and the entire population. These stories instilled in pupils a devotion to God, acceptance of the fate allotted to them by the Creator as well as modesty, honesty, mercy, respect to brethren Muslims, and many other human values. All of the aforementioned moral principles were considered within the context of well-known Sufis, and the Muslim community did not see in them any conflict with the Islamic doctrine.

Fourthly, the dominant *tariqa* (Sufi order) among Tatar Sufis in the first half of the 19th century was the *Naqshbandiyya-Mujaddidiyya*. This order, which was prevalent throughout the Turkic world, was distinguished by the fact that its followers were especially devoted to following the canons of Sharia and participating in Muslim community life. As far as we know, the brotherhoods whose ecstatic behaviour drew the criticism of Islamic scholars (for example, the 'dervish beggars' who belonged to the *Qalandariyya* order in medieval Central Asia or the eccentric members of the *Bektashi* order in Anatolia and on the Balkan Peninsula) had no Tatar or Bashkir adherents in the 19th century. As a rule, the Tatar Sufis did not recite the *Dhikr* out loud, a practice which could be criticised for its ecstatic nature; the majority of them did not dance or play music, unlike, for example, the representatives of the *Meveviyya* order ('whirling dervishes') in the Ottoman Empire, for example, and did not swallow serpents and swords like *Rifa'i sheikhs* in Arabic countries. On the contrary, the majority of Tatar sheikhs

taught their murids the less impressive 'quiet' *Dhikr*, in which the name of God and certain formulae are repeated to oneself silently. They practiced *rabita*—intense but silent internal contact between a sheikh and his murids. It was believed that such a form of prayer was completely in line with the Sharia and, therefore, Tatar Naqshbandis were not criticised by Islamic legal scholars, with few exceptions. Nevertheless, there were many disputes among the Sufis, mainly concerning rituals and moral behaviour.

Finally, Tatar Sufi literature does not focus specifically on miracles, which distinguishes it from the Ottoman *Bektashi* order, whose saints, according to descriptions in their hagiographies, constantly turn into animals, climb into flaming ovens in order to prove their holiness or strike down their enemies with lightning bolts. There was a number of village sheikhs among the Tatar Sufis (some dynasties did not stop for decades) who were known as messengers who passed on God's blessing (*barakah*) and healers. In particular, infertile women asked the Sufi saints to bless them so that they could conceive children. Nevertheless, as a rule, the miracles described in 19th-century Tatar Sufi literature stand out from the hagiographies of other Sufi orders for their modesty.

A few words on the social or public aspect of the *tariqa* as well as the proliferation of the Naqshbandiyya in a broader context. A *tariqa* is not a clear hierarchical organisation; rather, it brings together all of the sheikhs and their pupils, as well as the methods of spiritual development that trace back to the order's founding father. A pupil follows the *tariqa* of his teacher, and when he receives his *ijazah* (certificate), he becomes a full-fledged link in the chain of the spread of this idea. For this reason, a *tariqa* has the tendency of branching off like a tree: After they receive their *ijazah*, the pupils form new local branches. This phenomenon leads to the result that the orders take on a great number of additional names over many centuries. The viability of a new branch depends on its approval by other sheikhs and the number of the pupils who join it. For example, the Naqshbandiyya takes its name from that of sheikh Bahaaddin Naqshbandi (d. 1389 in Bukhara).

Another great Naqshbandi teacher, sheikh Ahmad Sirhindi (d. 1624) from India, is known as the reformer of the Naqshbandiyya and as the '*mujaddid*' ('reformer') of the second Islamic millennium; from then on, the branch of the Naqshbandiyya modelled after his idea is known as the 'reformed' Naqshbandiyya-Mujaddidiyya. Sirhindi's multivolumed *Maktubat* (treatises) were very popular among the Tatar population, and the majority of Tatar Naqshbandi in the 19th century joined the Mujaddidiyya branch (the old orders continued developing in other territories). Many sheikhs were considered to be members of several branches or even several different orders.

In all branches of the Naqshbandiyya, special emphasis is placed on the life of the community: members of the Naqshbandiyya taught at the *maktabs* and *madrassahs*, served as imams, built *khanqahs* (Sufi community centres) where they met with their pupils and where travellers could spend the night and be fed. Many people assert that the Naqshbandiyya cultivates a spirit of labour that supports trade (indeed, there were many wealthy merchants among the Naqshbandiyya) and social and political activity, a description which refers to Sufism in the Volga region as well.

The Tatar Sufis, mullahs, and legal scholars, who often belonged to the same circles, as was noted above, took up leading positions in the traditional Muslim community, whether it was in the slobodas of Kazan and Orenburg or in the countryside. Whenever the Muslim rulers (khan or caliph) were absent, the Sufis and teachers served as the main guarantors of the integrity of the Islamic character within society. As defenders of the Muslim Tatar identity, they commanded great respect and prestige. They built mosques, schools, and Sufi dwellings with assistance from merchants, reaffirming thereby that the Volga-Ural region remained a part of the Islamic territory (*Dar al-islam*). As a result of geographical isolation from the rest of the Muslim world, Tatar society (which was overall characteristically conservative) directed its efforts primarily towards the protection of 'purely' Islamic traditions from pernicious influence, especially from the encroachment of

Russian culture. Integration with Russia took on an Islamic form.

In the 19th century, this self-isolation of the Tatar Sufis from Russian society did not lead to jihad. The situation was significantly different in Dagestan and Chechnya, where the Naqshbandiyya-Mujaddidiyya-Khalidiyya order became an important partner in the jihad against Russia to three well-known imams: Ghazi-Muhammad, Hamzat-beg, and Shamil (around 1828–1859). Jihad as a movement appeared in Dagestan and Chechnya in about 1828 owing to young Muslim preachers' efforts to destroy the traditional moral principles of rural Dagestani communities and replace their customary law with Islamic laws. Some leaders of the Naqshbandiyya supported this struggle, which hints at a close connection between the ideas of Naqshbandi Sufism and the pursuit of the supremacy of the Sharia. Although the aforementioned imams were not full-fledged Sufi sheikhs, the Islamic movement in the Northern Caucasus was known in Russian literature as 'muridism' owing to its connection with the Naqshbandiyya. The situation in the Caucasus did, of course, differ from the situation in the Middle Volga region, where integration into imperial structures had been occurring for several centuries and where the Russians constituted a significant part of the population. Nevertheless, the following fact is noteworthy: as far as we can tell, the Tatar Sufis from the Mujaddidiyya did not participate in the jihad even at the height of the war in the Caucasus in the early 1840s. Likewise, during the Russian-Turkish war of 1877–1878, they again did not attempt to join their Naqshbandi brothers in the Caucasus in their armed struggle against the Russians. It is quite probable that they were not even aware of the ties between the northern Caucasian imams and the Naqshbandiyya. Tatar literature written in Arabic and Tatar contains almost no record of the jihad. This leads us to the conclusion that in the first half of the 19th century, the Naqshbandiyya-Mujaddidiyya in the Northern Caucasus took on a militant revolutionary stance (through its Khalidiyya branch) towards the Russian Empire, while in the Volga-Ural region the same order was proving itself conservative

and rather peaceful. The Orenburg Moham-medan Spiritual Assembly (OMSA) was the organisation that contributed most to the integration of Tatar mullahs and Sufis into Russia's administrative system. Sufi muftis (for example, the first mufti, Muhammadzhan Khusainov—d. 1824) were among the assembly's heads. The designated mullahs were officially subordinate to the OMSA. American historian Robert Crews proposed the idea that the Muslim Tatars of the Russian Empire even regarded the tsar as a formal defender of Islam. I would not go so far, but looking at the past, despite all of the anti-Islamic utterances of Russian journalists and politicians of that time, I will note that the Tatar mullahs, among whom there were many Naqshbandis, cooperated with the Russian state rather than posing a threat to it.

Another important issue concerns our sources. Almost all of the information about the members of the Naqshbandiyya-Mujaddidiyya has been taken from three well-known papers from the 19th century: "Mustafad al-akhbar" (Kazan, 1880) by Shigabuddin Marjani (d. 1889); a similar work by Murad Muhammad al-Manzilavi al-Ramzi (d. 1934): "Talfik al-akhbar" (Orenburg, 1908); and 15 brochures from the biographical encyclopaedia "Asar" (Kazan 1900, Orenburg 1901–1908) by Rizaeddin Fakhreddin (d. 1936). All of these authors were members of the Naqshbandiyya-Mujaddidiyya.

We know from the papers of the aforementioned scholars that the 19th-century Tatar Naqshbandiyya order can be traced back to two distinguished Sufi teachers from Bukhara and Kabul: Niyazkuli al-Turkmani (d. 1821) and Faizkhan bin Khizyrkhan al-Kabuli (d. 1802). Throughout the 19th century, Central Asian *madrasahs* were the primary Islamic centres for Tatar students, especially in Bukhara and Samarkand; it is thus not surprising that young Tatar students became members of the Naqshbandiyya-Mujaddidiyya specifically in these cities. As we know from the writings of Marjani, Ramzi, and Fakhreddin, Niyazkuli and Faizkhan attended to the education of many Sufis from Kazan, Orenburg/Kargaly and many Tatar and Bashkir villages. Returning home after many years studying in Central

Asia, these students brought their Sufi *silsilah*. Serving as imams and teachers in Tatar and Bashkir villages, they disseminated the ideas of the Naqshbandiyya among their pupils. One of Niyazkuli's many *murids* in the Volga-Ural region was Nigmatulla bin Biktimer al-Sterlibashi, the director of a large madrasah and Sufi centre in Sterlibashevo (in the Ural region), which was later taken over by his sons Kharis (d. 1870/1871) and Kharras (d. 1871/1872). Let us name a couple of them: Ghabdennasir Qursawi (d. 1812), a renowned Tatar scholar, imam and teacher from the village of Korsá; Davletshakh bin Gadelshakh Al-Chabanly (d. 1832 or 1833), who gave lessons in several mosques of the region; and perhaps the poet Abulmanikh Kargaly (d. after 1833). There were two opponents of the muftiate among the pupils of Faizkhan al-Kabuli: sheikh Dzhangfar bin Abdi (nicknamed 'Ishan the accordionist', most likely because he played music, d. 1823 or 1824) from the village Chishma near Ufa, and the well-known Gabdrakhim al-Bulgari (Utyz Imyani, d. 1834), who wrote a great number of Sufi verses, moralistic and legal treatises. In addition, Valid bin Muhammad al-Amin (Vali Muhammad ishan, d. 1802 or 1803) from Kargaly, who had the reputation of a saint, also received his *ijazah* from Faizkhan al-Kabuli. In his turn, Gubajdulla bin dzhangfar al-Kizlavi (d. 1822 or 1823), a pupil of Vali Muhammad ishan, was the founder of the Kizlavi Sufi dynasty in Kizlau/Kurmanaevó, Simbirsk guberniya. These examples illustrate that the idea of the Naqshbandiyya, first adopted by the pupils of a few sheikhs of Central Asia, later spread all over the lands of the Tatars and Bashkirs, embodied in the form of local Sufi centres with ages-old traditions.

However, relying entirely on sources such as Marjani, Ramzy, and Fakhreddin, one may develop a biased perception of the situation: they were writing in the late 19th century, when the ideas of the Mujaddidiyya order had already been widely promulgated across the territories of modern Tatarstan and Bashkortostan. Thus, Marjani, Ramzy, and Fakhreddin talk little about Sufis from other *tariqas*, in particular, the Sufi orders that existed before the 19th

Sh. Marjani.

R. Fakhretdin. Ufa. 1892.

century, some of which penetrated into Central Asia. As a matter of fact, one can conclude that in the first half of the 19th century there were Tatar sheikhs belonging to other Sufi branches as well (to the Naqshbandiyya and likely various other brotherhoods) who received their *ijazahs* not in Bukhara and Samarkand, but in Anatolia, Dagestan and the Arabic countries. We do not know much about these early interactions, as they were completely displaced or absorbed by the Mujaddidiyya of Central Asia.

One more shortcoming of the works of Marjani, Ramzy and Fakhreddin is that these authors tended to underestimate 'nonconformist' Sufis and scholars, even those that belonged to the Naqshbandiyya-Mujaddidiya order. This is especially noticeable when it comes to such outstanding figures as Nigmatulla al-Utari (d. 1816/1817), Gabdrakhim Utyz Imyani and Bagautdin Vaisov (d. 1893), whose style of Sufism did not belong to the "restrained" doctrine of mainstream Naqshbandiyya and who did not support quietism (political neutrality) or the integrative views of Marjani, Ramzy, and Fakhreddin and the devout bourgeoisie of Kazan and Orenburg. For a more profound analysis of these Sufis, one must turn to other sources—in particular, those written by the Sufis themselves.

The bulk of Sufi literature was written primarily in Arabic. The majority of these works were not printed. Over the first five decades

after their establishment in 1801, the famous printing houses of Kazan published only a handful of books by Tatar authors, and there were almost no modern writers, including Sufi ones. A few examples of Tatar Sufi compositions are preserved to this day in the form of manuscripts. Some of these manuscripts are unique: Tatar and Arabic translations, Arabic commentaries on Persian Sufi and ethical texts—in particular, '*Maktubat*' by Ahmad Sirhindi, the works of

al-Ghazalī (d. 1111) and Mehmed Birgevi (d. 1573) as well as original scholarly studies on the concept of Sufism and Sufi rites written by Tatar and Bashkir authors. The latter include two works on Sufism written in Arabic: '*In-ayat al-Subkhani*' ('Care of the Almighty') by Tadzheddin bin Yalchygul (d. 1837) in which a vision of the Sufi way is vividly described, and '*Risalay madiniya*' ('Book from Medina', a defence of Monism and Sufi oneness with God) by Nigmatulla bin Umar al-Utari (d. 1816 or 1817). Just as the Sufi literature in the Turkic languages of the Ural and Volga regions (that is, in the various local dialects preceding contemporary Tatar and Bashkir), Sufi literature in Arabic includes poetry and prose (including epics as well as *silsilah*, preserved in scrolls several meters long). The majority of what has reached us testifies to the influence of Central Asia, but as it will be shown below, the Tatar writers also followed some Ottoman models.

We seek to rethink the status of Sufism in Tatarstan from the 1800s to the 1860s. Additionally, we will discuss the most outstanding scholars who worked prodigiously in the field of Islamic law and theology; their activity will be highlighted in detail below. Since Islamic students and Sufis travelled a lot, their individual routes and locations of work crossed and covered the territories of modern Tatarstan and Bashkortostan, as well as the region in general. We are avoiding statements on the nationali-

ties of one Sufi or another, which, in any case, would be an unhelpful endeavour.

Instead, legends and shrines act as indicators of Islamic identity within the Russian Empire. Sufi teachers since the late 18th century have been making lists of Sufi shrines and mausoleums with relevant descriptions for pilgrims. Allen Frank calls these works 'catalogues of mausoleums (mazars)'. According to him, these shrines served as signs of Islamic identity in the topographic map of the Russian Empire. This is evident in the narratives on the Islamisation of Central Asia—for example, in stories on Babaa Tuklese (researched by Devin DeWeese), the catalogues of sacred mazars of the Volga-Ural region connect the emergence of Islam with the activity of Islamic Sufi miracle-workers. The veneration of dead sheikhs (as well as their descendants) reflected an early and original Islamic identity of the Volga-Ural region. The territory of this region, in general, coincided with the territory of the Orenburg Muslim Spiritual Assembly (OMSA), which came into existence at approximately the same time.

And catalogues of mazars of different places have been preserved. In them, the ruins of Bulgar are usually referred to as the spiritual centre of the united Muslim region. It was thought that Islam came to Tatar lands through Bulgar, and the graves of many Islamic saints and heroes were located there. According to one legend, Muhammad the Prophet sent his three companions to Bulgar, where they worked a miracle and by this miracle persuaded the khan to adopt Islam. There are several versions of this story, including a Bashkir genealogy story (*Tarikh-name*) by Tadzheddin bin Yalchygul (died in 1837/1838) and the famous '*Tavarikhi Bulgaria*' (History of the Bulgars). The latter is written in Turkic and is especially noteworthy.

Dozens of manuscripts and a number of printed publications of '*Tavarikhi Bulgaria*' have been preserved up to this day, a testament to its great popularity during the entire 19th century. A man by the name of Khisameddin bin Sharafeddin Al-Muslimi, who, as is reported, completed this work in 958 or 992 according to Hegira (1551 or 1584), is mentioned in the text itself as the author. Nevertheless, the

names of some scholars who apparently lived in the late 18th century are also mentioned in the text. And so it is reasonable to suppose that '*Tavarikhi Bulgaria*' reached us in the form it had been written in from the early 19th century (the earliest existing manuscripts date back to 1827). The contents of '*Tavarikhi Bulgaria*' represent a compilation of various chapters: along the legend on the Islamisation of the region and list of Sufi shrines in the region, it also contains information on the early history of Islam, geography of Eastern Europe, and Muslim calendar. The final chapter 'Conclusion' (*khatima*) contains several stories on the military campaigns of Aksak Timur (Tamerlane). Getting instructions from Allah and the legendary Central Asian saint Ahmed Yesevi, Timur (died in 1405) inflicts defeat upon Chinggis Khan (died in 1227), struggles against Persian ruler Nadir Shah (died in 1747), dispossesses Istanbul of an Ottoman caliph named al-Mahdi (fictitious), and finally, conquers and destroys Bulgar. In the 19th century, a number of Tatar scholars criticised the obvious historical distortions in these stories; in 1880 S. Marjani harshly criticised '*Tavarikhi Bulgaria*', asserting that it was completely useless because of its numerous anachronisms. As is known, Marjani was an opponent of a Bulgarian identity of the Volga Muslims, and urged the people to call themselves Tatars. This point of view of Marjani found support amongst scholars of TASSR, who believed that '*Tavarikhi Bulgaria*' was simply a fanciful conception of Islamic fanatics. M. Usmanov also paid serious attention to this work, indicating that '*Tavarikhi Bulgaria*' contains elements from earlier sources, including '*Daftari Chinggis-name*'.

The huge popularity of '*Tavarikhi Bulgaria*' in the 19th century meant the Tatar Islamic reader was not simply reading this collection of hagiographies and historical belles-lettres as a historiographical work. In the genre of hagiography, historical events are usually 'placed' into the sacred history of a certain tribe or community, and their function is not to transmit accurate historical evidence, but to affirm the continuous commitment of the population to Islam as well as declare the proper values and ethics of

society. In this specific case, the sheikhs represent Islam and some of the fictitious historical facts in *'Tavarikhi Bulgaria'* symbolically represent several fundamental topics within Sufism, theology, and sharia. Topics that caused arguments amongst the Volga-Ural Muslims in the 19th century. In particular, carefully considered tales on Timur's campaigns are very informative in this former respect; evidently they were intended to impart a moderate Sufi interpretation of Islamic ethics. Timur plays the role of defender of Islam. He protects Islam not only against the pagan Chinggis Khan, but also against the corrupted Muslim rulers of Istanbul and Bulgar. Ultimately, it is Allah, by means of miracles, who leads Timur to victory. In the story, Timur decides to conquer Istanbul after he learns that the elite of the city have not been praying at the proper time and have been practicing sodomy, and also that the men have even been killing their wives. And some time later, the genitals of all offenders become infected in an unknown manner, a fact that is offered as evidence of their guilt. When Timur finally begins governing the city, he executes the sultan and all the scholars who pandered to his disgusting habits. Later, Timur destroys Bulgar, as its residents were engaged in criminal activity and debauchery. Their Muslim theologians were justifying the drinking of alcohol and the omission of Friday prayers and the fifth daily prayer (the night prayer—*'isha'*). This is problematic in northern districts of the country, where it is bright at night in the summer. And lastly, scholars in both Istanbul and Bulgar were engaged in theological speculation (*kalam*) and disregarded the study of the Koran and the traditions of the Prophet Muhammad.

In general, this story carries a strong moralistic meaning, and, therefore, is connected to other Sufi stories, such as Tadzheddin Bin Yalchygul's *'Risalai Gazize'* ('Aziza's book'). *'Risalai Gazize'* itself recounts similar events as from a work of the famous Naqshbandiyya sheikh, Sufi Allahyar of Bukhara (died in 1723). As was mentioned above, the moralistic message of *'Tavarikhi Bulgaria'* is connected with the criticism of speculative theology as well as the appeal to return to the fundamental

foundations of Islam. In particular, *'Tavarikhi'* addresses the necessity of Friday prayers (even if only a few people came to Friday gatherings, as such was the case in small villages of the Volga-Ural region) and *'isha'* when it was still light outside. It is interesting that the aforementioned concerns and criticisms are the arguments we find in the theological and legal papers of Ghabdennasir Qursawi (died in 1812). Since *'Tavarikhi Bulgaria'* clearly lays out Qursawi's position on questions of Islamic law and theology, there is a high probability that at least 'Conclusion', in the version that came to us, was prepared by a key follower of Qursawi, perhaps Muhammadamin Bin Saifulla Al-Nalasavi (died somewhere between 1831–1833).

Thus, *'Tavarikhi Bulgaria'*, characterised by an original combination of historical, Sufi, and theological-legal issues, vividly illustrates a methodical component to the teachings of Tatar Naqshbandiyya, or, as a matter of fact, the 'moderate' nature of Tatar Sufism. A similar connection can be traced back in a small treatise called *'Qursawi's Life'* (*'Manakibi Abu Nasr Ghabdennasir al-Qursawi'*) [Institute of Oriental Manuscripts of the Russian Academy of Sciences, Saint-Petersburg, manuscript. A1241], which apparently was written around 1820. Here, Qursawi is described as a Sufi who was guided by God's inspiration. From this perspective, it becomes clear that the main purpose of the authors of *'Tavarikhi Bulgaria'*, was the integration of religious regional history (including both the Islamisation legend as well as the catalogue of holy places) with religious edification, in addition to the popularisation of Qursawi's detailed theological interpretations from within the Sufi framework.

Isolationism: Gabdrakhim al-Bulgari. It is evident from a story on Timur in *'Tavarikhi Bulgaria'*, that Istanbul was the second source of inspiration of moral righteousness and Sufi thought, after Central Asia. In the 17th century, the Kadizadeli movement appeared in the Ottoman empire. Mehmed Kadizade (died in 1635) and his followers were popular preachers in large mosques of Istanbul, including Hagia Sophia and Sultan Ahmed. Their sermons focused on moral purification. They concentrated

particularly on abstinence from consuming tobacco and coffee as well as adapting political and economic policies to follow Sharia law. The movement was mainly directed against military officers (who were accused of having sex with 'beardless' boys during military campaigns), eminent Ottoman scholars who were enriching themselves through charity funds (*vakuf*), and against Sufi brotherhoods, especially those of the *alvatiy* order, with their ceremony of *Dhikr* and the corresponding extravagant behaviour of its members. Sometimes these conflicts led to open clashes in the streets. A composition by Turkish scholar Mehmed Birgevi (died 1572) was the primary source of inspiration for members of the Kadizadeli movement. In Birgevi's ethical collection, 'At-Tariqa al-Muhammadiya va as-sira al-ahmadiya' ('The path and biography of the Prophet Muhammad'), the good and evil moral qualities of a person were studied and classified. In this piece, he criticised certain types of activity in the Ottoman Empire (for example, the creation of charity funds that were given loans in the form of credit in exchange for a percent of income). In Birgevi's opinion, such types of activity were *Bid'ah*, that is, an illegal innovation which went beyond the framework of Sharia law.

Within the Ottoman Empire, the supporters of the strict ethics of Birgevi and Kadizadeli were characterised as opponents of Sufism, but in the context of the Tatars, their struggle for strict observance to the principles of Sharia and Islamic morals fit in with the spirit of the Naqshbandiyya Sufi brotherhood, which was to equal extent defending Sharia and the interests of Tatar traders. Birgevi's doctrine was of great importance for Tatars, and so one of the most published works in the Kazan printing house was '*Pirkuli kitaby*' (Birgevi's book'), a brief statement, drafted by an unknown author in the Ottoman language, of Birgevi's ethics (there were six editions from only 1801 to 1808). There are several versions of this work, a rhymed edition being the most popular one. Birgevi's beliefs on trade and the economy can be found in '*Risalei Muhammad Efendi*' ('The Book of Mehmed Efendi [Birgevi]'), published first in 1808 in Kazan. Birgevi condemned fraud and corruption,

insisted on investing in charity in the name of Islam, and called for abstention from dubious economic undertakings. In the framework of his doctrine, trade was considered pious and not conflicting with Islamic laws, a fact that was taken by Tatar merchants as a guide to action. In other words, the doctrines of Birgevi and Kadizadeli gave Tatar traders an Islamic consciousness when they began integrating into the Russian economy. Moreover, the second Orenburg mufti, G. Gabdrakhimov, in his fatwas, quoted Birgevi and later commentators. These fatwas urged for the integration of the Tatars into various institutions of the Russian Empire (for example, in one letter he condemns the practice of self-mutilation to avoid service in the army as running counter to Islamic laws).

Nevertheless, Birgevi also had great influence on the Naqshbandiyya sheikh and scholar Gabdrakhim Al-Bulgari, later known as Utyz Imyani. Gabdrakhim Al-Bulgari (1754–1835) was against the integration of the Tatars into Russian Empire institutions. He had studied in Bukhara and Samarkand under the direction of well-known Naqshbandiyya sheikhs as well as in Kabul under Faizkhan Al-Kabuli. He first came to Central Asia when he was, perhaps, seeking to avoid prosecution in Russia. And as some sources note, he took part in Volga-Ural revolts in the late 18th century. His first jobs had been philological translations (from Turkic into Arabic) and commentaries, in Turkic, on two ethics papers of the above-mentioned Sufi Allahyar of Bukhara. Gabdrakhim also studied '*Maktubat*' ('Writings'), written by the Indian Naqshbandiyya sheikh Ahmad Sirkhindi (died in 1624), the founding father of the Mujhaddidiya branch of Naqshbandiyya. Gabdrakhim not only put together a dictionary of difficult terms of the '*Maktubat*', but also created a tiny copy of all relevant manuscripts and, as he wrote in one of his papers, constantly carried this copy around.

Gabdrakhim furthermore wrote poems. His series of poems, the '*Tukhfat al-guraba*' ('Gift of Foreigners'; we will return later on to the significance of the 'foreigner'), firmly criticised Sufi sheikhs of Bukhara for their poor work with students from the Volga-Ural region, dis-

cussed the incompetence and greed of corrupt sheikhs who were only interested in money and donations, and reproached corrupt sheiks for their use of young men as sexual objects. These mocking verses ring clearly and probably reflect the experience of Gabdrakhim. And while living in Bukhara, Gabdrakhim also expressed his disagreement with Qursawi. Gabdrakhim was resolutely against Kursavi's insistent demands to revive *ijtihad* (new interpretations of holy Islamic texts).

When Gabdrakhim returned from Central Asia, he became poor and an 'illegal' wandering preacher. As a matter of fact, Gabdrakhim was an ardent 'oppositionist'. He bitterly criticised muftiyat and the emerging Tatar bourgeoisie. Their rise provided the primary impetus for Gabdrakhim's turn to Mehmed Birgevi's works, whose main ideas Gabdrakhim sought to 'reconcile' with several aspects of Naqshbandiyya teachings. The names of several books, written by Gabdrakhim in Arabic after he had returned from Central Asia, remind us of Birgevi's works: *'Inkaz al-khalikin'* ('Salvation of victims') [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, item 2387]; and *'As-saif as-sarim'* [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, items 1204–1206]. Like Birgevi, Gabdrakhim attached a lot of importance to asceticism (*zukhd*) and morality (*akhlak*). But whereas Birgevi seems to have remained indifferent to some questions which were considered 'neutral' (*mubakh*, neither obligated nor prohibited by Muslim law), Gabdrakhim went much further. He asserted that any form of pleasure must be rejected as *kharam* (prohibited). Gabdrakhim followed the principle of *ikhtiyat* (great caution)—the concept that it would be better not to perform an action unless it was certainly pious. He wrote individual sermons rejecting wealth accumulation. They were directed against the Tatar merchants' predilection for acquiring luxury items. Gabdrakhim claimed that since the methods the merchants used to earn their money was questionable, even donations to charity could not be accepted. If Naqshbandiyya tariqa demanded complete devotion and asceticism only from

murids, Gabdrakhim asserted that each believer must live in poverty and that striving for wealth was a sin which corrupts and leads to death.

Considering himself a Naqshbandiyya sheikh Gabdrakhim effectively deprived the tariqa of its mystical aspects. He never mentioned mystical experience as a goal of the Sufi way in his works. The Sufi methods and means that he described never went beyond simple asceticism. Most likely Gabdrakhim was striving to understand Allah by strict adherence to His ethical and legal guidelines. Disregarding the mystical aspects of the tariqa, Gabdrakhim characterised the traditions of Naqshbandiyya as a path of extreme asceticism and perfect morality. In this way he united it with the Birgevi doctrine. At the same time, Gabdrakhim took the piety of the Birgevi to an extreme, turning it into a misanthropic refusal of the world.

The theme of the corruptibility of Muslim society was a dominant theme in Gabdrakhim's work. He believed that this moral decay occurred mainly through contact with the unfaithful. Thus, Gabdrakhim rejected all Russian cultural influences: tables, chairs, beds, windows (which he saw as resembling the Christian cross), leather tanned by non-Muslims, meat from the slaughterhouse of the unfaithful and, of course, tea and alcohol. The most pessimistic and isolationist of Gabdrakhim's writings were devoted to predictions that the apocalypse was coming. It is probable that he saw himself (in the tradition of prophets) in the role of someone warning that one day corruption will spread throughout the Muslim society to such a degree that people would see a Muslim still living according to the Islamic canons as being alien to them (*garib*). In the 19th century, similar apocalyptic expectations were evident in other parts of the Muslim world.

Gabdrakhim's fusion of the pious Ottoman Birgevi tradition and the Sirkhindi Naqshbandiyya concept, especially his criticism of Bukhara Sufis, can be seen as a step on the road towards liberating Tatar scholars from the influence of 'sacred' spiritual centres in Central Asia. By the end of the 19th century, their status was in decline. Gabdrakhim with his strict, uncompromising demands and refusal to recognise

official mullahs and muftis can be thought of as a forerunner of Bagautdin Vaisov (who died in 1893) and his passive resistance movement. Vaisov was also convinced that the Final Judgment was imminent. It is not surprising that Gabdrakhim's writings in Arabic were never published, nor that later historians, for example Marjani, had no liking for him.

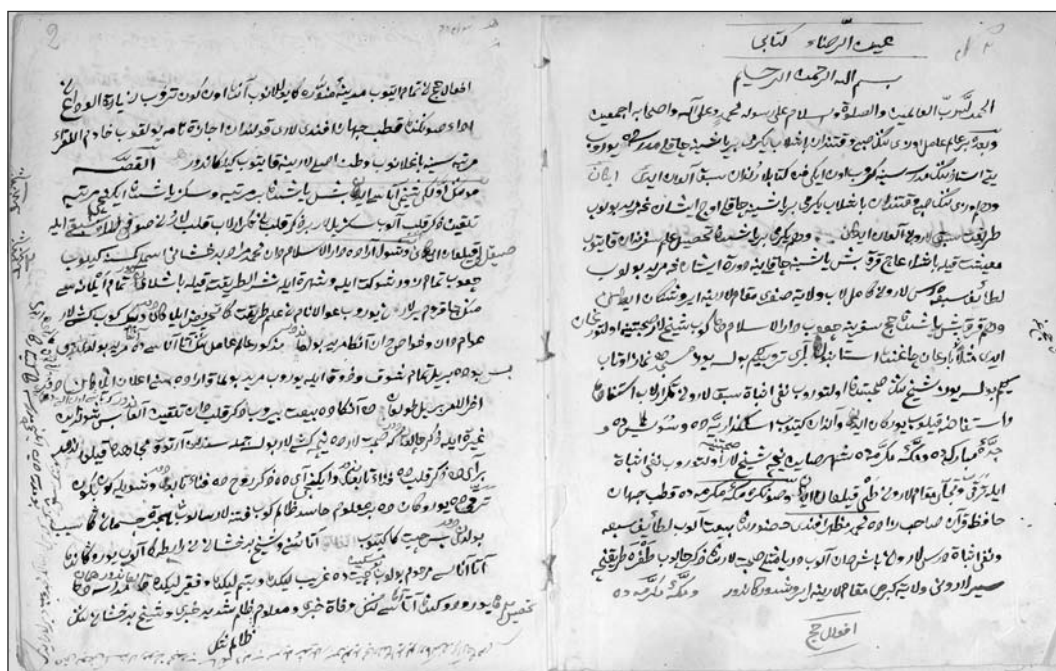

Integrationism: Ghaly Chokry. Muhammadgali Al-Chokry (1826–1889) was another famous Sufi in the Volga-Ural region in the 19th century. As part of the broad spectrum of Naqshbandiyya-Mujaddidiya views, Chokry was in favour of the Tatars integrating with Russia in a devout way. He was the reverse of Gabdrakhim Al-Bulgari. A Turkic-language work by Chokry entitled '*Madkhi Kazan*' ('An ode to the city of Kazan' Kazan 1306/1889) pays tribute to Islamic scholars, followers of Sufism, and merchants of the city who led Muslim culture and education to new heights through charities and Islamic institutions. Chokry disliked '*Tavarikh Bulgaria*', (especially the positive image of Timur portrayed in this work) but with this exception he was an ardent supporter of the concept of a unified Bulgar (Tatar-Bashkir) Islamic territory. In his panegyric, Kazan is portrayed as the new Islamic centre on Bulgar land, integral to the Russian Empire. Thanks to the Kazan publishing house, 'rays of Islamic civilisation' penetrated into the neighbouring regions.

Chokry (who established his own noble origins, allegedly going back to one of Chinggis Khan's commanders, Maiky-Bey) wrote many panegyrics on Tatar and Bashkir sufis and scholars (partly published under the title 'Luminous candles' [*'Sham' ad-diya*] (Kazan, 1883): such as Dzhangfar bin Abdi Al-Bulgari (d. 1823/1824), Valid bin Muhammad al-Kargaly (d. 1802/1803), Habibullah Al-Oruvi from Ura (d. 1817/1818), Gubajdulla al-Kizlavi, Gabdulzhabbar Kari from Novo-Al'met'ievo village and Nigmatulla bin Biktimer Al-Sterlibashi (Tukayev, d. 1844/1845), Gabdulla Machkaravi (d. 1859), Ali al-Tuntari (d. 1875). Poems praising the fourth mufti, Salimgaray Tevkelev, reflect Chokry's positive attitude to Orenburg Muslim Spiritual Assembly. Chokry devoted special praise to Haris, one of Al-Sterlibashi's

sons, who spent his fortune on building a large library, mosques, school and guest house for the Sufi Centre, which he opened in Sterlibashevo. Many of the aforementioned people followed the traditions of the Mujaddidiya of Faizkhan Al-Kabuli from Kabul. There were four people in Chokry's life who connected him with the Mujaddidiya: his father Gabdessalih (a follower of Al-Kabuli), Muhammad Murad al-Badakhshani (who was apparently from Tajikistan or Afghanistan), Haris from Sterlibashevo and Sheikh Muhammad Mazkhar Sahib-Zade, whom he met in Hejaz during a hajj. These relations show that although Chokry worked as a Mullah in Iskre Chokyr village (Birsik Uyezd), he was well integrated with a large international Naqshbandiyya network.

Less well known than his Turkic-language panegyrics, Chokry's Arabic treatises also give an idea of Sufi life in the 19th century. Chokry is likely to have written '*Fass al-akhiyar*' ('The engraved gem of the pious') [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, item 2673] in the late 1850s. In this treatise, Chokry defends the Islamic practice of forming a circle (*khalka*) in a mosque to improve *Dhikr*. Many Muslims were against this practice, arguing that it did not correspond to Islamic traditions. Chokry called them 'exhausted frauds' which possibly indicates that these critics were ascetic vagrants such as Gabdrakhim Al-Bulgari, opponents to Muslim integration. In response to their attacks, Chokry claimed that all these actions were fully consistent with the Sunna because during the *khalka* no one sat in the centre of the circle and they were not carried out during Friday prayers.

A book by Chokry's son, Garifulla al-Chokry (al-Basravi, 1861–1918), covers other aspects of his life in the countryside. In '*Ain ar-rida kitaby*' ('Book on the source of satisfaction') [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, item 680], Garifulla described his father's apiary as the place where Sufi exercises were conducted. The rich and the poor, scientists and sufis regularly came to *mejlis* (gatherings) to take part in conversations on morals or sufism, to read po-

The pages of a manuscript by Garifulla Chokry: 'Ayn ar-rida kitaby'. Late 19th century

etry, to pray and to perform Sufi rites, including *Dhikr* and (*khalka*). Women were also allowed to form their own *khalka* behind the trees. In this way, the garden is presented as a bucolic place for meetings. Travel was also part of Islamic culture in Russia. Chokry describes his Hajj pilgrimage in detail at a time when Russian infrastructure (including railways and steamships which made his journey via Odessa less arduous) was advancing. His assessment of Russian institutions in general was also

positive, compared to what he had seen in the Ottoman Empire. Chokry advocates the adoption of a positive attitude towards the Russian Empire as a place for 'Bulgar' Islam. He also argues in favour of Kazan's new role as an Islamic centre and for Sufism to be spread to the countryside. In general, his work is reflective of the tendencies towards integration adopted by Naqshbandiyya Sufism in the middle to the end of the 19th century, when so-called sheikh-'oppositionists' still existed.

§ 2. Sufism in the Volga-Ural Region in the Latter Half of 19th to the Beginning of the 20th Centuries.

Alfina Sibgatullina

In the second half of the 19th century, key aspects of Russian Muslims' spiritual lives underwent considerable change: having rejected the example set by Central Asia, which was going through a serious crisis in its education and Islamic belief system, they started to visit Istanbul, Beirut, and Cairo. These became the new centres of progressive Muslim thought. Ottoman Turkey, where various religious and

Sufi schools of thought developed, was also a place where representatives of Naqshbandiyya tariqa, to which the Tatars historically adhered, were concentrated. Mujaddidiya, which came to Anatolia at the turn of the 7–8th centuries [Şimşek, 2004, s. 100] from India and Hejaz, had a great number of followers in the Naqshbandiyya monasteries (*tekke*). There were also Central Asian monasteries ('Uzbek', 'Bukha-

ra'), to which Volga Muslims who arrived in Istanbul were usually affiliated [Sibgatullina, 2010a, pp. 89–94]. In relation to this a 'Kazan' tekke was founded as part of the Nur-Osmania mosque.

There were also Mujaddid sheikhs in Mecca and Medina who 'specialised' in dealing with non-murids, including pilgrims from the Volga region, Dagestan, and Central Asia [Algar, 2007, p. 414].

However, when the followers of the Indian Naqshbandiyya movement led by Sheikh Mevlana Khalid-i Baghdadi (Abul-Bakha Ziya'etdin Khalid Ash-Shahrezori (1776/1780–1827), who founded the khalid branch, gained influence of historical proportions, this gave the Naqshbandiyya order a powerful impetus and its popularity rose once again. Following Sheikh Imam Rabbani—Ahmad al-Faruqi Sirhindi (1564–1624), the Kurdish Sheikh Khalid-i Baghdadi, who was a supporter of *vakhdat ash-shukhud* (a stance advocating the absolute transcendence of God), believed that spiritual revelations from on high are available to mankind only if Sharia law is adhered to. Promoting perfect adherence to Sharia law and the Sunnah, he supported the Ummah's desire to promote education and encouraged them to use this to withstand European attacks against Islam. There are no fundamental differences between Mujaddidiya and Khalidiyya,¹ Mevlana Khalid-i Baghdadi's innovation could be described as an enhanced *rabita*—the mental connection between a praying Sufi and the image of the Sheikh. The Prophet remained the ideal of mankind, while his companion Abu Bakr (Siddiq) headed the spiritual genealogy of the tariqa also named *siddiqiya*.

Khalid-i Baghdadi refused the apolitical nature of Sufism and proclaimed the following principle: 'Engage in wordly affairs for the sake of religion'. On being asked what his dying wish would be, he replied: 'My dying wish is for religion, and to realise religion in all its

power and perfection, I require earthly experiences' [Yilmaz, 2009, p. 197]. At the same time, he believed that a Muslim must strictly follow Shariah law not only in everyday life but also in public affairs, and that the triumph of law was achieved through the administration of the State. Mevlana Khalid-i considered the Ottoman Empire a pillar of Islam, and so urged his murids to pray diligently for the welfare of the Ottoman Empire and its Sultan-Caliph. The Sultan was acknowledged as the leader and protector of all Muslims.

Khalid-i Baghdadi's followers differed from the leaders of other Sufi Brotherhoods in by their enlightenment, special righteousness, and piety. They also demanded scholarship and moral purity from their students. This was what primarily distinguished the Khalidiyya from the Bukhara Naqshbandiyya tradition.

Thanks to the khalidiyya branch, the Naqshbandiyya tariqa became the most important brotherhood in Turkey at the turn of the 19th and 20th centuries. It also had the closest links to power.

Khalidiyya was widespread in Kurdistan, Syria, and Iraq. In the 1820s it became dominant in Dagestan (where a new branch—Naqshbandiyya Mujaddidiya Khalidiyya Mahmudiya, named after Sheikh Mahmud Al-Almaliya, who died in 1877, was soon formed).

Volga Muslims probably first encountered this new branch of Naqshbandiyya during pilgrimages, which became significantly more popular in the latter half of 19th century. Volga Muslims had the opportunity to meet Khalidiyya sheikhs on their way to Mecca and Medina in cities such as Istanbul, Baghdad and Damascus [Abu-Manneh, 2005, p. 296–304]. While on a pilgrimage in 1826, Khalid-i Baghdai realised the vital importance of Mecca in spreading his teachings, and appointed Sheikh Abdullah al-Makkah Erzinjani to be his chief caliph in Mecca. It is thought that Khalidiyya spread in the Volga and the Urals through him acting as an intermediary.

Volga Muslims who actively acquired real estate in Mecca and Medina in the second half of the 19th century contributed to the consolidation of the Kazan community in these holy

¹ If we take into consideration the fact that Khalid b. Ahmad became the second after Jalāl ad-Dīn Muhammad Rūmī in the whole Islamic world, who got the title of 'Mavlan' (our lord, our victor), it becomes obvious how great his influence and authority was.

places. In addition to shakirds coming to Hijaz to study, there were also Tatar mudzhavirs: they lived in the Sufi monasteries, served pilgrims who arrived from the homeland during Hajj and provided mentoring in their free time. Murad Ramzi (1854–1934) was the most important Naqshbandiyya Sheikh in Mecca and a mudzhavir at the same time².

The Khalidiyya caliph, sheikh Yunus ibn JDzhagfar ash-Shirvani al-Khanafi (d. 1850) became the spiritual mentor of the Northern Azerbaijan Mahmud Daghestani ash-Shirvani (Mahmoud ibn Sadyk ibn Mustafa ibn Ghali ibn Sadik Ash-Shirvani Al-Shafi Al-Almaly (died in 1877)), who had been sent into exile to the Perm Krai by the Russian authorities. The exiled Sheikh actively contacted Muslims from the Ufa, Kazan and Astrakhan guberniyas and gathered many murids around him. The most famous of his followers were Muhammadzakir ishan Kamalov Al-Chistavi (1804–1893), Gabdulvahhab Al-Hadzhitarhani (d. 1899), Gabdulgali bin Gubajdulla al-Bajraqawi (d. 1901). A prominent expert and interpreter of the Karan was Ishan Kamalov who served as Imam-Khatib in Chistopol for half of century. It was home to the 'Kamaliya' madrasah which was very large for the time.³ He became the acknowledged leader of Naqshbandiyya-i-Khalidiyya in the central parts of the Russian Empire. Ishan fell out of favour with the authorities because of his opposition to the overt Russification policy of the Tsars. [Amirkhanov, 2001 pp. 74]. He resisted coercive measures to open Russian schools at madrasahs until his death, considering this move by the authorities as a threat to Tatar ethnic identity.

Shazilit Sheikh Sayfulla Qadi Bashlarov (1853–1919), a well-known figure in Dagestan, studied directly under Kamalov. In 1878,

Saifullah was exiled to Saratov guberniya on suspicion of having participated in the anti-Russian revolt of 1877. In this period, he received ijazat from Ishan Kamalov. After his death, Saifulla Kadi joined another Tatar-Bashkir khalidiyya Sheikh—Zaynulla Rasulev. This united two independent Khalidiyya movements in the Ural-Volga region.

M. Kamalov was related to prominent Tatar Sufi leader Ghali ibn Saifullah Al-Tunteri (d. 1874) who disseminated tasawwuf in the Malmyzh district of Vyatka guberniya. Ishan Ghali, a representative of Bukhara Sufism, was remarkable in the scope of his world view, his scholarship, and openness to innovation. He therefore adopted a positive approach to the Khalidiyya branch of tariqa and to the jadid reformers. S. Marjani said that he was 'the most knowledgeable, outstanding, eloquent and credible ishan in our country' [Fäxretidin, 2010, b. 16]. Imam-Khatib, mudarris Ishan Ghali, was the head of the madrasa in Tyunter village for a long time. His grandson, Muhammadnadhhib Shamsutdinov Tyunteri (d. in 1930), was also engaged in educational and mentoring activities. He later became Zakir ishan's son-in-law.

Another Khalidiyya sheikh who was well known in the Ottoman Empire was Ahmed Ziyaetdin Gumushkhanevi (1813–1893).⁴ Unlike in other Sufi teachings, he paid attention to social aspects of individuals' lives in his system for educating 'the perfect man'. His ideal was a true believer, industrious and morally pure. He rejected vagrancy, poverty, isolation and 'the avoidance of public activities'. At the same time, he always urged his followers not to be caught in the trap of the world of illusion; believing that one should always remember the Almighty, even when you are busy with worldly affairs. He was acutely aware of a regression and stagnation both in Sufi practice and philosophy, and in the Muslim world in general. The sheikh believed the reasons to be ignorance and

² Murad Ramzi (1855–1934), a theologian, was born in the Menzelinsk uyezd of Ufa guberniya. He studied in Medina from 1876 to 1880. Having performed the hajj in 1880, he moved to Mecca and stayed for a long time there.

³ Famous public figures and educators such as R. Fakhreddin, F. Karimi, G. Gafurov-Chygtay, Kh. Fayzi-Chistapuli, the revolutionary, journalist and teacher F. Tuktarov and others graduated from there [Amirkhanov, 2001].

⁴ Sheikh Ahmad Gumushkhanevli is considered to be of Caucasian origin. People from Dagestan and the Volga region were sheikhs in his residence at different times, for example, Omar Ziyaetdin Dagestani (1849–1920), Abdulaziz Bekkine al-Kazani (1895–1952) and others.

breaches of the rules of morality. As a theologian and practicing teacher, he had a positive attitude to jadidism and supported all initiatives which contributed to human progress. In this way, he proved that Naqshbandiyya-i-Khalidiyya is not a rigid, closed and weak doctrine, but rather a flexible philosophical system able to change and meet the modern requirements of society.

R. Fakhreddin's work 'Asar' contains an account of the Ottoman sheikh's Volga Muslim students. [Fäxretidin, 2009, b. 85–87, 233, etc., 262–263]. When Tatars visited Istanbul, they would visit the tombs of Sheikh Gumushkhanevi and his followers, where they would conduct memorial ceremonies [Mägazi, 1913, p. 51].

Z. Rasulev became one of the first and the most active disseminators of the khalidiyya branch of the Naqshbandiyya tariqa in the Volga-Ural region. He was a native of Bashkiri village, Sharip, in Zlatoust district, Orenburg guberniya. After studying in Troitsk, he was appointed as an imam in Akkuzha village, Verkhneuralsky uyezd, where he set up his own madrasah. In 1859, he joined the Naqshbandiyya-Mujaddidiya tariqa headed by Sheikh Gadelkhkim bin Kurbangali Chardakly (d. 1872). He met Rasulev Gyumyushkhanevi (according to *the silsilah*—Zainullah al-Kazani) [Gündüz, 1984, s. 157] in Istanbul in 1869/1870 during a pilgrimage to Hejaz, and had long conversations with him (*khalvat*). During these conversations, he learnt the secrets of this Sufi movement and was authorised to disseminate the theory of Sufi tariqas such as Naqshbandiyya, Qadiriyya, and Shadhili, as well as Sukhraverdiyya, Kubrawiyya and Chishtiyya.

In September 1870, Z. Rasulev began to spread the Khalidiyya in Troitsk and he soon gathered many supporters throughout the Urals, the Volga region, Kazakhstan and the Caucasus. In the middle of 1872, he was arrested; at the beginning of 1873, as a result of administrative proceedings, he was indefinitely exiled under strict police control to the northern guberniyas (first Vologda, then Kostroma), where he stayed for nearly seven years [Farkhshatov, 2009, pp. 22–23]. The reasons

for his exile are uncertain, but it seemed that Rasulev was framed by his competitors—local Mujaddidi sheikhs—but it is also possible that the authorities could have had their own far-reaching objectives, including even the desire to take over the Bashkir land [Farkhshatov, 2009, pp. 42–43]. If we consider these reasons side-by-side, then it seems that by exiling a 'Turkish spy' who distributed books in the Ottoman language, a 'false sheikh', who organised a 'sect' and engaged in 'bidah', who maliciously took murids from his former spiritual guide Chardakla Hadrat Gabdelhakim Kurban-galiev, both the authorities and the competitors of Zainulla-ishan supposedly achieved their goals. But exile for a Sufi is something known as '*chilla*'—a test of loyalty to the chosen path and the spiritual mentor, as well as a way to strengthen the faith. It is not surprising that immediately after his release, Zainulla Rasulev went for *hajj badal* (a hired pilgrimage) once again to Istanbul, where he met with his sheikh Gyumyushkhanevi. After his return, he lived in Troitsk, served as an imam and founded a madrasa and called it 'Rasuliya', which became a major centre of education for Muslims in the Russian Empire and the base for the spread of the teachings of the Naqshbandiyya-Khalidiyya. Zainulla-ishan adhered to an oral method of teaching and was not against the inclusion of secular subjects in his educational institution's curriculum, which focused on the study of the Quran and Sunnah. In this way, he combined kadimist and jadidist approaches in education⁵.

⁵ Z. Rasulev's works:

1. '*Al-fawa'id 'al-mukhimma li-l-muridina an-naqshbandiina wa al-awrad al-lisaniia wa as-salawat al-ma'sura*' ('The divine verities, which are necessary to conceive for the Murids of the Naqshbandiyah Sufi fraternity, doxologies to Allah and prayers—salavat') (St. Petersburg, 1989, 24b.). This work is written in the Arabic language and contains texts of prayers and Dhikrs of the Naqshbandiyah tariqah and the rules of their reading.

2. '*Әр-рисалә әл-Хыдырия*' ('Treatise about Prophet Xidra') (Troitsk, 1908, 33 b.). It consists of four articles about Khydra, Jesus Christ, Sufism (extracts from the book by Imam-a Ghazālī) and about the rules of how to read the letters of the Arabic alphabet. In the Tatar and Arabic languages. At the end of the work he cites passages from Al-Suyuti's book 'Khadis al-Abdal'.

In addition to classes at the madrasa and Sufi mentoring, Zainulla-ishan practiced medicine. The influence of his ideas was noticeable in Kazan, Simbirsk, Samara, Saratov, Orenburg, Astrakhan, Perm, Vyatka and the Urals, Semipalatinsk, Turgaysk, Akmola and other regions [Isxaqiy, 1906]. Noteworthy students of Zainulla-ishan: Riza Fahretdinov, Galimdzhan Barudi, mufti Sabirdzhan Hasani, father of famous scientist Akhmetzaki Validi Togan, Majid Gafuri, Ğabdulla Battal Taymas and the son of Gabdrakhman Rasulev, who became a mufti during the Soviet period.

An external factor in the clash between the Mujaddidiyya and the Khalidiyya among local ishans were such 'innovative' rituals as the out-loud recitation of the Dhikr (*dzhakhri*), the participation of women in the collective Dhikr, and the celebration of mawlid, which were allegedly led by Zainulla-ishan. M. Farkhshatov, on the basis on archival sources, also makes note of developments such as the introduction of the custom of wearing and using beads and decorating mosques and houses with shamails, as well as the use of 'healing' and fragrant oils during prayers and Dhikr [Farkhshatov, 2009, pp. 59–61].

It seems that the latter developments, even if they were innovations (most likely for the Bashkirs), had no fundamental significance.

3. '*Makalyate Zayniya*' ('Articles of sheikh Zainulakh bin Habibullakh ar-Rasuli an-Nakhshbandi'). (Kazan, 1908, 18 b.). These are the same articles that were indicated in 'Ar-Risale', except for the extracts from the works by Gazali and Suyuti.

4. '*Risale fi xayy al-Xidir*' ('About the life of Saint Xidr') (Kazan, 1908, 9 b.). An article about Prophet Khydra mentioned above.

5. '*Troitsk golāmasi vā usule jādid*' ('The scholars of Troitsk and a new method') (Orenburg, 1911, 11 b.). This booklet was aimed at opponents of the new teaching method, but it served as a blessing (fatwah) and for the proponents of the *usul-i dzhahid*. In early 1908, its text was published in the newspaper *Vakit*, and later printed separately.

6. '*ālīfba xakında*' ('On the Alphabet') (Orenburg, 1912, 13 b.). The article had been written for the *Vakit*, but the editorial board realised its importance and decided to publish it as a booklet titled 'Why Sound-Based and not Letter Name-based Approach is Essential in Teaching Arabic Alphabet to Children' [on: Maraş].

But the first three in fact could have led to 'confusion' among the local community, which had generally been brought up in the spirit of the Central Asian traditions of the Naqshbandiyya, in which the silent (*khafi*) Dhikr (silent litany) was essentially the most important attribute. Khalidiyya carried on the traditional commitment to the silent Dhikr, which one repeated quietly to oneself. And Zainulla-ishan certainly adhered to this daily ritual—he wrote about this in his book '*Al-fava'id al-mukhimma*'—however, during collective rituals (*khatm-i khadzhigan*), which took place on certain days of the week (Tuesday and Thursday) and in which outsiders, including women, were permitted to take part, he may have allowed the Dhikr to be recited out loud. A murid by the name of Gabdullatif reported in his memoirs that at *khatm*, they sometimes repeated several times in a loud voice the *Tahlil* (*Lā ilāha illā -llāh*) [Fäxretdin, 1917, p. 81]. It is questionable whether this can be considered a vocalised Dhikr. It is noteworthy that the vocalised Dhikr was not attributed to any other Khalidiyyan sheikhs of the Volga-Ural Region besides Z. Rasulev, which suggests that those strange cries which could be heard during collective rites at the 'Rasuliya' madrasa, about which Murad Ramzi and the witnesses of the spectacle wrote, could have been ecstatic cries brought on by a trance-like state during and after the Dhikr. Gabdullatif also reported that during the collective Dhikr, some murids fell into trances (*jezbe*) and during namaz they loudly exclaimed '*Hu wallah*' [Fäxretdin, 1917, p. 81].

As for the celebration of Mawlid (the Prophet's birthday, on the occasion of which the appropriate stories, also called 'Mawlid an-Nabi', are usually recited), this 'innovation' in Tatar society can not be associated only with the name of Z. Rasulev. The question of the permissibility of celebrating the birth of the Prophet, who did not allow such a practice during his lifetime, was being debated long before ishan Zainulla's time. The debates continued into the early 20th century [Barudi, 1906; 1914; 1916]. In the Ottoman Empire, Mawlid an-Nabi was declared an official holiday at the turn of the 16–17th centuries.

The Khalidiyya doctrine highly valued the Prophet, with whom the murid should be mentally bonded during the Dhikr via his sheikh [Gümüshanevi, p. 422]. In order to imagine the Prophet vividly, the adepts needed to be familiar with his life, temperament, the miracles he performed, and so on; thus, even poetry not devoted to his birthday, *Mawlid an-Nabi*, became relevant during this time. The printing houses of Kazan, Orenburg, Ufa and Astrakhan annually published numerous works devoted to the Prophet: *na'ts*, *qasidas* (panegyric odes), *Sirat-un-Nabi* (biographies), *Qisas Al-Anbiya* (prophets' life stories), *shamails and hilyas* (descriptions of internal and external features), *Miraj Nameh* (a description of the Prophet's Ascension), *Mujizat Nameh* (a description of his wonders), etc. Their authors were both foreign and local Muslims. After the Dhikr and evening namaz, they read *siras* and *shamails*, [Fäxretdin, 1917, p. 81].

Among the special literature on the history of Sufism in the Volga region during this period, in addition to the studies of Sh. Marjani and R. Fakhreddin, we may note the following works:

1. The book of Abu Gabdurrakhman Gabdulla bin Muhammad Garif al-Maghazi, who was educated in Tatar madrasas and in Bukhara, who served as an imam in the 3rd parish of the city of Orsk and was a follower of Z. Rasulev 'Öl-katra min bixar'il-xakaik tärjemäti äxvali mäşaixi ät-taraik' ('A drop from the sea of truth in the life biographies of tariqa sheikhs') (Orenburg, year unspecified). Maghazi-ishan mentions his grandfather Magaz bin Bey Muhammad (d. 1832), who, having received an ijazah in Bukhara from the students of Faizkhan Kabuli, served as a sheikh in Orenburg; the author also refers to the names of the followers of the sheikh in Kazan and Saratov.

Maghazi-ishan also tells of another of his books—'*Tarikhi Magazi*'. In addition, in Orenburg in 1908, his work '*Tarikh al-Bukhara vä tärjemät al-goläma*' was published ('The History of Bukhara and the biographies of its scholars').

2. *Holyasät əl-bayan fi vurud əl-ishan al-i bəldəi Kazan...* ('A brief description of the wirts of the ishans of Kazan') (Kazan, 1888).

Zainulla Rasulev.

3. '*Kitab al-mənakyb*' (The Life (menakyb/munakybname) of A. Z. Gyumyushkhanevi) (Kazan, 1900), written by Mustafa Fevzi-efendi (1871–1924), a murid of Khasan Hil'mi (died in 1911). The book contains several panegyrics *Qasīdah* (*kasida*) and elegies (*marsiya*s) dedicated to the founder of the Gumushanevi Dargah, a poetic silsilyaname of the Naqshbandiyya tariqa, where the thirtieth person in the golden chain (*altyn silsilah*) is Khalid-i Baghdadi and the 32nd is Ahmad Z. Gyumyushkhanevi. Dozens of his followers are mentioned, including Zainulla Rasuli, Ismail al-Krymi and other caliphs from Russia. In the khalidiyyan silsilah, Sheikh Hasan Hilmi is in the 33rd place; he was also well-known and revered by Sufis of the Volga Region [see: Mäğazi, 1913, p. 51].

4. '*Zhavakhire khikmet dervishan*' ('Pearls of the wisdom of dervishes') (Kazan, 1907). The author is a dervish called Darmend Bakhavetdin Naqshbandi Bulgari Vaiszade (1810/18–1893), a religious reformer of his time, who

aspired to resolve not only religious, but also social and economic problems that afflicted Tatar society [Usmanova, 2009].

The tariqa silsilah is given at the beginning of the book. Various Bid'ah that were prevalent in society are criticised in its verses; an increasing number of pseudo-scholars and pseudo-Sufis is noted and Khatm-khadzhigan is promoted. There are other compositions by Bakhavetdin Vaisov as well: *'Tarike xocagan'* ('The way of khojas', 1874), *'Sharigatel iman'* ('Dogmata of faith', Kazan, 1880). The first book consists of two parts: *'Tarike khojagan'*, (60 pages, by Bakhavetdin Vaisov) and *Divane shakhi nekishbendi* (87 pages, composed by his teacher Dzhangfar Salikhov). The content is primarily devoted to religion and morality. It sheds light on the sins of the representatives of Tatar society, mainly the priesthood and the local administration. The second source, which B. Vaisov compiled in order to train his murids, contains a variety of ritual prayers.

Criticism of Sufism and Sufis. In the latter half of 19th to the beginning of the 20th century, criticism of the representatives of Sufism intensified in Tatar society; the moral decadence, greed and ignorance of the ishans were revealed; they were accused of incompetence in the elementary rules of fiqh. This criticism was related to a certain extent to the confrontation between the kadimists and jadidists. The latter opposed ishanism, , 'which represents- a form of folk Sufism, one in which the pastor, instead of guiding the spiritual quests of his disciples, transforms into a faith-healer, magician and patron of pilgrims before the saint whose tomb he looks after' [Zarkone, 1997, pp. 119]. At the same time, Sufism drew the attention of a significant number of reformists, and many of them joined the tariqa. Ishanism was mainly practiced in the countryside, so it may fairly be called 'rural Sufism' [Demidov, 1978, pp. 112]. It had a primarily dynastic nature, and among the most significant ishan family names one can mention the Kurbanalievs (Medyak), the Tukaevs (Sterlibashevo), the Rasulevs (Troitsk), the Gubaydullins (Kizlau), the Galikeevs (Kargaly), and others. Tatar-Bashkir ishans generally did not take up the complex

theoretical problems of Sufi philosophy, devoting more attention to the practices and rituals. Ishanism had a 'communal' or 'spiritually organised form' [Zarkone, 1997, p. 119], murids from several villages came to the place where the ishan lived, and they remained with him until they received *'irshad'*—permission for them to educate their pupils themselves. The training period could last anywhere from a few years to 10–15 years, depending on the devotion and desire of the murid. Ishans were particularly respected by lay brothers. The authority of the founder of the ishan dynasty extended to his descendants as well.

Sheikhs and ishans, who as of the 19th century made up a rather influential part of the clergy, were largely themselves to blame for the degeneration of Sufism and its loss of progressive and democratic elements. Among the clergy, there were impostor Sufis, who connived to acquire the authority enjoyed by pious men among the laypeople, but they did not know and did not understand the intricacies of the religious and philosophical doctrine. Many of these pseudo-Sufis, who preyed on the religious sentiments of the faithful, used the teachings of Islamic mysticism as a convenient form of extortion. G. Tukay, N. Dumavi, F. Tuykin denounced such ishans in their poems. In the fiction and nonfiction works of Z. Khadi, G. Chygtay, G. Chykali, Ya. Muradi, G. Biktimirova and others, 'Sufi' is identified with such concepts as 'stupidity', 'fanaticism', and 'ignorance'.

The criticism of jadidists was not aimed at the study of Sufism as a whole. Only Zyia Kamali (1873–1942), in his philosophical work *'Dini tädbirlär'* ('Religious dispensation', 1913) harshly criticised Tasawwuf as not based on the Koran and Sunnah—that is, he viewed it as Bid'ah, which is contrary to Islam. Z. Kamali offered up the idea of the modernisation of Islam and reconciliation of its teachings with modern science and culture, emphasising that Muslims do not need any sort of intermediary to communicate with Allah. This implies that phenomena such as monasticism—and namely muridism, ishanism, and Sufism in general—are inherently alien to the spirit of Islam and are nothing more than the inventions of 'impious'

Zyya Kamali. Photo from the early 20th century.

mullahs. Apparently, the views of Zyya Kamali originated from Jamal ad-Din al-Afghani, with whom he studied in Cairo. Jamal ad-Din al-Afghani (1839–1897) considered it necessary to purge from the Islamic doctrine the later innovations introduced by various sects. To this end, he proposed to return to the original purity of the religion and carefully study the Prophet's life and his early companions.

Musa Bigiev in his work *'Böek mävsularda ufak fikerlär'* ('Simple thoughts on complicated issues', Saint Petersburg. 1914) makes a distinction between Sufism 'as a philosophical doctrine or personal religious practice and Sufism in its communal or organised religious form (ishanism)', dividing ishans into 'good' and 'bad' and into 'white' ('Ak Ishan'), and 'black' ('kara ishan'). At the same time, Bigiev 'disliked Sufism and did not belong to any brotherhood, but still defended Sufism and the system of religious communes' [Zarkone, 1997, p. 117].

In the scholarly literature, there was for a long time a quite rough division of Sufism in the Volga-Ural region into two variations: so-called 'politicised peasant-plebeian fundamentalism' and 'liberal and educational reformism'. B. Vaisov and the imam from the Kurbangaliev dynasty were noteworthy representatives of the first variation. They were considered to be the guardians of kadimism. The second variation, which was connected with jadidism, was alleged to be headed by Z. Rasulev [Yunusova, 1999, p. 72]. At the same time, there was the view that mujaddids were kadimists, and that the khalidiyyan ishans were jadidists.

Modern researchers have abandoned these categorical divisions of ishans and mullahs from the 18th and 19th centuries into kadimists and jadidists, calling to attention the fact that without kadimism, which is the foundation of the religious ideology, there would be no jadidism—that is, reformism—as such. Making such a sharp distinction between these two interrelated phenomena can lead to a distortion of historical facts. In this connection, it is appropriate to reconsider the attitudes towards those who were relegated to the ranks of 'kadimists' and reactionaries.

Thus, Sufism continued to occupy an important role in Tatar society at the close of the 19th and the turn of the 20th. Sufi leaders from this period mostly conducted educational activity, which was incompatible with the main directions of domestic government policy. Representatives of this 'brand new' branch of the Naqshbandi Khalidiyya tariqa managed on the whole to find a common language with the reformists, and thus made a contribution to the cultural revival of the Tatar people. On the other hand, society began to develop a critical outlook on pseudo-Sufis and pseudo-ishans and gradually turned toward anti-clericalism, which was especially noticeable in journalism and literature.

CHAPTER 2

Debates on Theology and Islamic Studies

Michael Kemper

According to Islamic tradition, theological reflections on God and religious dogma are known as *kalam* (discourse). Of central importance in the discourse of *kalam* (in its form which developed over the course of many centuries in several countries, including modern Tatarstan) is the question of how the human mind is capable of perceiving the teachings of the Islamic revelations (*the Quran*) and the Islamic tradition of the Prophet (*the Sunnah*), as well as how the arguments and reflections can support the dogmas of Islam, defend them from sectarians and be used during confrontations with representatives of other religions. *Kalam* has in large part incorporated many features of classical Greek logic and philosophy, using the classical disciplines of argument and rhetoric as auxiliary sciences. Islamic theologians saw a clear-cut division between *kalam* and philosophy (*falsafa* in Arabic) because Greek philosophers, such as Aristotle, were nonbelievers and were not guided by revelations and religion in their theories, basing them exclusively on human rationality. Philosophy had always been under suspicion and was not a part of the traditional curriculum of *madrasahs*. In the Volga and Urals regions, the works of prominent Islamic philosophers such as Ibn Sina (died in 1037) and Ibn Rushd (died in 1198) were if not rejected, then essentially ignored before they were again reviewed by Jadids at the end of the 19–beginning of the 20th centuries.

Theological reasoning in *kalam* is deductive: the speculative construction begins from the premise of the existence of God, as logically, the world must have a creator. God is perceived as a ‘necessary being’, the universal beginning, existing eternally. The next question in *kalam* is how a believer can imagine Allah for himself

on the basis of the known ‘names’, which are mentioned in the Quran and are understood as God’s ‘attributes’—his specific properties, by which he can be called and through which he influences his creation. The main point here is to avoid anthropomorphism, so as not to compromise the uniqueness and supremacy of God by attributing human traits to him. Another controversy among *mutakallimūn* (*kalam* scholars) has been about the origin of the Quran, understood as the word of God and, hence, as one of his attributes. The essence of this dispute was whether the Quran was eternal as God himself or ‘contingent’ (*mumkin* in Arabic), that is created by God. And, finally, the last main theme of debate in *kalam* concerns God’s attitude to his creation, and in particular to which degree a man is free to define and follow his will (this assumes that the man bears full responsibility for his deeds). Besides the above, theology also deals with matters of bodily resurrection (the basic principle of Islam), life after death (Heaven / Hell), the existence and role of angels and saints, etc.

A serious problem in the 7th century was that the Quran and the Prophet’s traditions (the *Sunnah*, the collection of *hadiths* about the words and actions of the Prophet) gave only vague and metaphorical answers to these fundamental questions. Only later, in the 8–10th centuries, Islamic scholars undertook the task of formulating a systemic doctrine of Islamic theological thought. During this classical period of Islam, there emerged numerous competing interpretations and theological schools, starting with the *Mu’tazilites*, who adamantly defended the idea that a man himself is responsible for his deeds, and ending with the literalist school of the *Hanbaliyya*, whose representatives believed in absolute predestination.

In between these extremes of Sunni theology were the *Ash'ari* and *Maturidi* schools, which tried to occupy a moderate position. Historically most Turkic peoples (including the Tatars) adhered to the Maturidi theological concept (formulated in Central Asia by scholar Abu Mansur al-Maturidi, who died in 944). Tatars and Bashkirs were also exposed to the ideas of Abu al-Hasan al-Ash'ari (died in 935). These two schools together represented the so-called 'Sunni basis' of Kalam in the region. The commentary is the main textual genre of kalam: scholars studied the works of earlier theologians, making commentaries upon them, which further on were commented by other scholars (in the form of a gloss), etc. Thanks to such a commentarial tradition, the texts of earlier scholars were preserved and the identity of the school was consolidated.

We do not know for sure when the first theological works by Tatar (Bulgarian) authors appeared. Central Asian scholars were apparently the main driving force, as was the case with Sufism and Islamic law. As reported, the first work *al-'Aqa'id al-bulghariyya* ('Bulghar Creed'), which has not survived to the present day, was written by Ishniyaz bin Shirniyaz al-Khwarezmi (died in 1205 / 1790–1791), a scholar from Urgench, who settled in Kargaly, the Muslim suburb of Orenburg. Most theological works were written in the first half of the 19th century, and the speculative discipline of kalam also became a field for disputes among Tatars.

Ghabdennasir Qursawi and Gabdrakhim al-Bulgari on speculative theology. The idea of a point-blank rejection of speculative theology initially belonged to Gabdrakhim al-Bulgari (Utyz Imyani). In his work *'Inqadh al-halikin min al-mutakallimin'* ("The Rescue of the Drowning from the [Errors of the] Scholars of kalam", partly reproducing the ideas of al-Ghazali (died in 1111), set forth in *'Thya Ulum Al-Din'*. Gabdrakhim charges the mutakallims with useless philosophising and empty rhetoric. He believed that the kalam scholars were discussing issues which had nothing to do with the Islamic faith—issues, which were not mentioned in the Quran and the Prophet's Sunnah and which, therefore, could not be considered

in the context of Islamic dogma. In Gabdrakhim al-Bulgari's opinion, the senseless debates of kalam scholars (represented, first of all, in the popular work by Umar an-Nasafi [who died in 1142] 'Aqida' ("Dogma") and the commentary, written by Sa'ad al-Din Al-Taftazani [who died in 1389]) brought no benefit, and only unnecessary doubts, to the believers. Al-Bulgari contended that God's revelations do not need any logical interpretation. A Muslim should just follow the known books on the Islamic law in order to fulfill God's will, with all further discussions being useless or even destructive. Thus, Gabdrakhim criticised kalam from the legal point of view of a traditionalist, equaling the speculative theology with the Hellenistic philosophy and, hence, with heresy.

Ghabdennasir al-Qursawi (died in 1812) was another serious critic of Middle Asian kalam in the Volga-Ural Region. He was a dedicated proponent of the supremacy of Islamic revelation over the human mind. He also believed that kalam debates came in essence to idle talk and *juhl* ["ignorance"]. Unlike Gabdrakhim al-Bulgari, who was a Hanafi traditionalist, Qursawi followed only the Quran and Sunnah as 'pure' sources of Islam, which were to be protected from distortions of later interpretations by theological and law schools. If Gabdrakhim al-Bulgari totally rejected the kalam doctrine and did not enter into discussions with its partisans (*mutakallimūn*), Qursawi, on the contrary, often argued with the leading scholars of Bukhara and other localities, trying to undermine the speculative theology from within. Thus, Qursawi did not reject the principle of theological argumentation, as Gabdrakhim did, and instead made use of the intellectual methods of theologians (including their favorite commentary genre) in order to prove that many of the most esteemed medieval and present-day mutakallims had abandoned the method of the first generations of Muslims (*salafs*) and contradicted the Quran and Sunnah. As Qursawi considered all issues through the prism of the 'fundamental' texts of Islam, we can tentatively call his position Salafist, or 'fundamentalist' (which, naturally, has nothing to do with the modern version of this term as violent political

Islam). According to some notes by Gabdrakhim al-Bulgari (an unpublished manuscript in Arabic *'Thatat al-zat'*, the Tashkent Biruni Institute, B-3122, dated 1217 / 1802–1803), the first conflict between Qursawi and Bukhara's Mutakallimūns took place in approximately 1801 or 1802. Qursawi criticised traditional Ash'arite and Maturidi schools' interpretations on the issue of God's essence (the core of His existence, *dhat* in Arabic) and God's attributes (characteristics related to His essence, *sifat* in Arabic). As reported by Gabdrakhim al-Bulgari, opponents accused Qursawi of heresy, but he managed to enlist the support of influential *qadi* (judges) and return to his native village. Having returned home to Yughary Qursa village, Qursawi became an imam.

However, in 1223 (1808–1809) Qursawi again left for Bukhara to continue his studies. This time his provocative statements and disputes with powerful scholars nearly cost him his life. We obtained information about subsequent events mostly from an early work by S. Marjani in the Arabic language *'Tanbih abna' al-'asr 'ala tanzih anba' Abi n-Nasr'* ("The Admonition of the Contemporaries about the Cleansing of the Reports about Qursawi", edition by Kemper, 2000). The young Marjani supported Qursawi in his views on the supremacy of traditions over human reason, and in this narration he reproduced some of the accusations forwarded against Qursawi, as well as his answers in the debates.

The main point of argument was still the question of how one should perceive the connection between God's essence (*dhat* in Arabic) and the various names of God (or characteristics, *sifat* in Arabic), which accompany the description of God in the Quran. According to the teachings of major Islamic theological schools, such epithets as 'the Living', 'the All-Powerful', 'the Knowing' and 'the Creator' demonstrate that God possesses certain characteristics or attributes (first of all, 'life', 'power', 'knowledge', 'will', 'hearing', 'speech' and 'the ability to create'), which can also be viewed as abstract qualities. God, as 'the first cause', 'being necessarily existent', and the creator of the world, is to have a certain num-

ber of attributes. After such a speculative division between God's essence and His attributes, the question arose over whether God's attributes are eternal, as is the very essence of God, or if they emerged only at a specific moment in time. That was a very delicate and complex question; for if some of God's attributes were eternal, then it would have been possible to assume the existence of multiple eternal entities, which would have led to polytheism. Ash'ari and Maturidi themselves tried to avoid such a trap, just stating that a human was not able to perceive the true nature of the attributes; with the attributes being 'neither God, nor anything but God'. Later on, however, scholars of the Ash'ariyyah and Maturidiyyah schools went further in their speculations: they established that seven or eight of the above attributes held a special place in God's description as 'attributes of the essence', while many other names and characteristics of God in the Quran were just 'attributes of action', revealing themselves only in relation to the creations (for example, 'the Merciful'—'mercy', which is shown only in respect to the man already created). These attributes were assessed to be non-eternal and derivative of the above mentioned eternal 'attributes of the essence'. Qursawi regarded such speculative exercises as useless and even dangerous.

Qursawi's opponents in Bukhara summoned him to the court of emir Haydar (who reigned in the years 1800–1826), where he was questioned by a group of eminent scholars. Among them was a certain Fakhretdin al-Kazani (died in 1844), the son of Ibrahim bin Hudzyash, the influential imam of Kazan, who came to Bukhara to teach the art of Quranic reading (the emir himself was one of his students). Another serious opponent of Qursawi in this dispute was a certain Shamsaddin al-Balkhi (from Balkh in Afghanistan). Qursawi refused to answer Balkhi's question on whether God's attributes are 'essential' (that is everlasting as the essence of God) or just 'contingent' (that is temporary and created), arguing that such issues had never been discussed either by the Prophet Muhammad, or by his companions in the 7th century. In Qursawi's opinion,

it was possible to only say that God must not be identified with his creation. This allowed his opponents to accuse him of admitting the plurality of eternal entities, that is of the polytheism. Qursawi tried to escape the trap, stating that the attributes could not be viewed separately from God's essence and from each other. Thus, Qursawi spoke against the whole doctrine of the Maturidi and Ash'ari concerning the linkage between the essence and attributes, as well as the differences between the everlasting and 'created' attributes of God. He asserted that the holy texts of Islam, the Quran and Sunnah of the Prophet, had nothing in common with the questions of kalam, and accused the mutakallims of deviating from the true way of Islam.

Apparently, Qursawi could have indeed faced the death penalty, and in order to save his life he had to backtrack publicly on his words. Some sources insist that Qursawi escaped the sentence thanks to the help of his Sufi mentor, the influential Niyazkuli at-Turkmani (died in 1821). Upon coming back home, Qursawi became the headmaster of the madrasah in his native village, where he started teaching his interpretations of the Islamic law and theology, which he had been forced to officially repudiate in Bukhara. Qursawi expounded his theological views in his treatise '*Sharh al-'aqa'id*' ("Commentary on the Dogma"), which he finalised after coming back from Bukhara. This book represents a thoroughly elaborated super-commentary (gloss) on the above-mentioned commentary by Taftazani (died in 1389) on '*Aqida*' ("Dogma") by Umar an-Nasafi (died in 1142). Apparently, '*Aqida*' by an-Nasafi in the original version, and especially in the interpretation of Taftazani, was the most popular textbook at the lessons of Sunni kalam in the Ash'arite and Maturidi schools. Criticising Taftazani and Nasafi, Qursawi always maintained that his sharp criticism of kalam was not directed against the founders of the Ash'ariyyah and Maturidiyyah schools, who had never engaged in pernicious arguments similar to those exercised by modern mutakallims, who claimed the legacy and authority of al-Ash'ari and Al Maturidi.

However that may be, Qursawi happened to initiate a serious provocation, which resulted in him also encountering problems at home. The scholars of Bukhara continued to send letters to their colleagues in the Volga-Ural Region, alleging that Qursawi committed an apostasy and should therefore be punished. Some local scholars, including Davletshakh bin Gadelshakh Al-Chabanly, took the side of Qursawi, while the powerful imams Fatkhulla al-Uruwi (died in 1259 / 1834) and Beymurad bin Muharram al-Mangari al-Kazani (died in 1265/ 1848) continued to defend kalam against Qursawi's criticism. Being tired of this pressure, Qursawi embarked on a pilgrimage to Mecca in 1812, but on his way, he died in Üsküdar (a suburb of Istanbul). Despite his notorious fame in Tatar society, Qursawi did not leave a school after himself. Only years later, in the 1860s, his theological views, as well as his position on the Islamic law, were supported by S. Marjani. It was S. Marjani who played the leading role in popularising Qursawi's works in the fields of theology and jurisprudence.

Discussion on Islamic legal methods: *ijtihād* and *taqlid*. Like most Turkic-speaking peoples of the Russian Empire, the Tatars and Bashkirs adhered to the Hanafi *madhhab*, one of the four Sunni law schools, demonstrating a mutual respect for each other. In the 19th century, the debates on Islamic jurisprudence (*fiqh* in Arabic) among the Tatars touched upon the theory of law (*uṣūl al-fiqh* in Arabic, 'principles' of jurisprudence), as well as legal customs. The main theoretic question was about the possibility or impossibility of *ijtihād*, that is whether it was still allowed for an Islamic jurist (*Faqih*) to appeal to the Quran and Sunnah of the Prophet in order to form his own opinion (*zann* in Arabic) about contemporary legal issues. *Ijtihad* has its antipode in *taqlid*—'imitation' of some expert of the present-day or earlier period, who is considered a competent source of knowledge. Thus, *ijtihād* stands for a 'fundamentalist' approach, resorting to the revelation and sayings of the God-inspired Prophet, while *taqlid* is 'traditionalist', following the way adopted by scholars of a given law school. Sunni legal thought regards Islamic jurists of the early pe-

riod as 'independent' *mujtahids* (scholars qualified to exercise *ijtihād* in all aspects of human activity), especially the founders of the major *madhhabs* (Islamic law schools), while scholars of the later period could be limited in *ijtihād* or were to perform *taqlid* only. Thus, there appeared to be a generally accepted idea that after the classical period of Islam, 'the gates of *ijtihād* became closed'. At a certain period (perhaps, in the 11th or 12th century), it was decided that answers had been found to practically all legal questions and in the future there would be no need (actually it would be prohibited) to appeal directly to the holy texts of the Quran and Sunnah to seek solutions for new legal issues. Instead, jurists were only to follow the opinions of the early teachers in their *madhhabs*. Abū Ḥanīfa (died in 767), Abu Yusuf (died in 798), and Muhammad al-Shaybani (died in 805) were great renowned masters of the Hanafi school of jurisprudence. Their knowledge was followed by many generations of Hanafi scholars, including many Bukhara and Samarkand theologians, who wrote commentaries, glosses, and summaries of their predecessors' works. The works of the Hanafi scholars represent a gigantic collection of literature on jurisprudence. Though most scholars of the Middle Ages and the early modern period considered themselves *muqallids* (performing *taqlid*), the *ijtihād* practice, in fact, had never ceased to exist. Even in the 18th and 19th centuries, outstanding scholars from every corner of the Islamic world continued to exercise *ijtihād* and assisted its further development, often acting contrary to the principles of their traditional *madhhabs*. Besides that, *taqlid* also is not just 'blind imitation', and indeed a *muqallid*, resorting to the works of the early theologians of his school, has at his disposal a wide spectrum of possible solutions, from among which he can choose the appropriate version. As a result, both the *mujtahids* and the *muqallids* have substantial possibilities for individual choice, as well as for contributing to the development of new legal thought (including such important spheres as economy and politics), meeting the interests of this or that social group. Consequently, the widespread belief that Islamic law does not develop and is not capable

of adapting to changing political and economic conditions is not entirely correct. The difference between *mujtahids* and *muqallids* was only in their method of finding legal decisions: the former appealed directly to the Quran (the fundamentalist approach of *ijtihād*), the latter followed the opinions of earlier scholars (the traditionalism of *taqlid*). The Tatar model of this phenomenon, represented by Ghabdennasir Qursawi and Gabdrakhim al-Bulgari, serves as an example of this.

In his book in Arabic '*Al-irshad lil-ibad*', ('Guidance for the religious'. Kazan, 1904; translation into Russian by G. Idiyatullina, 2005) Qursawi states that there are several levels of *ijtihād* and every believer must exercise it to the best of his abilities. Here, the writer does not exclude absolute or 'independent' *ijtihād* (*ijtihād mutlaq*), which goes beyond the frame of any of the existing Islamic law schools. Eventually, these assertions lead to the conclusion that outstanding scholars theoretically still have the possibility to establish new law schools. This naturally caused some concern among the clergy, as new schools could entail an even greater split of the Muslim community, forming new groupings. Qursawi himself had never repudiated the Hanafi tenets. Another argument often put forward against *ijtihād*, was that some *mujtahids* could be mistaken in their judgments, thereby going astray from the path of Islam and risking accusations of heresy and losing their place in paradise. However, Qursawi writes that there is no need to be afraid of this and that there are no grounds to renounce *ijtihād*, for, according to the Prophet's words, a *mujtahid* gets a reward from Allah even if he has made a mistake in his decision; but if he has been right, he gets a double reward. This stand taken by Qursawi forced a fresh look at the foundational texts of Islam. He even thought that a *muqallid* (a person who cannot perform *ijtihād*) also has to reflect at least a little and make sure that the person he imitates is pious and competent in Islamic law.

In this way, Qursawi openly declares his opposition to the generally accepted view that '*ijtihād* ceased to exist long ago' and that the only thing that contemporary Muslims can do

is to blindly imitate the earliest jurists and theologians. As stated above, Qursawi did insist on the primacy of the Quran and the Sunnah over the mutakallimūn's speculations. In the case of ijtihad, he also puts the Quran and the Sunnah above the traditional madhhabs. It is not surprising that Qursawi's appeals to perform ijtihad caused quite a few recriminations. For example, Fatkhulla al-Oruvi (died in 1843) from the village of Sluzhilaya Ura, sent a letter in 1810 to M. Khusainov, the official Mufti of Orenburg, laying blame on Qursawi; also Gabdrakhim al-Bulgari, in his *'Risala-i dibagha'* ("Treatise on the Tanning of Leather") [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, column 2400, sheets 79–87], claims (without mentioning his name) that Qursawi was implementing unlawful innovations (*bid'as*). In his other work, referring to the famous book by Mekhmed Birgevi (died in 1573) *'at-Tariqa al-muhammadiyya'* ("The Muhammadan Way"; see above, the section on Sufism), Gabdrakhim proves that ijtihad stopped being practiced centuries ago, and since then scholars have confined themselves to the opinions of previous mujtahids. Therefore, Gabdrakhim al-Bulgari saw himself as a muqallid, a true follower of the great masters of the Hanafi school of law.

Debates on night prayers. The most controversial question for both taqlid, and ijtihad was the issue of the fifth daily prayer (the so-called *'isha* or *yastu namazy* in the northern regions of Russia. According to the Prophet's sayings (*hadiths*), the fifth prayer is recited when it gets completely dark, namely, when not only the afterglow but also the very last ray of the sun disappears. The problem is that 'White Nights' can occur in Russia, which is a period when it does not get completely dark in the summer. What can Muslims living in the north do in regards to their commitment to reciting the night prayer in the summer? Today the issue may seem to be trivial, but in the 18–19th centuries and even in the early 20th century, it was of great significance for all believers. They were afraid that their prayers would not be accepted by God if they said them at the wrong time. For the first time, this

dispute arose in the 11th century when Hanafi scholars in Central Asia began to write treatises about the night prayer during the 'White Nights'. According to S. Marjani (*'Nazurat al-haqq'*, "The Binocular of the Truth". Kazan, 1870), the first scholar in the Volga-Ural area to raise the question was Amka Mullah (Mullah Agzam bin Gabdrakhman at-Tanaki al-Bulgari). In 1870 or 1871, in his treatise (which has not survived to the present day) he said that the night prayer was not obligatory if the night does not occur. Later, however, Amka Mullah reconsidered his position, saying that this namaz should not be skipped. As is reported, in the late 18th century, Ishniyaz bin Shirniyaz, who had moved from Khorezm to Kargaly, spoke against the namaz yastu/isha in his work. As before, Volga Muslims in the early 19th century could not reach a consensus on the issue. As Gabdrakhim al-Bulgari noted in *'Risala shafaqiyya'* ("Treaty on the Dawn" [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, items 1204–1206]) one part of the Muslim community in the Volga-Ural region (which he places among, *ahl al-Bulghar*, 'Bulgar people') do not ever read the night prayer out of fear of committing a sin, while others perform the namaz immediately after the fourth prayer when the sun's glow has disappeared but it is not entirely dark. Drawing on the writings of Abū Ḥanīfah and some later Hanafi authors from Central Asia, Gabdrakhim presented his views on the matter. As a mukallid, he was sure that by reading the night prayer at the wrong time, a Muslim committed a greater sin than if he did not do it. In this way, Gabdrakhim speaks against reading the fifth prayer in the period in which the night doesn't occur. In this case, taking the literalist position, he insists on the exact wording of the Prophet's teachings, according to which the night is a crucial component (*sabab* in Arabic as well as 'the sense' or 'the cause') of the fifth daily prayer. In the absence of night, observing the night namaz is not obligatory. Moreover, doing this is an act of disobedience to God. Gabdrakhim calls this stance extremely 'cautious' (*ihhtiyat*) or a warning against all potential wrongdoings.

Qursawi claimed the opposite. According to him, the general commitment to observe the five daily prayers has priority over the less important conditions for their completion. He believed that the established time limits for praying, which the Prophet mentioned, were only a 'hint' for believers that would help them fulfill the general commitments. That is, they were not meant to be 'the cause', without which the general requirement for the prayer loses its meaning. Therefore, the commitment to prayer ranks higher than the precondition for it to be night-time. The question of what should be done in geographical areas where the night doesn't fall is an issue of *ijtihād*, according to Qursawi, therefore, in the end, it is left to the discretion of each believer. The author himself leaned towards saying the night prayer immediately after the fourth *namāz* (*aksham*), at the same time, he did not rule out other possible resolutions of the issue. Qursawi was a person of rational (and as always, of fundamentalist) views, which meant that for him, the commitment to prayer had priority over secondary elements and that the Prophet's sayings in the Quran and the Sunnah were taken to be more significant than the fatwas of later theologians and even the scholars of the Hanafi madhhab. Qursawi thought that in such cases, *ijtihād* is not only possible but is even mandatory.

Relations with the unbelievers and the status of Islam in Russia. As Tatars lived in the Russian (Christian) empire, one of the most important topics of debate was the relations between Muslims and Christians. The Tatar legal discourse focused on whether the Russians were really 'people of the Scripture', that is, those Christians who are regarded as monotheistic brothers with whom relations are possible in Islam. Here the problem was that the veneration of icons, which is practised by the Russian Orthodox church, creates an impression that Russians pray to idols in the manner of polytheists (*mushrikun* in Arabic).

This theme was first examined by the Tatar scholar Murtada bin Qutlugush as-Simiti in the early 1720s. According to Marjani (*Mustafad al-akhbar*, part two), Murtada expressed the opinion that Muslims are absolutely forbidden

from eating the meat of animals slaughtered by Christians (that is without the corresponding Islamic rites) as well as from marrying Christian women. The opposite position was presented by an unknown author in *'Risala fi nikah al-kitabiyya'* ("Treatise on the Marriage of a Woman from the Book Religions") [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, item 999, s. 132–135], written in 1857 or earlier. This author believed that Russians were 'people of the Scripture' even if they venerated icons and called Jesus God's son. According to the author, icons were not perceived as individual gods, but rather directed prayers (*qiblah* in Arabic) offered by a Christian when he turned to God.

Considering the issue of marriage, the author refers to the Hanafi scholars and concludes that, according to the Quran, Muslim men are recommended to marry pious women from communities which received their divine books before Islam, that is from among the Jews and Christians. They are not pagans. Besides, the meat of animals slaughtered by Christians is *halal* (ritually clean and allowed for consumption). Undoubtedly, this position facilitated the development of relations between the two religious communities as well as the integration of Tatar Muslims into Russian society in general; namely, it supported cooperation between Tatar and Russian merchants.

Another question relating to this was whether the Volga region still belonged to the Islamic world (*Dar al-islam*) or Russia's domination meant that Tatars now lived in 'The House of War' (*Dar al-Harb* in Arabic), where it is impossible to live according to Islam. The earliest statement on the issue traces back to the Tatar scholar Yunus Akhund bin Ivanay, supposedly one of the first Volga region Muslims, who, after the Russians conquered Kazan in 1552, arrived in Bukhara and made a pilgrimage to Mekka. In the *a Fatwa* (an expert opinion of a jurist) written in Persian, he states that the Volga region belongs to the Muslim world: he considers Kazan to be the successor of Bulgar, that is, the Muslim state which voluntarily converted to Islam many centuries ago. In this way,

as previously, Kazan should be governed by sharia and Islamic taxation.

A similar position was expressed by a certain Mullah Murtada bin Husseyn al-Burali, the author of another manuscript written in Arabic called *'Risala fi bayan Dar al-Harb'* ("Treatise on the Land of War") [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, item 2400, s. 63–68]. He reasoned as follows: Abu Hanifa, the founding father of the Hanafi school of jurisprudence, stated specific criteria for establishing the status of 'Dar al-Harb' in a Muslim country 'when the country is dominated by the laws of the unfaithful and when its territory directly borders non-Muslim countries. Later, however, the views of Hanafi scholars became less stringent. According to a certain Nasyradin as-Samarkandi (died in 1258), the author of the book of Hanafi law *'al-Multaqit'*, lands governed by non-Muslims do not automatically become 'lands of war' as long as Muslim communities manage to retain their own laws. If Muslims submit to the unfaithful, it does not mean that they renounce Islam, but their obedience should rather be understood as a kind of an armistice or even as outright deception of the infidel. Here, he is likely referring to the curious 'dual power', when a Muslim leader stays in power while subordinate to non-Muslims. Thus, in his work, Murtada describes and 'legalises' the position of the Volga-Ural Muslims, who in 1788 got their official Mufti (and *qadi*) within the Orenburg Muslim Spiritual Assembly.

The question of whether or not Friday prayers should be conducted in the Volga-Ural region also became a subject for debate. It is said that the first fatwa in support of the need for Friday prayers traces back to Mavlyud bin Mustafa bin Yunus (died in 1820/1821) from the village of Kaltay (at Ufa), where in 1778 he was appointed *akhund*. According to him, the Friday prayer is lawful only in the presence of an imam and at least forty worshipers.

But the debate was not only about the necessary number of believers present at the ceremony. According to the Islamic tradition, the Friday prayer is accompanied by a sermon

(*khutba* in Arabic) in which a preacher (*khatib* in Arabic) mentions the name of the lawful Muslim ruler of the country. Therefore, the *khutbah* is also a political institute which urges Muslims to obey the Sultan or Caliph. The OMSA instructed mullahs to bless the Tsar and his family during the Friday sermon in their mosques and also to urge the community to pay taxes and obey the orders of the authorities. Conducting the Friday prayer in such a manner was an explicit adjustment to Russian rule in which the Russian authorities were regarded as a regime which did not prevent Muslims from complying with Islamic laws.

The opposite stand was taken by mullahs and scholars who opposed the muftiate and Muslim community's subordination to the Russian authorities. They openly refused to conduct Friday prayers, arguing that one of the conditions was to have a Muslim ruler and Muslim kadis in the region. According to them, these conditions were not met. The most outspoken opponent was Gabdrakhim al-Bulgari. He expressed his criticism of the Russian influence and ties with Christians not only in treatises written in Arabic but also in verses written in the Tatar language, which enjoyed popularity among a wide Muslim audience. In his satirical poem *'Awarif az-zaman'* ("Signs of the Time", edited by Sharipov, 1986), Gabdrakhim explains that Muslims of his time often drink alcohol and accept the customs of the unfaithful: they build houses the way Russians do, they sit at tables and eat like Russians and celebrate non-Muslim holidays during which men and women are together. According to him, this imitation of Russian customs results in the betrayal of Islam, as a Muslim who accepts the ways of the unfaithful becomes a *kafir*. In one of his treatises written in Arabic, entitled *'as-Sayf as-sarim'* ("The Sharp Sword") [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, items 1204–1206], Gabdrakhim accuses the Muslim brothers of ignoring prayers and traditional Muslim clothing. In his "Treatise on the Tanning of Leather", he calls on Muslims to not use the leather curried by Christians and animalists (Mari people) because of their

use of unclean ingredients; this also concerns fur processed by Russians. Finally in his work *'Risala fi dhamm shurb-chay'* ("Treatise on the Condemnation of Tea") [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, item 1635, s. 3–6], Gabdrakhim criticises tea drinking: according to him, tea (especially taken with sugar or honey) is a thing of luxury, that is, a devil's tool; it is a waste of money, which results in the physiological addiction of humans and social inequality. Besides, tea drinkers are prone to miss daily prayers as they frequently have to urinate. Gabderhim's criticism of the samovar as an element of the tea drinking cult shows that he thought that this drink, in addition to alcohol, was a pernicious influence exerted by the Russian people on Muslims.

Gabdrakhim wrote a short treatise called *'Risala fi l-jum'a'* ("Treatise on the Friday Prayer") [Department of Rare Books and Manuscripts of Nikolay Lobachevsky Scientific Library, item 182, s. 1–5], in which he spoke against Friday prayers in the Volga-Ural region, thereby denying that the territory was completely Islamic. According to him, not only was the condition of having a Muslim ruler not met but also many members of Muslim communities in the villages did not know how to pray correctly. Therefore, despite the necessary number of forty worshippers, there was a danger that due to a great number of mistakes, it would not be accepted by God, even from those who prayed correctly. In this way, an imam became a sinner who mislead his congregation. This opinion of Gabdrakhim about the Friday prayer is similar to his position on the isha prayer. He thought it was better to give up praying rather than recite it incorrectly or at the wrong time. All Gabderhim's statements conceal a general sense of the fact that the Volga-Ural Region is not part of 'Dar al-Islam'. This suggests his open disagreement with the OMSA about the fact that the legislation of the Russian empire makes it possible to live according to Islam. In this case, Gabderhim again is guided by taqlid, and this time by the opinion of Abu Hanifa, who said that the presence of an Islamic ruler was an indispensable condition for reciting Friday prayers.

It is no wonder that Gabdelnasyr Qursawi proposed the opposite opinion, that the issue of the Friday prayer required an appeal to ijtihad. In his book *'Al-Irshad lil-ibad'* ["The Guide for the Servants of God"], he claimed that the Friday prayer is mandatory for all Muslims and that Abu Hanifa's insistence on the conditions for its recital should not be regarded as strictly necessary. As we mentioned above, Qursawi places general commitments higher than all the secondary requirements. Interestingly, Qursawi does not see his contradiction with Abu Hanifa's opinion as a deviation from the Hanafi madhhab. As he explains it, a school of law (*madhhab* in Arabic, literally, 'movement' [towards the goal]) is not a clearly defined code of legal opinions, but rather a method. Therefore, even such outstanding mujtahids of the Hanafi school as Abu Hanifa could have made a mistake in their legal thinking. This is not critical, as all mujtahids can be mistaken, but all the same, they will be rewarded by God for their efforts. Qursawi asserts that the knowledge of the methodology used by the former teachers of the school is more important than carefully following their individual judgments. Thus, it is possible to assume that Qursawi regarded himself as a mujtahid, who followed Abu Hanifa's traditions, that is, who was committed to the Hanafi madhhab (but not those who wanted to establish their own independent madhhab).

In conclusion, it should be noted that Tatar discourse on Islamic law and theology shows that both ijtihad, and taklid can be used to form opinions on Islamic issues which became significant due to the status of Muslims in the Russian empire. Qursawi and Gabdrakhim al-Bulgari are considered outspoken opponents. They differed in the social interests that either of them represented. The wandering Mullah Gabdrakhim upheld the 'negativist views', opposing official muftis and rich Tatar merchants and any cooperation of the faithful with Russians. On the contrary, Qursawi supported co-existence with Christians: according to him, Islam and Muslims of the Russian empire are protected by law and are not in danger. There is every reason to think that Qursawi's interpretation was supported by representatives of

the Tatar bourgeoisie, both during his lifetime and at the end of the 19th century, when his works were considered as the prelude to the bourgeois movement '*usul-i jadid*', fighting for the reform of the Muslim system of education. Unlike him, Gabdrakhim has much more in common with a similar negativistic movement of civil disobedience led by Bagautdin Vaisov, functioning during the last decades of the century.

However, there is something that Qursawi and Gabdrakhim have in common. In stating their sharp criticism of the Islamic establishment of their time—the Bukhara and Kazan mullahs of authority—they both use tools of Islamic discourse. It should be noted that these thinkers made use of different methods and referred to different Islamic sources. As a muqallid, Gabdrakhim turned to the traditions of the Hanafi school of law, and Qursawi, as a mujtahid, addressed the sacred writings of Islam, the Quran and the Sunnah. But they both viewed their aspiration for 'true Islam' as a process of

'reform' (*the islah* in Arabic), namely, the restoration of pure, primordial and authentic Islam, from which the scholars of the last generations departed. Accordingly, they both looked at the Muslim life style of the good old days as an ideal model for the contemporary generation. The only question was which historical texts gave a better picture of the ideal time of Islam: the Quran's revelations and the traditions of the 7th century or the scholarly works of the subsequent period. Thus, Gabdrakhim and Qursawi represent two opposite views, sharply criticising the modern Islamic establishment from different positions. Despite the fact that their polemic works were often aimed at each other, their main target was the scholars of Bukhara and the followers of Bukhara traditions in Kazan, Ufa, and Orenburg. Therefore, the emergence of critical discourse in the field of Islamic law among Tatars was also the beginning of a scientific and intellectual movement aimed at liberating Islam from the domination of Central Asian scientific traditions.

CHAPTER 3

The Islamic Institutions of the Traditional Islamic Community and the Application of the Sharia Norms

§ 1. Traditional Muslim Communities

Ildus Zagidullin

The Russian empire had several historical and cultural regions where the adjustment of Islam to local conditions by the peoples who converted to Islam was asynchronous and influenced by different internal (the level of development of public relations and economy) and external factors (the policy of the autocracy and geopolitics). The convergence and coalescence of 'normative Islam' with the spiritual substratum of the peculiar cultures of the local communities contributed to the formation of specific features in Islam and its special regional forms.

In a preindustrial agrarian society, religion played a most important role in the formation of the social consciousness of the masses. In the empire, Islam played a key role in the preservation of ethnic and religious identity and in the development and revival of Muslim national identity. During the Russian period of history, the main and crucial problem for Muslim peoples was the harmonisation of 'public needs with the domestic and religious needs of Muslims' [Tärceman, 1894, 12 June].

The religious and cultural autonomy of Tatar and Bashkir people. In the inner gubernias of Russia, the mahalla was the main form of cultural and social organisation for Muslims. During its registration in accordance with the law, it was officially called a Muslim parish, within the framework of which the religious and ritual life of Muslims was organised and the norms of their everyday conduct were regulated. Tatar and Bashkir people preserved their religious and cultural autonomy, whose main units were traditional religious communities—

Muslim parishes—and the main institute was the OMSA. The legal basis for their operation were, on the one hand, the laws and regulations of the Russian state, which recognised Islam as one of the 'tolerated' religions and enabled the Muslims of the Orenburg Muslim Spiritual Assembly to perform their religious rites, while, on the other hand, there were the rules of Sharia whose boundaries were determined by folk customs and secular authorities.

Establishing a parish, recognised by the Imperial authorities as a basic religious unit of Muslims based on the rules of Sharia, took place at a general meeting of senior householders, whereupon Russian laws were observed, aimed towards ensuring fair elections. The issues of the election (or removal) of clergymen, construction (repairs, reconstruction, relocation) of a building of worship or study, the funding Islamic institutes, etc. were addressed democratically. These decisions made within the framework of procedures established by the legislation were coordinated with the secular authorities.

Despite the authorities' claim that Muslim parishes did not have the right to be a legal person, actually, they enjoyed this right in many respects. They had the right to defend their religious interests, to hand in petitions on behalf of congregations or rural communities in accordance with the law; the authorities allowed the donation (re-registration) of real estate or movable property to mosques and Muslim schools, which were run by the parishioners.

Despite the efforts made by the government to exercise control over the Islamic system of

religious training, Muslim communities, as before, dealt themselves with the issues of training and educating the next generation.

Traditional religious Tatar communities were divided into rural and urban types.

Most Muslim parishes were located in the countryside. There were three social institutions in Muslim villages: 1) the land community; 2) the rural society, and 3) the Muslim parish, whose territories did not always coincide.

The community was an economic union of rural class representatives connected by a common land allotment. Since 1838, an economic peasant union started to be officially called a 'land community' and received the status of a legal entity [Mironov, 1999, pp. 429, 430]; it represented the interests of ploughmen and their members before governmental, judicial and public institutions, as well as private persons. That is why the economic basis of rural parishes consisted of the common use of land, with leveling land used by peasants united by common economic interests and obligations to the state, as well as the peasant households of parishioners.

The economic life of land communities and the mentality of ploughmen played a role in shaping the lifeblood of religious institutions. It is important to note that community members themselves regulated the community's daily life within the period of seasonal agricultural work and did not depend on external factors such as officials. At the same time, the community as an administrative institution 'absorbed the peasant's individuality [and] did not give space for the civil independence of its members' [Vorobyeva, 2002, p. 22].

The rural society based on common residence and management of the peasant class was a settled association [Mariskin, 2004, pp. 104]. In the 19th century, the state used the peasant community as an administrative tax-paying unit without interfering in its internal life. As a result of the implementation of P. Kiselev's reforms in state villages, the peasant community was recognised as a 'rural society' and a self-managing administrative and economic unit for the first time. As a rule, Tatar land communities covered the entire village (a simple commu-

nity), so Tatar villages were characterised by the superimposition of the functions of these two institutions. Since 1866, in former state Tatar villages, the rules of conducting rural assemblies were largely similar to the procedure for holding a parish assembly: the assembly included all households owners and not only chosen delegates from every ten households [Druzhinin, Vol. 2, p. 562].

The autonomy of the rural society and the peasant community in solving social problems significantly complemented and simplified the organisation of religious and ritual life and the provision of religious institutions with sources of subsistence within a unified religious and cultural space in a monolingual environment.

There were three legal spheres in Tatar settlements from a judicial point of view: the norms of sharia, secular laws, and traditional law.

1. Sharia law regulated the life of Islamic institutions, the religious way of life of local residents, family and marriage relationships, as well as the partition of inheritance and property between family members. In the absence of a punishment institution under the Sharia law, observance of religious prescriptions was based on the authority of the clergy, the religious zeal of parishioners, and the opinions of the community. The 'Sharia sphere' often extended to villagers according to the circumstances by which the mullah learned about the event and his reaction.

2. Until the end of the 18th century, the self-administration of peasants was conducted under the customary law, which existed in the form of oral traditions. In 1797, the state administration, and in 1798, the apanage administration, worked out specific statutes governing the public organisation in villages and established volosts. However, even after the reform of 1861 and up to the fall of the autocracy, minor offences continued to be considered by volost courts on the basis of customary law. Decision-making was largely influenced by the personalities of volost elders as well as the ethnic and religious composition of the volost court. These questions were under the jurisdiction of Muslims in volosts where they were in the majority. There were 'extrajudicial punish-

ments' of guilty peasants, their expulsion from the community for various offenses as agreed with the administration, etc.

In regions, the spread of Islamic values was far from equal and depended on many factors. Therefore, at the end of the 19th century, even in areas with the official application of Sharia norms, customary law was traditionally applied, which often contained elements of Sharia and was syncretic in character [Steinfeld, 1893, pp. 235–236].

The daily life of the rural population and the relationships between the parishioners were greatly influenced by folk traditions and such holidays as Zhyen and Sabantuy. 3. Since 1866, the peasant community transformed into an institution of public law, an administrative cell in the state system of state control, and was transferred under the control of the government [Mironov, 1999, pp. 430, 462, 463]. Governmental control over the peasant (and religious) community received its substance after the introduction of the institution of zemstvo district heads under the Regulation dated 1889; they possessed broad authority to supervise the social life of the rural population and suppress offences. At the same time, Russian laws led to the transformation of some Islamic traditions in the district of the Orenburg Muslim Spiritual Assembly.

The term *traditional Muslim urban communities* meant communities of permanent residents who usually had the basic attributes of a parish, including a prayer building, clergy, and a national school. In cities, they united representatives of various social classes, who normally didn't have an ethno-confessional makeup or urban class institutions. If several parishes existed, the boundaries between them and their parishioners were not clearly defined, which was related to the mobility of a certain number of temporary residents and the specific nature of religious institutions. The economic base of urban traditional communities was the capital of rich Muslims as well as waqfs in large and wealthy communities.

The ethnic and confessional community functioned in another cultural environment;

View of a village cathedral mosque.
The Kazan guberniya. Photo by V. Karrik.
2nd half of the 19th century.

there were great difficulties in compliance with the five-time daily prayers caused by the internal regulations of the institutions where Muslims worked, as well as a lack of total control of the community members over their daily lives, etc.

The term *non-traditional Muslim communities* meant temporary communities of entrepreneurs and Muslims who travelled to fairs, which were usually localised at fair mosques or rented prayer houses, in workers' settlements, and military units. They were characterised by the predominance of adults, who were mainly represented by men. For this reason, there were no maktabas in them, and public prayers were often read in rented rooms only on Fridays; there was no mosque; there was only one mullah, etc.

In addition to the family, the issue of sustaining the religious and ritual life in non-traditional communities was bolstered by local Tatar communities in work artels, compact groups in workers' barracks, rented apartments, or a house, etc., which contributed to the preservation of religious traditions and counteracted assimilation.

At the same time, non-traditional communities appeared in large urban settlements where there were registered Muslim parishes. In the 1880s, a contemporary described the microclimate in Muslim work artels in the capital as follows: Tatars in Petersburg live in artels numbering 10–30 people. An artel and seniorman monitor each other carefully. It is strictly prohibited to come to the apartment intoxicated, which is forbidden by the Quran, and even to smoke. If the artel noticed that one of its comrades had come drunk, at first a verbal reprimand would be made to him. For the second time, the guilty person was tied and made a more tangible instruction with the help of fists, and for the third time, the ‘lost sheep’ was excluded from the artel’ [Bakhtiyarov, 1994, p. 163].

In non-traditional communities, which usually existed in extreme conditions caused by a high turnover of parishioner-workers (merchants) or the temporal nature of their residency, the clergyman was temporarily sent there by the Orenburg Muslim Spiritual Assembly or elected for a specific term (several years) with a monthly salary specified in the verdict. In order to ensure the support of the imam, Muslim worker artels concluded a contract with the administration of their company, under which a certain (the same for all) percentage of the wages of each worker was transferred in his favour; the issue of housing was also solved by the company administration (as a rule, at his expense), and an equal amount of money was collected from all of them [Zagidullin, 2006b, pp. 71–100].

In our opinion, one of the main signs of the transformation of non-traditional religious communities into traditional ones consisted in the appearance of an elementary school, which meant, on the one hand, the presence of a permanent contingent of parishioners (and family persons), and on the other hand, a public religious institution and collective principles in the actions of local Muslims.

Unofficial unregistered religious communities which existed in towns and the countryside were an integral part of the religious-cultural autonomy of the Tatars. The main impediment

to their official registration was the small size of their congregation and (or) number of permanent residents. The Tatars were interested in registering their communities, as a community legally fixed the observance of their religious rights, eliminated many obstacles associated with the national education of the younger generation and public prayers, and made it possible to register births in a parish register, etc.

The appointment of an Orenburg mufti by the sovereign rather than by elections led to disapproval on the part of the clergy and essentially deprived the Muslim religious autonomous system of its wholeness. However, this system would not have been formed without the Mohammedan religious administration. The rejection of the Orenburg Muslim Spiritual Assembly by certain Muslim groups sharply intensified at times when the imperial authorities initiated anti-Islamic measures and the Orenburg Muslim Spiritual Assembly supported the government. It should be emphasised that candidates for the position of mullah always had a chance to reject the religious path. The very fact of passing an exam in Ufa meant the subordination of the mullah to the OMSA.

The religious community as the main Muslim cultural and social medium and the basic unit of their religious and cultural autonomy was a key element in the organisation of self-government in the Muslim community, a self-sufficient social institution.

It was a miniature state with strong links between the parts and the whole, which had its own laws, customs, public order, institutions and traditions, maintained powerful and fresh with the spirit of Islam, its power in the face of elders and the entire parish did not need the highest recognition since this power was religiously and morally credible and was originated in the Quran [Gasprinsky, 1993, p. 39]. This definition of the Crimean Tatar educator I. Gasprinsky can be largely applied to Muslim parishes in the Volga-Ural region and Siberia in the period in question.

The legal fixation of the religious and cultural autonomies of Tatars in the Volga-Ural region began after the establishment of the Oren-

burg Muslim Spiritual Assembly, which made them systematic and complete, becoming the main institution representing their interests before the imperial power.

The most important condition for religious and cultural autonomies consisted in a single cultural and linguistic space in the territory of the settlement, which was not always limited to the mahallah. There were volosts in some guberniyas where Muslims prevailed or constituted all the population.

According to 'Tarzhaman' newspaper (1905), the Tatars were more religious than their co-religionists in the Caucasus and the Crimea, which was reflected in a great number of mosques, schools, and myurids. Unlike them, the Muslims of the Volga-Ural region were always cautious and suspicious about almost all measures taken by the administration [Iskhakov, 2007, pp. 87]. The isolation of the Tatars within traditional religious communities was mainly stipulated by their religious-national peculiarities [Materialy', 1936, p. 108]. Trying to preserve their traditional foundations, Tatars resisted the establishment of the volost administration in villages (rightly anticipating frequent visits by Russian officials), the opening of pubs, etc. The lack of Russian language knowledge among the majority of Tatar ploughmen and the lack of periodicals in their native language contributed to the isolation of the mahallahs. The informational vacuum was filled by information widely distributed in bazaars, Mejlis', prayer meetings, etc., and it was often distorted, leading to the spread of various rumours.

The establishment of new parishes was regulated by the authorities and depended on the number of residents in a settlement. In Western Siberia in the 18th and first half of the 19th centuries, there was 'greater stability' in Western Siberia in the distribution of the population [Kabuzan, 1971, pp. 31–37], which was supported by decrees prohibiting the movement of 'foreigners' living in the region to other areas.

While resettling, Tatar peasant usually lost their ties with their former community and created new independent communities [Nikolaev,

2003, p. 310]. In this situation, the distance from their native settlement was a key factor.

Along with migration and natural population growth, the dynamics of the number of residents in villages in the Ural region was greatly influenced by administrative resources. According to the 8th census (1834), the average number of residents in Bashkir, Mishar Tatar and Tatar peasant settlements in 19 uyezds of the Orenburg, Perm, and Vyatka guberniyas amounted to 119. 3 people [Zapadny'e bashkiry', 2001, pp. 111–377. Counted by us]. The latter half of the 19th century saw an 'enlargement of settlements up to 25–30 households' [Karimullina, 1993, p. 81].

According to our calculations, in the middle of the 18th century, the authority-established standard for an Islamic parish amounting to 200–300 registered people allowed them to acquire one mosque per 3–4 villages in the Kazan uyezd; this was an obstacle to the registration of new mahallahs in the 19th century. In 1835, it was officially announced that a mahallah should be established for each 200 registered people [Complete Code of Laws of the Russian Empire–2, Vol. 10, Sec. 2, No. 8663].

In the pre-reform period, when the issue of mosque building in peasant communities was influenced by the apanage administration and the Ministry of State Property, which were autonomous from the guberniya administration, and in villages from the serving military class—the War Ministry—it was often allowed to build new mosques without the strict dependence on the number of parishioners. In some cases, small parishes were a consequence of the removal of a part of the population. In 1866, the Orenburg Governor-General stated that earlier, the distribution of mahallahs 'had been connected with lawlessness and parishes had been modified in their composition as mosques were established' [Russian State Historical Archive, f. 821, inv. 8, file 652, s. 9].

As estimated by E. Malov, at the end of the 1850s, there were 224 mosques in Kazan guberniya (33 % of all active prayer houses) in villages, where the number of the population was less than 200 registered males, in Simbirsk

A village mullah. Simbirsk guberniya.
Photo by V. Karrik. 2nd half of the 19th century.

guberniya—17 mosques (12 %), in Samara guberniya—48 (23 %), in Saratov guberniya—39 (28 %), in Astrakhan guberniya—16 (25 %), in Nizhny Novgorod guberniya—1 (3 %) [Malov, 1997, No. 3–4, p. 251]. In 1851, there were 730 illegal mosques in Orenburg guberniya (44 %) [Azamatov, 1996, p. 99]. Obviously, some parishes whose mosques were located in sparsely populated villages united residents of several neighbouring villages.

In order to organise a full-fledged religious way of life in small villages, mufti S. Tevkelev requested the Ministry of Internal Affairs in 1865 to authorise the Orenburg Muslim Spiritual Assembly to permit the construction of prayer houses in regions where it was inconvenient for residents to visit the parish mosque because of the distance, but he was refused. In 1866, in one of its meetings, the OMSA recognised that the remoteness of small villages from the mosque ‘deprived their residents of any opportunity to fulfill one of their main religious duties’, which ultimately negatively impacted their moral principles: ‘First, they

do not consider deviation from religious rites as a sin, then weaken in faith, lose respect to marriage and oath, indulge in drunkenness and other sins and crimes’ [Russian State Historical Archive, f. 821, inv. 8, file 655, s. 1–1 reverse]. The fact was that mullahs lived in a settlement where there was a mosque; therefore, there was no control over the moral and religious life of inhabitants of small villages within their parishes.

If there were petitions from small communities to restructure or build new religious buildings instead of those that burned or petitions to elect an imam to a vacant position, the guberniya authorities abolished such parishes or renamed cathedral mosques to simple ones without asking the consent of the OMSA in order to combat ‘illegal’ mosques from the 1850s to the 1880s [Russian State Historical Archive, f. 821, inv. 8, list 616, s. 137 reverse]. Meanwhile, the number of parishioners could decrease for various reasons, and it was not necessarily connected with the construction of a mosque in a sparsely populated mahallah. Only in 1888, the Senate held that the parish standard shall only apply to newly-built mosques, and acting mahallahs should continue to operate [Sbornik czirkulyarov, 1905, pp. 29–30].

As a result of land allocation in 1866, former state peasants did not become owners of their land because the land was granted to the community. This inviolability of the community and its structure remained until the cancellation of redemption payments by the government at the beginning of the twentieth century. The land of great landowners and patrimonial and pripuschenniks was demarcated up to the fall of the autocracy. In view of these circumstances, both former state peasants, landowners and pripuschenniks could not actively move to vacant lands and form new pochinoks. Thus, land revisions led to a significant slowdown in the formation of new settlements, and therefore, to an increase in the number of people in villages (parishes).

Other factors also influenced population dynamics. In the post-reform period, zemstvo officials in Vyatka guberniya explained ‘the size

of Tatar villages' by religious requirements: the need to maintain a mosque and a mullah, which was 'quite expensive for small communities' [Materialy' po statistike, Vol. 1, p. 15].

The establishment in 1886 of a new standard of 200 males allowed some small villages to get their own mosques. At the same time, the authorities suppressed the activities of communities aimed at forming parishes by joining 'extra' co-religionists from a neighbouring village where a mosque existed [National Archives of the Republic of Tatarstan, f. 2, inv. 2, file 3089, s. 12–15 reverse].

At the turn of the century, researchers recognised the presence of a mosque in villages consisting of 60–80 households [Koblov, 1998, p. 23], and 'almost always' two mosques in settlements with more than 150 houses [Steinfeld, 1893, p. 267]. Thus, in the latter half of the 19th century, two models of parish registration were valid. The former involved the construction of a new mosque with the registration of a parish, usually by separating residents from the mosque of a neighbouring village. The latter model meant the division of a mahallah and the formation of a new religious community in the same settlement. The third (fourth, fifth, etc.) mosque appeared in large settlements. The OMSA and the provincial government allowed their transfer from one mahallah to another. The registration of a new mahallah was unprofitable for the priesthood, which lost a part of its income. Therefore, a mullah's opinion regarding a lack of the need for a new mahallah was not an obstacle to applying for its registration [Russian State Historical Archive, f. 821, inv. 150 file 404, s. 17, 59–59 reverse].

Localisation of new mahallahs within a village and registration of new parishes by reorganising existing mahallahs are illustrated by statistics on the dynamics of the ratio between the number of prayer buildings and the number of clergymen in a mosque. In 1833–1889, 20 mosques were built every year on average, and 59 clerics received certificates, and in 1889–1908, 51 mosques were erected each year on average, and 58 candidates for a clerical position swore an oath [Zagidullin, 2007, pp. 142–

143]. In the latter half of 19th century, a stable staff of clergy was established.

At the turn of the centuries, some villages had no mosques; their residents went to a neighbouring mosque for the Friday midday prayer and were forced to go after the mullah to perform their spiritual rites. Children had to opportunity to study in such villages.

Thus, by providing Muslims with an opportunity to choose clerics, build mosques, and determine their status, the state retained the right to control the life of the parish. Almost every step in the further religious and ritual life of the community had to be coordinated with the police and local administration.

Mosques and the Islamic divine service

In the system of Islamic religious institutions, Russian law defined a mosque as the main symbol of the formation of a legal mahallah; the mosque housed prayer meetings; clerics were approved there; maktabas and madrasahs were opened. Each mosque could only have one parish [Russian State Historical Archive, f. 821, inv. 150, file 404, s. 54].

The Russian legislation established the following indispensable conditions to obtain permission for building a mosque: 1) compliance with the parish standard; 2) presence of a public judgment; 3) obligation of parishioners to maintain the mosque (and clergy) at their own expense; 4) the possibility of erecting an Islamic religious building only if there was no temptation for nearby-living newly-christened Tatars or Russians (determined by the diocese's management); 5) presence of an open space around the future mosque (since 1829—not less than 10 sazhen, since 1842, 20 sazhen); 6) a duly approved scheme of the prayer building; 7) positive decision of OMSA; 8) identification by the local administration of an urgent need in a mosque and 'sufficient parishioners' funds' to 'decently maintain it'. Summarising the information collected, the guberniya administration made the final decision [Ustav stroitel'ny], 1857, cols. 261–265]. The administration of a number of guberniyas in the Volga-Kama Region refused the parishioners permission to build new mosques if the rural community had

large debts [Russian State Historical Archive, f. 821, inv. 8, file 706, s. 155–156; Kobzev, 2007a, p. 60].

Secular authorities formally controlled the functioning of mosques. The police had to ensure the compliance of buildings with fire-safety and sanitary standards [Yuldashbaev, 1979, p. 88].

The vast majority of religious buildings in villages were built of wood, which was connected with the relatively low cost of wood, the high cost of 'stone work' and the labour intensity of brick manufacturing. Stone mosques were usually erected by wealthy people who were interested in donating their capital for godly causes that would serve their coreligionists for centuries [Märcani, 1989, b. 388, 391]. In the Orenburg and Volga steppes, clay and turf were the main construction materials used in building prayer houses [Zheleznov, part 1, pp. 248, 252; Shitova, 1984, pp. 56, 57].

According to Sharia, the public namaz could be led by any Muslim man with sufficient knowledge and training. The social and political component of the Islamic liturgy in Russia was influenced by the following factors: 1) the view of the authorities that temples were an essential element for implementing the principle of religious tolerance as prescribed in the 'Major state laws'; 2) the recognition of public prayer as an effective means for an ideological impact on citizens; 3) the reading of the public prayer exclusively in a 'public building' approved by the authorities, under the control and personal responsibility of a cleric approved by the administration.

Since the mosque was recognised as the only place for reading public prayers, in accordance with the Russian law, the public prayer was a prerogative of persons having permission from the secular administration. OMSA stressed that the 'provision of the exclusive right to fulfill Islamic religious rites to special, government-approved mullahs pursued not only religious but also political tasks' [Sbornik czirkulyarov, 1905, p. 81].

The names of the *pyativremennaya* (simple) and cathedral (*Jami*) mosques became a part of the Russian legislation during the time of mufti

Gabdessalyam Gabdrakhimov. For example, in Arabia, the status of the settlement served as the main criterion in determining the type of its mosque; in Russia, it was the registered *ma-hallah*. Newly-formed communities immediately applied for the construction of a cathedral mosque. The Spiritual Assembly explained that sharia prescribed that persons having such clerical titles as imam, *mugallim-sabiyān*, and *muezzin* could serve in a *pyativremennaya* mosque, and imams, *khatibs*, *mudarrises* or *mugallims*, *mukhtasibs*, *mugallim-sabiyān*, and *muezzins* can serve in a cathedral mosque [Russian State Historical Archive, f. 821, inv. 8, file 594, s. 12 reverse]. The presence of a *khatib* at a *pyativremennaya* mosque was a basis for submitting a motion to rename the mosque into a cathedral mosque [Russian State Historical Archive, f. 821, inv. 150, file 404, s. 36–41]. However, the reading of the Friday midday prayer by the *khatib* was allowed in mosques officially renamed as cathedral mosques.

In 1833, there were 3, 313 mosques in OMSA, in 1856, there were 3, 478 mosques, 75 % of which were cathedral mosques. The number of *jami* mosques increased: in 1868, they made up 81. 8 % [Zagidullin, 2007, pp. 143–144], in 1911, more than 90 % [Farkshatov, 2006, p. 289].

In a mosque, *khatibs* had the opportunity to impact the religious and moral, as well as civic consciousness of parishioners. During the Friday midday prayer or during annual religious festivals, the *khatib* read the *khutbah* standing and leaning on a staff, which meant that Islam was spread in the country not with a sword but voluntarily, without compulsion [Koblov, 1907, p. 11; Islam, 1991, p. 285].

The *khutbah* read by the *khatib* during a festive service acquired political importance due to the need to mention the name of an existing Caliph, thus expressing the political orientation of the *khatib* and his community: if the name of the leader was not pronounced, it meant his rejection or deposition [Islam, 1991, p. 285]. In 1878, The OMSA issued a 'book of holiday service' with the lyrics of *khutbahs* [Central Historical Archives of the Republic of Bashkortostan, f. I–295, inv. 2, file 142, s. 377].

Basing their decision on the absence of Muslim settlements in the Middle Volga region which would correspond to a city ('mistr'), some mullahs spoke for the abolition of the Friday and festive prayers and for their substitution with an ordinary prayer [Adygamov, 2005, p. 84]. An outstanding public figure of the turn of the 18th–19th centuries. G. Utyz Imyani believed that both the head and the judge of a 'mistr' should 'be Muslims, not of another religion'. That is why he found saying Friday prayers invalid. The legitimacy of the prayers and other religious holidays were connected by G. Utyz Imyani directly with the existence of a Muslim government and statehood [Adygamov, 2005, p. 84].

The possibility of reading the Friday prayer in small villages was described by a madrasah teacher in Kyshdar village of Kazan uyezd, G. Kursavi at the beginning of the 19th century, in his book 'Instruction of People on the Path of Truth'. He wrote that according to the Koran and Sunna, the Friday prayer is obligatory and it contributes to the consolidation of the congregation [Kursavi, 2005, pp. 185–191]. However, there was no common view among religious figures concerning this question until the second third of the 19th century.

In the case of an illness or the absence of the khatib, the Friday midday prayer was read by the imam with his permission [Kobzev, 2007a, p. 74].

In 1826, mufti G. Gabdrakhimov published an order to perform the namaz to glorify the Russian emperor on Fridays and other holidays, addressing the text to akhuns for its distribution among parish mullahs. Since 1834, a special text in Tatar [Smolarts, 2011, p. 167] started to be used to read prayers on Fridays in honour of

A text exalting the great names used at Islamic worship services.
Order of the Orenburg Muslim Spiritual Assembly No. 3442
from 12 June 1903.

the tsar; since 1847, there were special holiday public prayers on 'tsar days' [Fäxreddin, 2006, b. 122]. The content of the received texts was announced in all mosques regardless of their status and the day of the week. Along with this, the OMSA established the mandatory arrangement of such religious and political events on 1 January (the New Year), the first day of the Shawwal month, after the prayer on the celebratory day of Eid al-Fitr, and on the tenth day of the Dhul Hijjah month, after the prayer on the day of Eid al-Adha [Sbornik czirkulyarov, 1905, , p. 224–225]. These prayers were the duty of the parish clergy and a new obligation for parishioners: village elders and the police tried to provide the 'universal participation' of parishioners in the prayer. That is how the transformation of the Islamic prayer occurred in the conditions of Russia. Since 1898, the prayer in honour of the Russian tsar during the Friday holiday service was considered to be

optional by the OMSA [Sbornik czirkulyarov, 1905, p. 149]. Since that time, the Friday prayer proclamation of the mullahs didn't mention the name of the Russian emperor and only contained a general phrase: 'God, help the one who helps faith' [Alektorov, 1906, p. 91].

Thus, the doctrine of 'official nationality' with respect to Muslims was implemented by the government under the scheme: 'monarchy, tolerance, ummah'. Clerics were to be the guides of the state ideology.

In the latter half of 18th—19th centuries, in European Russia and Siberia, Khutbah was delivered in the Arabic language. 'Mullahs had handwritten collections of sermons in the Arabic language' [Rakhim, 2004, p. 571]. At the turn of the 19–20th centuries some imams began to read Khutbah in the Tatar language [Gimazova, 2004, pp. 67]. The issue of the preaching language became a subject of disputes between traditionalists who advocated for delivering Khutbah in the language of the Koran, and Jadids who believed that Khutbah should be delivered in the Tatar language. The situation changed gradually [Marash, 2005, pp. 154–156]. The newspaper 'Kazansky Telegraf' (21 February 1898) reported that the Orenburg Muslim Spiritual Assembly had issued an order which made sermons in the native language mandatory during festive religious services.

The five daily prayers regulated to a great extent the everyday life of the mahallah. That is why the slow-paced life of the settlement was determined by adhan—a call to worship. In 1775, I. Georgi wrote the following about the Tatars: 'Nobody tries to avoid praying deliberately, should anything prevent them from participating in prayer, they pray at the very least alone in their homes or in the field during sunrise or sunset: While doing it they take off their shoes and sometimes step on their clothes spread on the ground' [Georgi, 1779, p. 2, p. 21].

Men were obliged to attend the mosque on Fridays, on other days, especially during the period of agricultural works, they worshipped at home. Even during hay-making and harvest days men would usually return to the village

to take part in the Friday Namaz. Occasionally, in some villages the Friday afternoon prayer would be disrupted 'because three persons were absent from prayer' [Steinfeld, 1893, p. 272, 307].

On regular days, the elderly ('mächet kartlari'), having retired from production activities, would join the imam. Quite often, however, the imam would perform a service at the mosque on his own [Russian State Historical Archive, f. 821, inv. 150, file 411, s. 25]. It is appropriate to say that there were large religious assemblies on Fridays and on annual Islamic holidays.

In the 19th—early 20th century some settlements of the Middle Volga region established a procedure according to which on Fridays women gathered in the mullah's house where the imam's wife (abystay) would recite the Koran or other religious books which replaced the Friday service for them [Koblov, 1907, p. 15; Barudi, 1997, b. 113]. Women also gathered in the mullah's house to join his wife for 'qader kiçäse' (Night of Destiny, Laylat al-Qadr) [Shino, Vol. 81, p. 281, 282, 284].

In fact women did not have to attend the mosque. In this regard, in the first quarter of the 19th century. Karl Fuchs authoritatively stated: 'While the men are holding a service in the mosque, the women are praying at home. Tatars perform five daily prayers in the mosque, and during these hours, no matter where a Tatar woman is, whether she is having tea at a friend's house, having breakfast, or is in the forest, in the field, in a stranger's house, she stops doing everything and looks for a convenient place and starts praying with such zeal that no noise can distract her from it or make her look back' [Fuchs, 1991, pp. 49–50, 98].

Confessional schools In the late 18th—early 19th century, the operating and emerging madrasahs and maktabas formed a common religious educational area in the district of the Orenburg Muslim Spiritual Assembly. The most influential madrasahs were the ones where instruction was delivered by imams who had received education abroad, particularly in Bukhara.

Madrasahs implemented the most crucial principle of Islamic religious education—its

availability to everyone who sought knowledge, without any restrictions.

Being an ethnic and confessional minority, and constantly being threatened to lose their confessional identity, the Tatars tried to teach their children the basics of Islam, as well as reading and writing skills, in the native language. The national school played a most important role in this process. As a rule, a maktab was located in one of the manor buildings, or in the imam's house which was hardly suitable for delivering classes because of poor lighting and stuffiness, or in a small dwelling which was specially built or re-equipped for the school. There was a system of mutual learning, according to the Lancaster method, that is why the teacher was not always present in class. This did not imply there was an absence of control: 'in the fences', separating the classrooms from the dwellings, small holes existed, which were skillfully cut out. They were used for 'observation and sudden inspections' [Sofiysky, 1893, p. 325, 329]. Classes were delivered by *khal-fas*—helpers of mudarris.

As for girls, they were usually taught the basics of Islam, prayers and reading by the wives of clergymen. Girls did not learn to write since it was prohibited by Sharia law.

'The Rules' of 1870 divided Islamic schools into two categories: schools funded by communities, and schools where children were taught privately or at home. Private schools belonging to Muslims of the district of the Orenburg Muslim Spiritual Assembly only appeared at the turn of the centuries when merchants began to establish maktabas which used new teaching methods and were funded by the merchants. The establishment of Russian classes at madrasahs was an innovation. As a rule, they were located in separate training buildings and were funded by the government or district councils.

Although, beginning from 1874, Islamic schools in the district of the Orenburg Muslim Spiritual Assembly were under the supervision of the Ministry of National Education, there were no construction or technical guidelines in regard to their building.

The Parish Clergy. As is well-known, Islam does not have a caste system, Sunnis do not have a place of worship as a mediator between Allah and the believers. According to Sharia any Muslim, familiar with the rituals of faith, could lead a public prayer (except for a festive one), perform burials, name a newborn, perform marriage rituals, etc. In the parishes surrounding Orenburg Muslim Spiritual Assembly, the performance of these rituals was the responsibility of certain mullahs. This procedure helped the government to exercise control over the social life of religious communities.

In Central Asia, where young Tatar men would go to acquire deeper religious instruction, the final stage of education after finishing the madrasah would be studying in a khanaqah (Sufi monastery). After that the young men were to be blessed by the teacher-murshid. In the Volga-Ural region, official clerics were also Sufis—representatives of Tariqas. In a madrasah, along with studying religious disciplines, shakirds prepared to become murids of mudarris-murshid. Thus, education according to tasawwuf became an essential element of the Tatar clergy's spiritual formation [Mukhametzyanova, 2008, p. 29]. In 1800–1860, according to incomplete data, the number of mudarrises in contemporary Bashkortostan who had received religious education abroad amounted to 21 %, in 1860–1890–13. 5 %. The major madrasahs were under their supervision, and they greatly influenced the educational process in the region [Khabutdinov, 2000, p. 57, 76].

In terms of spiritual instruction the official duties of mullahs were as follows: 'a) representation in the mosque during worship; b) delivering the necessary religious knowledge to believers; c) constant and relentless preaching about the need for peace and harmony among all Muslims, using the most noble and gentle words; d) the ability to value religious kinship among Muslims and general human rights and cherish them, as well as the ability to encourage the population to do the same' [Sbornik czirkulyarov, 1902, p. 41].

Nearly all spiritual and administrative power in mahallahs was concentrated in the

Haja and mullahs.

Early
20th century.

hands of the clergy. As a spiritual leader of the community the mullah settled family conflicts between spouses, between children and parents, all the while instructing and offering advice; as a judge he performed the distribution of inheritance according to Sharia norms and was engaged in educational activities in the local confessional school (funding it quite often). Apart from guiding public prayer, marrying and divorcing people, giving names, conducting burials and commemorative rituals, participating in funeral feasts according to Sharia law and resolving various disputes, imams also performed functions imposed on them by the official authorities: they declared and explained executive orders and kept parish registers.

The clergy performed a very important function—the function of organising the social life of the mahallah: they urged believers that mosques, schools and cemeteries should be maintained well, persons in trouble should get moral support; that sanitary and hygienic norms should be complied with in everyday life and that sanitary and epidemiological regulations of the administration and district councils should be implemented, etc.

The environment (the majority of mullahs lived in rural areas) significantly influenced the way of life and behaviour of parish mul-

lahs. Their equal legal status with that of peasants, as well as the fact that they had peasant households, united their social and economic interests with those of parishioners-farmers.

The religious and ethical influence of the mullah in the parish depended on his moral qualities, intellectual capabilities, his way of life and behaviour. If the mullah worked hard to perform his duties, was sober and kept a close eye on believers, then he would have authority among the parishioners and would generally be the recognised leader of the social and cultural life of the parish.

In the Ural region, in the second quarter of the 19th century, some mullahs, citing the fake decree of the Orenburg governorate board in the Tatar language, which instructed imams to punish Muslims who did not attend the mosque, began to use corporal punishment on parishioners. During the decades that followed, despite direct prohibitions by the administration, the practice of corporal punishment by mullahs for non-compliance with Sharia norms was widely spread in Islamic settlements of the Orenburg guberniya. Very often corporal punishment was applied to persons who came to the mosque in a drunken state. The mahallah supported such actions of mullahs and perceived such punishments as just retribution [Denisov, 2011].

An agreement concluded in 1845 between the imam and residents of the village Tyunter of Malmyzhskiy uyezd of the Vyatka guberniya regarding fulfillment of their religious duties was indicative of the existing problems in traditional communities regarding the organisation of the religious way of life. The parishioners agreed: that they would not produce or drink beer and other alcoholic beverages, that they would refrain from any actions against Sharia, would not miss the morning and evening Namaz for no good reason, would not allow members of their families to visit places disapproved of by Islam, and would not prevent 'fellow villagers from acting truthfully in life and faith'. In case of violation of the above-mentioned, they were ready to receive punishment [Fäxreddin, 2010, b. 32].

The clergy worked hard to establish Islamic traditions and way of life. At the end of the 19th century, imams made efforts to prohibit the celebration of Nowruz in the villages. However, despite efforts to implement the orders of the Orenburg Muslim Spiritual Assembly on the prohibition of the holiday Djien (during the reign of the muftis G. Gabdrakhimov, G. Suyeymanov, S. Tevkelev, Muslim merchants of Kazan and the Kazan governor in 1880s), the holiday still preserved its important role in the festive culture of the Tatars [Tatary', 1967, pp. 225–227, Zahidullin, 1991, b. 174–176; Khabutdinov, 2010, p. 59].

Clergymen were part of the national elite, they were the keepers of the historical memory of the people and served as models of piety for believers. In the traditional community, the clergy possessed immense power due to the absence of feudal class representatives in rural areas. It is profoundly symbolic that mullahs themselves called parishioners—members of the peasant community—'kara xalik' (vulgus).

During the decades when the mullah would fulfill his priestly duties, he would live to see several generations of believers grow up, and he would participate to one extent or another in all the crucial events of their family life. Therefore, in a small parish, the mullah knew each and every parishioner.

The increase of cathedral mosques in number influenced to a certain extent the increase of the number of clergymen. If in 1833 each parish had on average 1. 25 clergymen, then beginning from 1850 up to 1911 this figure was approximately 1. 6–1. 8 [Zagidullin, 2007, p. 143]. Notably, the number of muezzins was twice less than the number of mosques, and consequently, in half of the mosques, the duties of the muezzin were performed by persons privately appointed by the community, by the imams themselves, or by individuals who did not have the appropriate certificates.

Reasons for dismissing a clergyman from his position could be complaints received from parishioners or any individuals about negligent performance of duties, frequent absences, a lifestyle connected with alcohol, quarrels in the mosque or causing discord among parishioners, as well as incorrect entries in parish registers, etc. [Russian State Historical Archive, f. 821, inv. 150, file 404, s. 46; Central Historical Archives of the Republic of Bashkortostan, f. I-295, inv. 1, file 271 and others]. In case a mullah lost the trust of his parishioners, the Orenburg Muslim Spiritual Assembly 'would listen to their opinion' [Gilmudinov, 2005, p. 56].

In the middle of the 19th century, P. Pashino distinguished (based on his professional and social activities in the mahallah) several types of clergy. A small group consisted of mullahs who were keen on poetry and reading religious books. They were revered and loved by parishioners. Occasionally, there were mullahs who were interested in history and geography. They would keep notebooks and record events occurring in their respective location. Representatives of these groups diligently performed their priestly duties. Some mullahs earned their living by curing diseases (by way of whispering, pronouncing phrases from the Koran). One could seldom encounter mullahs who were religious zealots. Mullah-traders, who understood Russian, mullah-kushtans, intercessors and representatives of the community were interested in commerce and litigation. Quite often they neglected their direct duties, not always

A certificate on the successful sitting of a Russian examination by U. Abdulgazizov, a candidate for the position of mullah in the village of Staryj Ashit, Kazan guberniya. 1904.

performing the five Namaz (prayers), but delegating it to a muezzin. What is more, they 'sniff tobacco, do not refuse vodka, like to chat and make new friends, especially with Russians, and live in clover' [Shino, Vol. 81, p. 277]. Ishans were mudarrises who supervised large madrasahs and taught shakirds-followers. They enjoyed authority in the village and the neighbourhood, they were well-read people. Their activities were basically to read Namaz, teach, provide assistance and moral support to Muslims who got into trouble. P. Pashino divided the rest of the imams (and they were

the majority) into 'roguish' and 'sleepy' who do not do anything and 'and they represent this nation as a whole, which is spiritually asleep due to various circumstances' [Shino, Vol. 81, pp. 270–290].

In 1895, G. Ibragimov pointed out the main drawbacks of the Tatar community: disagreements between members of religious communities and hostility between scholars; the fact that imams narrowed down the Islamic doctrine to having the right form of beard and moustache, they laid down the law on how to wear turbans and perform rituals; the decline of religious education among the parish clergy and their ethical authority amongst parishioners; various disturbances and disorders caused by rumours about baptism [Gabderäshit, 2011, b. 64, 65, 68].

During the post-reform period, mullahs-cadimists were against the inclusion of secular subjects into the curricula of madrasahs and maktabas, assuming that the

Koran contained everything that was needed to know, and that learning it 'allows to get answers to any questions' [Mashanov, 1911, pp. 124]; they equated learning the Russian language to actions that were contrary to Islam [Russian State Historical Archive, f. 821, inv. 8, file 1051, s. 50]. However, after the introduction of the Russian educational standard for candidates for the post of an imam in 1891, mullahs-cadimists in an attempt to secure 'a place in the sun' for their sons, began to teach them reading and writing in Russian [Gany, 1998, b. 45].

Some Tatar clergymen were former serving Tatars or 'murzas in bast shoes'. The long-term education in a madrasah required money, which the poor could not afford for their sons. Mullahs wanted to marry daughters of salesmen and merchants in order to become relatives of rich people. This way family ties and clan systems were formed among the clergy [Fäxreddin, 2006; 2009; 2010].

Under the weight of seasonal works and the development of capitalist relations at the turn of pp. centuries, the clergy's influence on parishioners weakened which was due to the emerging general tendency of secularisation of Russian society. These phenomena were clearly observed in the urban environment [Ibrahmov, 1900, b. 5–29].

§ 2. Sources of existence of Islamic institutions

Ildus Zagidullin

The construction of mosques and educational institutions was performed amid the gradual reduction of land allotments, growing tax and loan debts for peasants, and other negative social and economic developments in the agricultural sector. As a rule, the building of a new mosque would be announced by the community when there would be a benefactor who would incur the costs of construction, and also if a certain amount of money, log structure and construction materials were available. The funds necessary for building a mosque were collected by way of leasing part of the communal lands, by way of a special secular levy under the principle 'give as much as you can' or, alternatively, everyone had to submit equal sums, and also by way of transferring available 'secular money' from private donations, etc. [Gibadullina, 2008, p. 50, 51].

Many mosques and schools in the district of the Orenburg Muslim Spiritual Assembly were built and funded at the expense of the peasant community or several of its members, by a benefactor⁶ or a clergyman, who would quite often impose conditions such as 'to have his son elected as mullah' [Senyutkina, 2009, p. 240–241] or receive payment for teaching [Mukhametzyanova, 2008, p. 126], etc. In cit-

ies, mosques and educational institutions were usually built by merchants. Once the construction was completed, authorised persons of the community provided the parish with information on the expenses incurred. During the construction of a new mosque, funds were usually allocated by parishioners of the existing parish and the one being built. If the funds were not enough to complete the construction, an additional levy was imposed according to a special arrangement [Kobzev, 2007a, pp. 50, 51].

In the sources of the 19th century, there is information about mosques 'falling to pieces' [Shino, Vol. 82, pp. 50, 51; Steinfeld, 1893, p. 286]. When considering issues, connected with the maintenance and the reconstruction of mosques, the Spiritual Assembly gave priority to the heirs of mutawallis. In the 1840s, K. Fuchs noted, 'the Tatars have a strange custom: their mosques and schools cannot be built or maintained by society, but only by a wealthy person. I wonder why some of their public buildings are poorly maintained on the exterior in terms of their strength and solidity' [Fuchs, 1991, p. 22].

The Mahallahs were against the special 'secular levies' as was the case with Orthodox peasants who used this money to support schools, churches and the clergy of a parish. However, in reality, the Tatars widely used the administrative resources of the peasant community which was clearly manifested when the rural community allocated funds for all the mosques

⁶ According to Sh. Marjani, Gabdulla Bey (d. 1832, at the age of nearly a hundred) from the village of Machkara, renowned in the Kazan guberniya, built approximately 150 village mosques [Märcani, 1989, b. 387].

functioning in a village or collected a onetime 'secular' or 'community' tax for religious needs [Kobzev, 2007a, pp. 36–37].

The main obstacle which prevented Muslims from receiving financial aid from the district councils to maintain maktab and madrasahs was the absence of the provision (in Sharia) making it possible to receive financial allowance from such institutions. On 8 August 1906, the Orenburg Muslim Spiritual Assembly declared that Sharia does not prohibit the use of financial assistance from district councils for building and maintaining Islamic schools. Only after the First Russian Revolution did the Islamic communities of the Volga-Ural region begin to see 'the financial allowances from district councils' as an important part of the income of parishes [Naganava, 2012, p. 79].

Muslims were pragmatic in matters of construction and maintenance of mosques: they were primarily worried about the cost of services rendered and the qualification of contractors [Central Historical Archives of the Republic of Bashkortostan, f. I–295, inv. 6, file 3237], not their religious denomination.

There was no practice of having guards at the mosque. Watchmen on duty were responsible for keeping the peace and quiet in the locality.

The archive of the Orenburg Muslim Spiritual Assembly contains many cases reflecting the hardships of parishioners, seeking to renew divine service after a fire [Central Historical Archives of the Republic of Bashkortostan, f. I–295, inv. 3, file 6391, s. 2–3]. The difficult economic situation of a community that had lost quite a few peasant estates in a fire and the lack of benefactors were the main reasons behind delays in the construction of a mosque ranging from several to fifteen years [National Archives of the Republic of Tatarstan, f. 4, inv. 102, file 9, s. 20 reverse]. Even large communities were unable to immediately start the construction of a new mosque, as a rule, it took 2–3 years to raise funds and purchase the necessary materials [Central Historical Archives of the Republic of Bashkortostan, f. I–295, inv. 11, file 614, s. 18–18 reverse, 28–28 reverse; file 672]. In the meantime, public worship was held in the

house of a wealthy parishioner or in a building specially built for this purpose and used for a different purpose after the mosque had been reconstructed.

In 1839, the Department of appanage approved the regulation on the insurance of peasant buildings paving the way for the insurance of places of worship at 'half price', and contributions were collected from the 'community' according to the law. Starting from 1858, they were subject to insurance without restriction of the amount in terms of actual value [Istoriya udelov, Vol. 2, p. 336, 340]. The Ministry of State Property, realistically evaluating the limited capacity of peasants to prevent the spread of flames in case of a fire, almost involuntarily forced rural communities to insure peasant estates. Mosques often were included into this list [Central Historical Archives of the Republic of Bashkortostan, f. I–295, inv. 3, file 5988, s. 1–2 reverse]. In the post-reform period, the insurance of public buildings in rural areas was handed over to zemsky institutions and became statutory.

Maktab were maintained at the expense of students' parents and parishioners [Kobzev, 2007a, p. 53].

The rural community addressed the matter of allocating land for the building of a madrasah. In matters of organisation of a madrasah (secondary school), the most important point was the presence of two persons: a scholar-mullah, who had a desire to teach and a rich merchant or parishioner willing to construct a building and annually provide funds for maintaining the educational institution. Lack of waqf—a stable source of religious endowments—made madrasahs dependent on Muslim benefactors. The existence of madrasahs for locals was a symbol of development of a mahalla, increasing its authority in the region [Mukhametzyanova, 2008, p. 125, 145].

Large madrasahs represented educational complexes that included educational buildings, dormitories, canteens, etc. Usually, a mutawalli built a mosque near an educational building and it was officially considered as a place of worship of the rural community. Madrasahs were usually one-storey buildings, made from

A Tatar village, Simbirsk guberniya. Drawing by A. Derrick. 1874.

wood or stone, consisting of one or two large rooms and a kitchen; a madrasah also had household plots and backyards.

A Zakat was valid only when a Muslim distributed it to certain individuals, poor people. As a result, wealthy Tatars tried to distribute money in madrasahs to shakirds, and not for maintaining the building itself since public activity was not recognised as Zakat.

In rural areas, where the land belonged to the community, a mullah, as a rule, was provided with a free land allotment, and as a clergyman he could be released from taxes and duties. If a mullah was from another locality, then the newly formed parish could provide him with accommodation or land for building a house, often he was provided with funds to go to Ufa to take exams at the Orenburg Muslim Spiritual Assembly, etc. As a rule, land allotments were provided free of charge in the size of one land plot for one soul or in regard to the number of males in a family [Kobzev, 2007a, p. 53]. The resolution on the selection of a clergyman does not specify the exact amount of the financial allowance. Since there were no stipulations in the law to fulfill this obligation, very often, especially in lean years, clergymen found themselves in a difficult situation.

As a rule, in Tatar parishes a mullah received a Zakat al-Ushr—1/10 part of crop yield (tax on agricultural products), however, this information was rarely recorded. Zakat al-Ushr existed only in rural mahallas, but not everywhere. In places where this custom existed, mullahs were wealthier than mosque clerics who did not receive Zakat al-Ushr [Koblov, 1998, p. 25]. At a poor farm, the grain harvest was up to 20 carts, while at a rich one - up to 300 carts. The size of a Zakat al-Ushr for every clergyman was set by parishioners [Sel'skij svyashhennik, 1874, pp. 523–524].

According to R. Fakhreddin, very often Russian language teachers at schools of the Ministry of National Education, looking for material profit, would reject educational positions (annual salary—300–400 roubles) and would become mullahs [Fäxretdin, 2012, No. 2–3, p. 87].

As a rule, in compound parishes, residents assigned to a nearby mosque, did not pay Zakat al-Ushr. For the convenience of collecting income, some mullahs took a second wife, settled her in a nearby locality and during visits to the locality performed religious service [Shino, Vol. 81, p. 283].

According to some data, in the middle of the 19th century, in some areas of the Oren-

burg Krai, every fifth worker of a mosque was getting a fixed income from his parishioners [Farkhshatov, 2006, p. 291]. For instance, in a number of localities of the Menzelinsk uyezd of Ufa guberniya, mullahs did not get allotments, they paid zemsky, earthly, state monetary and natural duties, and they did not receive Zakat al-Ushr. Moreover, on the basis of collective responsibility, rural communities forced them to pay their arrears on loans, that mullahs did not even take out [Russian State Historical Archive, f. 821, inv. 8, file 1072, s. 1–2, 36].

As a rule, clergymen were engaged in bee-keeping and gardening. In poor parishes and small mahallas, they dealt with arable farming, in wealthy parishes they employed workers for their farms: they exploited indebted parishioners, rented allotments, etc. [Koblov, 1998, p. 17; Materialy', 1936, pp. 103–104].

Donations from parishioners during major religious holidays—Eid al-Fitr (feast of fasting) and Eid al-Adha (feast of sacrifice) formed the next significant source of income for the parish clergy. During Eid al-Fitr every adult parishioner provided his religious mentor with alms and gifts which could be food or money. Holiday offerings during Eid al-Fitr were called 'fitr sadakasi (in Arabic—zakat al-Fitr), they were binding and in monetary terms amounted to at least 20 kopeks per household [Koblov, 1998, p. 24]. In the Volga-Ural region villages, the "fitr sadakasi" could make a total of up to 100 and more poods of crops and from 50 to 100 roubles in money, and in cities up to 400–500 roubles [Farkhshatov, 2006, p. 291].

Almost all mullahs had to become sellers several times during the year: at the rural market or city they would resell sheepskin, that they had got from parishioners during the Eid al-Adha [Shino, Vol. 81, p. 271], and also a part of their Zakat al-Ushr in the form of grain, sheaves or flour.

In Russia, there were no levers enforcing the performance of one of the most sacred obligations of Muslims—zakat (a tax to the benefit of needy Muslims, amounting to 1/40th part of the total income during a calendar year, paid during the holy month of Ramadan). Payment of zakat was the prerogative of the wealthy Muslims and

was a purely voluntary act. The specific feature of paying zakat was that it was mainly used to support the parish clergy. Zakat was distributed to the poor and students at madrasahs [Yunusova, 2006, p. 61]. The terms zakat and sadaka (alms) among Tatars and Bashkirs had almost merged under the name sadaka and implied voluntary, unregulated donations by Muslims, which were mainly used to support mosques, schools and the clergy. In the middle of the 19th century. P. Pashino noted that "a mullah gets more alms than all the poor people in a village" [Shino, Vol. 81, p. 284]. In his circular letter dated 22 July 1916, the mufti of Orenburg M. Bayazitov urged the faithful to give zakat to mullahs [Minnullin, 2006, p. 39]. This phenomenon needs legal evaluation. The point is that, according to Sharia law, mullahs could not be taxed. According to Sharia, scholars who do not pay taxes (the state does not provide them with a salary) are considered to be persons in need, and they have a right to get Ushr, Fitr and other obligatory donations for Muslims [Fäxretidin, 1907, p. 360].

An additional source of income for the clergy was the performance of occasional religious rites (performing wedding ceremonies, funerals, giving names, etc.) and scholastic work. In every community there was a minimum amount of annual natural and monetary offerings to mullahs, but quite often this was a token gesture. For instance, a mullah got 10 kopeks for giving a name to a child, 25 kopeks for a wedding, 50–60 kopeks for a funeral, etc. [Farkhshatov, 2006, p. 291].

In newly formed urban parishes, a wealthy seller or several parishioners were obliged to provide the clergy with accommodation. In urban areas, where the custom of Zakat al-Ushr did not exist, mullahs lived off the offerings (sadaka) of parishioners, which was in abundance during Islamic holidays. As a rule, urban parishes were considered to be wealthy, while rural ones were considered to be poor.

At the turn of the 19th-20th centuries, the revival of the Islamic renewal movement was marked by the emergence of new organisational forms of Muslim charity, which included wider sections of the population. One of the new forms of collective care over mosques

and schools was the establishment of a trusteeship, consisting of the most proactive members of the parish. If there was a waqf, they would manage the correct influx of funds and their intended expenditure.

The Arabic word *waqf* literally means the presentation of an item for serving sacred purposes, broadly construed it means the waiver of rights to property in favour of a certain legal entity [Islam, 1991, p. 45]. In Russia, waqf meant inalienable property, intended for specific charitable purposes.

The Empire recognised waqf properties of Muslims in certain areas joined to Russia in the last quarter of the 18th –mid- 19th centuries: in the regions of Tavrichesky Muslim Spiritual Assembly, spiritual directorates of the Muslims in Transcaucasia (for Shias and Sunnis) and Turkestan.

After 1552, waqfs were liquidated in the Middle Volga region, but they began to appear once again in the latter half of the 18–first half of the 19th centuries [Denisov, 2009b, p. 46], however, they did not become a social phenomenon⁷.

According to Sharia law, the right to appoint a supervisor primarily belongs to the donor, if he is absent—to the executor, if the executor is absent—to the government [Nofal, 1886, p. 180]. Donors and their closest relatives regarded the fiduciary duties as a private matter, and the provision of any reporting was construed as interference in family matters or in the life of a mahallah.

Waqfs in the Orenburg Muslim Spiritual Assembly, despite the lack of legislative regu-

lation, had a right to exist. In 1837, the legislative branch developed a mechanism, whereby the donations of subjects would be assigned to religious institutions [Complete Code of Laws of the Russian Empire–2, Vol. 12, No. 10303, item 97]. Donations were approved by the Ministry of Internal Affairs upon submission from the local governor. The Governor-Generals of Western and Eastern Siberia independently approved donations for charitable purposes [Zakony' grazhdanskie, 1857, Article 981, fn.]. The identity of the donor, his financial situation and the property itself were investigated prior to official approval (right of ownership, whether it was mortgaged or not, etc.).

According to legislation, the period for submitting and receiving approval of the will to be executed for Russian nationals residing in the homeland, was 1 year, for those staying abroad it was 2 years (from the date of the testator's death). After this period, the document was considered to be invalid [Zakony' grazhdanskie, 1900, article 1063]. District courts were interested in the accurate drafting of the document, they were not entitled to modify its content.

In correspondence with civil authorities, the Spiritual Assembly complied with Russian legislation, that is why it did not have right to use the term waqf, however, when dealing with the trustees of the donated property it operated under Sharia law. It could not be any other way since donors clearly stated the purpose and objectives of the donated property in the deeds. Sharia stipulated the following procedure for organising waqfs: 1) usage of the term waqf in relation to the donated property; 2) no expression shall limit the existence of waqf; 3) exact references to the life or death criteria, or both, that is when exactly a property receives waqf status - by virtue of a donation (during life) or by virtue of a will (after death). According to Sharia law, the recognition or announcement of the owners of the donated property is equivalent to a formal act of donation [Nofal, 1886, p. 180]. In the latter case the Orenburg Muslim Spiritual Assembly would recognise donations as valid, and afterwards it would be recognised by the Ministry of Internal Affairs. A key role

⁷ By 1870, the Orenburg Religious Board of Muslims recorded four waqfs: 1) Gubaidulla Yunusof, a merchant of the top guild from Kazan of two stone workshops (1830); 2) Aitynkin, Tatar merchant of the top guild to the first grand mosque in the town of Tara of 30 thousand rubles of paper money notes (8,541 silver rubles) with a bank (1841); 3) funds for the Moscow grand mosque and income gained from the sale of a waqf house (159 roubles 90 kopeks) with the Moscow savings bank (1848); 4) Gabdelkhalik Ibraev, a merchant from Sterlitamatak, in favour of the First Grand mosque of Sterlitamak of 5 shops and 90 dessyatinas, 1480 sazhen of land (1848) with total annual of approximately 120 rubles [Russian State Historical Archive, f. 821, inv. 8, file 611, s. 34 reverse].

here was played by the act of donation, which was conclusive evidence that the spoken will of the deceased was authentic. Meanwhile, verbal testaments had no legal power in the eyes of judicial bodies [*Zakony' grazhdanskie*, 1857, article 1023].

Immovable property belonging to Christian and non-Christian churches and specific properties which were leased and did not bring income were not subject to real estate tax [*Ustav o pryamyx nalogax*, article 84].

According to Russian law, donations for religious needs were registered to mosques and (or) educational institutions. According to the Orenburg Muslim Spiritual Assembly, in 1889 there were 21 donated estates, 10 of which were located in the Ufa and Orenburg guberniyas [*V pamyat' stoletiya*, 1891, p. 28]. The involvement of the Orenburg Muslim Spiritual Assembly in terms of waqf supervision had always been dictated by necessity, that is in case of complaints against mutawallis on the part of parishioners or the heirs of a donor, in case of the mutawalli appointed a new official after the death of the donor or if there was unwillingness from heirs to fulfill the testament of the deceased. If the number of members of the religious community was less than the legal standard for a parish, then the donation, despite the will of the deceased, was handed over to the Orenburg Muslim Spiritual Assembly, which registered the parish and then transferred it for the intended purpose.

In the post-reform period, the government tended to curtail the activity of waqfs in guberniyas. That is why in 1894, draft regulations drawn up by the Orenburg Muslim Spiritual Assembly on the basis of the management system of Crimean waqfs, were not approved⁸. Never-

theless, in the early 20th century the Orenburg Muslim Spiritual Assembly controlled waqfs based on these unapproved rules, obliging trustees to provide copies of lease agreements every six months, 'the maximum period was set at three years' [Zagidullin, 2006a, pp. 82–87].

The waqf system was mainly based on the honesty and decency of mutawallis. The Spiritual Assembly acted as a fair and impartial judge during the settlement of disputes, and it gradually earned the respect of Muslim communities. Often donors empowered the religious institution to monitor mutawallis. It is no coincidence that at the turn of the 19–20th centuries in most cases of donation, the Orenburg Muslim Spiritual Assembly was called in as an arbitrator.

As rightly stated by D. Azamatov: 'Getting no proper support from the government, it tried to act independently and as a result not only received a decisive rebuff from the bureaucracy, but also caused resentment among major benefactors. The actions of the Orenburg Muslim Spiritual Assembly were evaluated as interference into the internal affairs of Muslim communities, and also as an attempt to lay hands on the property of religious and educational institutions. Despite such attacks, the state institution managed to sustain its line, aimed at introducing double control over expenditure of waqf funds' [Azamatov, 2000, p. 80].

Thus, the existing legislation in general allowed Muslims to independently resolve issues related to the construction and support of Islamic institutions.

However, class restrictions affected the implementation of the legitimate rights of the rural population. According to the 1865 'Regulation on Bashkirs', only the treasury and the rural population were allowed to sell and donate free lands not belonging to Bashkir landowners in the amount of 15 desyatinas [Azamatov, 2000, p. 21]. The inhabitants of former state villages became the owners of the allotments only after the abolition of redemp-

⁸ According to these rules, the Orenburg Religious Board of Muslims was to record them with the Ministry of the Interior, to supervise the accounting of mutawallis, up to prosecution and appointment of a new mutawalli, and, when agreed by the community, to be a trustee of waqf property: in the absence of mutawalli under the will, it could appoint the person recommended by mahalla; in case a last will and testament missed a point on mutawalli's fee, it could assign a fee from an income of waqf property. Waqf property approved by the Ministry of the Interior, by common consent of the parish clergy and mutawalli, was recorded in 'shnu-

rovye knigi' for further rent, whereas capital was to be loaned. Mytawalli was either to deposit waqf capital (funds) with a savings bank to gain interest, or to issue it as a loan. Income received was then to be invested in credit and banking institutions.

tion payments and arrears on them in the early 20th century. During the Stolypin agrarian reforms, plots of allotted lands in the ownership of separate householders were equated to outbuilding-patrimonial plots that could only be transferred to people, who were registered or were going to be registered in the rural communities. This was not the case with religious institutions [Russian State Historical Archive, f. 821, inv. 133, file 478, s. 38]. Along with the shortage of land and the reduction of prosperity of the rural population, these factors represented a serious obstacle for donating allotments by Muslims to the advantage of Islamic institutions. It turned out that only a purchased land could be handed over as waqf in the rural area. That is why waqfs in the village were symbolic (grain, clothes, peasant buildings, in rare cases—land) [Kobzev, 2007a, p. 49]. The situation in the city was different, waqfs con-

sisted of monetary capital, real estate (stalls, land plots, residential and non-residential buildings, etc.) [Azamatov, 2000].

In the region of the Orenburg Muslim Spiritual Assembly, income-producing waqfs were not widespread and did not play an important role in the upkeep of Islamic institutions. They were inexpensive due to the social and economic situation and the religious mentality of Tatars and Bashkirs. According to estimations by D. Azamatov by 1917 [Azamatov, 2000, p. 78], there were 91 institutions with waqf property, mosques and educational institutions had 49 houses with outbuildings, two large hotel complexes, 20 retail shops, 1382 desyatinas of land and more than 516. 6 thousand roubles of inviolable bank capital in the region of the Orenburg Muslim Spiritual Assembly. Waqfs, that had not been properly registered in state institutions, were not included into this list.

§ 3. Baptised Tatars Returned to Islam: the Particularities of Religious Life

Ilduz Zagidullin, Aleksandr Kobzev

The build-up of Islamic religious life among the baptised Tatars who had returned to Islam was influenced, among other things, by such factors as prosecution for performing Islamic rituals, control and missionary activity on behalf of the dominant clerical power. In the pre-reform period nominal Christians performed Islamic rituals secretly, outwardly following the Orthodox faith. Drastic changes in Islamic ritual performance occurred due to the mass return to Islam of baptised Tatars in 1860 and 1870s and the socio-demographic shifts among those 'lapsed' in the following decades, particularly resulting from the growing number of the Tatars not related to the church. Of a great significance was moral support from Muslims, who thought that the ancestors of the 'new' Muslims had left their natural faith 'under compulsion', and were impressing this view on baptised Tatars. They supported 'the lapsed' and didn't denounce them to judicial inquiries [Kobzev, 2007; Zagidullin, 1990, p. 66–78].

The most important factor in the build-up of this religious life was that newly baptised Tatars were cohabiting (several, or dozens of families) with Muslims. Usually, the 'Old-baptised' Tatars lived in separate settlements.

From the moment of public statement of their wish to return to Islam, 'the lapsed' severed all ties with the church, refused to pay ruga and church maintenance collection, went only by their Muslim names, refused to attend sermons and fought systematically against missionary schools by, among other things, protesting their opening [Iznoskov, Ed. 3, p. 48] and forbidding their children to attend lessons there.

The 'lapsed' sought to transform the bicultural balance of the settlements to their advantage, which should be marked as a special trait of the way they organised their religious and ritual life. Through various means, sometimes by compulsion, 'new Muslims' influenced the 'Old-baptised' Tatars, convincing them to return to Islam. Sometimes, households were divided

by conflict and split into two parts, a Christian and a Muslim one.

Since 1880s parish clergy had practically stopped meddling in the religious and ritual lives of the 'lapsed', who were living together with Muslims. But the authorities prevented their official incorporation into local mahallahs.

The appointed ('decree') mullahs and 'the lapsed'. The ban on missionary activity among Christians, imposed by the authorities on the mullahs, had a negative impact on the relationship between imams and their 'new' Muslim neighbours. Such contacts were visible during public prayers in the mosques. There existed a tacit agreement, according to which the 'lapsed' had to stand in the back rows of the congregation during prayer. In case of a police check it would provide the mullah with the excuse that he didn't know how they had entered the mosque. Till the late 1880s mullahs were very reluctant to let the 'lapsed' neighbours attend public prayer [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 5720, s. 20 reverse; f. 4, inv. 1, file 6578, s. 27 reverse; Russian State Historical Archive, f. 821, inv. 8, file 782, s. 16–19]. The situation started to change after a generation of 'new' Muslims grew up, one without relations to the church. Placing themselves in danger, local imams sometimes performed rituals in their houses. At the same time their civil status was not recorded in the parish registers [Russian State Historical Archive, f. 821, inv. 8, file 786, s. 56–57 reverse].

Contacts of 'the lapsed' with a mullah of a neighbouring settlement was quite common, providing secrecy to the rites performed [National Archives of the Republic of Tatarstan, f. 4, inv. 94, file 22, s. 77]. The services were not left unpaid, as the mullah was substantially rewarded for putting himself at risk of criminal prosecution.

In the 1890s, in their appeals addressed to the governorate administration and the central seats of power, the 'lapsed' asked to be joined to a local or neighbouring mahallah, which testified to considerable changes in their relationship with the local mullahs.

The public mullahs. Most imams were afraid to establish contacts with the 'lapsed',

which brought to life the office of public mullahs. This office was often taken by literate Tatars from other settlements, who temporarily lived away from home, or activists recruited from among the local 'lapsed'. Prayer meetings were often held in the house of the public mullah, or under his guidance, in some other cabin. As the basic tenets of Islam were learned by the 'lapsed', they themselves became public mullahs [National Archives of the Republic of Tatarstan, f. 4, inv. 94, file 22, s. 77].

The funds for public worship, teaching children and performing rituals were collected as it was usually done by the Muslim Tatars.

'Family mullahs'. In the first decades after public return to Islam the baptised Tatars didn't always have public mullahs. Taking care, lest they be prosecuted, they practiced the Islamic rites secretly, in family. There existed a tradition of transmitting religious lore by word of mouth, learning prayers by heart. The head of the family or kinsfolk, who knew the lore, usually performed rites of namegiving or funeral rituals [National Archives of the Republic of Tatarstan, f. 13, inv. 1, file 1043, s. 326]. Thus the 'lapsed' avoided compulsory baptism of infants and Christian funerals.

In the late 19th century as administrative control weakened, especially after 1894, when criminal prosecution for 'Muslim ways' of people reconverted to Islam was abolished, the need for 'family mullahs' ceased. Public mullahs were active in many settlements where they were able to perform all or some of the functions of the appointed mullahs. In settlements where the 'lapsed' and the Muslims lived side by side, these functions gradually fell into the hands of the appointed mullahs.

Performing the Islamic funeral rites. As the Islamic funeral could be prosecuted and the corpse forcefully reburied, the 'lapsed' had to bury their dead clandestinely. In 1880s in Vyatka guberniya, Malmyzh uyezd, the 'lapsed' buried their kinsfolk in the Orthodox cemeteries, but according to the Islamic rite, or with no rites at all, which could happen because they tried to keep it secret, didn't know the rite or couldn't invite a mullah or anyone who 'knew the order of Muslim funeral' [Russian State Historical Ar-

chive, f. 821, inv. 8, file 786, s. 45–47 reverse]. In an emergency, the 'lapsed' saw an Orthodox cemetery as a suitable place for an Islamic burial.

In villages where Muslims and the 'lapsed' lived together, there was a tacit agreement concerning burying the dead outside the cemetery. Sometimes, kinsfolk buried their dead in their lots, because they were immune from repartition and remained within a single household. Alternatively, the dead could be buried in the land not used as pasture or hayfield. New Islamic cemeteries appeared in the 'Old-baptised' settlements, while in localities where the Muslims and 'the lapsed' cohabited, the latter were buried in local Muslim cemeteries.

Marriage and divorce. The established marriage rite required the presence of a stranger to the kin. Among the Muslims, such person was usually the appointed mullah. At the same time, mullahs very seldom contracted nikah, as they feared losing their spiritual office. The married couple started their family life after a prayer held in the bride's house and attended by their parents. It could be solemnised with no rites at all, when the girl moved in with the bridegroom. Often, a prayer said by any member of the families involved, amounted to all of the wedding ceremony. Marriages were often contracted by the 'family mullahs' [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 228, s. 18–18 reverse] or the 'public mullahs'. Most marriages occurred between the baptised Tatars who had returned to Islam. Some of the 'lapsed' were also taken as wives by Muslims.

By a circular of 28 May 1892, the Orenburg Mohammedan Spiritual Assembly empowered mullahs to perform marriage according to passport records. It enabled mullahs to register marriage between 'lapsed' Muslims if their passports mentioned their respective faith [National Archives of the Republic of Tatarstan, f. 4, inv. 131, file 26, s. 5].

At the end of the 19th century Muslim rites of marriage and divorce were gradually adopted among the 'lapsed', and there were some particular cases of polygamy as well.

Diet and Fast. Diet is one of the main markers of Islam, with its requirements for the

preparation and consumption of food. This issue lay completely within the cognizance of families. Priests and missionaries reported that the 'lapsed' observed the Islamic fast, which also presupposed slaughter of livestock and fowl according to the Islamic rite, the Islamic prayer before and after the meal, etc.

Circumcision. The 'lapsed' usually tried to emulate the Muslims in every aspect, which was crucial for them. Circumcision was an indispensable 'attribute of a true Muslim' for the 'lapsed'. It was performed by the public mullahs or specialists invited from the Tatar villages [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 3068, s. 4–26 reverse].

The Hajj. Positioning themselves as Muslims, the 'lapsed' were willing to make the hajj. Pilgrimage, an indispensable duty for Muslims, was a costly enterprise for the denizens of the Volga-Ural Region. Only isolated cases are recorded of the 'lapsed' making the hajj.

Religious education. The children of the 'lapsed' helped to socialise their parents within the Muslim socio-cultural space. In order to teach reading and writing to their children of both sexes in clandestine home schools, the 'lapsed' invited literate Tatars of both sexes who knew prayers from neighbouring villages. In autumn and spring, living in the house of one of the local residents, they taught children the basics of Islam. Instruction often happened in the secret prayer-house. The teachers' living expenses and work were covered by the parents. Some teachers taught free of charge, considering teaching to be a charitable deed. Some of 'the lapsed' sent their children to maktabas or madrassas of neighbouring uyezds and governorates.

In settlements with both secret Muslim schools of 'the lapsed' and the officially established Orthodox missionary schools, there was 'rivalry' between their students and parents [Izvestiya, 1883, pp. 771–772].

Unlike in traditional mahallahs, in 'lapsed' families, Islamic religious books, prayers and rituals were studied by both children and their parents.

Mahallahs of 'lapsed' Tatars. In 'lapsed' rural communities which had no Muslims and

where most residents openly claimed a conversion to Islam, public mullahs and prayer-houses soon appeared. The architectural representation of such mahallah was a separate Quibla-oriented prayer-house⁹.

Religious meetings could also take place in the house of one of the local residents [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 9740, s. 1]. The resident who donated premises or a building for a public prayer-house, as a rule, became a muezzin who looked after the building, keeping it clean, heated and in good order. A person well versed in rituals became a mullah.

The most important attributes of the 'New Muslim' mahallahs were the office of public mullah, religious home-schools and the Islamic cemeteries. The public mullahs performed almost all rites for their fellow villagers. These included funerals [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 1278, s. 1–1 reverse], circumcision [National Archives of the Republic of Tatarstan, f. 4, inv. 4, file 6], and others. If there were two of them in the settlement, they shared the functions of an imam and a muezzin between them.

The first public mullahs as a rule lacked religious education, so lessons in maktabas was usually taught by literate Tatars invited from the neighbouring settlements. Usually, there were no special buildings for maktabas. This accounts for the simultaneous presence of sev-

eral home-schools in big communities of 'the lapsed', protecting the secrecy of their activity.

In the late 19th century as trained public mullahs became available, almost all responsibility of appointed mullahs gradually fell under their responsibility. The public mullah became one of the teachers of his parishioners' sons, or the only teacher. The prayer-house of the 'lapsed', besides imam, had a muezzin serving there.

From the 1860 to the 1880s Muslim villages saw the parallel functioning of two religious organisations: 1) a mahallah headed by an appointed mullah, which was the officially registered muslim parish, and 2) a 'religious community' or a 'confessional group' which united several families reconverted to Islam. In multi-religious settlements they functioned alongside with the Orthodox parish, but in the villages totally populated by 'lapsed' Muslims, there were the unofficial religious communities with the public mullahs, house-schools and a prayer-house.

In the 1890s settlements with mosques saw lasting contacts between the descendants of the 'lapsed' not related to the church in any way, with local mullahs and their integration into local mahallahs, though mullahs didn't register their civil status.

When the decree 'On the strengthening of religious tolerance' was promulgated on 17 of October 1905, most communities of 'the lapsed' were living Islamic lives little different from the religious lives of the mahallahs.

§ 4. The Orenburg Muslim Spiritual Assembly (Makhama-i Shargiya Ürünburgiya)

Nail' Garipov

In the Russian Empire, Islam formally obtained the status of official religion after the decree of 17 June 1773 'On tolerance of all religions and on prohibition of Archbishops to engage in matters relative to... the erection

of prayer-houses, according to their law, ceasing all power to the secular officers' [Complete Code of Laws of the Russian Empire–1, Vol. 19, No. 13996]. The basis for this decree was laid by the 'Instruction' forwarded by Catherine II on 30 June 1767, to the Commission of Laws (Ulozhennaya komissiya). The 'Instruction' formulated the ideological bases for the government policy [Complete Collection of Laws of the Russian Empire–1, Vol. 28, No. 12949]. Acknowledging Islam as one of the 'tolerated'

⁹ In late 19th century, prayer houses were open in the villages of Bolshiye Kibyak-Kozi, Yelyshevo, Azyak, Verkhneye Nikitkino, Pochinok, Shemordan of Kazan guberniya [Bagin, 1910, p. 12], Tatarskaya Buinka, Trekhbolyayev, Byurgany of Simbirsk guberniya [Kobzev, 2007a, pp. 231–233].

religions implied the necessity of a legal basis to regulate the relations of state and church in Russia.

An imperial edict of 28 January 1783 was the signpost of systematically reinforcing state control over the appointment of mullahs. 'On permitting subjects of Mohameddan law to elect their own akhuns' [Complete Collection of Laws of the Russian Empire-1, Vol. 21, No. 15653].

The imperial edict of 22 September 1788 establishing a special governmental body for Muslims, was aimed at creating a stratum of spiritual leaders subject to the Russian crown and loyal to the imperial regime. They were intended to counter the spread of anti-government Islamic ideology from the Ottoman Empire and the Khanates of Central Asia. In Russian this body was named the Spiritual Assembly, or the muftiate, in Tatar—the Sharia Office (Makhama-i Shargia). Legalising Muslim parish clergy and the establishment of a religious office testified to the integration of Islam into the imperial legal system. By establishing the Spiritual Assembly Russian government sought to create among the Muslim clergy the same administrative vertical which existed in the Orthodox Church.

The Orenburg mufti was appointed by the monarch as proposed by the Minister of Internal Affairs [Ustavy' duxovny'x, 1896, art. 1422]. Any judicial action against the Orenburg mufti was to be carried out by the Senate, which demonstrated his high status [Azamatov, 1996, p. 44].

The first step to systematise the proceedings of the religious office was a Senate edict of the 17 August 1793 'On the election of mullahs

Building of the former Orenburg Muslim Spiritual Assembly.
Ufa. Photo from the middle of the 20th century. Modern-day 50 Tukayev St.

to a Spiritual Assembly of Mohameddan law established in Ufa, within three years' [Complete Code of Laws of the Russian Empire-1, Vol. 23, No. 17146]. In accord with the regulations of governorate middle rank judiciary, the Senate announced the replacement of clerical members of the Spiritual Assembly with clerics gathered from the Kazan' guberniya every three years. Since 1890, qadis were appointed only as proposed by the mufti and were confirmed in office by the Minister of Internal Affairs.

The Spiritual Assembly was a collegiate body comprised of a mufti and three quadis (kaziy). Decisions were made by simple majority of the votes of its members. The decrees of the mufti did not have the power of judicial verdicts and were not enforced [Azamatov, 1996, p. 12].

The territory supervised by the Orenburg Muslim Spiritual Assembly was once and for all settled in Catherine of Russia's edict of 22 September 1788. The new body was to manage the Muslim clergy of all Russia, except Taurida guberniya. In 1868 the Kazakhs (except for the Bukey Horde) were excluded from the jurisdiction of the Orenburg Muslim Spiritual Assembly. Thus, the Orenburg Muslim Spiritual Assembly regulated vast territories, with the

exception of the Taurida guberniya and Western governorates, the Caucasus and Transcaucasia, Turkestan and the steppe provinces.

There were three other religious establishments for Muslims, besides the Orenburg Muslim Spiritual Assembly. In the late 18th century the Tavrichesky Muslim Spiritual Assembly was established, and in 1872 two other bodies of the Shiite and the Sunni clergy were created in Transcaucasia. The Black Sea guberniya, Dagestan, Batumi, Kars Oblast' and Zakatali and Suhumi Okrugs did not fall within their jurisdiction. The Kazakhs and the Muslims who resided in Kuban and Terek Oblast', and in Stavropol guberniya did not have any clerical oversight.

The proceedings of the Orenburg Muslim Spiritual Assembly were controlled by the Ministry of Internal Affairs and local governorate administration. Between 1817–and 1824 the Spiritual Assembly was part of a newly created Ministry of Spiritual Affairs and Public Education, which supervised all religions in the state. Then oversight was returned again to the Ministry of Internal Affairs.

The first Orenburg mufti Muhammad-zhan Khusainov (1788–1824) spent considerable effort to establish the Spiritual Assembly [Ishmukhametov, 1979, p. 32]. In 1787, on his initiative, the first printed Quran was published in Russia, which was an incentive toward the spread of printing among the Tatars. He was active in rebuilding dilapidated religious buildings and argued for broadening the agenda dealt with by the muftiate.

In order to expand the functions of the Orenburg Muslim Spiritual Assembly, the mufti tried to use his high position to the best advantage. It is obvious from his project aimed at reorganising the Islamic education, which envisaged Islamic schools under the auspices of Kazan University and in Orenburg, supervised by Governor General. Besides religion, the schools were to teach secular subjects, such as arithmetic, geography and others, as well as Persian, Arabic, Turkish and Tatar languages. M. Khusainov considered knowledge of Russian language mandatory for the clergy. The best alumni of the madrassa could enter Ka-

zan University. The mufti also insisted that the Muslim students had the same rights as Orthodox students [Vishlenkova, 1998, pp. 30–31].

Akhun Gabdessalam Gabdrakhimov of Orenburg (1824–1840) became M. Khusainov's successor. He carried on the cause of his predecessor, trying to strengthen the muftiate. However he was impeded by Nicolas I's policy [V pamyat' stoletiya, 1891, p. 45]. The most significant event during his office was the introduction of metric books in 1829. Mullahs, as well as the Orthodox priests, started registering acts of civil estates in their parishes. It was the first step toward a Muslim public census in the territory supervised by the Orenburg Muslim Spiritual Assembly.

In 1840 Gabdulvakhit Suleymanov (1840–1862) took the post of the Spiritual Assembly's chairman. According to S. Marjani, he translated many books on religion from Turkish and took an interest in medical science. The mufti penned the 'Regulations of Familiar and Marital Relations', published in 1841 [Sbornik czirkulyarov, 2004, pp. 15–18].

In 1857 the religious administration received its first charter. According to the charter of the Orenburg Muslim Spiritual Assembly (OMSA), it had the following matters under its jurisdiction: 1) clerical administration: conducting examinations in the knowledge of Islamic laws among people elected to clerical capacities by congregations; supervising the work of clergy through local akhuns, determining the degree of guilt and penalties for clergymen; matters concerning worship, ceremonies and mosque construction; 2) religious court: cases of marriage and divorce among Muslims, as well as cases concerning the relations of children and parents; 3) verifying registers with dates of birth, marriage and death of the worshipers and issuing corresponding certificates; 4) civil court (under Islamic law): disputable cases on wills and inheritances, as well as property claims during divorcements and disputes between parents and children [Ustav' duxovny'x, 1896, art. 1347, 1399].

Disputes falling into succession and family law were resolved by the Spiritual Assembly under the laws of Islam. In cases on dissent

Gabdulvahid Suleymanov

Salimgaray Tevkelev

Muhammedyar Sultanov

against parents and adultery, the religious institution contented itself with ‘admonitions and inflicting spiritual punishment and correction’. Criminal penalty was meted out by judicial bodies. Committing to trial and commencing proceedings didn’t belong to the list of OMSA functions either. The Spiritual Assembly could only inform the governorate administration about unlawful actions of clergymen and recommend the initiation of a criminal case.

In its activities the Spiritual Assembly followed a peculiar fusion of Sharia law and Russia’s general legislation. Under governmental pressure OMSA adopted rules banning religious officiants from applying provisions of Sharia which openly contradicted laws of the Russian Empire. These bans mostly applied to the system of Sharia-defined punishments for breaking rules of public morals and disorderly behavior.

Administrative work in the office of the Spiritual Assembly was conducted in Russian. A Russian literacy test for members of OMSA was introduced only in 1891. The sessions of OMSA proceeded in the Tatar language, and a Russian translation was recorded in the minute book.

Appeals on OMSA’s verdicts were handed to the governor, who, having requested the information needed from the Assembly, submitted them to central authorities for consideration.

The staff included a secretary, a translator, a registering clerk, heads of desks, etc. [V pamyat’ stoletiya, 1891, pp. 14–15]. Due to insufficient number of staff members, increase in the amount of work, low salary and constant financial straits, OMSA had ‘problems with conducting its administration’ [Azamatov, 1996, pp. 82–87].

In 1865 nobleman Salimgaray Tevkelev (1865–1885), retired staff captain of cavalry, was appointed mufti. His candidacy received mixed feedback from Islamic clergy with S. Marjani in particular giving a low assessment. However, rights being restricted, the mufti’s efforts couldn’t be more active. S. Tevkelev was the first mufti to actively perform charity work.

The decree of 2 January 1886 appointed nobleman Muhammedyar Sultanov (1886–1915)—justice of the peace, retired second lieutenant—mufti of OMSA. M. Sultanov had received a traditional Muslim education. He graduated from a gymnasium and entered Kazan University (but dropped out during the first year due to a illness) [V pamyat’ stoletiya, 1891, pp. 43–45]. He specialised in issues of religious ritual practice and theology. Editions of *Haftiyak* (which contains the most widespread and read passages from the Quran—*N. G.*) were found to have a great number of mistakes. Publishers’ negligence towards the holy Islamic books attracted a lot of criticism

from the believers. In 1889 Kazan editions of the Quran and Haftiyak were edited [Sbornik czirkulyarov, 1905, p. 112].

In the 1890s the Assembly showed an aspiration for developing enactments regulating the activity of Islamic institutions, specifically the status of clergy. There emerged a trend of interpreting certain dogmatic and confessional questions in Islam, those questions which used to present a problem for clerics. The Assembly began systematising the archive and cataloging documents. As a result of purposeful work, in 1903 and 1905 Tatar and Russian versions of 'Collection of circulars and other instructions of the Orenburg Muslim Spiritual Assembly' were published [Sbornik czirkulyarov, 1903; Sbornik czirkulyarov, 1905]. In the end of the 19th century, when baptised Tatars returning to Islam became a very urgent matter, mufti M. Sultanov had to compromise and prohibit turning pagans and Christians to Islam. However, despite constant pressure from the autocratic

Orthodox state, in 1894 the mufti prohibited Muslims from consuming 'Russian-cut meat' [Sbornik czirkulyarov, 1905, pp. 57–58, 103].

In the circulars published in the 19th and early 20th century, the Spiritual Assembly repeatedly advocated for overcoming the scholasticism and perfunctoriness in the system of Islamic education, welcomed adding secular subjects and Russian language into the curricula of elementary, secondary and higher Islamic educational institutions, worked over for the propagation of Jadid ideas among the local Muslim population, advocated renewing public life of mahallahs.

OMSA protected the interest of the Russian Ummah in broadening the sphere of Sharia's application in imperial sociocultural space and creating conditions to satisfy the religious needs of Russian Muslims. The Assembly's work on the whole promoted the significance of Islamic values among Tatars and Bashkirs, spiritual consolidation of Muslims.

§ 5. Application of Sharia rules in the everyday family life of Muslim Tatars

Ilshat Mukhametzaripov

It is well known that in everyday life Muslims follow Sharia—a set of rules based on the Quran and Sunnah. However, until the beginning of the last quarter of the 18th century the Russian government had not been paying attention to legal regulation of everyday family relations of non-Christian peoples of the empire. That is why we can suggest that family and inheritance relations among Muslim Tatars were based on the rules inherited from ancestors (that is, on common law).

Sharia retained such 'half-legal' status until the Manifesto of 17 March 1775 was published, lifting all previously established marriage restrictions for people 'of any kin and generation' [Complete Code of Laws of the Russian Empire–1, Vol. 20, No. 14275]. From now on 'every tribe and people... is permitted to enter marriage under the rules of their law' [Svod zakonov grazhdanskix, 1900, art. 90]. Capturing such 'referring' provision created a possibil-

ity of applying the set of Islamic marriage and family rules.

At the same time, the Russian government introduced some changes. Marriages and divorces of Muslims were subject to obligatory written registration. A marriage agreement between Muslims was considered valid only when composed by clergymen in accordance with Sharia rules in the presence of witnesses and included into registers [Resheniya Grazhdanskoho kassacionnogo departamenta, 1905, pp. 40, 41]. A marriage was considered lawful only when recorded in registers [Svod zakonov grazhdanskix, 1900]. Registers were a special document not only in family, but also in property relations of Muslims [Zakony' o brake i razvode, 1899, pp. 110, 111].

The age of marriage set by Islam underwent major changes in Russia. While Sharia allows marriage starting from 15 years old for men and 9 years old for women [Shariatny'e, 1910, p. 1],

in Russia since 1835 a Senate decree extended the age requirement for intended spouses on Muslims (18 years old for men and 16 years old for women) [Complete Code of Laws of the Russian Empire–2, Vol. 10, No. 7990]. Researchers note that the majority of Muslims obeyed the stated provisions. [N-ch, 1869, p. 22].

Under Sharia the presence of a cleric during the marriage isn't obligatory. The only necessary condition is the presence of witnesses—walis [Shariatny'e stat'i, 1910, p. 2], but paragraph 2 of OMSA Marriage Rules 1841 secured that only congregation imams could 'perform a marriage'. Although paragraph 1 of the Rules mentioned 'private character' of wedding, in reality, for example, in the case of B. Vaisov, who had married two wives on his own, OMSA deemed 'an unauthorised person performing cleric's duties being unallowable'. [National Archives of the Republic of Tatarstan, f. 2, inv. 3, file 413].

According to Sharia law, every Muslim entering into a marriage should apportion a certain part of his property ('Mahr') to the bride [Shariatny'e stat'i, 1910, pp. 7, 8]. Mahr, being wife's property, composes neither hereditary, nor bankruptcy estate [Bayazitov, 2005, p. 128]. Among Tatars the notion of mahr was often replaced with 'kalym' (bride price) [Valeev, 1993a, p. 160]. According to OMSA Marriage Rules, walis of the bride should not take belongings (property) as a kalym under the pretense of bride upbringing expenses. Among such things horses, food, and other goods were mentioned. During the wedding all Muslims, personally or through walis, should set the kalym and specify the amount of the first and the second halves of the kalym ('magajal' and 'moajal') in the register. Doing this, it was advised to act in accordance with one's position and funds, and for the bride it was forbidden to 'abandon married life' in order to receive the second half of the kalym [Sbornik czirkulyarov, 2004, p. 16]. The second half of the kalym was finally paid only in case of talaq divorce or death of the spouse.

Evading paying a part of the kalym after the marriage was rather wide-spread. In cases of non-payment OMSA ordered to enforce the

kalym, sending copies of decisions to courts and police, as property disputes resulting from a breach of kalym obligations were subject to the jurisdiction of civil courts, rather than spiritual assemblies. It was courts that 'applied coercive measures to debtors' [Solovyov, 1888, p. 33].

Another important element of marriage among Tatars is dowry, though it is not obligatory in a marriage under Sharia. Bride's dowry consisted of funds handed by the fiancé as kalym and funds raised by the parents of the bride [Naibolee vazhny'e, 1912, pp. 28, 29]. The close link between kalym and bride's dowry was pointed out by E. Solovyov: 'Among the Mohammedan Tatars of the Kazan governorate and all the regions they inhabit... a bride's dowry is mostly prepared for kalym. It serves to provide for the woman in case the husband illegally banishes her, and as a result she receives the whole naket into her possession' [Solovyov, 1888, p. 32]. A contemporary wrote that 'one can hardly find a case of strict division between husband's and wife's property, especially if they agree well'. As a rule, income from 'different farm products (dairy surplus, yarn) went into common property of husband and wife' [N-ch, 1869, p. 25].

An important condition of marriage under Sharia is its voluntariness [Van den Berg, 2005, p. 135, 137]. OMSA's Marriage Rules of 1841 specifically mention bride's consent being obligatory and marriage being made between sides even in social position and for a kalym proportionate to bride's fortune. In the case of a marriage made under duress or unfairly, the bride (or the widow) could demand declaring the marriage to be null and void [Sbornik czirkulyarov, 2004, p. 16]. Mufti A. Suleymanov's fatwa of 17 October 1851 confirmed the right of a bride to publicly express her consent or refusal during the wedding [Central Historical Archives of the Republic of Bashkortostan, f. I–295, inv. 2, file 40]. Researchers expressed different opinions upon the subject of marriage between Muslims being voluntary. For example, E. Solovyov noted: 'Among Mohammedan Tatars... maids are often married off to men they do not know at all and have never seen, as

A wedding feast. Drawing from the early 20th century.

long as pragmatic calculations of their parents show that the fiancés were a favourable party for their daughters. In such conditions there are many cases when a bride glares at her groom, but parents... pay no attention to it, which often results in unhappy marriages' [Solovyov, 1888, p. 24]. N. N-ch, on the contrary, believed that 'usually among Tatars there are no cases of parents forcing the young into marriage, but society sometimes resorts to this means if they have been found out to have had a love affair' [N-ch, 1869, p. 22]. We suppose that the stated points of view are partially true and reflect real facts. Patriarchal tradition, condemning non-obedience to parental will, gave rise to the possibility of marriage made against bride's will.

Notably, there were marriages through women moving to their bridegrooms house without their parents' knowledge. G. Akhmarov thought that the majority of marriages between Tatars in the beginning of the 20th century 'were performed this way' [Akhmarov, 1907, p. 9, 10].

Legislation provided for punishment in case of kidnapping single and married women, forcing marriage, including parental compulsion

[Ulozhenie o nakazaniyax (Penal Code), 1857, art. 1549, 1550, 1580, 1585]. However, one should distinguish between forced kidnapping of a bride and marriage by capture, where capture was a part of the marriage ceremony. Among Turkic peoples this custom existed before adopting Islam. These actions belonged to the features of local peoples' ceremonies, were performed by mutual consent and violated the principles of neither Sharia nor Russian legislation.

Sharia allows entering marriage without prior consent of the couple, but an obligatory consent expression by the bride and the groom should follow

['fuzuli' marriage] [Marginani, 2008, pp. 141, 143]. For example, Y. Koblov mentioned marriages between Tatars which were made 'in the absence of the groom' [Koblov, 1908a, p. 23]. If a marriage was contracted with no groom present, rules established by Sharia were applied. For example, in such cases the man who learnt about marriage being made was to tell that he agrees, otherwise the marriage was deemed null. If the man heard from someone that his marriage was contracted and said nothing on this subject, then the marriage was not declared legal [Efendiev, 1911, p. 31].

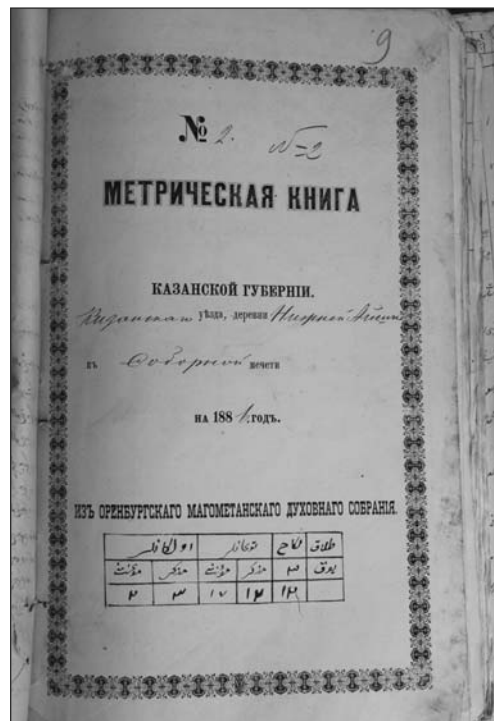

Adultery, prohibited by Sharia, belongs to the list of criminal offenses and is punishable by corporal punishment [Van den Berg, 2005, pp. 175, 176]. Although Russian criminal legislation contained such elements of crime as adultery, the authorities opposed applying Sharia punishments to Muslims. In 1832 The Senate, having examined the cases of clerical institutions applying corporal punishment, banned this practice. It decreed that after researching the circumstances of a case and taking into account clergy's opinion, Russian

courts meted out a punishment to the guilty depending on their estate—‘police detention with no work, detention in an asylum or a prison with labour from one up to four months’ [Complete Code of Laws of the Russian Empire–2, Vol. 7, No. 5500].

Sharia does not allow a marriage between individuals related to a certain degree [Kazembek, 1845, pp. lxx-lxxii]. G. Akhmarov wrote on the Tatars: ‘There are no cases when maids consensually marry a more or less close relative. There are no cases of kidnapping among one’s kin either. Such marriages are contracted exclusively by the will of the parents’ [Akhmarov, 1907, p. 14]. Upon discovering such marriages the OMSA declared them illegal [Central Historical Archives of the Republic of Bashkortostan, f. I–295, inv. 3, file 6281, s. 1, 2].

Sharia allows a man to have up to four wives [Efendiev, 1911, pp. 36, 37]. Article 90 of the Digest of Civil Laws, being a ‘referring’ one, allowed for the application of this provision. However, polygamy did not become widespread among Muslim Tatars. D. Meyer argued: ‘... In fact it is not so widespread as the religious law allows. In Kazan, for example, the Mohammedan society consists of several thousands, but only few Mohammedans have two or three wives, and mostly people live with one wife’. [Russkoe grazhdanskoe pravo, 1864, p. 686]. As a rule, polygamy was practiced ‘among the wealthy layers of society’ (the clergy, rich townfolk, retired military men, etc.) [National Archives of the Republic of Tatarstan, f. 12, inv. 19, file 8; f. 51, inv. 5, file 29].

Sharia does not attach a specific ceremonial character to marriage, reducing the marriage procedure to a civil law contract [Mashanov, 1876, p. 63]. That is why OMSA’s resolution of 30 September 1886 strictly prohibited playing music and dancing at weddings [Central Historical Archives of the Republic of Bashkortostan, f. I–295, inv. 8, file 554, s. 1]. As D. Azamatov notes, Islam and its institutions failed to completely replace traditional wedding ceremonies among Tatars, Bashkirs and Kazakhs [Azamatov, 1996, p. 135]. Despite that, the ban on alcohol consumption had a certain influence.

Cover of the Metric Book of an Islamic parish
in Nizhnaya Aysha village of Kazan uyezd
of Kazan guberniya. 1886.

G. Akhmarov wrote on Tatar weddings: ‘There are no ardent drinks; if the guests have a special leaning to them, then they are treated after the mufti and others leave, especially in the evening’ [Akhmarov, 1907, p. 21].

Divorces among Russian Muslims were performed in accordance with Sharia rules. Researchers estimate that Tatars mostly practiced khula (wife paying for divorce) and lian (mutual cursing) [Azamatov, 1996, pp. 135, 136]. When spouses wanted to divorce through khula in OMSA district, imams performed the divorce upon wife handing the redemption-fee and each party receiving its property. Note that both the divorcing parties and the witnesses signed an article on this divorce in the register. Then the divorcee was handed a copy of the ‘divorce article’ (paragraph 11 of OMSA Marriage Rules). Divorces through talaq (through uttering the divorce words three times), despite ‘material disadvantage’ for the husband, still happened. [National Archives of the Republic of Tatarstan, f. 51, inv. 5, file 347, s. 22].

There were reports of abuse by local clergymen when performing divorces. As a result of 'profitability of a divorce' through khula, husbands tried to alter the document in a corresponding way with the help of the clergymen registering the divorce.

Sharia sets no restriction for the number of remarriages. Remarriages were a habitual event in the life of Tatar families too [National Archive of the Republic of Tatarstan, f. 51, inv. 5, file 347, s. 22; Central Historical Archives of the Republic of Bashkortostan, f. I-295, inv. 3, file 451, s. 1-1 reverse].

Russian legislation had provisions regulating the relations between spouses and applying to all denominations. A husband was obliged to love his wife, live in concord with her, earn her keep and maintenance [Svod zakonov grazhdanskix, 1900, art. 106]. The wife was obliged to obey her husband, love and respect him [Svod zakonov grazhdanskix, 1900, art. 107, 108]. The relationship inside a Muslim family were not regulated specifically. However, on the whole the provisions were in line with Sharia. Under Sharia man is the head of the family [Bayazitov, 1990, pp. 10, 11]. The scholars quote the following evidence regarding the Tatars of Kazan guberniya: 'The family is always headed by the father, who possesses unlimited power. He has the right to manage and dispense all property, which he does as he pleases, he also receives everything other family members earn, watches over their behaviour and morality and can judge and punish those who stray. After the father's death, the leadership according to the existing tradition, goes to the eldest in the clan, that is to the brother of the deceased, or to his son, and lacking those, to the mother...' [N-ch, 1869, p. 26]. The wife and children must obey their husband and father. If the wife is disobedient (nashizat), the husband must 'first admonish her', and if it doesn't help, 'he is entitled to lock her up, deprive her of his caresses and care, and if needed, beat her without causing wounds or crippling' [Van den Berg, 2005, p. 141]. The latter Sharia norm was not only absent from the Russian laws, but, on the contrary, a husband who crippled, wounded, heavily beat or otherwise tortured his wife, was liable to criminal

punishment [Ulozhenie o nakazaniyax, 1857, art. 1477-1496]. The wife, who did the same to her husband, was liable to the same punishment [Ulozhenie o nakazaniyax, 1857, art. 1583].

Due to the reason that Sharia norms in many cases were not supported by the threat of state compulsion and punishment, there occurred cases of disobedience of wives and children to the heads of families.

The norms of bringing up children in the Tartar families were in line with Islamic morals as formulated by the Sharia law [Zagidullin, 1966a, p. 16]. The Orenburg Muslim Spiritual Assembly in their admonitions to the Muslims pointed out the necessity for the parents and caretakers to follow Sharia law in bringing children up [Sbornik czirkulyarov, 2004, p. 100]. G. Badamshin, author of the brochure 'Muslim Faith, or An Answer to Those Who Attack Muslim Religion', acknowledged the necessity for parents to make their children familiar with the issues of faith from the age of 7 - to 8. [National Archives of the Republic of Tatarstan, f. 199, inv. 1, file 773, s. 205]. G. Bayazitov thought the principal duty of a father was to teach his children the tenets of religion, providing them with spiritual and ethical education [Bayazitov, 2005, p. 134]. Sometimes, an imam's reluctance to teach the younger generation Sharia norms became a subject of internal inquiry [Central Historical Archives of the Republic of Bashkortostan, f. I-295, inv. 3, file 910, s. 1, 12, 49].

The clergy tried to settle family quarrels which often sprung from 'marital discord' in a peaceful way, aiming at keeping the family together. When the Orenburg Muslim Spiritual Assembly received such queries, it sanctioned ordered proceedings between the parties by the mediators, selected by the parties themselves, trying to 'settle the matter peacefully through admonishments'. If the peaceful outcome was impossible, 'it was prescribed to make the decision according to Sharia law', declare it against receipt to the litigants through the local police department of the uyezd, with the right of appeal to the Orenburg Muslim Spiritual Assembly [Central Historical Archives of the Republic of Bashkortostan, f. I-295, inv. 3, file 6536, s. 1-2 reverse]

At the birth of a child the parish clergy registered the newborn. On this day the Tatars of Kazan guberniya invited a mullah, placed the infant with his/her face towards Mecca and the mullah conferred on the baby's name with the parents, recited the prayer and wrote the baby's name down in a log book. A few days passed between the baby's birth and the name-giving (to let the mother recover after labour), though Sharia law commands to give a name right after birth. In celebration of a baby's birth in some places rams were sacrificed (two for a boy, one for a girl). Circumcision was indispensable for boys [Koblov, 1908a, pp. 5–7, 8, 9].

Sharia norms were employed to settle matters of guardianship among the Muslims. However, their implementation was limited and varied across different regions. For example, the Tatar Orphans' Court functioned in Kazan, initially supervised by the Tatar city hall, which determined cases of guardianship among the Muslim Tatars. Though orphans' courts were unable to implement Sharia law on their own, they nevertheless played an important role. If there were persons or property in need of guardianship, the orphans' court not only establish guardianship, it could also inventory the property [National Archives of the Republic of Tatarstan, f. 12, inv. 160, file 21, s. 1, 2].

Inheritance was regulated by Sharia norms among the Muslim Tatars. The law of 4 December 1802 enabled the Muslims to follow Sharia inheritance rules [Complete Code of Laws of the Russian Empire–I, Vol. 27, No. 21634].

Initially the legal documents didn't mention the shares other persons might have in the inheritance (such as children, brothers and others) of Muslims. It was only in 1826 that the law allowed 'division of the property left after the Mohammedans according to their law' [Complete Code of Laws of the Russian Empire–2, Vol. 1, No. 386].

The division of inheritance according to Sharia law was administered by 1) the clergy, which functioned as referee and made the preliminary division; 2) civil courts which made the final ruling. It is noteworthy that civil courts tried to follow the Sharia rules regarding the

proportion of the shares and the order of succession [National Archives of the Republic of Tatarstan, f. 51, inv. 5, file 1033, s. 21–22].

The inheritance taxes paid by the heirs were rated 'in proportion to their Sharia shares' [National Archives of the Republic of Tatarstan, f. 51, inv. 5, file 2875, s. 3–3 reverse].

Sharia law prohibits non-Muslims inheriting from Muslims, and vice versa [Mukhin, 1898, pp. 31, 32]. Inheritance from Muslims was allowed by the imperial law for the newly baptised only in Tavrichesky guberniya [Zakony' grazhdanskie, 1900, art. 1340].

In cases of dissent in the division of inheritance, Muslims often referred their pleas to the courts, defending their right to the share determined by Sharia law.

Among the Muslim Tatars, the will of the testators to disinherit their heir(s) in some cases had precedence over Sharia norms [National Archives of the Republic of Tatarstan, f. 12, inv. 17, file 65, s. 13]. Meanwhile, Sharia law allows disinheritance in three cases: 1. in case of murder of the testator by the inheritor; 2. apostasy from Islam; 3. curse imposed by the husband on a wife (lian) [Mukhin, 1898, p. 35].

Spiritual wills were quite widespread among the Tatars. The wills often contained a detailed list of actions which were to be done after the testator's death.

Thus, family life of the Muslim Tatars was mostly regulated by Sharia norms. The norms that regulated family relations and inheritance were widely implemented, while the cases were decided not only by the Muslim community and the clergy, but also by the state establishments, such as civil courts. Despite the initial negligence of the problem and a semi-legal status of Sharia law in the state, legislators who consequently faced the problem of co-habitation of Christians and the Muslims in one state, chose to combine norms of Russian law and certain norms of Sharia law. The recognition, though limited, of the norms of Sharia law in the Russian Empire met the interests of both the state, as it served to allay displeasure in the Islamic regions, and among Muslims themselves, who strove to preserve their familiar ways of life.

CHAPTER 4

Religious Beliefs and the Orthodox Institutions Among the Baptised Tatars and the Nagaibaks

Radik Iskhakov

Religious Beliefs. The religious beliefs of the baptised Tatars (Tatar-Kryashens) formed over a long period of time, influenced by complex ethnic, social, cultural and religious processes and contacts across religious and ethnic borders. They were also influenced by the transformed religion and myths of the pre-Islamic Turkic and Tatar tradition.

By the early 19th century the religious system of the 'Old-baptised' Tatars (the Starokryashens)¹⁰ was syncretic, including ancient religious traditions ('paganism'), as well as the closely intertwined Christian and Islamic elements. The changing beliefs of most baptised Tatars were dominated, up to the 1860s, by traditional ethnic religious convictions. They stemmed from ancient agricultural religions of the Turkic and the Finno-Ugric peoples of the Middle Volga Region. They included worship of the common Turkic demiurge— *Tengri*, (Tengri, Tengere), who embodied the universal cosmic principle.

An important role in preserving ancient religious tenets of this ethnic group was played by the traditional Tatar jien system which supported their rural community. It provided a model of a stable closed cultural and religious auton-

omy, virtually immune to cultural incursions from outside [Makarov, 2001, p. 28]. This very conservative structure emerged as a 'protective reaction' aimed at the preservation of their ethnic and cultural identity.

The key part in the traditional religion of the 'Old-baptised' Tatars was taken by the worship of Tengere, linked to the cycle of agricultural works. The 'Old-baptised' Tatars were wholly dependent on the gifts of nature, being mostly peasants, and their religious life centered on public prayers and sacrifices (korman, chuk), aimed at pacifying the powers of nature and its Supreme Deity. Such rituals were performed several times a year. The most important were public prayers in spring, before the sowing started, in mid-summer, intended to prevent crops from disaster, and in autumn, after reaping harvest [Lyapidovsky, 1848, pp. 17–18; Maksimov, 1876, p. 6; Zhertvopri-nosheniya, 1895; Obryady', 1930, pp. 81–84]. A sacrificial animal was prepared for slaughter in advance. Depending on the wealth of the community it could be an ox, a cow, a sheep, a ram or a domestic fowl. A sacrificial animal had to be without physical defects, and had to be born or hatched in the same year when the sacrifice was to take place. Public prayers were performed in special places. Depending on the location of the settlement, it could be a bank of a river or a rivulet, a hill, a mount, edge of the wood, a grove or an isolated tree, considered sacred and given sacral meaning¹¹. The rituals were administered by people, appointed by the community. Sometimes this honorary office went from father to son. After

¹⁰ In order to classify groups of Tatars whose ancestors were baptised in the late 16th to the early 17th centuries, alongside kryashens (a term they use for themselves) we will employ 'old baptised Tatars'. This is the expression adopted in ethnographic literature and, for purposes of retrospective analysis of history and ethnography, we find it the most adequate for this confessional grouping. The term makes a clear distinction between the 'old baptised' and a local group of baptised Tatars that formed during forced assimilation of 18th century, so called 'newly baptised' Tatars, who were significantly different in their religiousness and traditional culture.

¹¹ Common prayer on rain (chuk) always took place near some water pond.

the slaughter, meat of the animal was boiled in cauldrons, and then distributed among the people present, with boiled cereals, gathered by women. After the sacrificial feast, prayers were said, asking Tengere for prosperity and bounteous crops [Zhertvopri-nosheniya, 1895; Obryady', 1930, pp. 81–84]. Especially archaic were prayers (chuk) of the 'Old-baptised' Tatars in Mamadysh uyezd of the Kazan' guberniya, bearing remarkable traits of ancient Turkic religious ritual [Davletshin, 2004,

p. 37]. For instance, people of the village Bolshiye Arnyashi went for public prayers to a venerated ancient oak-tree, which symbolised the 'world tree' ('tare'), connecting people with Tengere [Tradicionnoe, 1988, pp. 22–23]. During the slaughter a long band of oak bark was sprinkled with blood, with incised tamgas (marks, stamps) of the families taking part in the sacrifice. This band was then attached to the sacred oak and three elders performed special rituals and said special prayers. After sacrificial meal, a part of meat and cereals was thrown into a sacred brook which flowed nearby, as an offering to the Water Lord [Znamensky, 1868, pp. 361–363].

According to the belief of the 'Old-baptised' Tatars, the world was inhabited by spirits. Ambivalent in nature, they could be harmful or beneficent depending on humans' treatment of them. Thus it was necessary to appease the spirits and give them offerings. The most significant of those were the lords of places: Zhir iyase (Ground Lord), Urman iyase (Lord of the Woods), Su iyase, Su anasy (Lord and Lady of the Water), Üi iyase (Lord of the house), Abzar iyase (Lord of the barn). Lower in the hierarchy stood spirits of places and elements: shurale (spirit of the wood), ubir (the evil one), albasty (a super-being), peri (an evil spirit) and

'Kurman uryny' (place of sacrifices). Kryash-Serda village, Pestrechinsky district, Republic of Tatarstan. Photo, 2010

others [Maksimov, 1876, pp. 3–21]; Koblov, 1910; Matveev 1910, pp. 20–22; Rites, 1930, p. 81]. The pantheon of these spirits, with slight variations, was present in all groups of the 'Old-baptised' Tatars, even among the baptised Tatar Cossaks, the Nagaibaks. Despite their lasting sojourn as Cossaks in the vast steppes of the Ural region and the Lower Volga, the Nagaibaks kept, up to the early 20th century, the belief in woodland and water spirits (su anasy, shurale) practically identical to that of the trans-Kazan Tatars, well-known though the poetry of Gabdulla Tukay [Maksimov, 1876; Vitevsky, 1891, pp. 257–280; Katanov, 1900, pp. 11–12; Bekteeva, 1902, pp. 176–177; Emkeev, 1902, pp. 343–344]. Unlike the Muslim Tatars, whose spirit belief, under the influence of Islam, lost its initial religious meaning and remained only in legends and mythology, the 'Old-baptised' Tatars retained it as an important part of religious practice and world-view. The belief in spirits formed their real life and had an impact on their ethical conduct and behaviour. According to the tradition, spirits were honoured with offerings (coins, foodstuffs) and bloody sacrifices (livestock and cattle).

A separate category of spirits were the kiremets (кирәмәт). Belief in kiremets, that is,

disembodied evil or neutral spirits, was common for all non-Russians of the Middle Volga region, except the Muslim Tatars. Kiremet worship among native peoples of the region is rather well-studied, but there is still no consensus regarding its origins or the meaning of the word 'kiremet' [Apakov, 1876; Magnitsky, pp. 132–138; Malov, 1882, pp. 3–7; Marr, 1935, pp. 29–30; Matorin, 1929, pp. 44–45; Romanov, 1856, pp. 1–2; Denisov, 1959, pp. 66–67; Akhmetyanov, 1981, pp. 31–32; Vladykin, 1990, pp. 86–88; Kaliev, 2003, pp. 154–156; Salmin, 2007, pp. 404–418, and others]. I think that the most plausible theory is the one by N. Zolotnitsky [Zolotnitsky, 1875, pp. 34–35], later supported by the famous Turkologist N. Ashmarin [Ashmarin, 1923, p. 270]. According to this theory, the word 'kiremet' derives from the Arabic كرامت 'spiritual bounty', and the kiremet worship stems from the Muslim worship of saints, transformed by traditional local religion. This theory is corroborated by ethnographic data of kiremet worship among the 'Old-baptised' Tatars. Other non-Russian peoples of the Middle Volga region adopted kiremet worship from without, which is reflected in some Chuvash and Mari legends where kiremet figures as a 'little Tatar' in 'tyubiteyka'—a traditional Tatars scullcap, or an old gray-haired Tatar sitting in a horse-cart or mounted on a horse.¹²

¹² The Cheremis, an ethnography essay by I. Smirnov, hangs a noteworthy tale on how keremets appeared with the Maris. The Cheremis got the Keremet from the Tatars. Being a human, he lived among them, wore Tatar clothes and did no evil. And suddenly, he began to play dirty tricks on the Tatars. Angry Tatars made up their mind to kill him. Keremet ran away, the Tatars pursued him and would certainly have killed him. When, all of a sudden, Keremet noticed a Cheremis busy with digging a hole for a fence post, who allowed the Keremet to hide in it. The Tatars ran past. The Cheremis took the Keremet out, brought to his place and gave him Cheremis clothes. The thankful Keremet told Cheremis: 'Since now on, I will be yours, not Tatars; so, when anything will go bad with you, like cattle or human disease, I will be here to help, just pray to me' [Smirnov, 1889, p. 167]. The archaic legend fixes the fighting between monotheistic tradition and 'pagan' beliefs, Islam assimilating traditional and syncretistic views of Tatars, their repression of the 'pagan' world of local ethnic groups.

Unlike them, the 'Old-baptised' Tatars perceived this tradition as an old native legacy of their Tatar ancestors [Apakov, 1876, p. 11].

Generally, kiremet worship of the 'Old-baptised' Tatars had many parallels with similar worship among other non-Russian peoples, which is indicative of close ethno-cultural contacts in the Middle Volga region in the past. Among the 'Old-baptised' Tatars kiremet worship had a complex, multi-component structure, which comprised ancestor worship, worship of the Islamic saints, worship of lords of places and natural forces. The word 'kiremet' could denote both kiremet spirits as such, or special places they inhabit, and sacrificial offerings to them [O kiremetryax, 1876, p. 57]. Communities, clans or families could have their own kiremet spirits. To have 'one's own' spirit was a prerequisite for a 'rightful' social status. When a separate family formed, it was endowed with its own kiremet. Each kiremet every year was offered livestock, fowl, coins and cloth rags [Apakov, 1876, pp. 11–13; Sofiysky, 1891, pp. 1–3].

Besides kiremet worship, worship of the Islamic saints and Islamic holy places was spread among the 'Old-baptised' Tatars [Ilminsky, 1848, p. 9 reverse; Timofeev, 1887, pp. 143–146; Iznoskov, 1893a, pp. 35–36; Sofiysky, 1891, pp. 7–8; Chicherina, 1906, p. 107; Filippov, 1915a, pp. 1038–39]. These forms of worship were rather widespread, covering the historical region of Volga Bulgaria and the Kazan Khanate. The baptised Tatars, as well as the Muslim Tatars, and sometimes both together, made pilgrimages to the ruins of Bulgar, to the old Tatar cemeteries and towns, where the Muslim saints were buried (ishans, halfas, shahids and others). When worshipping the holy places, the 'Old-baptised' Tatars recurred to the services of the Muslim clergy and performed sacrifices according to the Muslim rite, though with somewhat different meaning.

Part of belief and practice of the baptised Tatars and Nagaibaks, besides traditional ethnic and Islamic elements, were the Orthodox Christian traditions, adopted during the long period of Christianisation. It can be said that

Christianity among the 'Old-baptised' Tatars in this period was mostly present by elements of its symbolism. It resulted both from poor missionary activity of the Russian Orthodox Church, whose clergy was not trained for it, and the reluctance of the 'Old-baptised' Tatars themselves to change a time-honoured religious system. Despite their long presence in the Orthodox church, the 'Old-baptised' Tatars mostly adopted festive rituals from the Christian culture. The Orthodox clergy, preoccupied with physical performance of church rituals, paid little attention to their flock's mind and soul [Ilminsky, 1848, pp. 1–19; 1849a, pp. 1–16 reverse; Nurminsky, 1863, pp. 250–254; Timofeev, 1887, pp. 9–23]. The 'Old-baptised' Tatars, therefore, adopted only external forms of Orthodox Christianity. They performed the main Christian rituals—baptism, wedding and funeral—as indispensable attributes of belonging to the Orthodox confession and Orthodox civil status, and attended churches on religious festivals, giving little religious weight to such activities. The 'Old-baptised' were practically ignorant of Christian dogmas, which were seen by them through their traditional world-view, creating a picture of Orthodox Christianity which had little in common with the mainstream Christian tradition. Symptomatic in this respect is the way the 'Old-baptised' Tatars venerated the Orthodox icons ('tare'). Included into their worship as another rank of venerated deities, Orthodox saints, according to their 'pagan' tradition, were endowed with particular qualities. The 'Old-baptised' Tatars brought their family icons to public prayers and sacrifices to the kiremets. These icons were prominent in the traditional religious rites [Ilminsky, 1856, p. 18; Sofiysky, 1891, pp. 8–9; Zhertvoprinosheniya, 1895]. The weak presence of Christian tradition in the minds of the 'Old-baptised' Tatars is attested by the fact that before the 1860s their language lacked words denoting the main Orthodox dogmas,¹³

particularly, the Trinity (there was, however, the name for the feast of 'Trinity Sunday' 'semit', from the Russian folk name of this feast, 'semik', 'the seventh [Sunday after Easter]') [Ilminsky, 1856, p. 17 reverse]. However Christianity, as 'incorporated' into a syncretic religion of the 'Old-baptised' Tatars, was perceived as an important part of religious identity, unlike the 'newly-baptised' Tatars. Its rites and mysteries, as a legacy of their ancestors, were deeply rooted in their cultural life.

Such religiosity of the 'Old-baptised' Tatars, which had existed for centuries, started to change in 1830s to the 1860s. 19th century. The main causes of these structural shifts in religion were the gradual dissolution of a closed organisation of rural community under the influence of new socio-economic relations in the countryside, greater labour mobility (due to seasonal work) and the crisis of 'pagan' ideology. Depending on external conditions, in mixed ethno-religious populations there appeared groups which abandoned the traditional folk ways and sided with either Orthodox Christianity or Islam. Thus, owing to missionary activity of Orthodox and Islamic clergy, some 'Old-baptised' Tatars living in parish centers and mixed Russian-Tatar villages adopted the Christian religious practice, while villages engaged in tailoring, in Mamadysh, Laishevo, Kazan uyezds of Kazan guberniya and in the west of Menzelinsk uezd of Ufa guberniya, gravitated towards Islam.

New groups appeared among the baptised Tatars: those who chose to follow Orthodox Christianity ('Kara Kereshen', 'black baptised [Tatars]', 'Urusymak', 'Russian-like') or Islam ('Ak Kereshen', 'white baptised [Tatars]', 'Tatarsymak', 'Tatar-like'). The very process of religious differentiation, though it only occurred among the 'Old-baptised' Tatars in contact zones, represents deep transformations that were already underway in their pa-

among the 'old baptised'. E. g. *çirkeu* was a term for a Christian church, crosses and icons were known as *täre*, Orthodox liturgy, *çukinmak*, confession, *Gönah aitu*, Holy Communion, *daru oçu*, the Christmas holiday, *Oli*, *bök kön*, etc. [Ilminsky, 1856, p. 18].

¹³ On the contrary, words for external attributes, symbol and feasts of Christianity got a wide spread

Congregation leaving a church in the village of Yantsevary, Laishevo uyezd, Kazan guberniya. 1904.

triarchal society. A more visible and essential result of these transformations was the emergence of new cultural and religious implications in the collective consciousness of the 'Old-baptised' Tatars. Their 'pagan' belief and practices were gradually being replaced by monotheism of the world religions. The most remarkable metamorphoses were due to Islamic influence. It significantly transformed the religious practice of a part of the 'Old-baptised' Tatars in Mamadysh, Kazan uyezds of Kazan guberniya and in the Menzelinsk uyezd of the Ufa guberniya. The traditional name of the Supreme Deity, *Tengri*, was replaced by the Islamic *Allah* and public worship became qibla-oriented, while before the worshippers faced east. The performers of rituals adopted certain Islamic habits, wearing turbans during prayers and saying Islamic prayers before slaughtering the sacrificial animal [Mashanov, 1875, pp. 9–20; Zhertvopri-nosheniya, 1895]. A strong Islamic influence is also reflected in the mythology of the 'Old-baptised' Tatars, their festive and funeral rites and in their everyday life [Mashanov, 1875; Timofeev, 1887, pp. 21–23; Balyshev, 1879, pp. 1–2; Preobrazhensky, pp. 146–153; Ilm-insky, 1880, pp. 1–2; Odigitriyevsky, 1895, pp. 12–13].

The crisis in the 'pagan' worldview vividly depicted in the memoirs of a baptised Tatar educator and Orthodox missionary V. Timofeev (1836–1893) [Timofeev, 1887, pp. 242–256], led to erosion of the traditional religion of the 'Old-baptised' Tatars and made them choose their further paths of religious and cultural development¹⁴. The dissatisfaction with the old religion urged the 'Old-baptised' Tatars to engage in spiritual search and learn more about the religious traditions present in the region. Most of the 'Old-baptised' Tatars who lived in contact zones were faced with the alternative of converting either to Christianity or Islam. This choice was complicated by the fact that for the Tatars religion was closely linked to ethnicity. Despite long isolation and religious differences, the 'Old-baptised' Tatars retained cultural ties with the Muslim Tatar majority, being conscious of their Tatar identity and

¹⁴ Processes differed from region to region and were typical, first of all, for mixed ethno-confessional areas, where inter-confessional and intercultural contacts were strengthening. Up to the early 20th century in some villages (Laishevo, Chistopol, the Zivl'sk uyezds of Kazan guberniya, the Yelabuga Uyezd of Vyatka guberniya) with a traditional way of life, there were groups of old times zealots who had traditional religious views—taza, çï, çin kerâshen (pure, raw, real kryashen)

their common legacy of traditional culture, history and language. At the same time, integration into mainstream Tatar ethnic and cultural sphere was possible for the 'Old-baptised' Tatars only if they converted to Islam, which was the most important attribute of the Muslim Tatar identity. The choice of Christianity meant a conscious refusal to integrate.

Profound shifts in the religious world-view of baptised Tatars and Nagaibaks and their openness to cultural influences contributed to the enforcement of missionary activity. The influence of Islam on the traditional religion of the baptised Tatars, new groups of 'secret' Muslims and mass 'relapse' into Islam of 'newly-baptised' Tatars, demanded a more systematic, active and efficient missionary and educational effort on the part of church authorities. N. Il'minsky (1822–1891), the famous Turkologist and missionary, was the main ideologist and leader of the new missionary politics [Il'minsky, 1849; 1858; 1859].

He proposed the idea of an 'ethnisation' of Orthodox Christianity and its harmonious adjustment to the culture and world-view of the natives, without radical breakdown of their ethno-cultural environment. Il'minsky formulated the program of 'spiritual Russification of the natives', which implied creating liturgy in national languages and appointing clergy of national origin. National education in the spirit of religion was supposed to become the main channel of Christianisation.

Il'minsky correctly judged, that the situation in the religious life of the 'Old-baptised' Tatars was susceptible to change, as the Tatars themselves aspired to cultural development. In the early 1860s Il'minsky started energetically to put his ideas to practice. With the help of the first Orthodox zealots among the baptised Tatars and financial aid of public missionary groups, the Ministry of National Education and the Synod, he managed to create, in relatively short time, a robust missionary infrastructure. Besides a wide network of missionary schools, it included 'native' schools, sponsored by zemstvos and the Ministry, as well as parish institutions with clergy recruited from native peoples of the Volga and Ural Regions. In order to educate and convert the 'Old-baptised' Tatars N. Il'minsky and V. Timofeev devised a Tatar alphabet based on Cyrillic script. Translation of the Orthodox liturgy into the spoken Tatar language was initiated.

The most important for the Christian education of the baptised Tatars was the emergence of the Orthodox liturgy in Tatar language. The Tatar liturgy was first performed in Kazan Central Christian Tatar School by a missionary from Altai, heiromonk Macarius (Nevsky). Another important instance was the ordination of V. Timofeev as a priest in 1869 [Kazanskaya czentral'naya kreshheno-tatarskaya shkola, 1887, pp. 265–267]. The liturgy in Tatar was later introduced everywhere, and

Table 44

Data regarding baptised Tatar priests in the eparchies of East Russia, for 1904

Kazan	27
Ufa	37
Orenburg	10
Samara	5
Vyatka	5
Perm	1
Tobolsk	1
Semipalatinsk region	2
Total:	88

priestly positions were gradually occupied by Tatars in the 'Old-baptised' Tatar parishes. In 1891 there were 137 villages in Kazan, Orenburg, Ufa, Vyatka and Simbirsk bishoprics where church office was conducted in Tatar, with 53 ordained 'Old-baptised' Tatars. In the early 20th century the 'Old-baptised' Tatar priests were so numerous that they were appointed to the Russian and ethnically mixed parishes and missionary stations of the Kazakh steppe and West Siberia.

A special role in the development of missionary activity among the 'Old-baptised' Tatars was played by missionary schools. N. Il'minsky thought that educating the children of the 'Old-baptised' Tatars in the spirit of Christianity would help to root the elder generation in the Orthodox faith. So, missionary schools had to take on some functions of a family, as the 'Old-baptised' family did not provide a Christian education. Il'minsky's system of education juxtaposed Christian school education to the traditional family education. One of the family members, who was educated as a Christian, became a 'home preacher' for his family [Taymasov, 2004, p. 261]. A good psychologist and an able educator, N. Il'minsky realised that, unlike grown-ups, the younger generation whose religious world-view was not yet full-fledged, was ripe for missionary indoctrination and would imbibe any new ideas suggested by missionary teachers. Conscious of the fact that religion for baptised Tatars, living in a patriarchal, non-secular society, is the basis of their whole world-view, Il'minsky relied not so much on teaching, as on inculcating in the students a religious outlook based on Orthodox Christianity. Thus, there grew up a generation of baptised Tatars, taught at missionary schools, where they were torn away from the religious tradition of their elders and immune to the cultural and religious influence of Muslim Tatars.

Due to these innovations and their systematic implementation, the religious life of most 'Old-baptised' Tatars saw radical shifts, which comprised a turn from paganism and Islam to Orthodox Christianity. The young

generation, educated in the tenets of Christianity, the growing spiritual intelligentsia, became the main supporters of the church. It was through them that Christian ideas spread rapidly among the baptised Tatars and the Nagaibaks. One of the signs of the growing Christian identity of the 'Old-baptised' Tatars was the spread of monasticism among them. From the 19th century the 'Old-baptised' worshipers started to go on annual pilgrimages to Kazan, to the site of the especially venerated Sedmiozyorsk image of the icon of Our Lady of Smolensk (18–26 of June). In 1893 up to 300 baptised Tatars came to the city to honour the icon [Otchet Bratstva, 1895, p. 6]. There appeared many Orthodox enthusiasts among the 'Old-baptised' Tatars who on their own initiative started to preach among their kinsfolk.

Of course, one should not speak in absolute terms about the process of Christianisation among the 'Old-baptised' Tatars in the post-reform period. Proliferation of Orthodox Christianity and its assimilation of traditional beliefs was not an easy process. It sometimes resulted in religious conflict and generational clashes, when the young, educated at missionary schools openly confronted the adherents of the old ways and not always gaining the upper hand in such conflicts [Odigitriyevsky, 1895, pp. 28–29]. Though orthodox ideology significantly influenced the religious consciousness of Christian Tatars and Nağaybaks, it did not fully supersede 'pagan' worldviews and traditions in their lives. Thus formed a dual belief system, a special model of 'Kryashen' common Orthodoxy [Rossijskij e'tnograficheskij musej, photo collection, Vol. 271, pp. 1–2; Obryady', 1930, p. 81]. Due to objective reasons, introducing new Christian educational methods to the missionary and educational practices could not fully solve the problem of 'the previously baptised' people turning to Islam. Despite the colossal effort made by the Orthodox church and the state, cases of Islamisation and mass 'secessions' from the Orthodox church were increasing. The process of confessional differentiation affected a rather large group of 'previously baptised' Tatars (ac-

cording to different sources, they comprised 6 to 10% of the total population). This process was induced not only by their religious preferences, but also by the wish of some Tatar Kryashens to join the collective Tatar cultural-national space [Iskhakov, 2009, pp. 31–42]. However it can be established that, owing to new approaches of Christian enlightenment, the majority of Tatar Kryashens deliberately chose the Orthodox confession as the basis of their religious worldview. Christianity became an integral part of confessional belonging and a cultural dominant for 'the previously baptised' Tatars. It led them to form a Kryashen ethno-confessional self-consciousness that separated them into a distinctive special confessional group inside the Tatar nation.

Orthodox religious institutes of Christian Tatars. A large group of Christian Tatars formed as a result of a long process of getting to understand the Orthodox religious tradition and the ecclesiastical administrative work aimed at Christianising non-Russian peoples of Eastern Russia. This was situated in the Volga-Ural region by the beginning of the 19th century. Two local subgroups are traditionally distinguished among them: the so-called 'previously baptised' (таза керәшен/таза Kräšen) and the 'newly-baptised' (яңа керәшен/яңа Kräšen).

According to canonic rules and state legislation, Christian Tatars were included in the existing system of confessional institutions of the Russian Orthodox Church as its members. Its lowest ecclesiastical administrative unit was a parish, consisting of a priest and his parishioners. Parish clergy were divided into clergymen (archpriest, priest, deacon) and ministers (clerks (sextons, acolytes, readers)). The priest was the head of the parish. Orthodox parishes formed church areas (deaneries). They were parts of certain eparchies that were run by members of the highest ecclesiastic administration from the regular clergy (bishops, archbishops, metropolitans).

For a long time the territories of the Volga-Ural region eparchies were not identical to the territories of the equivalent governorates.

Sarapulsk, Yelabuga and Malmyzh uyezds were separated from the Kazan eparchy and joined to the Vyatka eparchy only in 1799, in the course of territorial unification of governorate and eparchy borders initiated by Paul I. In 1832 the Kazan eparchy was divided in two independent cathedras, one in Kazan and one in Simbirsk. In 1851 the eparchy of Samara was formed. It included the territories of Stavropol and Samara uyezds (former portions of the Simbirsk eparchy), Buzuluk, Buguruslan and Bugulma uyezds (former parts of the Orenburg eparchy). Final unification of eparchy and governorate borders in this region took place in 1859 when the Orenburg eparchy was divided in Ufa and Orenburg arch-priesthoods.

To facilitate managing the vast ecclesiastic administrative areas and to ensure effective conceptualisation of missionary activities among non-Russian population, from the late 18th century vicar eparchies were formed in the Volga-Ural region. They were run by vicar bishops who were subordinate to eparchy arch-priests. In 1799 the Sviyazh vicarial district was formed (and abolished in 1802), and several vicary eparchies of the Kazan eparchy were established: in 1853 in Cheboksary, in 1899 in Chistopol, and in 1907 in Mamadysh [ref.: Bogoslovsky, 1896, pp. 24–42]. In 1868 the Sarapulsk vicar eparchy was formed; in 1889, the Glazov vicar eparchy of the Vyatka eparchy [ref.: Vyatskaya eparxiya, 2005, pp. 148–164].

Church reforms of the Peter I epoch led to substituting the unitary authority of the church for the collegiate form of administration with the Ecclesiastical College as its head (1721), later re-named into the Most Holy All-Ruling Synod. These reforms also gave way to nationalising the Orthodox church and turning it into the 'administration of Orthodox confession', merging the church with the government. Along with Orthodox religious institutes being bureaucratized, the Orthodox priesthood was turning into a secluded professional corporation that was subordinate to governmental structures represented by local

A church in a Nağaybäk settlement. Photo by M. Krukovsky Early 20th century.

ecclesiastic administrations, consistories, and the Synod. Despite that, in the beginning of the 19th century in the Volga-Ural region it was still possible to enroll representatives of local non-Russian population in the clerical order. In the Kazan and Orenburg eparchies of the time there were clergymen and ministers from Christian Tatars, Bashkirs, Chuvashs, Kazakhs and other non-Russian nationalities. The majority of them were brought up in Kazan's schools for the newly-baptised and the Kiev Ecclesiastical Academy (the old one). According to E. Malov, a total of 65 'foreign' graduates of the newly-baptised schools were ordained to become clergymen and ministers [Malov, 1868, p. 112].

Despite dignifying Christian Tatars to the clerical orders and appointing them to ministerial positions in parishes that included other Tatars, this did not result in the formation of a Kryashen Orthodox clergy. Tatar graduates of Synodal educational institutions and newly-baptised schools quickly lost touch with their compatriots and completely forgot the language and national culture of their ancestors, being separated at an early age from their cultural everyday environment and not having an opportunity to speak their native tongue during their studies [Kharlampovich, 1905, p. 51].

Such spiritual pastors and missionaries, despite their origin, did not differ much from Russian clergymen and joined them shortly afterwards. As a result, up to the 1860s Russian clergymen served in almost all Christian-Tatar parishes.

According to the type of staff for Orthodox clergy, in 1842 all Orthodox parishes were divided into seven types based on the amount of male parishioners. The amount of parishioners in Ortho-

dox parishes of Central Russian eparchies varied from 1500 to 2000 males on average. In the Volga-Ural eparchies the numbers were a bit higher as the majority of the Orthodox population was comprised of local non-Russian people. For example, at the beginning of the 1860s one of the Orthodox parishes in the Kazan eparchy included 2, 599 male parishioners [Pamyatnaya knizhka, 1862, p. 15].

Material support of priesthoods was comprised of payments for performing religious rites, salary from the treasury, and income from church land that was 33 dessiatins in size (30 desyatins of tillage and 3 desyatins of hayfields) according to the General land survey of 1765. In case a church lacked land, a practice to collect natural goods from parishioners was established (*ruga*). The amount of it was determined by the size of land the church lacked [see: Obzor, 1867].

Building Orthodox churches in Christian-Tatar villages was connected with developing Christian enlightenment work with Tatars initiated by the Russian Orthodox Church. Based on historico-ethnographic narrative, it can be assumed that first churches in Christian-Tatar villages appeared due to the work of first Orthodox preachers of the latter half of the 16th–beginning of the 17th centuries [Stein-

feld, 1893, pp. 291; Historico-statistical Description, 1904]¹⁵.

Expansion of church infrastructure was notable in the second third of the 18th century; that is, during the period of active missionary movement to the regions and the work of the Novokreshchenskaya office. By the beginning of the 1860s, according to partial data collected by E. Malov based on ecclesiastic statistics, 7 eparchies of the Volga-Ural region included 189 Or-

thodox parishes with Christian Tatars [Malov, 1866]. The majority of such parishes were mixed in their ethnic composition, and Christian Tatars represented a minority. Exceptions were some parishes in Mamadysh and Laishev uyezds of the Kazan guberniya and in Menzelinsk uyezd of Ufa gubernia that consisted solely of 'the previously baptised' Tatars.

Contemporaries noted that the majority of Orthodox churches in Christian-Tatar villages differed from the others in their small size and being built predominantly of wood. Church interiors were modest. This was related to the common practice of shifting building costs and church maintenance to parishioners. This was perceived by Christian Tatars, not yet consolidated to Orthodoxy, as an additional burdensome governmental tax that they tried to avoid. This can also explain the fact that the majority of Christian-Tatar parishes had many parishioners, but the income was low. Positions in such parishes were not popular among the Orthodox clergy, high levels of

A drawing of the facade of a church in the village of Nikiforovo, Mamadyshsky uyezd Kazan guberniya. 1895.

staff turnover were a typical phenomenon for them. People with low quality ecclesiastical education and poor missionary training were usually sent to serve here. They usually did not speak the language of their parishioners. Thus, in the information collected in 1828 on the instructions of arch-bishop Filaret (Amfiteatrov), it was noted that there were almost no Tatar-speaking priests in Christian-Tatar parishes of Kazan and Simbirsk guberniyas. At the same time, only 7 out of 43 Christian-Tatar parishes had priests who finished a full course of studies in ecclesiastic educational institutions [Mozharovsky, 1880, p. 135].

Serving in Christian-Tatar parishes was not popular among Russian clergymen due to low salary and the complexity of pastoral and missionary activities. Relationships between Orthodox clergymen and Christian-Tatar parishioners were inconsistent. As early as in 1778 it was stated in a Kazan Theological Consistory that 'not only the newly-baptised, but also many of the 'previously baptised' people don't cross themselves and have no respect for the holy images, they don't attend communal prayers in the holy churches. Instead they live together with the not-baptised adherents of other faiths and cause distur-

¹⁵ By the second half of the 19th century, some the oldest Tatar kryashen villages had been almost completely Russified because of close cultural interaction and mixed marriages, and they preserved only a historical memory of where their ancestors originated from.

Table 45

* The term 'Christian-Tatar parish' is relative and used here to denote all Orthodox parishes with Christian Tatars.

bance, organising pagan space for prayer and sacrifice according to their old habits of a different creed. Thus, the newly born children lose the opportunity to be baptised, the sick have no access to confession or communion, while the dead do not get a proper church funeral. They constantly quarrel and argue with the clergymen who encourage them to adhere to Orthodox Christian beliefs and teach them the prayers to God Almighty' [quoted from: Ilminsky, 1882, p. 89]. As is evident from numerous sources, this situation remained unchanged through the first third of the 19th century [see: Ilminsky, 1848; 1849a]. Along with not knowing the Tatar language, a serious obstacle in the religious enlightenment of the Orthodox clergymen was the significant social and ethnocultural difference between them and their parishioners. Another important factor was lack of constant contact between the clergymen and their parishioners, for they were situated too far from the majority of the parish's Christian-Tatar villages of the parish. As a result, the Orthodox clergy visited their parishioners quite seldom, usually during big religious holidays or collections of ruga and alms. During these short visits many Christian Tatars (especially the 'newly-baptised') tried to avoid meeting their pastors as they did not feel the spiritual need to do so. The distance of churches from parishioners' villages created significant hardships for Christian Tatars to perform religious rites (baptising, weddings, funeral services) which were an obligatory part of governmental registration. Thus, according to observations of N. Ilminsky, inhabitants of Verkhny Arnyash village of Mamadysh uyezd in Ka-

zan guberniya had to spend a whole day to travel 80 versts and invite a priest from the parishioner village of Abdi to perform occasional religious rites [Ilminskiy, 1856, p. 1 reverse]. Naturally, it was rather hard for the Orthodox clergy to fulfill their responsibilities under such conditions, as well as to watch over the religious-moral state of their parishioners, conduct Christian enlightening activities aimed at returning the baptised but not active Christians back to the church, and introduce Christian Tatars to the internal contents of Orthodox dogma to a full extent.

The most complicated aspect of the relationship between a priest and his Christian-Tatar flock (as well as parishioners of other nationalities) was collecting money and goods for conducting religious rites and using church land. The trying financial position of Orthodox clergy forced them to search for opportunities to replenish their scanty salary at the expense of their parishioners. It resulted in forming inimical attitude towards them among parishioners and led to open conflicts. The majority of Christian Tatars, not understanding the traditions of the Orthodox church and not accepting them, saw clergymen's demands for money and goods in exchange for religious rites as 'illegal and excessive extortion'. They tended to avoid paying the Orthodox clergy. However, the complex relationships in Christian-Tatar parishes should not be reduced only to passive confrontations between the clergy and the parishioners. The priest's personality played an inevitably major role in the internal atmosphere of such parishes. Along with people who treated their responsibilities nominally or even misused their

power,¹⁶ there were real spiritual pastors and ascetics who gained respect of Christian Tatars with years and years of altruistic work. Such priests intended to get their flock to settle with Christianity, arrange trustworthy relationships in their parishes, and open parochial schools for teaching Russian literacy and the basics of Orthodoxy to children. Largely due to their activities in the first part of the 19th century,

it was evident that Christian influence intensified among a portion of the Christian Tatars ('the previously baptised'). They slowly integrated Orthodox ceremonial traditions in their own festive calendar.

The role of the parish as a socio-religious institute was decreasing, it lost many of its functions 'beyond the sanctuary'. The decrease was promoted by strengthening the governmental presence in church life and by cancellation of electoral appointment of clergymen [Fedorov, 2003, pp. 45]. Financial and administrative control of clerical activities, the responsibility of church wardens, remained one of few aspects of the life of Orthodox parishes where lay people still played a significant role. According to the 'Guidance to Church Wardens', consolidated by the Imperial court

Christian-Tatar School of Saint Gury Brotherhood in Yeryksa village of Mamadysh uyezd of Kazan guberniya. Photo from the early 20th century.

on 17 April 1808, a parish member appointed by the eparchy was elected to this position on a general meeting at the presence of a rural arch-priest. A warden organized alms gathering, selling of votive candles, managed a church building, kept church money and property and controlled their expenditure. He was also responsible of maintaining records of income and expenses, as well as preparation of reports, which were submitted to an ordained person for inspection. [Complete Code of Laws of the Russian Empire–1, Vol. 30, No. 22971]. Church wardens in baptised Tatar parishes were mostly Russian peasants because of the necessity to know reading and writing. However there were some exceptions [Ilminsky, 1856, p. 15 reverse].

The increase in confessional differentiation peaked between the 1830s and 1850s, which resulted in the 'going over' of a part of baptised Tatars from Islam to Orthodoxy ('newly-baptised' Tatars) and the raise of Orthodox orientation among the other part ('old-baptised Tatars'). This occasioned attempts by the church administration to intensify educational activity and to extend the influence of

¹⁶ Sources report that some priests of 'non-Russian' parishes in the early 19th century turned a blind eye to their parishioners following Muslim and 'pagan' religious rites. For a fee they would allow the non-fulfilment of duties mandatory for the members of the Orthodox Church [Russian State Historical Archive, f. 797, inv. 15, file 35644, s. 4; Ilminsky, 1848, p. 5 reverse]

the church on the foreign congregation. The consolidation of the church authority among baptised Tatars was also caused by other activities of the government and the department of religious affairs. The reform of the synodal education system (1808–1814), the foundation of the Kiev Ecclesiastical Academy (the new one, 1842), equipped with missionary departments (1854), resulted in the improvement of the qualifications of Orthodox clergy and missionaries, the adoption of the Statute on Ecclesiastical Consistories (1842), introduced distinct regulations of cultural and religious life of Orthodox parishes and rules of state and church control over church members, and others. Famous church leaders, who served in the Volga-Ural dioceses, played an important role in the development of the religious Orthodox institutions among baptised Tatars: archbishops Filaret (Amphiteatrov), Grigory (Postnikov) and others. Owing to their efforts some effective measures were taken involving objective exploration of the religious state of baptised Tatars, translation of Orthodox worship books into the Tatar language, appointment of people, ready for missionary work and knowing the language of their church members, to serve in the parishes of baptised Tatars. Along with the construction of new Orthodox churches they introduced the practice of ministerial talks and preaching with the use of Christian texts, translated into the Tatar language, as well as administering the Sacrament and holding occasional services outside church in baptised Tatar villages. Despite the changes, it can be stated that in the second half of the 19th century the current system of church institutions couldn't fully satisfy the spiritual and religious needs of baptised Tatars. In this regard most of them kept adherence to the former, pre-Christian beliefs. With rare exception, they had a weak connection to the church and a vague idea of Christian religious ceremonies.

The epoch of great reforms became a new stage in the history of the Christian education of baptised Tatars, when significant changes were carried out in the system of the organisation of missionary and religious institutions

of the Russian Orthodox Church in the region. A program of reforms, established by the government of Alexander of Russia, comprised almost all spheres of political and socio-economic life of the country and, to one extent or another, affected the interests of all the social classes of Russian society. Attention was paid to the reforming of the system of religious institutions of the Russian Orthodox Church. On 24 November 1861 they established a special committee headed by Grand Duke Konstantin Nikolayevich [Fedorov, 2003, p. 212], who initiated a series of laws, intended to reform the system of financing the Orthodox clergy and to raise its credibility in the parish and the society. The abolishment of clerical class became one of the most important innovations: the free withdrawal from this class and the recruitment of representatives of other social classes to the priesthood were allowed. This reform made a lasting impact on the church institutions of the department of religious affairs—it became really possible to carry out deep renovation of missionary work, to conduct ministerial staff turnover at the expense of those who truly wanted to devote their lives to pastoral care, to engage the representatives of the local non-Russian peoples with church efforts.

Another no less important premise to intensify Christianisation of baptised Tatars became the shift in the position of the government in the sphere of missionary policy and the attitude of the society towards the missionary movement of the Russian Orthodox Church. It is no coincidence that the Epoch of Great Reforms of the 1860s to the 1880s in the history of the Orthodox Church is called the 'golden age' of missionary activity. The rise of Orthodox missionary work was prompted by the democratisation of missionary institutions and the engagement of lay people with these bodies. The idea of religious education, according to I. Zetkina, started to be considered by the Russian intelligentsia in the traditions of the Byzantine missionaries, who strove to transfer God's word and the complex of modern knowledge into the minds and souls of the converted. This concept extended to even a

global socio-cultural phenomenon [Zetkina, 2002, p. 61].

In 1865 the Orthodox Missionary Community was founded in St. Petersburg [Novoye missionerskoye, 1865, p. 3], which was re-organized and moved under the aegis of the metropolitan of Moscow at the end of 1869 [Izvlecheniya, 1870, p. 87]. Owing to the support of country's top leadership and church hierarchy, the OMS soon acquired the status of the central missionary regulatory body of the Russian Orthodox Church. Representational offices (committees) of the Orthodox Missionary Community were created in the Volga-Urals region: in 1870 the Orthodox Missionary Community was opened in Vyatka, in 1872, in Samara, in 1872, in Perm, in 1875, in Simbirsk, in 1878, in Nizhny Novgorod and Ufa guberniyas [Iskhakov, 2011, p. 110]. In Kazan guberniya the committee functions were assigned to the church brotherhood of St. Gury, founded in 1867 [Otchet Pravoslavnogo missionerskogo obshchestva, 1871, pp. 43–44]. The main fields of concern of those missionary unions became the organisation and financing of missionary work among the local non-Russian population, the opening of confessional schools and churches, the financial support of Orthodox neophytes, priests, providing Christian education for parishioners. Special attention was given to the consolidation of 'old-baptised' Tatars in Orthodoxy, for which it was necessary to gather considerable resources, such as monetary grants from the state and private donations, for missionary unions. Missionary programs to develop primary confessional schools for non-Russian peoples of the region are quite remarkable in this regard. Thus, in the 1904–1905 academic year, 64 of 150 schools of the Brotherhood of St. Gury in Kazan guberniya were schools for baptised Tatars (1 school for 735 baptised Tatars of male and female sex), others were 48 Chuvash schools (1 school for 11320 Chuvashes), 22 Mari schools (1 school for 5826 Mari), and one Mordovian school (for 26179 Mordovians) [see: Otchet Bratstva, 1905]. Besides the missions, the local territorial or-

ganisations and the Ministry of National Education took part in the development of Orthodox education among baptised Tatars. They managed to structure the teaching process in village schools in compliance with the ideas of N. Ilminsky.

The chain of confessional (missionary) schools became an important part of the system of religious Orthodox institutions among baptised Tatars which was formed in the second half of the 19th century. Along with learning how to read and write, children got acquainted with the essence of Orthodoxy and perceived the chief matter of Christian rites. From the pupils singers were chosen to put together choirs, religious talks were held on Sundays. In 1886 the Synod issued a decree to allow Orthodox priests and missionaries to perform the liturgy on portable communion tables and altars in schools [Sbornik postanovlenij, 1899, p. 627]. During religious services teachers and pupils of those schools took part in the worship and sang Orthodox prayers in their native language. The development of the chain of missionary schools managed to significantly expand the presence of the church in the cultural and religious life of baptised Tatars, and to make Orthodox sermons and services accessible for the greater part of the parishioners.

Organisation of the translation of liturgical and missionary literature into local languages became one of the principle Orthodox missionary activities in the region. The developments of the famous Kazan Orientalist scholar and Orthodox educator N. Ilminsky, who proposed to use the colloquial Tatar language based on the Cyrillic Alphabet for translations in the beginning of the 1860s, became scientific background for translator's work. Up to the 1860s translations of Orthodox worship books for Tatars were made on the basis of the Arabic type, which was commonly used by them. By the end of the 1850s leading turkologists (A. Kazembek, N. Ilminsky and G. Sablukov) were engaged in this activity bringing it to a rather high scientific level. This is evidenced by the fact that up

to the early 20th century these translations were by the students of synodal schools as the main textbooks for learning the Tatar language. But these translations remained understandable only for a narrow group of Tatar intelligentsia, who had a command of complicated and flowery forms of the Tatar literary language, rich in Arabic and Persian words. For the baptised Tatars who were out of touch with the all-Tatar written tradition, based on the 'high' Islamic culture, these translations turned out to be unintelligible and were unpopular among them. Furthermore, the usage of Arabic script, in the missionaries' opinion, was fraught with the danger of introducing baptised Tatars to the Islamic tradition and would rather serve to intensify Islamisation. The transition to a new alphabet and using of the 'colloquial' Tatar language in translations resolved this problem to a large extent. The use of the Cyrillic alphabet as a material monument and symbol of Christianity, introduced in the Russian tradition by the first Slavonic Saints Cyril and Methodius must have symbolized an invisible spiritual liaison of baptised Tatars with Orthodoxy and the Russian people [Ilminsky, 1883a, p. 18]. Although the practice of translations of religious literature with the usage of the Cyrillic alphabet into the languages of non-Russian peoples was not new and occupied an important place in the history of Orthodox preaching and dated back to the tradition of Velikopermsky Stefan, it was N. Ilminsky who managed to form a scientific and methodological basis for the development of new alphabets for 'non-literate' peoples of Eastern Russia and translations of Orthodox worship books for them. Transliteration of the Tatar language on the basis of the alphabet of the country's titular population, originally conceived by N. Ilminsky for purely practical purposes, was later spread over the languages of the other ingenious communities of the Volga region and Siberia. This became, according to the Canadian researcher W. Dowler, not only the basis for the language policy of the Russian government in the state's eastern borders, but also

precursor to similar policies in other European Empires [Dowler, 2001, pp. 153–154].

In 1868 the Translation commission was established on the basis of the Kazan Brotherhood of St. Gury for centralised work on translations of Christian liturgical literature and its popularisation. It was subjected directly to the Orthodox Missionary Community in 1876 and was directed by N. Ilminsky. The commission, which existed unofficially even before 1868 and dealt with the translations of liturgical and missionary books for baptised Tatars (N. Ilminsky, V. Timofeev, E. Malov, G. Sablukov participated in this activity), increased its financial capacity and acquired a more proper management after the foundation of the Brotherhood of St. Gury, and, as a result, extended its activity on other baptised non-Russian peoples of Eastern Russia and got the right to censor editions in these languages. However the work over the Tatar editions was the priority area of activity for the Kazan translators, and these translations themselves, as M. Mashanov remarked, served as 'some-what of originals for translations into other foreign languages' [Otchet Perevodcheskoj komissii, 1894, p. 11]. Students and teachers of missionary schools were also involved in translation into the Tatar language. They had to eradicate defects and inaccuracies of the editions and make them intelligible for readers [Ilminsky, 1876, p. 63]. To check the practical usefulness of the translations, teachers and students of the Kazan Central Christian Tatar School visited ethnic settlements every year during their summer holidays, where they read these editions and distributed them among the locals. Incomplete data indicates that, in all from 1876 to 1905, 89 books, primarily on religious subjects, were translated into the Tatar language with the total print of 559, 050 copies [see Xronologicheskij, 1910, pp. 17–25].

Innovations in the system of missionary work, the development of the chain of missionary schools and translation of religious texts facilitated more effective use of the Tatar language in the divine service and enabled bringing the representatives of the emerging

baptised-Tatar intelligentsia into the priesthood. In 1867, the Synod formalised the right to ordain baptised Tatars in legislation [Russian State Historical Archive, f. 797, inv. 36, dept. 2, file 251, s. 17–20 reverse]. At the same time, unlike the Russian candidates, they were not required to have a special religious education. It was enough for baptised Tatars to have a high degree of Orthodox commitment, to be familiar with the basics of Christian doctrine, to know the Russian language, to reach the age of 30 and to gain support of the local diocesan authorities. As a result of the active recruitment of the students of the Kazan Central Christian Tatar School and the Kazan Teachers Seminary into the priesthood and the pressing of this issue directly by N. Ilminsky, by the beginning of the 19th century baptised Tatars came well ahead of other non-Russian peoples of the region in amount of ethnic Orthodox priests per capita. For instance, in the Kazan guberniya 39. 7% of priests were baptised Tatars, 44. 1% were Chuvashes, 6. 8% were Mari and 0. 6% were Udmurts from the total amount of the national secular clergy by 1904. Therefore, 1 priest from baptised Tatars accounted for 1, 742 of those baptised Tatars residing in his province, 1 Chuvash priest accounted for 18, 113 Chuvashes, 1 Mari priest for 12, 818 Mari, 1 Udmurt priest for 26, 179 of his compatriots¹⁷ [Bobrovnikov, 1905, p. 178].

The possibility to celebrate the divine service for baptised Tatars and *nağaybäks* in their native language became an important result of the work of Kazan missionary translators. Originally introduced into the church practice in 1869 by the Altai archimandrite Macarius II (Nevsky), the divine service in the Tatar language gained universal currency in baptised-Tatar parishes in the beginning of the 1880s as a result of a special decree of the Synod issued on 15 January 1883 [Mashanov,

1892, p. 168]. Therefore the most of baptised Tatars received the possibility to listen to the divine service in their native language, to get acquainted with the beliefs of Christianity and to be closely involved in the religious life of their parish.

Along with widespread inaugural ceremonies for 'Old-baptised' Tatars, massive construction of churches and opening of parishes began from the 1870s. The Department of Religious Affairs allocated special quotas and monetary grants for these purposes. Thirty six Orthodox churches were constructed in the settlements of baptised Tatars from the late 1860s to the early 1890s only in the Kazan and Ufa guberniyas.¹⁸ This amounts to 60% of the total amount of Old-baptised Tatar churches that had already been built by that time [see Bobrovnikov, 1899; Zlatoverkhovnikov, 1899]. Resulting from the widespread conversion of 'new-baptised' Tatars from Orthodoxy and the massive construction of Orthodox churches in the settlements of 'old-baptised' Tatars, most baptised-Tatar parishes became more homogeneous in ethno-confessional terms. The parishioners in these churches were mostly 'old-baptised' Tatars, who accepted Christianity as an important part of their culture and identity owing to active Christian educational and cultural activity of Orthodox missionaries, and because of the fact that the priests had the same ethnic background.

The development of Orthodox institutions among baptised Tatars from the second half of the 19th to the beginning of the 20th centuries was closely connected with complicated surrounding ethno-confessional processes that were occurring, leading to the growth of the Orthodoxy's influence. As a result of the rooting of the greater part of 'old-baptised' Tatars in the Orthodox faith and the formation of their ethnic clergy, it became possible to establish old-baptised monasteries and convents in the beginning of the 20th

¹⁷ It must be noted only some priests from baptised Tatars served in the Kryashens' compact settlements. Many served in Chuvash, Mari, Udmurt, Russian or ethnically mixed parishes.

¹⁸ These included churches in the villages of mixed national composition, where parishes consisted mostly of baptised Tatars.

Cover page of a book in Tatar about the Orthodox faith: "Chyn Den knyagyase" (Kazan, 1897).

century. The main mastermind of the foundation of the first monastery for baptised Tatars became the archimandrite of the Kazan Saviour-Transfiguration monastery Andrey Ukhtomsky (from 1907 the bishop of Mamadysh). Owing to his efforts, the Priory of Three Saints for baptised Tatars was officially opened as a part of the Holy Transfiguration monastery near the Maloye Nekrasovo village of Laishev uyezd in the Kazan guberniya

in 1905 [Alekseev, 2008, p. 138]. In 1907, a baptised-Tatar educational sisterhood of the Protection of the Virgin was founded at the expense of the family of the Counts of Ukh-toma, not far from the Bogdanovka village of the Mamadysh uyezd of Kazan guberniya.

A long and complicated process of the development of Orthodox institutions among baptised Tatars lead to the formation of an articulate system of religious organisations of the Russian Orthodox Church in the early 20th century, which corresponded to cultural and religious demands of this ethno-confessional group. It included a broad chain of primary religious schools (where children were taught in their native language, and the main attention was paid to church subjects), ethnic parishes headed by priests from baptised Tatars and Orthodox monasteries where divine services were held in Tatar. The specific character of the establishment and work of these institutions, which fulfilled not only religious, but also cultural, educational and missionary functions, were conducive to their harmonious incorporation into an ethno-cultural field of baptised Tatars. In the absence of other sufficiently important social institutions it was their educational activity that became an important factor of cultural mobilisation of baptised Tatars during the epoch of global changes in the second half of the 19th century and contributed to the creation of the domain of the rural and urban intelligentsia, as well as the literary tradition and formation of 'high' culture. Thanks largely to this fact they played an important role in the change of baptised Tatars' religious sensibilities and their confirmation in Orthodoxy.

Section VI

The Ethnic and Confessional Autocratic Policy

CHAPTER 1

The Administrative and Management Systems in the Tatar Settlement Territories

Sergei Lyubichankovsky

Russian Administrative and Management systems from the 18th –the beginning of the 20th century did not generally consider the 'Tatar factor' much.

From 1775, imperial systems of administration and management were being adopted into the governorate reform of Catherine of Russia [Complete Code of Laws of the Russian Empire–1, Vol. 20, No. 14392]. The reform formed 6 General Governorates established at territories where Russian Tatars settled (by 1781, each received its own ordinal number, from 1 through 19) that, in their turn, included several regions (governorates) ¹. Regions were broken down by population size: 300–400 thousand made a region [Complete Code of Laws of the Russian Empire–1, Vol. 20, No. 14392, art. 1], 20–30 thousand made up an uyezd that, aggregated with others, made up a region (oblast' and namestnichestvo) [Complete Code of Laws of the Russian Empire–1, Vol. 20, No. 14392, art. 17]. This measure evened the load on regional administrations.

Establishment of regions was accompanied with making of new governorate (regional and governorate boards, official chambers, departments of treasury charity etc.) and uyezd institutions (district police officers were appointed

from members of the local gentry; yet, when elected, they came under the run of the governors) [Russian State Archive of Ancient Acts, f. 16, inv. 1, file 636].

Governor Generals were not only to supervise of the adherence to laws and duties performed by local public officers, but also to be in command of armed forces positioned at the territory in their charge. As they were authorised for some foreign policy activities (diplomatic negotiations with their neighbours, spying, even local military expeditions), they were not mere executors of royal commands, but policy-makers in their territories. This explains why they had the right to sit in the Senate and vote for local affairs. Governors under them were just administrators [Lysenko, 2001, p. 119].

The Governor General Board was the main local authority. It consisted of a Governor General, the head of the Governor General Board, two members and a clerk. The Board was managed regional chambers and departments, controlled police, approved reports of regional institutions, appointed officers of uyezd and governorate bodies, supervised performance of natural, money, military and other conscriptions [Complete Code of Laws of the Russian Empire–1, Vol. 21, No. 15170]. Next in importance was a government chamber, before 1845 reform headed by a vice governor. It controlled the funds of the region [Complete Code of Laws of the Russian Empire–1, Vol. 21, No. 15141].

Orenburg Religious Board of Muslims was established in Ufa in 1788 as an integral part of the regional government. It was to examine the candidates for Muslim clerical positions. Yet, it was for the regional board to finally approve

¹ Thus, the 10th governor-general district included the Yaroslavl and Vologda viceroyalties; 12th governor-general district included the Nizhny Novgorod and Vyatka Viceroyalties; 13th governor-general district included the Perm and Tobolsk Viceroyalties; 15th governor-general district included the Simbirsk and Ufa Viceroyalties; 16th governor-general district included the Kazan and Penza Viceroyalties; 17th governor-general district included the Saratov, Astrakhan, Azov and Novorossiysk Viceroyalties [Complete Code of Laws of the Russian Empire–1, Vol. 21, No. 15774; Vol. 44, Part 2, No. 17494, appendix].

an akhund, a mullah or a muezzin [Complete Code of Laws of the Russian Empire–1, Vol. 22, No. 16170].

In 1796 Paul I liquidated General Governorates and regions and replaced the latter with the governorates [Complete Code of Laws of the Russian Empire–1, Vol. 24, No. 17634]. The process went alongside another division of governorates into smaller units, a natural result of Catherine's principle on the relation between the number of administrative-territorial units and the size of the population. By that time, the territory settled by the Tatars included Astrakhan, Saratov, Simbirsk, Penza, Nizhny Novgorod, Yaroslavl, Vyatka, Perm, Orenburg and Tobolsk guberniyas headed by civil governors. It was only in the Orenburg guberniya that Paul I preserved the position of military governor, an intermediate instance between the Emperor and the military governor of Orenburg. In his brief he had the lands of Ural and Orenburg Cossacks, Kalmyks, the Ural Mountain territories of nomad Kazakh zhuzes; his authority also included Bashkirs outside of the Orenburg area, in Saratov, Perm and Vyatka guberniyas. The Orenburg Military Governorate existed until 1851 when the Samara guberniya that had been established a year before was removed from it [Russian State Historical Archive, f. 383, inv. 9, file 7674, s. 73].

With the Governor General position liquidated, civil governors became the pivot of local administration in the empire. Though in 1802 the system of ministries was implemented and spread to regional level through various lines of authority (e. g. treasury chamber subordinated to the Ministry of Finance, courts became a part of the Ministry of Justice etc.), the power of the governor was mostly limited by the authorities directly subordinated to the Ministry of the Interior. It was an obvious contradiction to 'General Mandate to Governors' of 1837, where governor was defined as 'immediate supervisor and master' of the territory entrusted [Complete Code of Laws of the Russian Empire–2, Vol. 12, No. 10303]. One more limitation to the power of the civil governor was the institution of marshals of the nobility, who, by

law, could work in some governorate boards. However, at the most part of the Volga-Ural area the institution did not tie the hands of the governor as it either did not have any corporations of the gentry (Vyatka, Perm, Tobolsk guberniyas) or was rather weak economically as compared to the indigenous governorates of the empire. This predetermined the domination of people of noble birth at lower and middle levels of the regional state apparatus [Zagidulin, 2010, pp. 450–452].

After the assassination of Paul I, the emperors revived some of the Governor General districts. For example, between 1804–1811 Vyatka and Perm guberniyas were merged into one General Governorate Region (the so-called D. Balashov experiment). In Western Siberia, Siberian (from 1803), and, later, Western Siberian (from 1822) Governor General regions existed and had their centre in Tobolsk. This was voided in 1882. In similar way, the void of Orenburg military governor region in 1851 resulted in Orenburg and Samara General Governor regions established at the Orenburg region. In 1865, Samara guberniya was segregated from that administrative-territorial unit, while Orenburg guberniya split in two governorates (Orenburg proper and that of Ufa) was made a part of Orenburg Governor General Region [Complete Code of Laws of the Russian Empire–2, Vol. 40, No. 42058]. Orenburg Kirghiz oblast that since 1844 had been subordinated to Orenburg military governor [Complete Code of Laws of the Russian Empire–2, Vol. 19, No. 17998], in 1868 was split in Ural and Turgai oblasts under the Orenburg Governor General. At the local level, the power was executed by the elders of the families. With the void of that administrative-territorial unit in 1881, its main parts (governorates) came under direct management of the Ministry of the Interior. Therefore, with institutions established everywhere in 1775, since the 19th century Governor General regions covered only the south and the east of the Tatars settlement areas, in other words, outlying, bordering districts of the country.

With Governor General regions void, civil governors got stronger as now they had no

supervisory body to involve with their competence, as, more often than not, had been the case in the past. Some extent of independence was restricted by sectoral (departmental) principle, systematically introduced in civil governorate management; many local structures were taken out of direct control of the governor. It should also be noted military power of the Governor General was passed not to the civil governors, but to the heads of appropriate military regions, the measure that certainly did not contribute to raising the status of 'governorate masters' up to the one of their voided curators.

The period of the Great Reforms dramatically influenced regional administrative structures. The Governor remained the core figure of the local administration; he was the chief officer of the crown management in the empire. As an officer of the Ministry of the Interior, the governor headed almost all its local collegial bodies (governorate board, forest supervision committee, governorate office, office for factories and mining, selection committee, office for *zemstvo* and cities etc.)

The Governorate board established as early as 1775 was the main body in the system of civil management. It was a kind of 'government' headed by the governor. The board was responsible for 'public improvement', protected 'human and property rights, general security, peace and quiet', ruled 'matters of public health, smallpox vaccination, prevention of cattle plague, food, economy and industry (to the extent allowed for public institutions)', assisted 'all other institutions in execution of laws' and 'forced places subordinated to execute their duties'. It published laws and decrees in the *guberniya*, interpreted them for inferior bodies, examined claims on officers' activities, settled matters of legal liability for public officers, made foreigners swear naturalisation, supervised measures and scales, collected statistics on various aspects of the governorate life, was in charge of, among other things, construction, land surveying, road building, concluded official contracts, controlled administration of wills, examination of the insane. The governorate board oversaw the laws to be observed everywhere, had power to void 'any action' of the

police. Its power was defined as 'police power in the broadest sense of the term, namely, judicial and police, executive, administrative and impelling powers' [Obshchee Uchrezhdenie, 1892, art. 437–438, 467–471]. It is noticeable the position of translator was on the list of the Orenburg governorate board not only in the pre-reform period, but also later, when the region was not bordering any more [Russian State Historical Archive, f. 1284, inv. 185, file 29, s. 93 reverse] This attested to the fact that though the region had lost its bordering status, there was still an urge to adapt local authorities to specific ethnic composition of the people who populated a huge region.

Yet, numerous departmental normative acts, that regulated many institutions outside the Ministry of the Interior, constrained or even nullified the powers of the governorates heads in many matters of their competence. It is true that since the second half of the 19th century, there appeared a number of autonomous institutions responsible for some important issues and staying outside the Ministry of the Interior. As a result, 'war of ministries' typical for the Russian Empire, descended to governorate level. Newly established institutions (the excise, tax office, selection committee, etc.) supervised the matters the Ministry of the Interior had been responsible for in pre-reform Russia. That meant the responsibility of the Ministry of the Interior was reducing, while that of other ministries was widening. Their activities were poorly coordinated, and, naturally, were harmful for efficient management, limiting the power of the governor.

In most of the governorates, *zemstvos* were introduced in 1864–1874 (in 1905, only the Tobolsk and Orenburg *guberniyas*, as well as steppe areas, had none). *Zemstvo* dumas and councils undertook most of the economic functions previously assigned to the governorate administration. In cities, the powers were vested in city dumas and councils, established in 1870.

In 1864, the governor lost his authority to control judiciary authorities, though the regulation on enhanced and extraordinary security enabled them to use non-judicial methods of prosecution for residents of their territories.

Court Offices in Kazan Drawing by V. Turin, 1820s

The police reform of 1862–1867, under which the uyezd police department was established, extended the police hierarchy up to the uyezd level, thus increasing the police powers of the governorate administration while bringing political investigation out of the governor's jurisdiction as it was controlled by the gendarme colonel at the head of the autonomous governorate gendarme administration.

As the result, by the early 20th century the law describing the governor as the chief representative of the governorate's supreme power, its head, protector of justice and public interests, etc. [Obshhee Uchrezhdenie, 1892, art. 201, 270–274] had become rather inaccurate [Strakhovsky, 1913, p. 63]. New judiciary establishments, procuratorial supervision, control chambers, excises, departments of the State Bank, customs, mining authorities, the technical part of the railway, post, and telegraph departments, and army units garrisoned in the governorate had dropped from under the governor's jurisdiction by the late 19th century. It is no coincidence that, until the First Russian Revolution, numerous committees, councils, and meetings of high public officials suggested that the governor should have more power. This they wished to ensure not just by increasing the number of establishments that he controlled but by broadening his powers [State Archive of

Orenburg Region, f. 10, inv. 1, file 175, s. 1–2; Usilenie gubernatorskoj, 1904]. The Governor of Ufa, I. Sokolovsky, wrote to the capital in 1903, '... it is only the Governor who can be the unifying power over the governorate. He... must have every instrument and means to rule and manage the governorate in fact and not in name, 'we have to... provide proper support to the Governor's power by securing it against any infringement by other authorities not subordinated to the Governor, without which no transformations in governorate administration will yield the positive results that they aim at' [Central Historical Archives of the Republic of Bashkortostan, f. I–9, inv. 1, file 655, s. 4–4 reverse].

The uyezd administration system was not wholly consistent either. On the one hand, the uyezd police officer at the head of the local police was a direct extension of the governor's power at the uyezd level. The police department that he controlled exercised supervision to ensure 'quick and accurate' execution of laws and instructions by superior authorities. It was also responsible for providing urban amenities, releasing administrative orders to the public, preventing natural disasters and epidemics, levying taxes, ensuring correct units of measurement, holding trading sessions, keeping account and ensuring conscription of

Governor's Palace, where there was a chancellery of the Kazan governor.
Kazan Kremlin. 1848. By architect K. Ton. Photo, 1892.

people bound to military service, etc. [Obshee Uchrezhdenie, 1892, art. 679–684]. The uyezd police officer was a member of various uyezd collegiate authorities like the prison committee, the school council, public offices for alcoholic drinks, etc. However, it was the uyezd marshal of nobility who presided over these and many more boards. In 1895, it was this position which was in control of uyezd zemstvo meetings, the uyezd convention, the noble trustee board, the prison committee department, the school council, the public offices for military service and alcoholic drinks, the land management board, and a dozen less committees, trustee boards, and commissions of less importance. Despite their accountability to the Ministry of Internal Affairs, zemstvos acquired enough authority to claim leadership in controlling uyezd economy soon after they were established. In this way the uyezd administration with its balance of power in the authorities of the uyezd police officer, the chairman of the zemstvo council, and the marshal of nobility presented a varied picture— from the dominance of one of the three to major confrontations among them and/or some form of coalition. This brought about more unresolved administrative issues, constantly generating conflicts.

Excessively centralized relations within the system of the Ministry of Internal Affairs—governor and governorate board—inferior establishments were the key issue of local

administration. For instance, the Governor of Orenburg V. Ershov wrote to Minister of Internal Affairs I. Goremykin in 1889, reporting 'a voluminous but not especially significant correspondence currently signed by the governor, 'as well as the fact that even in 'issues of little importance that are not subject to collegial discus-

sion and require no special consideration and guidance from the superior authorities' heads of departments of the governorate board could not take independent decisions but had to 'ask for the chairman's permission' [State Archive of Orenburg Region, f. 10, inv. 1, file 175, s. 61 reverse–62]. The practice gave a special meaning to appointing high-ranking administrators for the multiethnic Volga-Ural Region.

The ethnic and confessional composition of the region's governorates was in principle homogeneously Orthodox Christian (all the governorate generals were Orthodox Christians). However, at least 8% of people in the office in 1825–1905 (1825 was the date when records of service began to specify religion) were Lutherans. Their number decreased towards the end of the period. Those were mostly Baltic Germans, noblemen from the western territories that Russian had annexed in the 18th century. There is no mention of Muslims among the governors. However, a number of famous Russian dynasties from which public officials, in particular governors, stemmed, were of Oriental, mostly Tatar, descent, such as the Yusupovs [Lysenko, 2001, pp. 191–192]. Lower-ranking public officials in the local state apparatus were also predominantly Orthodox Christians. Thus, the population to be managed was multi-confessional and multiethnic, while the administration was evolving towards a multi-confessional composition. This posed major

problems for the regions' governors in terms of their job responsibilities.

Apart from the classical governorate administration form above, some territories within the region had special administrative systems.

Western Siberia was highly illustrative of how flexible the imperial model of regional administration was. From the end of the 18th century, the territory had a special status because the governorate reform of 1775 did not apply to it. In 1822, M. Speransky was able to ensure a special 'Siberian Establishment' for the space [Complete Code of Laws of the Russian Empire–1, Vol. 38, No. 29126]. Western Siberia was controlled by the governor general. He presided over the so-called General Directorates, half of their members appointed by the chairman and the other half by the Ministers of Justice, Finance, and Interior Affairs, as well as their consultative bodies, councils. Collective decision-making was an innovation long ahead of the time. The Statute on non-Russian Administration, under which all non-Russian peoples of the region received a special class status, emphasized the unique socio-cultural situation there. Local Tatars were viewed as 'sedentary' non-Russians, who were treated as equal to state peasants in terms of all rights and duties except for military service. After the governorate general was abolished in 1882 [Complete Code of Laws of the Russian Empire–3, Vol. 2, No. 886], laws were adopted to smooth over the region's peculiar features. They introduced the office of peasant head, whose power applied to indigenous people too, and abolished the term 'native lands', which locals had occupied from antiquity [Complete Code of Laws of the Russian Empire–3, Vol. 18, No. 15503].

The canton administration system existed from 1798 to 1865 [Complete Code of Laws of the Russian Empire–1, Vol. 25, No. 18477]. It applied to the Bashkirs, the Mishars, the Orenburg and Ural Cossacks (the Kalmyk Army of Stavropol made a separate canton).

In 1863–1865, the peculiar regional administration system was abolished, and canton dwellers transferred from the military class to 'rural dwellers'. However, this did not apply

to the Cossacks, who maintained their unique administrative practices even after cantons were abolished. Army atamans remained their leaders.

Mining administrations were another region-specific administrative system. The Chancellery of the General Directorate for Siberian, Kazan, and Orenburg Plants was abolished within Catherine II's governorate reforms. Its functions were vested in governorate treasury chambers. In 1802–1806, the following four mutually independent mining administrations accountable directly to the Collegium of Mining were established in the territory: Yekaterinburg, Perm, Mount Blagodat, and Bank. The Governor General of Perm and Vyatka relied on the Perm Mining Administration and the Mining Inspector of Perm for general management of them. However, after the governorate general was dissolved in 1811, control was in fact lost because the Mining Inspector was unable to perform his coordinating functions without the Governor General [Loransky, 1900]. At the same time, the Mining Department was established within the Ministry of Finance at the capital level in 1806. It enjoyed broad administrative autonomy. It had police, post, and court establishments, schools, hospitals, pharmacies, poor-houses, and churches in the region. This brought about parallelism between civil and mining authorities, causing constant differences and clashes. In 1826, the office of Chief Manager of Mines in the Ural Mountain Range was established. It offered enormous powers and independent from the governorate authorities. Following the abolition of serfdom, the mining administration was completely released from any duties not related to mining directly, including management of military units and judicial bodies, churches, hospitals, pharmacies, poor-houses, post offices and stations, mining schools and vocational schools. In 1886, the Ural Administration for Mining (Uralskoye gornoye pravleniye) was renamed Administration for Mining in the Urals, a name it held until 1893, when it was renamed the Ural Mining Administration (Uralskoye gornoye upravleniye). As the Fac-

tory Inspection was introduced in 1886, the offices of regional inspectors were abolished and the Mining Inspection was founded. By 1905, the whole territory of the Ural Mining Region had been divided into 12 mining regions headed by regional engineers². The regional engineer's responsibility was to ensure adherence to mining regulations, work safety, exercise supervision over the purchase, storing, and usage of explosives, ensure timely duty income, investigate conflicts between workers and entrepreneurs, etc. [Alekseev, 2008, p. 439].

Those were the key administrative systems in the Tatar-inhabited territories in the late 18th to early 20th century. To sum up, 1) administratively, the territory was not viewed as a whole; the fact that it had a Tatar population was not considered to be its key feature; no attempts were made at making a separate ad-

ministrative unit out of the predominantly Tatar-populated region (as compared to Bashkirs and Kazakhs); 2) the administrative system established was representative of the imperial nature of the state, because the power hierarchy relied on the local elite and local administrative traditions were taken into account for it, though with total control over key institutions and offices; 3) the evolution of the Russian state apparatus in the Ural-Volga Region was largely determined by gradually bringing up the marginal and peripheral territories to meet Central Russian local administration standards; the standards did not provision for any ethnic administrative traditions but relied on unified principles of rationalized and highly bureaucratic administration with supra-personal dependence and the priority of supra-communal public interests in the administrative practice.

² The Vyatka, Perm, Cherdyn, Northern Verkhoturie, Southern Verkhoturie, Northern Yekaterinburg, Western Yekaterinburg, Southern Yekaterinburg, Ufa, Miass, Verkhne-Uralsk and Orenburg mountain districts [Istoricheskij ocherk, 1910].

CHAPTER 2

Governmental Tatar Policy in the Pre-Reform Period

Aidar Nogmanov

§ 1. The 'Tatar Issue' During the Rule of Alexander I

When Catherine of Russia reigned, governmental measures were largely aimed at cooperation with the Tatar elite, which was expected to become a reliable partner to the state while pursuing common interests.

The flexible policy under the slogan of religious tolerance was generally efficient at winning over Tatar murzas, merchants, and high-ranking clergymen to ensure better control over the rest of the population. According to the government, the political, economic, and social integration of the peoples of the Volga Region into the state by the late 18th century [Kappeler, 1982, p. 377].

The main goal of Alexander I was further, deeper integration of the Tatar population into various spheres of the Russian life. Catherine II's policy was manifested in her early decrees to the Tatar nobility. On 5 May 1801, Alexander I signed a law that confirmed a Tatar murza's right to become a nobleman [Complete Code of Laws of the Russian Empire–1, Vol. 26, No. 19856]. The decree of 9 December 1802, under which the government issued a compensation to Tatar princes and murzas whose serfs had converted into Christianity, also suggest that the government was willing to cooperate with the Tatar elite [Complete Code of Laws of the Russian Empire–1, Vol. 27, No. 20548].

The land laws of the first quarter of the 19th century is marked by succession. The decrees of 1803 and 1824, which established the land survey procedure for the Orenburg and Perm guberniyas [Complete Code of Laws of the Russian Empire–1, Vol. 27, No. 20868; Vol. 39, No. 29772], stemmed from the enactments of the 1760s that were related to the Manifesto on

General Delimitation of Lands in the Whole Empire of 19 September 1765 [Complete Code of Laws of the Russian Empire–1, Vol. 17, No. 12474]. For instance, the 1803 decree instructed the Governor of Orenburg to adhere to the Instruction to Governorate Land Surveyors of 1766 [Complete Code of Laws of the Russian Empire–1, Vol. 17, No. 12659], which protected the interests of the Tatars, Mordovians, Chuvashes, Cheremises, and other non-Russian peoples [Complete Code of Laws of the Russian Empire–1, Vol. 27, No. 220868]. The decisions were most consistent with the principles of Catherine of Russia in the sense that she attached primary importance to preventing social, inter-ethnic, and religious tension.

Alexander I continued to shape the multi-stage education system that Catherine of Russia had founded. When the University of Kazan was founded in 1804, it was not only the advantageous geographical situation but the historical mission of Kazan as Russia's ancient 'eastern gate' what was taken into account. Apart from teaching students German and French, the statute of the University of Kazan provided for Tatar classes [Complete Code of Laws of the Russian Empire–1, Vol. 28, No. 21500]. By comparison, the Moscow and Kharkov Universities, their statutes signed on the same date as that of the University of Kazan, offered English and not Tatar classes [Complete Code of Laws of the Russian Empire–1, Vol. 28, Nos. 21498 and 21499]. This suggest that the newly established educational establishment was initially East-oriented and expected to play a special part in the cultural development of the Em-

Emperor Alexander I

pire's Asian periphery by training experts to work with non-Russians.

Apart from the University of Kazan, the Neplyuev School in Orenburg, founded under the Decree of 9 February 1824 trained personnel to work in the Empire's eastern regions [Complete Code of Laws of the Russian Empire-1, Vol. 39, No. 29770, pp. 50-54]. It accepted children of staff of the Separate Orenburg Corps, 'Asians without stable citizenship' and 'any people of free standing'. It was Russia's first educational establishment to open its doors to non-Russians. Besides, each 'Cossack, Bashkir, Mishar, Tatar and Asian regardless of his rank' who sent his son to the school, undertaking the obligation to 'refrain from taking him away until the course of study has been completed', received a certificate of recognition from the Military Governor of Orenburg [Complete Code of Laws of the Russian Empire-1, Vol. 39, No. 29770, p. 51]. The curriculum included Arabic, Tatar, and Persian. Upon completion of studies, alumni went to the military or began public officials. In particular,

those who were able to demonstrate 'excellent performance in Eastern languages' would get a job as 'translators, confidants, and interpreters for the borderline administration of Orenburg' [Complete Code of Laws of the Russian Empire-1, Vol. 39, No. 29770, p. 54].

The University of Kazan was established at the beginning of the rule of Alexander I, and the Neplyuev School at the end of it. Symbolic as this was, it characterised Alexander's era, which, as well as that of Catherine II, can be called a period of 'enlightened monarchy'. It is beyond doubt that the inclusion of the Tatar Language in the curricula of the two educational establishments crucial to the state's interests was reasonably necessary, which by no means makes the initiative less meaningful. Language studies were the first step towards further academic research on the history of the Tatars, their custom and traditions, written and physical heritage.

The spiritual policy of Alexander I also largely followed Catherine II's course. Missionary activities had grown less intense in the Volga-Ural Region by the time of his enthronement. It was parish priests who were formally responsible for attracting pagans and Muslims to the official church. The functions were vested in them in 1800, when the homiletic institution that Catherine II founded in 1764 following the abolition of the New Christian Office was liquidated [Complete Code of Laws of the Russian Empire-1, Vol. 26, No. 19455]. In 1800, the schools for New Christians' children that were founded in 1742 closed [Complete Code of Laws of the Russian Empire-1, Vol. 26, No. 19455]. Missionary functions as such were vested in Orthodox Christian parish priests, who did not feel very enthusiastic about them. Only one of the numerous benefits and privileges introduced in the former half of the 18th century to encourage conversion to Christianity, namely exemption from taxes and recruit supply for three years, had survived by the end of the century.

The religious liberalism prompted not only Tatars but representatives of pagan peoples of the Middle Volga Region who had converted into Orthodox Christianity to use this freedom

to restore their own cultures, which had been affected by religion. Even though anti-Christian movements did not become mass-scale until the second quarter of the 19th century, they had precursors already at the beginning of the century.

In 1802, the New Christian Tatar community of the Nizhny Novgorod guberniya asked Alexander I to 'permit them to convert back to Islam'. Converting back from Orthodox Christianity was still forbidden under Russian law. This is why the Emperor signed a special decree to 'forbid abyzes from seducing and converting new Christians into the Mohammedan faith [Complete Code of Laws of the Russian Empire–1, Vol. 27, No. 20535]. In order to keep Tatars Orthodox Christian, it was recommended that they would be moved to Russian settlements. Russian-Tatar marriages were encouraged. Local authorities were responsible for preventing any New Christians from being excluded from 'village administrator elections' (heads, peasant policemen, etc.)

Those were instructions traditional for Russian rulers, similar to those issued both before and after Alexander I. At the same time, the liberal outlook of the young tsar, who was inspired by the humanism of the Enlightenment at the early stage of his rule, affected the content of the decree. The document warned local public officials against any extreme measures. They were to prevent conversion back out of Orthodox Christianity in a way consistent with the principles of 'lenience and enlightenment' [Complete Code of Laws of the Russian Empire–1, Vol. 27, No. 20535].

The government's tolerant attitude to Muslims was also manifested in the Decree of 26 June 1804 [Complete Code of Laws of the Russian Empire–1, Vol. 27, No. 20868], which gave Muslims who had ran away from Russia during the reign of any previous rulers a year in excess of the two years' period specified in the Manifesto of 15 March 1801 [Complete Code of Laws of the Russian Empire–1, Vol. 26, No. 19786] during which they could return home.

The government's attitude to Islamic religious literature is also characteristic. In 1787,

the Quran in Arabic was printed at the governmental cost on the personal order of Catherine of Russia to later appear in 1790, 1793, and 1796 [Krymsky, 1904, p. 138]. It was extremely circumspect of Catherine II. According to A. Karimullin, this made it possible to postpone the requests of the Tatars to have their own printing office for some time. It was used for political purposes during the war with the Turks as an example of protecting the Muslims of the Russian Crown. It also brought substantial financial benefits to the treasury [Karimullin, 1992, p. 98]. Tatar and Islamic religious books began to appear during the reign of Alexander I in Kazan.

Indicative of the liberal religious position of Alexander I is that the codification of Islamic law began when he was on the throne. It mostly affected family and marital relations, where inheritance from deceased Muslims was a burning issue.

Until the early 19th century, Russian judicial bodies referred to the Decree of 17 March 1731 [Complete Code of Laws of the Russian Empire–1, Vol. 8, No. 5717], according to which the wife was entitled to 1/7 of her deceased husband's movables and 1/4 of his real property. Local judicial bodies were at loss as to how that applied to Tatars because Sharia entitled Muslims to have up to four wives at the same time [Tornau, 1850, p. 137], while Russian laws contained no special provisions for it.

Numerous petitions by Muslims and inferior courts motivated the Senate to address the issue. Having consulted various authorities, Alexander I signed a decree on 20 December 1804, under which 1/4 of all movable and real property of a childless Muslim was to be divided among his wives on an equal basis. If the deceased person had children, 1/8 of his property was to be divided among his wives. According to the Senate's Decree of 23 February 1805, the edict was divulged to all authorities affected [Complete Code of Laws of the Russian Empire–1, Vol. 28, No. 21634]. This legalized certain Islamic regulations in Russian justice. The government took an utterly rational approach of killing two birds with one

Monument 'In Honour of Victory over the Tatars, 1552' Kazan. Photo, 1892.

stone, namely delegating Muslims' inheritance issues to themselves and demonstrating respect of the Islamic law to the Muslim community of Russia.

More religious innovations were introduced during the rule of Alexander I. In particular, the idea of centralized control over the Empire's religions was implemented. This dated back to the time of Paul I. At the beginning of the 19th century, the government had a vague idea of the Empire's ethno-confessional structure, its the Christian to non-Christian ratio, and the dogmatic and administrative features of Russian churches. The legal status of various confessions was largely determined on history and the monarch's personal attitude [Vishlenkova, 1997, p. 52].

Under the Manifesto of 25 July 1810, 'Muslim issues', which had been the responsibility of an expedition of the Ministry of Internal Affairs, were delegated to the newly established General Directorate for Spiritual Affairs of Foreign Religions. It functioned as a special ministry. One of the tsar's confidants, Prince A. Golitsyn, headed the Directorate. The new authority controlled 'all subjects related to the clergy of various foreign religions and faiths related to all of their affairs except for the judicial' [Complete Code of Laws of the Russian Empire–1, Vol. 31, No. 24307].

The General Directorate for Spiritual Affairs of Foreign Religions took to developing a concept of a governmental religious policy and its legal embodiment. Its functions included

collecting statistics, studying canon and church law, and rendering information on the history of the relations between the government and the church. A big job was done for Catholic, Uniate, Protestant, and Armenian churches. Muslims got less attention. The Decree 'On the Judgment of Muftis in the Administrating Senate' of 11 October 1811 [Complete Code of Laws of the Russian Empire–1, Vol. 31, No. 24819] was nearly the only law to specify the high status of the OM-SA Chairman despite the 'middling

place in court' of the religious institution itself.

As the Emperor grew more enthusiastic about religion and mysticism after 1815, his religious policy was modified. Alexander I was inspired by the idea of building a united Christian Nation as the foundation of the Holy Alliance [Complete Code of Laws of the Russian Empire–1, Vol. 31, No. 25943]. Thus, the initial orientation towards mutual tolerance of confessions and 'disapproval' of any missionary activities in the state was gradually replaced by ambitions to enlighten non-Russians into Christianity.

In 1817 Alexander I ordered that an annual amount of 5 thousand rubles should be allocated to the long-delayed construction of the memorial 'In Memory of the Victory over the Tatars in 1552' on the mass grave of those who fell when Ivan the Terrible was conquering the city, founded in 1813 [Zagidullin, 2002a, p. 27–33, Complete Code of Laws of the Russian Empire–1, Vol. 34, No. 246633]. This decision was clearly ideological because Russian historians and the public traditionally interpreted the events of 1552 as a victory of Orthodox Christianity over the 'Basurmans' (Muslims) [Complete Code of Laws of the Russian Empire–1, Vol. 34, No. 246633].

In the same year, the government permitted mixed marriages between Lutheran Christians and Muslims. All children born in a mixed family was to be baptised [Varadinov, 1859, p. 361]. In 1818, the Kazan Branch of the Biblical Society was organized, not only

to translate church books into the languages of peoples in the Middle Volga Region but to facilitate their Christianisation [Grigoryev, 1948, p. 258]. In 1819, the strict prohibition of converting representatives of other religions into Orthodox Christianity of 1813 was in fact removed [Vishlenkova, 2002, pp. 304].

As the religious policy grew less liberal, an attempt of clericalisation in the education system was made. Under the law of 24 October 1817 the General Directorate for Spiritual Affairs of Foreign Religions, re-organized into the Religious Department, became part of the Ministry of Religious Affairs and Public Education [Complete Code of Laws of the Russian Empire–1, Vol. 34, No. 27106, pp. 814–834]. It was now the ministry's responsibility to ensure church control over education 'so that Christian righteousness can always underlie true enlightenment' [Complete Code of Laws of the Russian Empire–1, Vol. 34, No. 27106, p. 814].

Yet, the enactment affected the Tatars because it regulated the administrative structure for the so-called religious affairs, now controlled by the Religious Department. Its powers were as follows: '1) appointing and removing muftis and addressing claims against them; 2) issues related to Mohammedan religious authorities and their officials as reported by muftis or civil authorities; 3) issues of special importance related to mullahs and other clergymen; 4) issues related to clerical property; 5) issues related to mosques and similar institutions, information on their count; 6) collecting complete data on this subject' [Complete Code of Laws of the Russian Empire–1, Vol. 34, No. 27106, p. 818].

When the Ministry of Religious Affairs and Public Education existed (1817–1824), the government took no radical measures in terms of organising control over Muslims. A lack of competent staff was one of the reasons along with the high priority then attached to Catholic and Protestant issues in Russia.

The Religious Department's activities were the most intense in collecting information on Islam and the Islamic clergy of Russia. It considered bills that affected its competency when

necessary. It was the case with the opinion of the State Council of 25 January 1822 on corporal punishment for mullahs found guilty of criminal offense, approved by the supreme power [Complete Code of Laws of the Russian Empire–1, Vol. 38, No. 28891]. Officials of the Department recommended that the Decrees of 9 December 1796 Complete Code of Laws of the Russian Empire–1, Vol. 24, No. 17624] and 22 May 1801 [Complete Code of Laws of the Russian Empire–1, Vol. 26, No. 19885], which relived Orthodox priests from corporal punishment for such offense, should not be applied to OMSA mullahs. The decision was justified by their 'status' as 'capital tax payers' [Complete Code of Laws of the Russian Empire–1, Vol. 38, No. 28891]. Before subjecting a guilty person to corporal punishment, the local authorities were to withdraw from him the order approving his appointment as a mullah. At the same time, they were to inform the OMSA and the respective Muslim parish so that they could elect another person to the office 'to avoid suspension in divine service' [Complete Code of Laws of the Russian Empire–1, Vol. 38, No. 28891].

Thus, attempts at enhancing control over Muslims and increasing clerical trends in part of the ruling elite had no material effect on the supreme power's attitude to Islam. Religion was still viewed as being inherent to Russia. Those who professed it had every opportunity to satisfy their spiritual needs. There was an adequate legal framework and a network of institutions (*OMSA*) to settle disputes and find solutions that both the government and the Muslim community would be satisfied with.

In some aspects, Alexander I went to a greater lengths than Catherine of Russia. The Decree of 9 February 1824, under which the Neplyuev School was founded, stipulated that Muslim students could study not only their religious law but other subjects separately from Christians. They also had meals separately. Muslims studied all subjects taught at the School but for Greek Christian Law and Holy History, which were replaced by Quran Studies and Principles of Islam. 'Experts' representing

the Muslim clergy as well as civilians were invited to examine students in 'the rules of the Mohammedan faith' and Oriental languages [Complete Code of Laws of the Russian Empire–1, Vol. 39, No. 29770].

The facts are suggestive of the government's rationalism and its intention to have constructive relations with Muslim subjects. The law maintained the status quo. Being essentially conservative, it acted as a check for anti-Islamic trends.

Another sphere of life in which the government had intense interactions with the Tatar population was commerce. Already in the 18th century, entrepreneurship became crucial to the Tatar community. Catherine II's government encouraged it. As an impetus for Tatar entrepreneurship, several serving Tatars from Kazan and the Kazan uyezd, several Tatars from Seitov Posad, and a murza from Kasimov were granted the right to free trade and, being Muslims, recognized as Russian merchants for showing loyalty during Pugachev's rebellion under a decree in 1776 [Complete Code of Laws of the Russian Empire–1, Vol. 20, No. 14540]. The rapidly growing group of Tatar merchants and burghers in Kazan acquired a self-government authority of its own in 1781, the 'Tatar City Hall', which was responsible for judiciary, economic, and administrative issues [Izmaylov, 2009, p. 15]. Under a decree of 1784, a similar body was established in Seitov Posad [Complete Code of Laws of the Russian Empire–1, Vol. 22, No. 16089]. In 1763 and 1788, commercial privileges were approved for Kazan sloboda's Tatars [Nogmanov, 2005, pp. 77–94]. The reason behind the encouragement of Tatar commerce was broad. The Russian government was intending to use its Muslim subjects to ensure political and economic control over the Steppe and Middle Asia for a longer term.

During the reign of Alexander I, Tatar merchants continued to represent the government's economic interests in the East. This is supported by the the Edict of 16 August 1807 which enabled merchants of the Tobolsk and Tomsk guberniyas to employ yasak Tatars and laschmanns who knew 'Asian languages' as sales-

men to accompany caravans abroad [Complete Code of Laws of the Russian Empire–1, Vol. 29, No. 22590]. They were numerous enough for an official term that did not relate to any class in particular to be coined, the 'trade Tatars' [Complete Code of Laws of the Russian Empire–1, Vol. 32, No. 22594].

The Manifesto on the New Benefits, Distinctions, and Privileges Granted to Merchants, dated 1 January 1807, was a recognition of the role that the Tatar commercial capital played in the country's economy [Complete Code of Laws of the Russian Empire–1, Vol. 29, No. 22418]. A 'velvet book of noble merchant families' was to be opened in Saint Petersburg under the document. It was meant for Christian Russian merchants constituting the elite of the merchant class, that is, the so-called *first class merchants* (those were merchants whose ancestors in several generations were 1st guild merchants.—*A. N.*). A book like this for merchants of 'Mohammedan faith' was to be created in Kazan.

In the first quarter of the 19th century, the trade law was improved to remove groundless preferences. This did affect the dwellers of the Tatar slobodas of Kazan, who lost their commercial privileges, dating back to the early district century and enshrined in law in 1685, during the reign of Alexander I. The document granted commercial rights similar to those of Russian 'patent' merchants to sloboda's Tatars while exempting them from taxes and duties levied on merchants. The merchants of Kazan had been struggling to have the privileges abolished for two centuries when the Senate's Decree of 31 January 1821 finally did so. Dwellers of Tatar slobodas in Kazan now were to be registered as either trading peasants, or merchants, or burghers. The 1821 decree was adopted because the government wanted to universalize entrepreneurial procedures across the whole empire.

To sum up the period of Alexander I's reign, it was largely favourable for the Tatars. The legacy of Catherine II was preserved and enriched. Political priorities remained unchanged, including cooperation with the Tatar elite, religious tolerance and economic freedom. The

number of laws addressing the Tatar population sharply decreased as compared to the 18th century due to the high incorporation of Tatars into the Russian legal environment, as well as the government's approach of not bothering them with petty protective measures as

what would happen latter under Nicholas I. In the first quarter of the 19th century, the government only thought about its Tatar subjects when it was reasonably required. As a result, the legal code of the period contained few, if any, transitive and haphazard acts.

§ 2. The Tatars of the Middle Volga Region and the Cis-Ural Region during the Reign of Nicholas I

Information on Nicholas I's ethnic policies (1825–1855) in Russian literature is fragmented and largely focuses on the Jewish, Polish, Baltic, and Finnish 'questions', the Caucasian War of 1817–1864, etc. It thus focuses attention on the issues that became clear during that period of time, in the late 18–early 19th century. In the meanwhile, the government's relations with those ethnic minorities which became part of Russia at earlier stages were downplayed. This is the case with the Volga-Ural Tatars, who were very nearly the main addressees of the tsarist government's ethnic policy.

The historiographical neglect is to some extent attributable to the practice of ranking ethnic territories, which was enshrined into law during the reign of Nicholas I. According to S. Kodan, the legislative system that functioned in the Empire in the 1830s–1850s was a 'layer cake', where imperial law occupied the first layer, local enactments the second, and government approved custom the third [Kodan, 2003, pp. 178–179].

Local laws and custom, which prevailed over all-imperial regulations, remained efficient to a varying extent in the Baltic provinces, the Kingdom of Poland, the Western provinces, the Bessarabia Guberniya, the Caucasus Krai, Siberia, and the Grand Duchy of Finland, that is, in the country's periphery. As these territories were located on borders, policies were more circumspect there than in the rest of the Empire. The government was always looking for a balance between the interests of the centre and those of the local ethnic elites, who had, with a few exceptions, a 'high' culture.

Imperial law was completely effective in European Russia [Danevsky, 1857; Gulyaev,

1897]. The Volga-Ural Tatars also fell under the jurisdiction of these laws. These Tatars had come a long way in integrating into the Empire's legal environment from the mid-16th century. Characteristically, the government wanted full legal unification among non-Russian peoples in order to smooth out any authentic features in their economic, social, and cultural activities. When the achievement of certain success, the 'Tatar question' lost part of its relevance in the eyes of the government. In the early 19th century, hardly any legal documents viewed the Tatar population of the Middle Volga Region as socially or economically isolated, which is indicative of high legal incorporation.

To shed light on the Tatars' status during the reign of Nicholas I, it is generally more important to analyze Muslim-related government resolutions.

Even though the percentage of Tatars among Russia's population had decreased due to the addition of new territories (the Kingdom of Poland, Moldavia, Transcaucasia, etc.) by the second quarter of the 19th century,³ (they numbered 1, 327. 7 thousand people in 1833 [Tatar Encyclopaedia, 2010, p. 224], including 1, 019. 5 thousand people in the Volga-Ural Region [Iskhakov, 1993, p. 72], with the Empire's total population numbering 60 million), the government continued to pay special attention to them. Islam was the main reason.

Nicholas I adhered to the principle of religious tolerance as a pre-requisite of stability in the multi-religious empire. In turn, the possibility of professing the faith of one's ancestors

³ Here the Volga and Siberian Tatars, Meshcheryaks and Teptyars are meant.

Emperor Nicholas I

secured the national identity of non-Russian peoples, which was largely based on religious traditions.

The government's attitude towards the Poles was largely determined by its attitude towards Catholicism; that towards the Finnish, towards Lutheranism; that towards Jews, towards Judaism, etc. In turn, the attitude of non-Russian peoples towards the Russian monarchy was considerably determined by religious issues and whether non-Orthodox people could adhere to their traditions and customs.

Being Orthodox-oriented, the Russian government failed at times to match its laws with the canonical prescriptions of other religions that were wide-spread in the Empire, which sometimes caused conflicts. For instance, Catholics viewed the violation of their administrative canon by the Russian government as a pretext to disobey religious orders by the Russian Emperor. This eventually became one of the ideological reasons behind the Polish rebellion of 1830–1831, which was intended as protection of Catholicism [Tikhonov, 2007, p. 92].

The period of Nicholas I was a time when a large number of decisions were made concerning the lives of Muslims in Russia. We estimate

the number of documents which deal with Islam in the 'Complete Code of Laws of the Russian Empire' from 1825 to 1855 to be around 190. Most of them affected the interests of the Tatar population of the Volga-Ural region directly.

It was a period when the European constitutional ideas promoted by Alexander I were discarded for a new religious policy of a *national Orthodox Christian autocracy*. The place of each confession in the country's political system, as well as the rights and responsibilities of those who professed them, were specified.

Russian religious law was largely based on recognising Orthodox Christianity as dominant and superior [Ustavy' duxovny'x del, 1857, Article 1]. The government also recognized freedom of worship for 'foreign faiths', Jews, Muslims, and 'Pagans' [Ustavy' duxovny'x del, 1857, Article 2]. However, this did not ensure equal rights for confessions that were widely represented in the Empire as the law discriminated among them more tolerable and less so. Muslims, along with Jews and Pagans, occupied the third and lowest step of the Russian religious hierarchy. They were inferior to the dominant Orthodox Christianity and other Christian churches, who also held a lower status. It was the official religion, with which Islam had been historically competing in the Volga-Ural region, which influenced a number of legal restrictions on its development.

As the main evidence of its dominance, the Orthodox Church had the exclusive right to carry out missionary activities. It was the only church which could 'persuade adepts of other Christian confessions and non-Christians to accept its own doctrine of faith.' [Ustavy' duxovny'x del, 1857, Article 4].

In the late 1820s, the government began again to view missionary work as an important state function and thus attempted to aid such processes. In 1829, an amendment was introduced to the Charter of the Order of St. Anna, which entitled those clergymen who had converted at least 100 'non-Christians to the Orthodox faith' to a reward [Complete Code of Laws of the Russian Empire—2, Vol. 4, No. 3349]. In 1830, two missionaries were assigned

to the Diocese of Kazan; they were to persuade renegades to return to Orthodox Christianity [Mozharovsky, 1880, pp. 163–188].

In 1842, the Kazan Spiritual Academy was founded on the order of Nicholas I [Complete Code of Laws of the Russian Empire—2, Vol. 17, No. 15803], in which a dedicated anti-Islamic department opened in 1854. The academy offered classes in the Tatar and Chuvash languages to fill the lack of priests who spoke the languages of the Volga Region peoples.

The official principles of missionary activities were 'exhorting', 'lenience', and 'good examples'. However, any attempt at dominating the sphere by non-Orthodox confessions triggered the punitive mechanism of the state apparatus. The Sobornoye Ulozheniye of 1649 prohibited any propaganda of Islam—a prohibition which was not raised until 1917. The 'Seduction' of any Christian to Islam was a capital crime until the mid-18th century [Complete Code of Laws of the Russian Empire—1, Vol. 8, No. 5333]. The government's position in principle remained unchanged in the 19th century. It was the punitive measures that were altered. According to the Criminal Code of 1845, one of the key legal documents pertaining to Nicholas I's rule, those found guilty of 'seducing' Christians into Islam were subjected to prison and exile for penal labour for a period of 8 to 10 years. In case of violence, the period would be increased to 12–15 years [Complete Code of Laws of the Russian Empire—2, Vol. 20, No. 19283].

Apart from prohibiting Islamic propaganda, the state impeded the circulation of its influ-

ence at the lowest levels. This policy focused on restricting Orthodox Christians' contact with Muslims. The mid-18th century prohibition to build mosques in settlements where Tatars co-resided with Russians and the newly-baptised was confirmed in 1829 [Complete Code of Laws of the Russian Empire—2, Vol. 4, No. 2902]. It was in the same year when an order was issued under which only Muslim servants could be assigned to Muslim officers [Complete Code of Laws of the Russian Empire—2, Vol. 4, No. 3054]. In 1837, 'officers of Mohammedan law' were banned from serving in training carabineer regiments, apparently to prevent them from influencing younger soldiers [Complete Code of Laws of the Russian Empire—2, Vol. 12, No. 9285a]. The Decree of 30 April 1838 instructed local authorities to

First page of the I volume. Complete Collection of Laws-2. Manifesto on the 'Enthronement of Emperor Nicholas I'. 1825.

take measures to ensure that Christian and Mohammedan settlements formed separate communities in volosts with a mixed ethnic composition [Complete Code of Laws of the Russian Empire—2, Vol. 13, No. 11189]. According to a 1839 order, soldiers who converted to Orthodox Christianity in predominantly Muslim units were to be re-assigned [Complete Code of Laws of the Russian Empire—2, Vol. 14, No. 13022]. Of note is that it was not only people but Christian sacred objects that the law protected from contact with Muslims⁴.

While putting legal obstacles to the circulation of Islam as a religion, the government encouraged Tatars to convert to Orthodox Christianity, for which purpose it employed a large and well-developed system. A number of enactments were adopted during the rule of Nicholas I under which the newly-baptised were entitled to various benefits. Most of them were the same as regulations dating back to the 18th century. According to the Decree of 17 June 1826, non-Christians who were baptised could join any Christian community they wanted and were exempted from any duties for three years [Complete Code of Laws of the Russian Empire—2, Vol. 1, No. 409]. Payments in cash were the key form of encouragement in the army. According to a 1836 decree, Muslim and Pagan cantonists were entitled to a reward of 25 roubles in bank notes if they converted to Orthodox Christianity [Complete Code of Laws of the Russian Empire—2, Vol. 11, No. 8812]. Lower army ranks were entitled to a reward of 7 roubles 15 kopecks for converting to Christianity beginning in 1851 [Complete Code of Laws of the Russian Empire—2, Vol. 26, No. 25314]. Of great importance for the situation in the second quarter of the 19th century was the exemption of the newly-baptised and their families from recruitment payments and military service under the Recruitment Regulations of 1831 [Complete Code of Laws of the Russian Empire—2, Vol. 6, No. 4677].

⁴ According to the edict of 1841, icons inherited by non-Orthodox people were subject to transfer to the Orthodox people or the church within 6 months [Complete Code of Laws of the Russian Empire—2, Vol. 16, No. 14603].

An efficient way to attract people to the Christian Church was through the legal mitigation of punishment for those found guilty of criminal offenses⁵. According to the Code of Penalties of 1845, a non-Christian who converted to Christianity during investigation or trial could expect not only the punitive measure but the 'extent' and 'type' of punishment to be mitigated (that is, he could hope not only for the least severe punishment legally possible for the offense but also for the offense to qualify as less severe, meaning a different scale of punitive measures.—*A. N.*) [Complete Code of Laws of the Russian Empire—2, Vol. 20, No. 19283]. Moreover, the Resolution by the State Council of 6 April 1849 obliged the Senate and other judicial authorities to apply to mitigate punishment for those criminals who were willing to convert to Christianity [Complete Code of Laws of the Russian Empire—2, Vol. 24, No. 23155]. Gradually, certain forms of encouragement were replaced by others to adjust to the changing situation. For instance, the practice of issuing a 'monetary and clothing allowance' to baptised Muslims was abolished in 1837 [Complete Code of Laws of the Russian Empire—2, Vol. 12, No. 10135], though it was popular with Orthodox missionaries in the 18th century.

In spite of government's effort, missionary activities were of no great success in the 1830s–1840s. The greatest achievement of missionaries and local priests was in bringing non-Russian renegades back to Christianity formally and temporarily [Mozharovsky, 1880, pp. 195–206].

Apart from directly assisting the church's missionary activities, Nicholas I's policies were indirectly pro-Orthodox. This was manifested in enactments that imposed Christian customs on Muslims as all-state standards. One such example is the 'Decree on Non-Deviation from General Rules for Mohammedan Burial' of 1830, which defied century-old Islamic traditions and custom [Complete Code of Laws of the Russian Empire—2, Vol. 5, No. 3659].

⁵ The first edicts of this kind have been known to exist since the middle of the 16th century [*Acty*', 1836, Vol. 1, No. 241/2].

According to it, the 1704 law that prohibited burial 'before three days had passed' applied to Muslims in Russia. When it was issued in 1830, the decree met with severe disapproval among Muslims. In 1833, 677 clergymen from the Orenburg guberniya filed a petition to the Emperor, asking him to repeal the regulation. However, their request was denied [Varadinov, 1862, pp. 559–560].

The decree of 1835, that extended the wedding age restrictions that were introduced for Orthodox Christians in 1830 to Muslims, was also received without enthusiasm [Complete Code of Laws of the Russian Empire—2, Vol. 10, No. 7990]. The minimum wedding age of 18 years for men and 16 years for women established by the government was quite reasonable and in line with the government's concern about women's health and that of their children [Mironov, 1999, pp. 167–169]. However, it was in contradiction to the Sharia, which set an age majority of 15 for men and 9 for women [Tornau, 1850, p. 125; Kerimov, 1999, p. 116].

In terms of governmental interference in Islamic religious affairs, it should be mentioned that the conditions under which Islamic places of worship were constructed and used were the focus of intense government attention. In 1829, Nicholas I personally approved a 'model' mosque design by the Construction Committee of the Ministry of Internal Affairs [Complete Code of Laws of the Russian Empire—2, Vol. 4, No. 2902]. The drawings of four new 'model' wooden mosques, approved by the Tsar and authorized under the Senate's Decree of 18 January 1844, replaced it [Complete Code of Laws of the Russian Empire—2, Vol. 19, No. 17539; Zagidullin, 2002, p. 271].

Islam and its adherents were oppressed not only as compared to the dominant Orthodox Christian Church but also in comparison to other Christian confessions. Disputes which occurred when the interests of different confessions clashed are representative of this trend. There is legislative evidence that the government deliberately referred to the country's religious hierarchy when settling such disputes. With few exceptions, it supported Orthodox

Christians over Catholics or Lutherans and the latter over Muslims or Jews. Conversion procedures are indicative of this.

According to Russian law, a Muslim convert to Catholicism, Armenian Gregorian Christianity, or any other Christian faith was subject to authorisation by supreme power [Ustavny' duxovny'x del, 1857, Article 6; Complete Code of Laws of the Russian Empire—2, Vol. 10, No. 8480; Vol. 17, No. 15195]. Representatives of non-Orthodox Christian confessions were entitled to carry out missionary activities among people from the Caucasus and regions bordering Russia [Complete Code of Laws of the Russian Empire—2, Vol. 35, No. 35941]. As has already been mentioned above, it was legally impossible for a Christian to convert to Islam, and it was also a criminal offense.

The inequality of 'tolerable' confessions was especially obvious in family and marital relations. In the first half of the 19th century, mixed marriages of Muslims with representatives of certain Christian confessions became possible. For instance, the earliest mention of mixed Muslim and Lutheran marriages dates back to 1817 [Varadinov, 1859, pp. 530–531]. They were legally justified soon after Nicholas I's enthronement in the Decree of 17 June 1826, followed by the 1832 Charter of the Evangelical Lutheran Church [Complete Code of Laws of the Russian Empire—2, Vol. 1, No. 410; Vol. 7, No. 5870]. Those willing to enter into such a marriage were to ask for the Emperor's permission. The Muslim partner was openly inferior and in fact had no voice. According to the law, it was a Lutheran priest who officiated such marriages. The Muslim husband was to undertake in writing to bring up his children as Lutherans and refrain from impeding his wife and children's professing of the faith, as well as from persuading them to turn to Islam. In case he violated any of these undertakings, the marriage was to be severed and the man subjected to judicial attainder and exile to Siberia [Complete Code of Laws of the Russian Empire—2, Vol. 20, No. 19293; Article 192]. The procedure was essentially the same when a Muslim's wife converted to Christianity.

It should be noted that mixed Muslim and Lutheran marriage was the only type of inter-confessional marriage which the government never discouraged. For instance, Muslim and Catholic marriages were prohibited because they were viewed as Catholic proselytism. The government's attitude towards mixed Muslim and Orthodox Christian marriages varied depending on the period. In particular, the 1841 Charter of Spiritual Consistories permitted such marriages [Complete Code of Laws of the Russian Empire—2, Vol. 16, No. 14409] but was later abolished. The government's attitude towards families where one of a Muslim's wives converted to Christianity was noteworthy. A 1836 law provided for maintaining such marriages without an Orthodox church wedding as long as the husband 1) undertook to baptize his children into Christianity; 2) promised to refrain from persuading his wife to return to Islam and impeding her religious practice; 3) undertook to divorce the rest of his wives and live in a monogamous family. Otherwise the marriage was severed, and the wife could marry a Christian [Complete Code of Laws of the Russian Empire—2, Vol. 11, No. 9610].

Catholics, Lutherans, Protestants, and other Christian confessions other than Orthodoxy were always poorly represented in the Orthodox-Muslim-Pagan population of the Volga-Ural region. This is why Tatars were rather unlikely to convert to one of these faiths or marry their representatives. However, the very fact that a legal procedure for such disputes existed is characteristic. It indicates both that the Russian law was highly developed in the second quarter of the 19th century and that religion was a high priority for it.

Belonging to a third-rate confession, Tatars suffered from other discriminative practices that were legalized during the rule of Nicholas I. In particular, qualification requirements and other restrictions for elected positions in administrative bodies were established. It was resolved in 1835 that volosts where pagans co-resided with Christians could not elect pagan 'volost/village leaders or scribes' as they had been doing [Complete Code of Laws of the

Russian Empire—2, Vol. 10, No. 8021]. The Decree of 30 April 1838 extended this provision to Christian-Muslim villages and volosts [Complete Code of Laws of the Russian Empire—2, Vol. 13, No. 11189]. Muslims could only be elected assistant volost administrators or leaders, etc. However, the decree was sometimes neglected in practice [Malov, 1892, Vol. 223].

At the end of Nicholas I's rule, in 1854, following the abolition of the Tatar City Hall, the State Council permitted the Muslim community of Kazan to elect their representatives to the city дума provided that they constituted no more than one third of the total membership [Complete Code of Laws of the Russian Empire—2, Vol. 29, No. 28704].

Tatar merchant's confessional affiliation negatively affected their status. The institution of honorary citizens was established in Russia in 1832 to encourage entrepreneurship [Complete Code of Laws of the Russian Empire—2, Vol. 7, No. 5284]. Tatars could receive the title and inherit it. However, they were legally deprived of a number of benefits that Orthodox Christian entrepreneurs enjoyed. In particular, they could not receive awards, orders, and ranks as Russian merchants did or apply for civil service for their children after 12 years in the 1st guild [Complete Code of Laws of the Russian Empire—2, Vol. 18, No. 16599].

The status of the Muslim clergy was indicative of that of Russia's Tatars in general. Nicholas I's rule was marked by a large number of regulations concerning its rights and responsibilities.

Mullahs' low social status affected them negatively. From the 1st quarter of the 18th century, they were legally defined as state peasants and presented as tax payers in censuses in the Middle Volga region [Complete Code of Laws of the Russian Empire—2, Vol. 25, No. 23817]. This made them stand out against Christian clergymen and the Muslim clergy of the Crimea, who constituted special clerical classes and enjoyed certain privileges⁶. Until

⁶ Benefits were provided to the Islamic clergy of the Crimea by the edicts of 9 December 1796 and 22

1850, Tatar mullahs were subjected to corporal punishment for criminal offenses [Complete Code of Laws of the Russian Empire—2, Vol. 25, No. 23932], as well as to military recruitment.

These facts provide insight into one of the aspects of the government's relations with the Volga-Ural Tatars, namely the legal restrictions that they faced in their everyday life in the second quarter of the 19th century. Nicholas I personally approved many of the restrictions as he sincerely believed the Orthodox Christian Church to be the pillar on which the Russian monarchy rested. This belief, as well as his idea of his duty as a monarch, which included making every effort to enhance Orthodox dominance in the state, greatly influenced his decision-making and attitude towards the situation. The fact below is illustrative.

During his only stay in Kazan in August 1836, Nicholas I refused to meet representatives of the local Tatar population as Catherine II had done in 1767 [Ibneeva, 2006, p. 115]. Nicholas I had different priorities. When sight-seeing in Kazan, he paid special attention to visiting the burial vault under the church in memory of the Russian warriors who had fell during the conquest of the city in 1552 [Zagoskin, 2005, pp. 245–246].

It is beyond doubt that the events in the Caucasus, where a war was fought against the mountain peoples from 1817 to 1864, contributed to the government's negative attitude towards Muslims in general and Tatars in particular. The idea of expanding the Empire with such strategic areas as the Caucasus was popular with the Russian public. The cost, though, was high. In some periods, as many as 60 to 200 thousand military personnel were concentrated in the Caucasus, their maintenance being extremely burdensome on the treasury [Otechestvennaya Istoriya, 1996, p. 431]. Enormous financial expenditures, dramatic casualties, and periodic military failures caused irritation and dislike for Muslims in the public, which the government could not neglect.

At the same time, it would be wrong to restrict our analysis to the negative aspects of Nicholas I's policy towards Muslim Tatars, describing it in terms of government oppression. The policy was ambiguous and controversial. The law of the second quarter of the 19th century combines discriminative decrees with those consistent with the principle of religious tolerance. Such important aspects of Muslim lifestyle such as polygyny, Hajj,⁷ and oath-swearing according to Islamic formulae were tolerated⁸.

Some benefits that Christian institutions enjoyed applied to Islamic ones. When religious rites were performed directly in the houses of Islamic clergymen, they were usually exempted from the accommodation duty [Complete Code of Laws of the Russian Empire—2, Vol. 30, No. 29483]. Islamic madrasahs and makhtabs, though up to 1 per locality, were exempted from this duty under a 1850 decree [Complete Code of Laws of the Russian Empire—2, Vol. 25, No. 23892].

The legal status of the parish Muslim clergy was established during the reign of Nicholas I. In 1826, the Senate permitted village communities to undertake their imams' state duties [Complete Collection of the Laws of the Russian Empire—2, Vol. 1, No. 564]. The follow-

⁷In 1843 the procedure for performing hajj by Muslims of the Orenburg guberniya was officially established. This was stipulated in the edict of 30 December 1856, which established this procedure for the Crimean Tatars [Complete Code of Laws of the Russian Empire—2, Vol. 31, No. 31332]. Anyone who wanted to travel to visit sacred places had to seek support from the rural community and obtain a certificate of reliability from the local authorities.

⁸The authorities never tried to impinge on this right, and ever since the Council Code of 1649 was adopted had been confirmed repeatedly, including in the 19th century: See: The Charter of the Criminal Law of 1864 [Complete Code of Laws of the Russian Empire—2, Vol. 39, No. 41476]. The reason for this tolerance was that the authorities recognised that the oath taken should be in accordance with the religion one adheres to. Otherwise, it would fail to bond him effectively. The form of the oath changed several times. One of the last versions of the judicial oath was introduced by the Regulation of the Committee of Ministers of 25 April 1850 [Complete Code of Laws of the Russian Empire—2, Vol. 25, No. 24116].

May 1801 [see: Complete Code of Laws of the Russian Empire—2, Vol. 1, No. 564].

ing procedure for electing mullahs and other local clergymen was legalized in 1837: 2/3 of all family heads constituting the village community were to vote for the candidate. Elections were to be attended by volost and village leaders. All electors were to sign the resolution. When registered with the volost administration, the resolution was to be submitted to the zemstvo court and then to the provincial administration for final approval [Complete Code of Laws of the Russian Empire—2, Vol. 12, No. 10594]. In 1855, the State Council established age restrictions for people assuming clerical offices. The minimum age for qadis, akhunds, muhtasibs, and mudarrises was 25; for khatibs and imams, 22; and for muezzins, 21 [Complete Code of Laws of the Russian Empire—2, vol. 30, no. 29040].

The state wanted to legitimize decisions made by authorities in Muslims' eyes. It even began to encourage imams to become members of judicial and other bodies through monetary stimulation. In 1852, a compensation was established for travel costs in business trips to public institutions [Complete Code of Laws of the Russian Empire—2, Vol. 27, No. 25972].

The rule of Nicholas I was marked by the introduction of parish registers in OMSA-controlled regions in 1828 [Complete Code of Laws of the Russian Empire—2, Vol. 3, No. 2296]. Beginning then, the government could receive accurate information on the Muslim population because the record keeping function was vested directly in parish imams. It was their responsibility to maintain dedicated books reporting births, deaths, marriages and divorces in Muslim settlements. Since most imams did not know Russian, they were allowed to keep parish books in Tatar.

Nicholas I continued Alexander I's policy of legalising certain Islamic regulations. It was during his rule that decrees permitting the application of Sharia to cases of property division among Muslims' heirs were adopted in 1826 and 1836 [Complete Code of Laws of the Russian Empire—2, Vol. 1, No. 386; Vol. 11, No. 9158]. In 1830, cases related to children's disobedience to their parents were included in the jurisdiction of Islamic religious authorities

[Complete Code of Laws of the Russian Empire—2, Vol. 5, No. 3559].

It was in the era of Nicholas I that the Muslims of the Volga-Ural region received access to higher and secondary education establishments, which was determined by a severe need for officials to implement government policy in the southern and eastern peripheries of the Empire. The Neplyuev Military School in Orenburg and the Department for Foreign Languages in the Kazan Gymnasium school, which began to accept non-Christians in 1836, were among such educational establishments [Complete Code of Laws of the Russian Empire—2, Vol. 11, No. 8742]. Muslims born in Orenburg Krai could continue to study at the Medical Faculty of the University of Kazan [Complete Code of Laws of the Russian Empire—2, Vol. 11, No. 8771; Vol. 18, No. 17136],⁹ but had no access to other occupations¹⁰. The state also reserved the right to use them for a different purpose [Complete Code of Laws of the Russian Empire—2, Vol. 24, No. 23616].

This suggests that, being Orthodox-oriented, Nicholas I could not neglect the actual situation. In particular, he could not but admit the value of Islam as underlying public order. He did not realize it until about the second half of the 1830s. There is evidence that the 'thaw' in Muslim policy is attributable to revolutionary events in Western Europe. At some point, the Emperor and his associates came to view Islamic 'fanaticism', familiar and nonthreatening to the state's

⁹ Upon graduation from university, persons of non-Russian origin were obligated to serve as doctors in Orenburg guberniya for at least six years. The edict of 1843 established a salary for them in the amount of 257 rubles 90 kopecks [Complete Code of Laws of the Russian Empire—2, Vol. 18, No. 17099]. But despite the existing practice in Russia, they still could not raise their social status even after having received higher education. Pursuant to the edict of 1850, people from the Baskirian and Meshcheryak class who had completed a course of study in a Russian educational institution were not to be excluded from this class [Complete Code of Laws of the Russian Empire—2, Vol. 25, No. 24431].

¹⁰ The Decree of the State Council of 31 October 1849 prohibited Muslims from transferring from the medical department to other departments of the university [Complete Code of Laws of the Russian Empire—2, Vol. 24, No. 23616].

foundation, as less dangerous than the atheism and revolutionary ideas that were coming from Europe. Being apprehensive about external threats, they had to search for compromise with the Muslim population of the Empire, in particular, the most well-developed and Europeanized part of it in the Volga-Ural Region.

Facts of life also motivated greater flexibility in their relations with the Islamic world. The annexation of the Caucasus and Kazakhstan increased the Muslim population of Russia greatly in the first half of the 19th century, making it too powerful to neglect.

Nicholas I took a number of public measures to demonstrate the government's respect for Muslims' religious feelings to the Muslim community of Russia in the last decade of his rule. A series of decrees was issued in 1844–1846, under which the cross on Muslim-recognized orders (those of St. George, St. Anna, St. Vladimir, St. Stanislaus.—*A. N.*) was replaced with the imperial eagle. [Complete Code of Laws of the Russian Empire—2, Vol. 19, Nos. 18137, 118188, 18286; Vol. 20, Nos. 18650, 19227; Vol. 21, No. 20551]. Muslims in penal battalions received Fridays off to pray beginning in 1849 [Complete Code of Laws of the Russian Empire—2, Vol. 24, No. 23062].

The reason behind many regulations on the rights of Muslims and the clergy's responsibilities that appeared in the second quarter of the 19th century is not the increasing bureaucratisation of the Russian administrative system,

which was taking place, but rather the need for actual content to fill the principle of religious tolerance. When Islam was subjected to persecution, the government did not find it necessary to work out any standards for Islamic institutions.

The Crimean War (1853–1856), which the Russian government initiated on the pretext of protecting the Orthodox Church's interests in the Ottoman Empire, actually divided Russian society confessionally. Rumour spread among Tatars that the government was intending to Christianize Russia's Muslims, that the Turks were defeating the Russians, etc. [Materialy', 1936, pp. 156–161]. In February 1855, the government resolved to take aggressive measures against Tatar refusal to fulfill recruit duty. Several initiators of the movement went to prison [Complete Code of Laws of the Russian Empire—1, Vol. 30, No. 29033].

Thus, the policy of Nicholas I towards the Tatars of the Volga-Ural region was ambiguous and controversial. The fact that tolerant decrees were combined with those discriminating against Tatars as Muslims in the legislation of that period is indicative of the confrontation of two trends within the Russian ruling elite. Apprehensions lest internal and external threats could 'shake the foundation' largely checked the ambition to force the Tatars and other ethnic minorities' integration into the administrative, social, and cultural environment [see Islam, 2001].

CHAPTER 3

The Autocratic Government's Domestic Policy for Muslim Tatars in 1861–1905

§ 1. A Revision of Catherine II's Concept of 'Disciplining' Islam in the Empire

Anatoly Remnev, Ildus Zagidullin

In the middle of the 19th century, a new generation of public officials in the Empire's administration developed a 'new point of view' of Islam, which included a revisionist attitude towards the principles of Catherine's confessional policy. This primarily affected the confessional and socio-cultural policy for the Kazakhs. The combined ethnic and confessional self-identification of Oriental peoples and dangerous competition with the Volga Tatars, who were the most well-developed group in cultural terms, were seen as the main threat to the Empire.

The head of the Orenburg Borderline Administration V. Grigoryev attributed Kazakh protests against Russian government's measures to the activities of Tatar and Bashkir mullahs [Kharuzin, 1888, p. 96]. In terms of evolutionism, Islam was viewed as a dead-end branch. Its civilising potential was denied. Imperial experts worked out an ideological justification for seeing it as a force that impeded Kazakh integration into the Empire. The Tatars and Islam became dangerous political and ideological opponents.

It was not only the Caucasian and Crimean Wars but the aggravated 'Polish issue' that determined the political shift. Facing the threat of Ukrainian, Belorussian, and Lithuanian Polonisation and Estonian and Latvian Germanisation in the western peripheries, the Empire found the Tatars to be no less dangerous to the Russification of the Volga peoples, the Bashkirs, and the Kazakhs in the eastern periphery. K. Matsuzato classified Muslim Tatars as the Empire's 'respected enemies' [Matsuzato, 2004, pp. 450–

451], while the so-called Muslim question was burning on the list of its numerous issues [Vorobyeva, 1998, pp. 40–55; Campbell (Vorobyeva), 2001, Vol. 4 (122), pp. 132–157]. It became common to criticize the former policy of ignoring Islam and express apprehension about Kazakhs' 'Tatarisation'.

Suspicion towards the activities of the Islamic clergy developed against this political backdrop. It was a common worry that the Orenburg Muslim Spiritual Assembly would become an 'Islamic Rome' for Russia's Muslims. The muftiate institution began to be viewed as a powerful instrument for 'Muslim consolidation to enhance their autonomy, reinforce Islam, and raise it in the eyes of the non-Muslim non-Russian population that co-resides with Muslims' in the 1860s [Arapov, 2004a, p. 108]¹¹. Beginning in the middle of the 19th century, Kazan was considered central to anti-Islamic Christian missionary activities.

Several causes raised the question of changes to the Empire's policy in its Asian steppe periphery in the early 1860s. Firstly, state borders changed in the south and the east, turning the Kazakh Steppe into an inner periphery. Secondly, bourgeois transformations took place, which reformers wanted to extend to the Empire's eastern population. Thirdly, new national priorities seemed to promise a synthesis of the imperial and the national to build

¹¹ While at first the Orenburg governor-general N. Kryzhanovsky suggested that the Orenburg Muslim Spiritual Assembly should be reformed by tightening state control over its operations, in 1870 he had already advocated for its dissolution.

the ideal 'one and undivided' Russia through the Russification of peripheral peoples and territories. These reasons all dealt with the gradual erasing of legal and administrative differences between inner provinces and the periphery ('administrative Russification') and changes to the 'power geography' through the modernisation and standardisation of the Empire's administrative institutions and practices. The changes to the 'steppe policy' were most likely partly determined by the general reformist trend of the 1860s, which not only affected the administration and the judicial system but aimed at extending the contact area in which Russian and Kazakh societies interact, mainly through peasant migration, Russian merchants' economic activities in the region, and the modernisation of the educational and confessional policy. The Empire changed the rules of the game in the Steppe. It shifted from traditional cooperation with the nobility to a democratic imperialism with greater centralisation and direct administration.

The government's anti-Islamic policy in the south-western periphery, which was totally inconsistent with Catherine II's principle of 'disciplining Islam', was enshrined in the 'Provisional Regulation on the Transformation of the Administration of the Kyrgyz Steppes of the Orenburg and Western Siberian Departments and the Ural and Siberian Cossack Host', dated 21 October 1868. It was implemented in a consistent manner until the fall of the autocracy. Aggressive accusations of fanaticism replaced the tolerant vocabulary towards Muslims and Islam. The Empire came to proclaim itself the protector of those peoples who were suffering from Tatar economic and cultural expansion.

Thus, the Muslim question in the Kazan steppe included, apart from the confessional constituent, an apprehension that, lest the Empire should lose the cultural struggle on its eastern borders, the whole Kazakh Russification policy had to face the Tatar ethnic and religious project, along with the traditional Muslim threat from Central Asia. It became increasingly common to view it as a threat to the Russian people themselves to be subjected to 'Tatarisa-

tion', 'Yakutisation', 'Buryatisation', 'Kazakhisation', etc. [Sanderland, 2005, pp. 199–227].

As the imperial policy became nationalized and the range of its socio-cultural objectives broadened, new activists entered the stage. These were Orientalists and teachers, who exerted heavy pressure on diplomats and military personnel, who were the former ideologists and practitioners in the Kazakh Steppe. The most influential theorists, who largely determined the linguistic policy towards the Kazakhs, were the famous Orientalists V. Velyaminov-Zernov, V. Grigoryev, V. Radlov, N. Ilminsky, along with their associates and disciples I. Altynsarin, N. Ostroumov, A. Vasilyev, A. Alektorov, and others. V. Grigoryev's biographer N. Veselovsky gave him special credit for officially bringing the Kazakh language into use [Veselovsky, 1887, p. 217]. The Orientalist Professor N. Ilminsky from Kazan was a key figure in the new linguistic policy. Like V. Grigoryev, he insisted on the existence of a threat of Tatar cultural and religious awakening [Nishiyama, 2003, pp. 200–224].

The prominent public official D. Tolstoy, who occupied the posts of Chief Procurator of the Synod (1865–1880), Minister of Public Education (1866–1880), Minister of Internal Affairs and Chief Gendarme (1882–1889), as well as his successor to the post of Chief Procurator of the Synod K. Pobedonostsev (1880–1905), had major influence on the government's domestic policy after the reforms.

Following his visit to Orenburg in 1876, Count D. Tolstoy presented to the Emperor a programme for combating the Muslim Tatar influence in the Kazakh Steppe [Central State Archive of the Republic of Kazakhstan, f. 369, inv. 1, file 2040–a]¹². He divided the Muslim peoples in the east of the Empire into three groups, depending on how high their 'religious fanaticism' was. The Tatars ranked first because they were the least enthusiastic about Russian education, followed by the largely Muslimised and Tatarised Bashkirs. Tolstoy viewed the

¹² He invited N. Ilminsky to accompany him on this trip as an expert.

Count D. Tolstoy.
Photo from the second half of the 19th century

government's purpose regarding these groups as ensuring that they preserved 'their style' without turning into Tatars. The Kazakhs, who had begun to become 'Tatarised', ranked third [Materialy', 1936, p. 338].

For the purpose of resisting Muslim Tatar influence, alphabets were to be created for a number of peoples in the empire and books published in their mother tongues. Ensuring the study of Russian was also presented as an important government objective.

Thus, evolutionism and the theory of cultural progress, along with the paternalistic idea of protecting the Kazakh, Bashkir, Chuvash, and Finnish peoples from the influence of Islam and Tatar culture, gave an attractive populist tinge to the Russification-oriented activities of imperial activists. They seemed to show concern about the peoples and their authentic cultures.

When participants of the Caucasian War, who had faced the heroism and fierce resistance to Russian arms of the mountain Muslims, fighting for their independence and traditions, as well as military personnel who had served in western provinces and seen the 'national claims' of the Poles as a threat to the Empire's integrity were appointed to Muslim-populated regions

and received broad administrative powers, they introduced a policy based on discrediting Islam and Muslims. It was not uncommon for them to use methods from their experience in the Caucasian War and military service in the western provinces.

In annexed Turkestan, the 'new vision' of Islam took the form of a government policy that ignored century-old relations between the government and Islam. It consisted of denying to recognize Islamic institutions, primarily the clergy, which by no means meant a lack of government control over the local population. Its author and implementor was Turkestani Governor General K. Kaufman (in office in 1867–1882), who joined the Caucasian war in 1844 and served as Governor General of the North-western Krai in 1865–1867.

Orientalists in public offices, who were in control of the Kazakhs, developed a theory of 'state usefulness' of fragmenting the Muslim population by cultivating linguistic and cultural differences, which became common in the Volga-Ural Region, where the government encouraged the establishment of Kazakh and Bashkir schools to combat Tatarisation and founded Finno-Ugric, Chuvash, and Tatar Christian schools according to N. Ilminsky's method of combating Islamisation.

The mass conversion of Tatar Christians to Islam in the 1850s–1860s caused local bishops to throw public accusations at Muslim Tatars of Islamisation of the indigenous peoples of the Volga-Ural Region. It was not infrequent that the formal nature of the 'renegades' baptism in previous centuries and the poor efficiency of former missionaries and priests were downplayed. High-ranking officials viewed the clerical authorities' accusations of Muslims and the appeal to the public fear of an Islamic threat in the Volga-Ural Region as evidence that society had come to believe the Orthodox clergy to be inefficient because of its adherence to the 'language' and not 'spirit' of faith by the late 1850s–early 1860s [Dolbilov, 2010, p. 136].

Following the establishment by the government of Anti-Muslim Department of the Kazan Spiritual Academy in 1854, an anti-Islamic missionary school developed. Works

by its members shaped the public idea of an 'Islamic threat' to the national security of the Russian Empire and made a major contribution to the Islamophobia of Russian public officials of all ranks. Research by Russian Orientalists and Kazan missionaries was of great significance too. In 1912, V. Bartold claimed Russian Oriental studies to be 'generally backward' as compared to those of Western Europe, complaining that 'not a single more or less elaborate work on Islam has appeared in Russia as a step forward in science' and noted the Russian literature to be dominated by works written 'either to protect Islam or to combat it.' [Bartold, Vol. 6, p. 366]. However, after his trip to Turkestan in 1902, Russia's most famous Orientalist expressed doubt that Muslims would support the Russians and the Russian Empire, meaning that it was in danger of dissolution. As the revolutionary events of the early 20th century demonstrated, V. Bartold's prediction of Muslim separatism failed to materialize [Iskhakov, 2007, p. 71].

The above-mentioned factors resulted in two opposite attitudes towards Islam to form in the government in the 1860s–1870s. The first of them was popular in Turkestan, the Steppe Areas, and in the Northern Caucasus. It consisted in fully revising Catherine II's traditions of government confessional policy. Its adher-

ents viewed the establishment of the Orenburg Muslim Spiritual Assembly as a defeat in the fight against Islam. They were opposed to the 'Muslim fanatics' consolidating power. The camp included N. Ilminsky, his disciples, the Military Minister L. Milyutin (1860–1881), etc. Their opponents insisted on continuing to centralize control and supervision over Islamic institutions, primarily the clergy, by establishing new religious administrative bodies like the OMSA. They suggested that Caucasian borders should be sealed, lest any religious ideas inconsistent with the Empire's interests should infiltrate the region, and that Muslims should be prohibited from studying in Islamic centres abroad, etc. Officials of the Ministry of Internal Affairs were the most steadfast adherents of the approach [Severnyj Kavkaz, 2007, pp. 253–254].

High-ranking officials sought new solutions in imperial confessional engineering. They wanted to see the government to affect the religious affiliation of its subjects while remaining culturally aloof from clerical elites (especially those who were non-Orthodox Christian) and manipulating negative images of Islam as 'fanatic', 'superstitious', mercenary, excessively worldly, etc.' [Dolbilov, 2010, p. 162]. As a result, imperial regional policies for Islam caused tension to increase among Muslims.

§ 2. Tatars in Self-Governing Authorities: Zemstvo, City, and Peasant Authorities

Ildus Zagidullin

In the 19th century, the class hierarchy of the Russian Empire was the main criterion for determining the legal and, to a significant extent, socio-economic status of Russian subjects. In the post-reform period, the class-regulated scale of rights and responsibilities for Russia's multi-ethnic society was developed further. It was not contrary to the population's class status but allowance made for it that Alexander II introduced his liberal reforms. A. Kappeler rightfully remarked that even though the Great

Reforms of the 1860s–1870s did serve as an impetus for modernisation, 'the social mobility of society and its complementary function beyond class and regional limits were still in their infancy in the late 19th century' [Kappeler, 2005, p. 400]. This is why even in the early 20th century, one's social status determined one's legal standing, especially in rural communities.

It is not uncommon for historians speaking of the Tatars' status in the Russian Empire to

limit themselves to saying that local peoples lived among the titular population and were by no means legally different from that population in terms of either social status or privileges, while the specifically 'imperial' nature of government here was not quite obvious. The right approach would be not to analyze the rights of those ethnic minorities in each class group, but to compare the class scale for each ethno-confessional community over a long period, namely from the time the Tatars became part of the Muscovite State. It would also be methodologically correct to view Tatars' social and legal status in the 19th century as an outcome of the government's domestic policy in relation to them in previous centuries. In 1552, the Muscovite State conquered the Khanate of Kazan, which was approximately equal to Moscow in social and economic development. The Khanate contained all the social and public institutions characteristic of a feudal state formation. They were transformed in the following decades, while any protests and movements of the local population against discriminative government policy were suppressed cruelly.

Class groups were introduced in the new Russia within the framework of the Petrine reforms. Peter I, whose goal was to form a new Russian Christian elite, liquidated the Muslim Tatar feudal nobility as a class because most of them had remained true to their confessional identity in spite of heavy government pressure. By defining Tatar murzas as members of the rural taxable class, the government turned the Tatars into a non-privileged element within Russian society. They formed a peasant population and were to play a poor part in the country's economic and socio-cultural development with all the implied consequences of such a position. The Tatar nobility that was restored in the late 18th –early 19th century was poor and merely held an 'honourable title' [Azamatova, 2008, p. 132]. The absence of Tatar public officials was caused directly by their low class status and the small number of their nobility.

Another major influence on Tatar social development within the Russian Empire was the government's confiscation of the traditional

sources of income of Islamic institutions, including waqf and other property after 1552. Having no other funding, Tatar culture encountered a state of stagnation. It was not until a stratum of merchants formed in the 18th century, who undertook to maintain Islamic educational centres, that the Islamic education system was restored.

The development of capitalist relations, liberalized legislations, and other reform-minded circumstances facilitated Muslim integration into Russian society. These processes were most pronounced among urban dwellers and entrepreneurs. The modernisation of Russia extended and accelerated the renewal processes among its Tatar population.

A number of reasons explaining the suppression of such processes should be mentioned as well. The most important of these was that the Volga-Ural region was economically and industrially behind as compared to European Russia's average. Class restrictions and Russian educational qualification requirements also affected the implementation of liberal reforms.

Elements that most scholars believe to have been 'colonial' (personal and institutional superiority of one nation over another which is culturally different) were present in the Volga Region. Representatives of different ethnic groups within the same class had generally the same status [Werth, 2005, p. 59].

In the post-reform period, the government applied all-Russian laws to the Empire's periphery and pursued the goal of unifying its non-Russian population in terms of language and culture. Part of the measures took place under the slogan of implementing progressive Western European transformations—the liberal reforms of the 1860s–1870s—into the social and cultural spheres. The supreme authorities extended the scope of liberal reforms in pursuit of political purposes. The transformations were aimed at reinforcing and modernising the unitary multi-ethnic empire with Orthodox Christianity as its official religion. It is no wonder that the interests of privileged classes and the Russian nation enjoyed the highest priority. This trend in the country's development was

especially pronounced during the reign of Alexander III.

In fact, the government adopted consistent measures to create a national state in the European part of the country by ignoring the fundamental principles of the Empire's non-Russian administrative system.

In this respect, the abolition of the military canton system of administration and the transfer of the Bashkirs, the Mishars, and the Teptyars to the civil authorities in 1862–1865, as well the introduction of universal provincial administrative institutions in the large region, greatly affected the Muslims of the Cis-Ural region. This reform accelerated the transformation of the Cis-Ural region into an inland territory of Russia, like the Middle Volga region, through intense settlement with migrants from central areas and the introduction of Russian private land ownership. The liquidation of the institution of the Orenburg Governorate-General and allocation of its functions to different branches of power in 1881 was an important stage in the establishment of new standards. Thus, the Tatars and the Bashkirs, as the main groups of Muslims under OMSA jurisdiction, found themselves in a legal environment with a uniform administrative system.

Zemstvos. The liberal reforms of the 1860s–1870s, for which the specific character of Russian society was taken into account, were implemented in a gradual and uneven way in the periphery. In key Tatar-populated areas, zemstvos were established at the same time they were introduced in Russia's central regions, which is suggestive of deep integrative processes in the provinces. We are inclined to attribute the fact that zemstvo institutions were established in the Ufa guberniya as late as in 1874, with a 10-year delay, despite petitions by the Governor General of Orenburg (1864) and the nobility of Ufa guberniya (1865) [Azamatova, 2008, pp. 22, 23] to rapid Russian colonisation in the region resulting from the mass sale of patrimonial Bashkir land and the establishment of groups of large Russian landowners and migrant peasants.

The new class qualification requirements ensured a special status for Russian noblemen and public officials within local self-government authorities. To establish zemstvo institutions in regions where non-Russian noblemen were predominant (Polish, Belarusian, the right-bank Ukrainian provinces, the three Baltic provinces) would mean that the national elite would play a more important role in uyezds and provinces, which would turn zemstvos into consolidated bodies for the national intelligentsia, which contradicted imperial interests. The fact that no zemstvos were established in the Astrakhan, Orenburg, and Arkhangelsk guberniyas, as well as in Siberia [Istoriya Soyuza sovetskix soczialisticheskix respublik, Vol. 5, pp. 99–100], where there were hardly any landowners, also confirms our findings concerning the social and ethnic priorities of post-reform liberal transformations. In 1898, the Ministry of Internal Affairs submitted two zemstvo bills to the supreme authorities. One dealt with nine western governorates, the other covered those of Astrakhan, Orenburg, and Stavropol. Chief Procurator of the Synode K. Pobedonostsev and Minister of Finance S. Vitte were opposed to the idea of expanding zemstvo self-administration. 'The one who controls the country should control the administration,' S. Vitte said emphatically. Soon, in 1899, the initiator of the bill I. Goremykin was removed from the post of Minister of Internal Affairs for being politically short-sighted [New Encyclopaedic Dictionary, Vol. 18, pp. 662–663].

Zemstvo self-government authorities were meant to ensure cooperation among different representatives of class and ethnic groups in uyezds and governorates. Zemstvos never became true self-governing bodies for Tatars as they were viewed as part of the Russian administrative system. Tatars were only elected to zemstvos from the peasant community curia because of their low social status. Their poor knowledge of Russian and illiteracy prevented them from attending zemstvo meetings. It was more an exception than a rule for a Tatar to work in uyezd and provincial zemstvo administrations. In some governorates, it was mostly

Governorate Zemstvo Council in Ufa Photo from the early 20th century.

Tatar noble farmers who became zemstvo officials.

At first, Tatar members of zemstvo bodies were extremely passive. In the Kazan guberniya, where Tatars constituted about 1/3 of the population, about 25% of the Muslim members of uyezd zemstvo assemblies were elected from the rural community curia in 1883 and 1886. However, they constituted about 10% of the total members (289 people) [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 5836, s. 2–70; file 6930, s. 1–127. Our calculation.—*I. Z.*]. Very few Muslims were elected to provincial zemstvo assemblies. Those uyezds of the Ufa guberniya where Muslims prevailed were an exception, with Muslims accounting for about 50% of all zemstvo assembly members in the 1880s [Steinwedel, 2011, pp. 71, 72]. While in Ufa guberniya, where most of the Tatar nobility resided, cooperation began in the 1880s, in the rest of the provinces, especially where there was no guild merchant group, interaction began following the renewal processes that took place after the First Russian Revolution, especially in 1910 [Vladimirova, 2011, pp. 340–341].

It is noteworthy that Governor of Kazan P. Poltoratsky, the former Head of Ufa guberniya, suggested to the Ministry of Internal Affairs in his 1889 report that 'in order to mitigate the influence that Tatar representatives have on the Muslim masses... Russian literacy should be made a prerequisite for their participation in addition to the limit on the number of Mus-

lim Tatar members in zemstvo and city assemblies' [Russian State Historical Archive, Item No. 35 A, p. 3].

The zemstvo counter-reform of 1890 caused the number of Muslim members to decrease because zemstvo bosses preferred to appoint deputies elected by the Ortho-

dox peasant curia, and the governor approved such lists. After zemstvo deputy elections by the peasant curia were permitted in 1906, the number of Muslim assembly members once again increased [Steinvedel, 2011, pp. 71, 72].

Volost meetings in the Ufa guberniya considered proportional representation for Muslims in zemstvo assemblies during the revolution of 1905–1907. In particular, the Birskskiy uyezd and Ufa guberniya meetings addressed the issue in 1906. However, the zemstvo members who represented the Russian Orthodox majority did not accept the idea of ethnic-based elections [Sevastyanov, 2005, pp. 105–106].

It was common to violate the principle of allocating funds depending on the percentage of incoming taxes funding Muslim education at the zemstvo level [Azamatova, 2005, pp. 11–138; Vladimirova, 2009, pp. 9–34]. This meant that funding was used to meet the cultural demands of the Empire's titular population.

City Self-Government Authorities. Elections to city self-government bodies in post-reform Russia were property-based. However, the introduction of new criteria was no final solution to the national question. A dedicated law was necessary to modify the property qualification requirement. According to the 1870 City Regulations, the City Duma was to consist of 2/3 Christians and 1/3 non-Christians [Complete Code of Laws of the Russian Empire—2, Vol. 45, Section 1, No. 48498, Article 35]. Beginning in 1892, a confessional restriction of no more than 1/5 of all members was established

[Gorodovoe polozhenie, 1892, Article 44]. The restriction proved irrelevant for the Volga-Ural region because its urban Tatar population, especially the wealthy part of it, was small with few exceptions.

Peasant Self-Government Bodies. In the post-reform period, peasant self-government bodies played a major part in clergyman appointment. Raised by the administration of the local diocese, the question became widely discussed in the Kazan guberniya in connection with the mass re-conversion of baptised Tatars to Islam. For instance, the Kazan Provincial Office for Peasant Affairs issued a dedicated edict in 1867, under which all Muslim volost leaders in volosts where Tatars co-resided with Orthodox Christians were to be replaced, which caused disturbance in a number of Tatar rural communities [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 1834, s. 1–2].

In their annual reports, the heads of certain governorates (those of Kazan, Samara, Saratov, Nizhny Novgorod, Perm, and Penza) advocated 'preventing Muslim influence', in particular by restricting the voting rights of Muslim peasants. The Ministry of Internal Affairs and then the Committee of Ministers had to reject suggestions which Tatars could rightfully interpret as religious oppression and which could cause mass disturbances. The administrative division of rural communities by religion in order to isolate Christian Tatars from Muslim public officials was also found inefficient because it would have negative economic outcomes [Vorobyeva, 1997, p. 232].

A special meeting of the Committee of Ministers to discuss the Emperor's remark to the 1881 report by the Governor of Kazan concerning the prevention of further Tatar Christians converting back to Islam, which took place in 1884, declared it 'inconvenient' to take any legislative measures in terms of prohibiting Muslims from being elected to peasant public offices in order to protect Tatar Christians from Muslim 'oppression'. It was resolved to limit the measures to administrative supervision to ensure the appointment of Russian and not 'fa-

natic Muslim' peasants to peasant and volost self-government bodies where possible [Council of the Minister of Public Education, Vol. 9, Column 676–677].

It should be noted that the resolution remained in effect until the fall of the autocracy. The new law was applied in volosts where Muslims constituted the majority of the population. The local administration addressed the issue depending on the candidates' personal qualities. It was common for multi-confessional volosts to elect a Muslim Tatar assistant volost leader.

It is of note that in 1879, 1883, and 1886, the Laishev, Spassk, and Sviyazhsk Uyezds, with Tatar percentages of 43%, 30%, and 30% respectively, did not have any Muslim volost leaders. Their representation was also insignificant in the Mamadysh Uyezd, where Muslims accounted for 60% of the population. Muslim volost leaders were present in the Kazan Uyezd [Muslim percentage: 54%]—20%, Tetyushi Uyezd [Muslim percentage: 50%]—29%, Chistopol Uyezd [Muslim percentage: 33%]—14–29% [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 4882, s. 24–62; file 5752, s. 4–12, 49–49 reverse; file 7142, s. 8–16, 97–105]. Most Muslim Tatar volost leaders could speak Russian, but could not properly write in it. This was even more true among village leaders.

It was common to replace volost administration bosses in the post-reform period. For instance, in 1879, 18% of them in the Kazan guberniya had been previously elected volost leaders, associates, or had been candidates for the position, while 56% of all volost leaders had worked in peasant self-government bodies [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 4882, s. 24–62].

Few officials in peasant self-government bodies of the Volga-Ural region commanded literacy in Russian. For instance, as few as 0.03% of land captains, 3.7% of village leaders, and 39% of volost leaders were literate in the Kazan guberniya in 1880. The situation made the role of the volost administration scribe, who was appointed by the local administration, even more important. He enjoyed a lot of control because volost leaders were generally

Volost foremen from the Russians and the Tatars with the head of zemstvo
Nizhny Novgorod guberniya Photo by M. Dmitriev. 1891–1892

illiterate and frequently removed. Archival documents suggest a vast majority of them to have been peasants who had only received primary education.

The records of the First General Census of 1897 reveal Muslim Tatars to have been poorly represented in the local and uyezd apparatus of the Kazan guberniya: they constituted only 13%, with the Russian percentage being as high as 74. 1% [Pervaya vseobshchaya, Vol. 14, pp. 178, 184, 188–189. Our calculation.—*I. Z.*]. Even in volosts where indigenous peasants constituted a vast majority of the population, the administration consisted, with few exceptions, of Russians, not to mention uyezd and provincial institutions [Daishev, 1980, p. 122].

Thus, Muslim Tatars were a minority in the city and zemstvo self-government bodies

established in the post-reform period, which was caused by their small percentage of representation in the uyezds and provinces well as their social class composition and financial standing. The activity of Muslim Tatars largely depended on their class affiliation and literacy.

Rural Muslim Tatar self-government institutions operated within land communities and in volosts where Muslims constituted a majority of the population. However, Tatar leaders and members of volost administrations lacked literacy in Russian and were responsible for collecting taxes and maintaining order, which made 'Muslim' volost self-government authorities merely executors of instructions by the local administration and not protectors of their local co-confessionals' interests.

§ 3. The Observance of Muslims' Religious Rights in Government, Public and Private Institutions

Ildus Zagidullin

The ministries and various offices which coordinated and controlled the implementation of government decisions, and issued by-laws clarifying certain provisions and articles of laws approved by superior powers, were of special importance to the government's domestic policy.

At the formal level, there hardly were any ethnic-based legal restrictions in Russian law. Regulations were applied depending on a subject's confessional affiliation and Russian language skills. According to the famous expert on the ethnic issue in the Russian Empire S. Dyakin, the 'Russian state idea', that of an autocratic great power, 'denied not only Russia's largest ethnic groups' the right of administrative autonomy, but denied the very right of existence to the smaller ones, expecting them to be assimilated into the Russian nation' [Dyakin, 1998, p. 15].

Days off. The work of government and public institutions was regulated by a uniform schedule of days off and holidays specified by the government. The Orthodox Christian church ritual affected this tradition considerably. Sunday was a day off at all public offices, educational establishments, plants, and other institutions, as well among the Russian peasant community. Apart from this, the empire rested on Orthodox Christian holidays, 'tsar days' and days which were legally established as holidays in memory of important socio-political or military events. In particular, by request of the administration of the Diocese of Kazan, the Emperor's Decree of 12 April 1854 established 4 October, the day that Ivan the Terrible entered defeated Muslim Kazan and the relics of the first missionaries Archbishop Gury and his collaborator Barsanuphius were discovered, as a day off for government institutions and educational establishments in the Kazan guberniya [Complete Code of Laws of the Russian Empire–2, Vol. 35, Section 1, No. 28160].

Muslims working at government institutions, and city and zemstvo administrations could not rest on Fridays or Islamic religious holidays. The organisations' internal work regulations or statutes did not provide for Muslims to have the opportunity to pray.

The range of government public institutions which provided opportunities for Friday services and resting on Islamic religious holidays in the Russian Empire was limited to the OMSA, Tatar and Kazakh teachers' schools, Russian-Tatar [Bashkir] schools, penal battalions and prisons. The OMSA and the previously-mentioned educational establishments also had days off on Sundays and Orthodox Christian religious holidays [Zagidullin, 2006, pp. 232–329].

Judicial Institutions. For a long time, it was the social duty of Islamic clergymen to visit hospitals, penal battalions, police offices, and other institutions when summoned by officials. In 1852, the procedure for the compensation of travel costs from the treasury of 'clergymen of Christian confessions in case of business trips', established under the Senate's Decree of 16 December 1847 for the Orthodox clergy, was extended to apply to mullahs [Complete Code of Laws of the Russian Empire–2, Vol. 27, Section. 1, No. 25972].

According to the Circular Regulation of 6 May 1878 by the Ministry of Internal Affairs, clergymen of all confessions summoned by public offices and officials for religious services were to receive from budget of the Ministry of Internal Affairs an allowance to cover travel, daily expenses and accommodation just as officials sent on business trips or appointed by managers received one.

In 1886, the practice of rewarding clergymen for attending trials for oath swearing with 'one ruble per trial' was extended to apply to all the confessions recognised within Russia [Complete Code of Laws of the Russian Empire–3, Vol. 6, No. 4098].

Layout of prison in the city of Mamadysh of Kazan guberniya, 1869.

In the late 19th to early 20th century, some uyezd zemstvo administrations began to cover wagon costs for mullahs [Russian State Historical Archive, f. 821, inv. 8, file 695, s. 19].

Penitentiaries. The prison was a closed institution. Third parties were not granted entrance. The Law of 5 March 1849, according to which Muslims and Jews in penal battalions were released from work for prayers on Fridays and Saturdays respectively, but in turn worked on Sundays, was an important regulation concerning the religious practices of imprisoned non-Christians [Complete Code of Laws of the Russian Empire–2, Vol. 24, Section 1, No. 23064].

Jews, Muslims and prisoners of other confessions remained in their cells when Christian rituals were performed in prisons. Prisoners 'of foreign confessions' were allowed to pray 'in a dedicated vacant room'. The rest of the time, the attendance of public prayer services largely depended on how crammed the cell was, relations between the prisoners, and how 'zealous' Muslims were in fulfilling their religious duties.

In 1864, prisoners who professed religions which were permitted in Russia were allowed to receive 'fasting food' [Sbornik czirkulyarny'x, 1880, p. 60]. Beginning in 1854, prisoners in civil and military prisons received three days off during annual Islamic holidays [Russian

State Historical Archive, f. 821, inv. 8, file 1181, s. 8]. The order of the Provincial Inspector of Samara for the Samara City Prison, dated 15 December 1899, is illustrative of how the instructions were applied to Muslim prisoners: 'Provide separate praying cells so as to prevent those convicted of the same deed from being together during the Mohammedan month-long fast 'Ramazan' beginning on 21 December. Because Mohammedans traditionally cannot take meals before sunset, I suggest that their lunches be delivered to them along with their suppers during this period' [Aleksushin, 2003, p. 119].

The positive changes in how Muslim rights were observed were largely brought about by the Ministry of Justice, which was responsible for penitentiaries.

Primary School. Liberal reforms brought about positive changes in primary education for ethnic minorities. From 1870, it was made official that Muslim pupils at primary schools did not have to attend Theology classes. This also applied to reading classes, where books in Church Slavonic were used, in village and city primary schools, and Church Slavonic classes in uyezd schools. For the first time, Muslim students of private and public primary and secondary, and secondary vocational schools had the opportunity to attend classes on the Principles of Islam on a voluntary basis (at the students' or community cost). From 1878, principals of public schools had to observe the requirement, initially established for Jews, to teach Muslim theology in the afternoon [Central District Department of Education, 1878, No. 3–4, pp. 34–35].

Secondary School. Certain regulations on the religious rights of representatives of ethno-confessional minorities applied to gymnasiums. 'The Regulations on Gymnasiums and Pro-Gymnasiums' of 1864 [para. 43] provided for non-Orthodox classes only at the cost of ethno-confessional communities. The 1871 'Regulations on Gymnasiums and Pro-Gymnasiums' were the first to not prohibit the funding of religious classes for non-Orthodox students at the government's cost or from a special school fund subject to the permission of the Minister of Public Education. Textbooks were to

be published in the students' native language, while the language of instruction was to be the official language [Central District Department of Education, 1899, No. 3, p. 131].

The introduction of the Principles of Islam at secondary educational establishments met with difficulties at an early stage. In particular, the parents of students of the Ufa Men's Gymnasium made several attempts at introducing Islamic Theology (in 1872, 1884–1886). In his petition to the Trustee of the District Department of Education, dated 24 January 1887, Mufti M. Sultanov adopted a conceptual approach to the issue, emphasising that it was necessary for Muslims to fulfill their civic duties on the same level as Russians. 'It is hardly justifiable or reasonable to deprive Mohammedan youth of the opportunity to take classes in their native—and the only adequate—language apart from general subjects, which is all the more so important because this idea has long been invented and implemented at military educational establishments [Russian State Historical Archive, f. 821, inv. 8, file 817, s. 33–34]. This time the administration of the District Department of Education supported the mufti, and in 1888, 18 students of the Ufa Men's Gymnasium began to attend classes on the Principles of Islam 3 times a week [Russian State Historical Archive, f. 821, inv. 8, file 817, s. 39–43]. The fundamental principle underlying the model consisted in providing vacant rooms to various confessional groups at hours when Theology or foreign languages were taught.

In the early 20th century, the Tatars of Kazan often called the authorities' attention to the need of appointing theology teachers for schools, gymnasiums, and other educational establishments 'where Muslims would be willing to send their children' [Kazansky Telegraf, 1901, No. 2483, 21 February]. Beginning in 1903 in the Kazan Educational District, Islamic classes at the 2nd Kazan Gymnasium and the Yelabuga Non-Classical Secondary School were organised using special school funds [Czirkulyar po Kazanskomu uchebnomu okrugu, 1903, No. 867]. In the early 20th century, principals of private educational establishments were eager to fulfill the requests of students' parents, whose payment of education fees constituted their income [Makhmutova, 1982, pp. 78–79; Biktimirova, 2003, pp. 55–64].

The extent to which the rights granted to Muslims were observed depended chiefly on their parents' perseverance, the local ethno-confessional community's economic potential, and the opinion of the administration of the educational establishment and the Muslim spiritual leader.

In 1905, inspired by general democratic sentiment, the Tatar community of the Kasimov Uyezd, in Ryazan guberniya, declared that it would be 'desirable for all government educational establishments, attended by at least five Muslims to employ Islamic theologians as public officials for an adequate salary' [Zagidullin, 2006, pp. 297–298].

§ 4. Legislative Ethno-Confessional Restrictions

Ildus Zagidullin

Orthodox Christianity was 'leading and dominant' in the Russian Empire's system of religious tolerance [Svod uchrezhdenij, 1896, Article 1]. Public Orthodox religious ceremonies and other events 'were not subject to any restrictions except those determined, for instance, by police and sanitary measures' [Suворov, 1912, p. 510].

The Russian administrative, police and judicial system supported the high status of the Russian Orthodox Church. In order to secure this prestige, the Code on Criminal and Correctional Penalties contained a section titled 'On Offences against the Faith and on Violation of Regulations That Protect It', aimed at imposing a respectful and tolerant attitude towards

Orthodox Christians' religious feelings and institutions among ethno-confessional minorities [Ulozhenie o nakazaniyax, 1857, Article 192–274].

No penalties were provided for to protect Islam and Muslims' religious dignity. Thus, the autocratic government created a legal environment that caused Christians to feel like they would not be punished for offending Muslims' religious feelings, which helped form a great power attitude towards non-Russians [National Archives of the Republic of Tatarstan, f. 41, inv. 1, file 2195, s. 26].

It was not until the beginning of the 20th century that positive changes were introduced into the Russian law. The new Criminal Code of 22 March 1903 was the first to specify a number of penalties for violating or restricting 'the religious rights of Muslims' [Ugolovnoe ulozhenie, 1904, pp. 156–160].

It is safe to say that the government wanted to protect the religious rights of the Orthodox population in nearly all cases. In the 1890s, the Synod presented to the State Council the issue regarding 'the necessity of protecting the Orthodox Christian population of some areas in Russia from the harmful influence of Tatars, who often make their Orthodox employees work on Sundays'. As the result, Muslim Tatars followed Jews in being prohibited from impeding their Orthodox servants, workers or employees 'in worship or fulfillment of other religious duties' in 1896 [Ustav o preduprezhdenii, 1890, Article 88]. Craftsmen did not have to work on Sundays and the feast of the Great Twelve 'except when necessary'. Non-Christian craftsmen could work on such days as long as they did not engage their Christian apprentices. At the same time, Christian craftsmen could not force non-Christians to work on their religious holidays [Ustav o promy'shlennosti, 1893, Article 430]. Non-Christians who were found guilty of oppressing Christians were to pay a fine of up to 50 rubles [Ugolovnoe ulozhenie, 1904, p. 161].

As a result of the Russian Orthodox Church's exclusive right to carry out missionary activities among Russian subjects [Ustav o preduprezhdenii, 1857, Article 97], Islamic missionaries among Orthodox Christians were

subjected to prosecution [Ulozhenie o nakazaniyax, 1857, Article 114, 116, 220, 202], as were those found guilty of 'raising obstacles for their coreligionists who want to convert to Orthodox Christianity' [Ulozhenie o nakazaniyax, 1857, Article 209]. According to the Edict of 2 August 1854 on measures preventing pagans from converting to Islam, the Ministry of Internal Affairs issued instructions that such conversions should not be accepted. Any exceptions were subject to the Emperor's decision [Nacional'nyj vopros, 2009, p. 8].

The confessional approach also applied to court trials involving Orthodox Christians. According to the Decree on Prohibiting Muslims Members and Secretaries of Judicial Places to Participate in the Investigation and Judgment on Cases against the Christian Faith and Church Laws of 30 May 1866 [Opis' del, Vol. 6, p. 288], only Orthodox judges could try cases relating to religious issues. In case non-Orthodox people were present among the 30 jurors summoned, they were to be automatically replaced by reserve jurors of the right confession when drawing lots to form the jury for any case 'against the faith' [Ustav ugolovnogo, 1892, Article 1010].

During the reign of Alexander III nationalist trends in the government's domestic policies became much more pronounced. On the one hand, they were caused by the modernisation of Russia and the tsar's personal qualities. On the other hand, they were a response to the awakening self-awareness of peoples and their resistance to assimilatory government policies [Dyakin, 1998, p. 27].

When Tatars came to occupy certain administrative and public offices, the government began restricting their range of activities to prevent further contacts with the Russian element. In 1889, the government adopted a 'special procedure' for appointing non-Orthodox Christian chamber councils to judicial institutions and advisory juries. Before a law concerning this question was issued, each case was to be personally considered and approved by the Minister of Justice, and for uyezd assembly chamber councils, the Minister of Internal Affairs [Uchrezhdeniya sudebny'x, 1892, Note to Article 380].

The government attached special importance to isolating Muslims within the primary education system. Such discriminatory acts included 'prohibiting Muslims from presiding over uyezd and provincial school councils and membership in them as representatives of zemstvo institutions and city self-government authorities' (1888) [Svod ustavov ucheny'x, 1893, Article 3495 and Note to Article 3495], and the loss of rank for non-Christian family teachers and tutors of both sexes who had teaching licenses and worked among Orthodox people [Svod ustavov ucheny'x, 1893, Article 3779, 3825].

Children and Family Relations. In a clerical state like the Russian Empire, family values and relations were determined by church canons. Laws enacted under Nicholas I, which gave priority in decisions to the Christian member of a family, had remained in effect during the post-reform period [Svod zakonov grazhdanskix, 1900, Article 80].

A Muslim man could marry an orthodox woman provided that he converted, which meant losing his confessional identity. At the same time, a Circular by the Ministry of Internal Affairs No. 182 of 12 July 1888 instructed Islamic clergy to refrain from performing any Muslim and Pagan mixed marriages [Nacional'nyj vopros, 2009, p. 8].

Thus, the dominant status of the Russian Orthodox Church, police protection of its privileges nearly in every sphere of life, and impunity for oppressing or violating the religious feelings and rights of representatives of other religions brought about the religious oppression of Muslims in areas of contact between the two groups.

Legislative restrictions mostly served the purpose of protecting the interests of the Russian population, eliminating any reasons for which the existing self-government bodies could be used to protect certain ethno-confessional groups.

§ 5. Censorship of Tatar Books

Ildus Zagidullin

In the post-reform period, namely after the Polish Rebellion of 1863, the autocratic government developed a negative attitude towards Tatar initiatives that would favour national consolidation and secular cultural development. In the meanwhile, modernisation in Tatar society was marked by the establishment of periodicals in their national language. In particular, the Governor of Kazan wrote regarding a petition by the inspector of the Russian-Tatar Teachers' School Sh. Akhmerov (1894–1895): 'Developing literature and periodicals in the Tatar language among non-Russian tribes inhabiting Russia can hardly motivate the tribes to get closer to and merge with the Russian people... developing literature in their mother tongue can merely awake non-Russians' national awareness and, more than that, their political aspirations' [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 9690, s. 10–10 reverse].

Tatars had filed over 20 petitions for permission to establish a periodical in the Tatar language to the Minister of Internal Affairs, the General Directorate for Publishing, and the Censorship Committee of Saint Petersburg, as well as Kazan guberniya, by 1905. Government authorities always denied permission to the potential publisher on the pretext of either his incompetence or lack of opportunities to censor periodicals in Tatar [Amirkhanov, 2002, pp. 35–36].

The first Tatar newspaper 'Nur' ('Light') appeared on 2 September 1905. G. Bayazitov, translator at the Ministry of Foreign Affairs, collegiate assessor and akhund of the 2nd Saint Petersburg Mahallah, received permission to publish it after a series of refusals concerning the newspapers 'Xäftä' ('Week'), 'Çışmä' ('Spring'), and 'Nur' ('Ray') in 1891–1895.

Taking into account the practice of total prohibition, Islamil Gasprinsky's (1851–1914) Turkic-speaking newspaper 'Tärceman' ('Translator'), established in 1883, which printed parallel Tatar and Russian texts and was subjected to preliminary censorship by the Censorship Committee of Saint Petersburg, was a breakthrough. In 1884 Gasprinsky was able to break with the Committee 'by referring the newspaper to censorship in Simferopol' [State Archive of the Russian Federation, f. 102, DPOO, inv. 226 (1898), file 11, part 3, s. 3–17].

In 1865–1905, The Ministry of Internal Affairs, the General Directorate for the Press and judicial authorities banned 240 books. The list did not contain those in Tatar, except for a few. The fact is that according to the Law on Censorship of 6 April 1865, original works having a volume of at least 10 quires and translated works with at least 20 quires were not subject to preliminary censorship. It was the responsibility of judicial authorities, then within the Ministry of Internal Affairs [beginning in 1872] and the censorship authorities themselves [beginning in 1874] to withdraw books published lacking preliminary censorship. The right of publication without preliminary censorship did not apply to all Tatar books [Karimullin, 1983, pp. 142, 143]. Manuscripts of Tatar books were banned from publishing already during consideration by the censor. When the Directorate for Censorship was moved from Kazan to Saint Petersburg in 1871, significant difficulties emerged.

Some Tatar books were banned because the government would no accept any public criticism of itself. For instance, in 1879 the pamphlet 'Mäkärce bäete' ('Bait on the Makaryev Fair') was withdrawn from sales and printing because it told about a district superintendent of police who violated Tatars' dignity and religious feelings. The Russian official wanted people to call him 'khazrat' and would not allow meeting attendees go 'until prayer time was over'. The bait presented a very vivid depiction of the policeman's bureaucratism, bribery, drunkenness, and criminal behaviour [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 4467, s. 6–9]. Censor Sarruf was found

guilty of 'political immaturity' and removed for approving the pamphlet.

In 1880, the 'Erbet bäete' ('Bait on the Irbit Fair') 'criticising the law, an office, a public official, ministers, and the Senate' and the manuscript of the book 'Vasıyatnamä' ('Will') as similar to 'Mäkärce bäete' ('Bait on the Makaryev Fair') were banned [Karimullin, 1983, pp. 110, 120, 124].

A number of criteria for banning Tatar manuscripts were mostly determined by political circumstances and the censor's personal attitude.

The Censorship Committee undertook the mission of 'presenting' to Muslim peoples an attractive image of the Russians while banning Tatar translations of such classical Russian authors as A. Pushkin, N. Gogol, and L. Tolstoy ('The Kreutzer Sonata'). In particular, a translation of L. Tolstoy's story 'The First Distiller' was banned for 'forming the wrong idea of the Russian people among the Turks'. 'Qırıq baqça' ('Forty Gardens') by N. Nasyri, which described a Tatar defeating a Russian athlete in a fight on Lake Kaban, was banned for some phrases that were found to offend Russian national dignity.

Encouragement of protest was another important reason cited for denying the publication of Tatar manuscripts. In particular, Censor V. Smirnov banned 'Tärbiya' ('Upbringing') by R. Fakhretdin as 'an emotional pamphlet advocating for the establishment of new schools', and to save up capital for this purpose 'by minimising their needs in life and filing a group petition to the government...' [quoted by: Karimullin, 1983, pp. 111, 127–130].

'Äl fiker äl xosusi fi äl cälläd' ('Particular Thoughts on a Dispute') by Kh. Maxmutov was banned in 1899 because of the author's speculations that a national newspaper should be published in order for the Tatars to unite around to preserve their language and religion [Karimullin, 1983, pp. 128–129].

Publishing of Islamic religious books was inherent to the religious rights of Muslims, for whom the government guaranteed 'freedom of worship'. In certain periods of national history, 'the Islamic book issue' acquired a political

nature and triggered comparable government measures.

The Arab script and the Turkic language in such manuscripts and books limited the audience among Muslim readers. However, phrases in these publications that told Muslims they should know how to pray were often viewed as Islamic propaganda and consequently resulted in this works being banned. The first case like this was initiated in 1845–1849 by the administration of the Diocese of Kazan, which believed publishing Islamic religious literature to be the same as Islamic missionary activities among Christian Tatars. Banning the Quran and other Islamic religious books, which were at that time being published in many countries, damaged Russia's image beyond repair. According to A. Karimullin, one of the main reasons why religious literature began to appear in Russia again was the autocratic government's apprehension, lest English commercial companies came to control the trade in Islamic literature and thus influence the Muslims of Russia. When the ban was lifted in 1845, it was accompanied by instructions that the supervision over book publishing in Kazan should be strengthened. Apart from official censorship, 'Orientalist professors of the University of Kazan were to engage in censoring Tatar works', which could not contain '... any sayings against the government and the ruling Christian church' [Karimullin, 1983, p. 100].

Authorities consulted the OMSA in considering religious books. After mistakes were made while printing the Quran in Kazan publishing houses, Sh. Marjani was obliged in 1860 to ensure the 'completeness and absolute accuracy' of the text of the Holy Islamic Book [Russian State Historical Archive, f. 821, inv. 8, file 831, s. 24–27]. Sh. Marjani was involved in this work, with breaks, for over 20 years. On Mufti M. Sultanov's petition in 1889, the Ministry of Internal Affairs turned the function of preliminary censorship of the Quran and the Haftiak over to the OMSA [Russian State Historical Archive, f. 821, inv. 8, file 829, s. 182, 189–189 a].

In 1889, the Petersburg priest B. Dalton published a book addressing the Ober [Chief] Procurator of the Synod K. Pobedonostsev, stating that Muslims in Russia had more rights than Lutherans did. As evidence, he cited three Tatar books containing the words 'kyafer' and 'jihat'. Censor V. Smirnov challenged the statement by reporting the Islamic usage of 'kyafer' to traditionally denote all non-Muslims and non-believers, and claiming the word 'jihat' to be a similar traditional cliché [Karimullin, 1983, pp. 112–115].

In his expert opinion on Dalton's 'open letter', N. Ilminsky reported to the Ministry of Internal Affairs on 30 October 1889, that 'Fanatic ideas such as holy war are contained directly in the Quran and essentially belong to the very foundation of Islam despite civilised decorators' attempts at presenting Islam in a poetic manner. Therefore, the fanatic excess in the books in question is not novel to Islam. However, I believe it to be reasonable and timely to protect the censorship from intrusive claims by Mohammedan publishers with guidelines that would prohibit the publishing in Russia of articles, chapters, or thoughts of a fanatic nature which are not appropriate for Muslim Russian subjects, whether in Tatar or in Turkish. These cannot but include the duty of holy war as well as equal payment for wrongs committed—mutilation or murder for an act of mutilation or murder—or calling the sultan our padishah to mix his dogmatic, religious leadership with the secular tsar. Taking into account the current agitation of the Tatars, the nascent Tatar-Muslim nation, which shows an inclination towards Turkish tastes and sympathies, thanks to a Tatar newspaper [meaning 'Tärceman'—*I. Z.*], such places in books can be noticed by credulous Muslim Tatars and confuse their Mohammedan conscience' [Russian State Historical Archive, f. 821, inv. 8, file 829, s. 196 reverse–197].

The government refused to adopt such guidelines. However, authoritative as he was in government circles, the missionary from Kazan N. Ilminsky succeeded indirectly. Beginning in 1890, Censor V. Smirnov consistently crossed out words and sentences (especially those on

Jihad) from religious works dating back to the 10–12th centuries and Quranic ayats, words or sentences containing 'jugat', 'kyafer', 'giaour', viewing them, whether rightfully or not, as bearing the disguised humiliation of or intolerance towards Christians and Christianity, often associating them automatically with the inter-confessional situation in the Russian Empire, which brought about numerous individual and group complaints by Tatar publishers in Kazan as well as clergymen. Legally speaking, V. Smirnov took appropriate the measures. According to Article 184 of the 'Charter on Censorship and Printing', calling for the elimination of 'all books of [a foreign] spiritual nature which contain speculations and opinions inconsistent with the principles of the Christian faith, or challenge the Orthodox Christian religion, or cause godlessness, disrespect of the Holy Scripture, etc. ' [Ustav o cenzure i pechati, Article 184]. It is also important to note that public officials were affected by the policy of national conservatism which determined the domestic policy of Alexander III.

Tatar publishers were able to inform the global public of Russian censorship's persecution of Islamic religious literature and the

Quran with the help of the London newspaper 'Times'. Censor V. Smirnov's measures motivated Tatars to search for publishing opportunities abroad. The first time that the government paid attention to the tension was after 27 clergymen from Orenburg and Kargala filed a complaint. In 1892, the government prohibited the censor from abridging the Quran, 'its parts and extracts from it'. Beginning in 1893, religious books were printed according to former requirements [Karimullin, 1983, pp. 120, 124, 140, 141].

To sum up, despite the liberal reforms, as well as social and political modernisation, the Russian government's domestic policy for Tatars relied on pre-reform principles. Importantly, the Tatar issue in the Volga-Ural Region did not bother the government as much as the Polish, Jewish, Ukrainian, and Armenian national issues did, because the territory had long been a part of Russia, the Tatars held low social and class status, and ethno-confessional elites were too passive to protect their civil rights. This is also attributable to the particular path of development that Tatar society and culture followed. These factors influenced the nature and vector of the government's domestic policy directly.

§ 6. Conversion to Christianity and the Christianisation of Muslim Tatars

Radik Iskhakov

Throughout the 19th century, the government pursued a goal of religious unification (Christianisation) among the empire's non-Christian population by providing administrative, legal, and financial support to the Orthodox church to facilitate the advancement of its faith. However, the views of political elites concerning the government's participation in Christianisation and the methods of its implementation changed significantly. The establishment of an institutional network of a 'confessional' state made it possible to employ instruments for integrating non-Orthodox believers into the Empire's social environment through cooperation with their elites. However,

organs of higher power continued to view Christianisation along with Russification as the most efficient method of incorporating non-Russian peoples into Russian society. The cultural and historical background of the Russian Empire, where belonging to the ruling confession had been viewed as the key criteria of being Russian and a mark of loyalty to the Orthodox tsar, corroborated this idea.

The period of the Great Reforms became a new stage in non-Russian Christianisation. The religious policy polarised during this time. On the one hand, it was admitted that active secular interference with church affairs, such as the abolition of enactments granting

benefits and exemption for converts into Orthodox Christianity, had to be abandoned as they had become inconsistent with the morals and the vision of the objectives that westernised state's legal policy pursued, as well as those of Russia after the liberal reforms [Rimsky, 1996, pp. 32–48]. On the other hand, strengthening Russian nationalism and the accelerated integration of the Empire's population following the rebellion in Poland (January 1863) brought about the active employment of a confrontational method of incorporating non-Russian peoples through religious, cultural and linguistic unification through administrative coercion.

The key acts introducing new forms of controlling missionary activities were the Procedure for Performing Holy Baptism for non-Christians of 14 December 1861 and the 'Procedure for Establishing Orthodox Brotherhoods' of 8 May 1864. The former introduced more open and civilised forms of conversion into Christianity. It was forbidden to baptise Muslim, Jewish, and 'Pagan' children under the age of 14 without their parents' permission (paragraph 1); under-aged non-Christians could only be converted following six months of confirmation (formerly the requirement was up to 40 days) (paragraph 3); baptism could only be performed in a church and had to be attended by reliable witnesses or the local administration, for which purpose the witnesses were to make sure that the neophyte was sincerely converting into Orthodox Christianity and was aware of its principles (paragraph 5) [Rukovodstvenny'e, 1879, pp. 339–348]. The latter act specified a new system of Orthodox missionary activities in the Empire's multi-confessional regions. Its key bodies were to be made up of missionary religious associations consisting of Orthodox members prepared to serve 'the needs and use of the Orthodox Church against non-Russians and religious dissenters [raskolniki] infringing upon the Church's rights and in order to instill and reinforce the Orthodox faith' [Rukovodstvenny'e, 1879, p. 37]. The organisations were founded on private initiative and

funded from donations and dedicated charity and church fees. The government took no official part in their activities and provided no financial support to them.

The regulations enshrined the renunciation of active government interference in missionary activities and established educational forms of Orthodox proselytism as the priority. However, central and local administrations often violated the declared course deliberately in accordance with their political interests. In particular, official statistics for the period of Governor General K. Kaufman's administration in the Northwestern Krai reports 70,000 Catholics to have converted to Orthodox Christianity in 1863–1868 [Dolbilov, 2010, p. 366]. The cases, which are by no means attributable to religious enlightenment and voluntary conversion to Orthodox Christianity, were rather of an administrative and political character, or, 'official missionary work'.

The government policy was more consistent in the Volga-Ural Region. Unlike in the Lithuanian and Belorussian guberniyas, where imposing the ruling religion on the local population was viewed as restoring its rights to the 'native Russian land' and bringing renegades back to Christianity, in the Volga Region, where mass conversion to Christianity in the 18th century had left Muslims as the only non-Orthodox confessional group, the problem of further extending the influence of the Orthodox Church was a less pressing political issue. Thus, the policy for Christianising Muslim Tatars was of ideological rather than practical importance for the imperial government [Russian State Historical Archive, f. 821, inv. 8, file 594, s. 178]. Due to Islam's stable religious outlook and the important role it played in preserving their ethnic and cultural identity, Muslim Tatars were not prone to missionary propaganda. Being ready to put up with increasing fiscal pressure and government control, as well as the deterioration of peasant households, Muslim Tatars would not stand a foreign faith being imposed on them. Any attempts, whether obvious or implied, by the church and the government to intensify

K. Pobedonostev.

Photo from the second half of the 19th century

Christian propaganda triggered their resistance and open protest. Having realised this, secular authorities and the most pragmatic ideologists of the Orthodox mission had to admit that they could not succeed in Christianising the Muslims¹³. Given these new cir-

¹³ The evolution of views on the 'Islamic question' for governor-general N. Kryzhanovsky is just one such obvious case. After accepting the position of head of the Orenburg Territory (Orenburg and Ufa guberniyas) in 1864, Kryzhanovskiy, using the management experience he obtained during his service in the Western region, advanced a number of initiatives aimed at the facilitation of the Christianisation of local Muslims, public support for the missionary activities of the church, the active fight against 'Islamic fanaticism', the abolishment of the mufiyat institute (OMSA), etc. [see: Kryzhanovsky, 1866; 1870]. Moving forward, after he obtained more knowledge about the ethnic and cultural situation in the region with a prevailing Islamic population and lived through some new experience in his relations with those of the Islamic faith, Kryzhanovsky changed his stance. In the 1870s while following the interests of social and inter-confessional stability in the territory, he advocated for the restriction of any form of ministry activity among Muslims. In view of this, in 1875 he had an outright conflict with the high-powered leader of the Orthodox church, the 'Apostle of Alaska' Metropolitan of Moscow Innokenty (Popov), who had initiated the establishment of Orthodox Missionary Society Committees in Ufa and Orenburg guberniyas. Kryzhanovsky vehemently disagreed with this initiative, pointing out that it was not reasonable to create any missionary organisations in a territory where 'about two-thirds of Muslims lived, so as to avoid any

cumstances, the new objective was to ensure greater loyalty among previously baptised non-Russians and combat the cultural and religious influence of Islam which had gained momentum following the reforms, resulting in the mass conversion of Christian Tatars and the increasing Islamisation of indigenous non-Russian peoples in the region.

Laws that guaranteed benefits and preferences to converts to the ruling religion were repealed under the liberal reforms in the Volga-Ural Region. On 24 March 1866, Alexander of Russia approved the State Council's opinion concerning repealing those laws under which penalties were to be mitigated for non-Christian convicts who converted to Orthodox Christianity during their investigation or trial [Complete Code of Laws of the Russian Empire-2, Vol. 41, No. 43138]. While continuing to financially encourage conversion into Orthodox Christianity among non-Christians in the periphery (Jews, Kazakhs, Kalmyks, Siberian peoples), the government refrained from providing such aid to former Muslim Tatar proselytes [Otchet, 1898, p. 8]. In 1874, the most significant benefit formerly granted to Muslim for conversion, namely exemption from recruitment, was abolished within the framework of military reforms and the introduction of universal military service [Zagidullin, 2004, p. 238].

Still, the abolition of discriminative regulations did not mean the complete renunciation of support of the Russian Orthodox Church's missionary work among Volga Muslims. It rather took more open and civilised forms. The imperial government actively facilitated the establishment of missionary societies and brotherhoods in the region, to which it provided financial aid in the form of donations by the ruling house and monetary grants from the Synod and the Ministry of National Education. The key bodies of the region's mission became the Orthodox Missionary Society

disturbances and propaganda among them' [Nikolsky, 1895, p. 43]. Only when the Spiritual Department and central authorities interfered did he give his approval to establish missionary institutions in those areas.

(and its committees), reorganised in late 1869, and the Brotherhood of St. Gury, established in Kazan in 1867. These missionary unions, whose members included representatives of the local and central administrations, spiritual department, and zemstvo organisations, worked with local Muslims; they supported Orthodox missionaries and provided financial aid to new Christians.

When Alexander III came to power and the conservative wing of the government, led by K. Pobedonostsev, became more powerful, multiple attempts were made at ensuring intense Muslim Christianisation. In the 1880s the office of district, and in the 1890s–1900s diocesan, anti-Islamic missionary was introduced in a number of Volga-Ural dioceses. To train skilled Orthodox preachers according to the new 1885 Statute, named after K. Pobedonostsev, anti-Islamic missionary classes and departments re-opened (they had been closed in 1868) at synodic educational establishments in the region. In 1889, special missionary courses with a Tatar department opened at the Theological Academy of Kazan [Iskhakov, 2011, pp. 104–133].

Government and church authorities had to take a cautious approach to these matters due to apprehension of the negative outcome of forced missionary activities, caused by intensified Tatar social movements in the 1870s–1890s, partly brought about by the allegedly planned mass conversion to Christianity. The attitude of Muslim Tatars largely prevented this course from even becoming a consistent policy or having any real outcome. Muslim Tatars were flatly opposed to any forms of external religious proselytism; so missionaries and the administration had no opportunity to change the situation. By converting to Christianity a Tatar lost his coreligionists' support and acquired a marginal social status. Muslim Tatars continued to view Islam as their 'native' faith, inherited from the ancestors, and fitting their spirit, culture and everyday life. They were not only reluctant to betray it but could not do so because this would mean losing their way in life [National Archives of the

Republic of Tatarstan, f. 4, inv. 94, file 22, s. 57 reverse]. Though cases of conversion into Christianity occurred in that period, they were never of mass proportions and did not affect the demographic and confessional situation within Tatar society in any material way. A total of 5, 893 Muslims converted to Christianity in the 10 dioceses (provinces) of the Volga-Ural Region, where most Tatars lived, from 1866 to 1905 (Table 46). The average annual number of Muslim converts in all the dioceses was 147. This yields a ratio of one convert to Christianity per 20, 516 Muslims. By comparing this data with pre-reform statistics, we can conclude that much fewer Muslims were baptised in 1866–1905 as compared to the previous period (5, 021 Muslims converted in the dioceses from 1837 to 1861, yielding 201 converts annually), which is attributable to the suspension of active government support for Russian Orthodox missionaries working with Tatars and the abolition of benefits for converts to Christianity.

Unlike the pre-reform period, the main reasons why Tatars changed their confessional identity were connected with living standards, the cultural influence of the Russian population, mixed marriages, the prospect of improving one's social status by converting to Christianity, and religious educational activities by Orthodox clergymen.

In sum, in the latter half of the 19th to early 20th century, religious unification was of little importance for the tsarist government's general domestic policy for Muslim Tatars. The policy's results satisfied neither church nor government authorities. As a more substantial outcome of such policies, social and inter-confessional tension in the region grew. The Tatar public grew increasingly opposed to the idea, bringing about anti-government movements and intensified migration to Turkey. All these factors, together with changes in the country's political situation, caused by increased revolutionary and social activity in the population, as well as adjustments to ethnic policy upon the enthronement of Nicholas of Russia (1894) motivated the government

Table 46

**Number of Muslims who accepted Christianity according to eparchies
in the Volga-Ural region in 1866–1905**
[Otchety ober-prokurora, 1838–1862]

Eparchies	Number of people baptised	On average per year	Share of those baptised out of the total number of Muslims, in accordance with data from 1897
Vyatka	282	7	1: 18, 978
Kazan	580	14	1: 45, 216
Nizhny Novgorod	78	2	1: 20, 666
Orenburg	1, 700	42	1: 9, 149
Penza	130	3	1: 19, 548
Perm	471	12	1: 12, 624
Samara	791	20	1: 14, 433
Saratov	125	3	1: 32, 000
Simbirsk	269	7	1: 19, 131
Ufa	1, 467	37	1: 29, 614
Total:	5, 893	147	1: 20, 516

to revise its attitude towards its relations with the Russian ummah. By attaching primary importance to social stability and keeping Muslim Tatars loyal and not uncertain due to prospects of religious unification, the imperial government essentially abandoned the goal of imposing Orthodox Christianity on Mus-

lim Tatars [Vsepoddannejshij otchet, 1908, p. 148; Russian State Historical Archive, f. 796, inv. 191, section 6, column 3, file 163, s. 1–7]. Any intense missionary activity among Muslim Tatars died out after the Manifesto on the Freedom of Conscience was declared in 1905.

§ 7. The Legal Status of Christian Tatars Who Converted Back to Islam

Ildus Zagidullin, Radik Iskhakov

The Russian system church-state relations included a differentiated approach to supporting the Empire's recognised religious communities, protecting their rights and church discipling. The country's dominant religion and its social institutions enjoyed the widest privileges. The government's paternalism towards the Russian Orthodox Church is attributable to the special relations that had been established between secular power and the Orthodox hierarchy in the process of the long formation of the Empire. It was essential to the imperial order and official ideology. It

was the criterion of 'truthfulness', that is, a specific belief's affinity to Orthodox dogmas, that determined the status of each confessional group in the imperial environment [see: Krasnozhen, 1900; Reisner, 1905]. The government used this criteria to define its attitude in terms of the administrative and criminal prosecution of religious dissidents and violators of religious laws.

The law provided for preventative and restrictive measures for the following 'church offenses': the evasion of confession and the Holy Communion (not excluded from the

list of 'church offenses' until 1903), failure to observe church status by new converts, parents' failure to bring their children to confession, 'falling' from Christianity to other religions, concerning from Orthodox Christianity to other confessions, negligence of religious holidays, Orthodox recreancy, etc. [Suvorov, 1912, p. 281].

The Empire's religious law did not provide for individual rights of free choice of confessional status (except for the right to convert to Orthodox Christianity). Deeds related to proselytism by non-Orthodox religious communities, 'falling' from the dominant church and apostasy were traditionally viewed as the most severe crimes. Legal codes prohibited conversion from Orthodox Christianity to non-Christian religions and rendered such an act void. It was the government's prerogative to administer final judgment in such cases [Complete Code of Laws of the Russian Empire–2, Vol. 9, No. 7440]. The commencement of prosecution for 'seducing' Orthodox Christians or if they themselves began to leave the Church, was up to spiritual leaders [Ustav ugolovnogo, 1892, Article 1006]. In the first half of the 19th century, a procedure was established in Russia for extraordinary trials for 'seducers and those seduced to convert from Orthodox Christianity' [Zakony' o sudoproizvodstve, 1892, Article 576] to ensure prompt response by secular authorities. Converts from Christianity were to be sent to the parish clergy 'for admonition'. Criminal proceedings were commenced in case the person was adamant in their decision. Even after judgment had been administered, the Orthodox clergy could bring the 'fallen' person back to the church. As M. Reissner rightfully remarked, 'the entire Russian apostasy process is essentially missionary activity by secular authorities' [Reisner, 1905, p. 276].

The 'fallen' were not entitled to use their class-specific rights until they converted back to Christianity. The government took their property in custody for the time [Ulozhenie o nakazaniyax, 1885, Article 185]. Individuals tried for such crimes lost other civil rights.

They could not be elected to village self-government authorities and other public offices. Those found guilty of burying a baptised person without proper religious ceremonies were subjected to arrest from three weeks for up to three months [Ulozhenie o nakazaniyax, 1885, Article 209, para. 1]. The body was to be re-interred in an Orthodox cemetery [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 221, s. 53]. The Orthodox Church did not recognise marriages between 'fallen' people. The police were entitled to discharge them following a report to the secular administration. Those whom the clerical court found guilty of 'lawless marriage' were subjected to penance and, in some cases, a specific penalty. Orthodox Christians who married non-Christians were subject to a prison term of 4 months [Ulozhenie o nakazaniyax, 1885, Article 1564]. They were accused of 'adultery' and illicit cohabitation [National Archives of the Republic of Tatarstan, f. 4, inv. 101, file 23, s. 61 reverse–62]. Even if such individuals had adult children, their passport was marked single. Such couples' children were assigned to the maternal grandparents' family. Their surnames were derived from their mother's first name. It should be emphasised that the clerical court would declare such children adulterate and thus not entitled to inheriting their parents' property according to the law or their father's family and status [Berdnikov, 1889, p. 437].

Seduction of Orthodox Christians encompassed a special category of crimes. It was not only active and passive propaganda but the refusal to suppress it that was punishable. In particular, if one family member did not take measures to prevent others from converting from Christianity, he or she could be arrested 'for a term from 3 days to 3 months' [Ulozhenie o nakazaniyax, 1885, Article 209, para. 1]. The following penalties were established for encouraging conversion from Orthodox Christianity: 'attainder and exile for hard labour for a term of up to 10 years' [Highest Provision, 1845, Chapter 2, Section 1, Article 191].

The protection of the Orthodox Church's interests was not the only reason why the imperial law was so relentless in these matters. Viewing promotion of Orthodox ideology as an important channel for integrating the non-Christian population into the Russian community, the political elite interpreted giving up the dominant confession as undermining the existing religious situation. In this context, the government believed conversion to be a form of renouncing not only one's confessional (Orthodox) status but one's national (Russian) one as well, which caused other religious (Catholic, Protestant, Muslim) and ethnic groups ('Polonisation', 'Germanisation' in the Western Krai, 'Tatarisation' in the Volga Region) to become more powerful.

In the Volga-Ural region, the main object of the above-mentioned regulations were the so called 'fallen' Christian Tatar converts to Islam, who had formed into the 'New Christian' and 'Old Christian' Tatar movement for conversion [back] to Islam. The secular and clerical administrations' main motive in working against this movement was their aspiration to preserve the existing confessional structure which became established in the region in the latter half of the 18th century, and the dominance of Orthodox Christianity, to which any expansion of Islam's sphere of influence posed a threat. The situation did not favour the further cultural and religious incorporation of the local population into Russian society and the imperial environment.

The most active anti-conversion phase in the latter half of the 19th century took place in 1866–1867, when the Volga Region witnessed the mass conversion of Christian Tatars to Islam. In spite of the local complicated social situation caused by the abolition of serfdom and the declaration of liberalisation of the domestic policy, the government took unprecedented measures to coerce 'fallen' Tatars to convert back to Orthodox Christianity. Fearing that the mass movement could cause the majority of Christian Tatars to give up the Orthodox faith, the threat of which local missionaries confirmed, the authorities did not limit themselves to broad legal opportuni-

ties for prosecuting renegades and opted for intense administrative measures [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 231, s. 6]. Apart from attainder and arraignment, 'fallen' Tatars were subjected to mass execution, arrest and imprisonment. The police disavowed their 'illicit' marriages, sending wives and children to former places of residences, exhumed dead bodies to re-bury them in accordance with Orthodox rules, as well as closed and destroyed 'secret' Muslim places of worship in such settlements [Zagidullin, 1990, pp. 66–78]. The government prosecuted active members of the movement under the most severe articles of the criminal code, namely as 'seducers', and sent them to Siberia using an administrative procedure. For instance, in Kazan guberniya a total of 31 people, including 4 Muslims, were sentenced to exile in 1867 and 1870 for participating in and organising the movement of 1865–1866 [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 1823, s. 11, 74, 83–86].

The 'fallen' Tatars' stubborn assertion of their right to profess the faith of their ancestors in spite of aggressive measures made the government change its attitude. The government de facto had to recognise the existence of the 'fallen', which did not mean their official legalisation as members of the Muslim community. An ambiguous approach in relation to them developed in the 1870s. While demonstrating tolerance to New Christian Tatars who converted from Christianity and refraining from interference in their religious life, the secular administration and the spiritual department continued to actively employ aggressive legislative measures to 'Old Christian' Tatars and representatives of other non-Russian peoples willing to profess Islam. This is attributable to the confessional situation in these groups. Unlike 'New Christians', who tended to give up Christianity in village communities, it was mostly younger 'Old Christians' who performed seasonal labour in Tatar settlements that converted to Islam. When youth officially converted from Orthodox Christianity, two separate religious communities, New Muslims and Christians, emerged in

Those 'returned' back to Islam near their 'secret' mosque in the village of Bolshiye Kibyak-Kozi, Laishevo uyezd, Kazan guberniya. Photo, 1904.

settlements. Since there was no clear confessional border and it was entirely possible that other members of the rural community would follow their example, the local secular and clerical administration took all kinds of radical measures to stop the process, scare those who hesitated to convert and force the 'fallen' back to Christianity. During a new wave of mass conversion in the Kazan, Vyatka, Samara, and Ufa guberniyas in 1871–1872 and 1881, the local authorities commenced the prosecution of the most active participants of the movement. In particular, in 1875 the Kazan District court sentenced 2 peasants from the village of Verkhniye Otary, Mamadysh Uyezd, who were found guilty of 'seduction to the Mohammedan faith', to hard labour for 6 years. 8 dwellers of the village of Apazovo in Kazan Uyezd, were found guilty of the same crime and exiled to Siberia in 1881 [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 6541, s. 1]. The police took every measure to exclude Old Christian Tatar converts from normal religious life. They viewed any attempt at integrating them into society as 'tempting' to those still true to Orthodox Christianity. 'Secret' Islamic prayer houses, confessional schools were shut down in such settle-

ments, and their founders arrested and put to trial. For instance, in the 1870s–1880s, Islamic confessional educational establishments were closed in the villages of Yelyshevo, Bolshiye Kibyak-Kozi, Verkhniye Otary, Pochinok Shemordan of Kazan guberniya [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 3697, Otchet Bratstva, 1883, p. 34].

Due to the mass conversion of Christian Tatars to Islam, which created a special category of individuals who had broken with the church but had not yet been recognised by Muslims, the local bureaucratic system was facing the question of what this group's legal status was and what regulations applied to them. Without recognising their civil rights, the authorities still imposed on them all universal civil duties, like military service, state duties and taxes. Moreover, 'unofficial' Muslims were to make contributions towards Orthodox church maintenance and pay other church fees up until 1880 [Russian State Historical Archive, f. 821, inv. 8, file 788, s. 34]. This required clear forms of government control and registration procedures for this population group. Since 'fallen' Tatars refused to declare themselves, even formally, Orthodox Christians, the Orthodox clergy could not do

this either. The experience with Old Believers proved useful in solving the problem. A procedure for registering Christian converts to Islam began to be developed in the 1870s. In the Samara guberniya, the functions were vested in the local police department; in that of Astrakhan, in village administrative bodies (village heads); in those of Kazan and Vyatka, in volost administrations [Russian State Historical Archive, f. 821, inv. 8, file 788, s. 21]. Under the Special Decree of 20 December 1890, volost administrations (in rural localities) and the police (in cities) were responsible for recording the births, deaths and marriages of such individuals [Russian State Historical Archive, f. 821, inv. 8, file 788, s. 47]. Beginning in 1887, the Ministry of Internal Affairs officially permitted unbaptised children to be recorded in family lists under the names given to them by their parents, though with a remark stating that these children were not baptised 'due to their parents' obstinacy' [Russian State Historical Archive, f. 821, inv. 8, file 788, s. 44].

Another issue was how 'fallen' Tatars should take the oath of citizenship. In the 1860s–1870s, the local administration, based on their belief that the 'fallen' were still Orthodox Christians, tried to force them to swear a Christian oath, which often engendered violence, open conflicts and acts of disobedience [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 1837, s. 1–2 reverse]. In the following decades, when a younger generation of the 'fallen' had come of age who were not baptised, never went to church, and had had no contact with the Orthodox clergy, the authorities were forced to recognise their right to swear an oath according to Islamic rules, despite church protests [National Archives of the Republic of Tatarstan, f. 41, inv. 1, file 1, s. 41].

Despite some governmental concessions, Christian converts to Islam remained until the early 20th century the most deprived and legally marginal population group in the region. They could not follow Islamic prescriptions freely, go to mosques, turn to appointed mullahs for occasional services

or send their children to Tatar confessional schools. The 'fallen' could not marry 'official' Muslims openly and had to keep their 'adulterate' children in secret. They could be subjected to administrative and judicial prosecution and attainer at any time on the initiative of the Orthodox clergy and local public officials. Moreover, this group had difficulties dealing with representatives of other Tatars groups (baptised Tatars and Muslim Tatars) due to their special religious and social status, which in some cases caused inter-confessional conflicts. The complicated status of large rural groups, whose essential religious and civil rights were denied, brought about intense social tension and inter-confessional instability in the region. The authorities had to search for solutions. As confessional limits between the 'fallen' and loyal Christian Tatars stabilised and a new generation of 'unofficial Muslims', who already were not members of the Orthodox Church, appeared, the state bureaucracy came to believe that to keep them Orthodox by coercion would be inefficient and that their confessional and legal status had to be determined.

According to an Imperial Manifesto of 24 November 1894, the prosecution of non-baptised 'fallen' Tatars was halted [Chicherina, 1906, p. 133]. In 1894, 1895, 1896 and 1898 the first formal clearance was issued to allow the 'fallen' to be admitted into Muslim communities [Russian State Historical Archive, f. 821, inv. 8, file 788, s. 110–111, 120–123]¹⁴. All restrictions for this part of the region's Muslim population were finally eliminated in 1905, when the Manifesto of 17 April 1905 enabled them to enter mahallahs and profess Islam openly.

¹⁴ Residents of a number of settlements of the Chistopol and Spassky uyezds of Kazan guberniya whose ancestors had crossed over to Islam as early as in 1820s–1840s received the right to be considered 'official' Muslims. Due to the fact that they had been 'out of church' for a long period of time and absent from all church documents from 1860s–1870s, and due to the absence of any reliable information about their Christian past, the Synod did not find any formal reason to deny their petitions on the legalisation of their actual confessional status.

§ 8. Autocratic Policies in School Education

Ildus Zagidullin, Chulpan Samatova

Methods of Promoting Russian Education Among the Tatars. The government viewed the multi-ethnic and multi-confessional population's composition as 'one of the weak spots' in the empire's structure, which had to be eliminated. Apart from traditional elements based on maintaining socio-political stability and the external security of the state, a trend towards administrative and cultural unification had appeared in imperial policy by the latter half of the 19th century [Kappeler, 1996, p. 203]. This motivated the government to interfere more actively in the life of ethnic communities and integrate them into Russian socio-cultural environment. Authentic cultures were viewed as obstacles to homogenisation.

The new government school policy was part and parcel of Russian modernisation. It put the necessity of forming bilingualism among Russian subjects through educational institutions, which also meant interfering in the national education of non-Russians, on the agenda.

In 1869, the general regulations on public schools were extended to apply to all Evangelical, Lutheran, and Reformed schools of the North-Western Krai, turning the study of Russian into a compulsory subject. While addressing the 'Polish issue', the government introduced Russian Reading and Writing to all ethnic schools in the Kingdom of Poland, including primary ones, in 1871. In 1879, Russian became a compulsory subject at indigenous schools in Transcaucasia, and in 1884, in Armenian schools in the Caucasian Krai. Beginning in 1885, Russian was made compulsory at all educational establishments of the Derpt Educational District [Russian State Historical Archive, f. 821, inv. 8, file 816, s. 42–43].

Against the backdrop of aggressive measures in the Russian periphery, especially its western part, the situation in the inner provinces, populated primarily by Tatars, Bashkirs, Chuvashes, and Finno-Ugric peoples, created the impression that government measures were

seemingly delayed. The radical steps in the western provinces were driven by the aggravated national issue and were clearly political. They demanded an extreme and highly efficient response. Those reforms which were applied to Tatars were brought about by the implementation of liberal reforms which prioritised the Russian population's interests and the development of an outline of a nation-state in the region in a clear break with imperial tradition. This necessitated courses of written Russian for the titular population as a means of eroding those patches of land which were 'alien to the Russian population' and forming a uniform state cultural environment in order to stop the Tatarisation of Turkic and Finno-Ugric peoples.

It is noteworthy that the Ministry of Public Education analysed global colonial experience in this sphere before taking any specific measures [Materialy', 1936, pp. 282–283]. The information collected was processed and discussed, first by the Ministry's Learned Committee and then by school councils in educational districts. The ultimate authorities to address the issues of state concern was the Council of the Minister of Public Education, whose meeting—2 February 1870—was attended by Council members, the Director of the Department of Religious Affairs of Foreign Faiths, and the curators of the Kazan, Odessa, Saint Petersburg and Moscow Educational Districts [Materialy', 1936, p. 281].

The resolution passed by the Council of the Minister of Public Education on 2 February 1870 was embodied in the Regulations on Measures for the Education of non-Russian Inhabitants of Russia, approved by Alexander of Russia on 26 March 1870, which lay the legal foundation of school policy in the Kazan and Odessa Educational Districts [Sbornik postanovlenij po Ministerstvu narodnogo prosvesheniya, Vol. 4, Column 1556–1557].

The 'Regulations' introduced a new system of secular Russian education for Tatars

which consisted of bilingual primary, Russian primary and higher education. The first stage offered the following two variants for Muslim primary schools: 1) a Russian-Tatar primary school where Islamic subjects were minimised, while Russian and Mathematics were the focus; the students' mother tongue was used as an instrument for teaching them Russian; 2) Russian classes were to be introduced in all newly established Muslim educational activities and funded by the community; all shakirds under the age of 16 were obliged to attend Russian classes and master the curriculum [*Inorodcheskie i inovercheskie uchilishha*, 1903, pp. 14–16].

Thus, in 1870 the government initiated a shift towards the compulsory study of Russian at traditional ethnic schools in regions with compact Tatar and Bashkir populations.

The 1870 'Regulations' recommended preparatory classes to be established at Russian primary schools and gymnasiums to increase the proportion of Tatars in them. No preparatory Tatar classes were established in the Kazan Educational District because they were unnecessary. What they would need preparatory classes for was higher education. In 1887, the Ministry of Public Education canceled the Muslim privilege. In 1888, it permitted preparatory classes at secondary educational activities to accept 'non-Russian Christians' [Central District Department of Education, 1887, No. 7–8, p. 213; 1888, No. 11–12, p. 360].

The territory of the Kazan Educational District [KED] shrank in 1874 because Tatar and Bashkir confessional schools were subordinated to the Educational Department [*Sbornik postanovlenij po Ministerstvu narodnogo prosveshheniya*, Vol. 5, Column 1753]. The autonomous Orenburg Educational District [OED] was established to include the Perm, Orenburg, Ufa guberniyas and the Ural and Turgay regions. The KED eventually consisted of the following six guberniyas: Astrakhan, Vyatka, Kazan, Samara, Saratov and Simbirsk. In 1893, the Inner Bukey Horde, which used to belong to the OED, became a part of it. Having been withdrawn from the KED, the Nizhny Novgorod and Penza guberniyas were trans-

ferred to the Moscow and Kharkov Educational Districts respectively.

As a deviation from the 1870 'Regulations', an inspection of Bashkir, Kyrgyz, and Tatar schools was established in the KED and the OED. Its responsibilities were as follows: opening Muslim schools of the new type 'through persuasion', supervising over and managing them, considering existing books and making up publishing plans to meet the establishments' teaching needs [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 21785, s. 4]. In the KED, V. Radlov was appointed to the office. He took up his duties in 1872. Nobody in the newly established OED seemed to have a profound understanding of Muslim education. In 1875, V. Katarinsky (1875–1902), an alumnus of the Theological Academy of Kazan, Candidate of Theology, expert in non-Russian languages, was appointed inspector for Muslim schools on the recommendation of N. Ilminsky [Central District Department of Education, 1902, No. 5–6, p. 291]. However, he was 'inadequately prepared' for his duties. Therefore, Curator P. Lavrovsky (1875–1880) prompted him to focus on establishing Christian schools for non-Russians [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 76].

After V. Radlov went to the Imperial's Academy of Sciences in the capital (1884), KTTS Inspector Sh. Akhmerov became Assistant Inspector on a part-time basis. Lacking both time and money to cover traveling expenses, he was only able to undertake two inspection trips during his five years in office [Russian State Historical Archive, f. 733, inv. 172, file 2271, s. 29].

In the time of V. Radlov and Curator P. Shestakov (1865–1883), the KED employed a model where the 'Muslim school inspector was the district curator and public school principals and inspectors merely carried out their orders'.

The liquidation of the position in the KED in 1889 was initiated by N. Ilminsky, who believed it to be necessary for establishing new educational establishments and creating textbooks for them only. Thus, 'the dedicated office is not necessary anymore' [Russian State

V. Radlov.

P. Shestakov
Photo from the second half of the 19th century

Historical Archive, f. 733, inv. 171, file 656, s. 85 reverse–86]. A new administration system was thus established in the district, made up of inspectors—management of public schools—district curator.

The positions of the OED inspector for Muslim schools and KED inspector for Chuvash schools were abolished in 1903 [Central District Department of Education, 1903, No. 4–5, pp. 171–172]. This happened on the initiative of the Chief Procurator of the Synod K. Pobedonostsev [Russian State Historical Archive, fund 733, inv. 172, file 2287, s. 7]. Supervision over Russian-Tatar schools became the exclusive responsibility of the inspector for public schools.

To quote V. Radlov, 'their establishment was a failure where local administrations were reluctant to cooperate, and success was only ensured with support from and influence of the police... the classes were introduced almost by force' [Materialy, 1936, p. 323].

One of the deviations from the 1870s 'Regulations' was connected with adjustments to the funding model. It was common for parish people to justify their refusal to establish Russian classes based on financial difficulties. Therefore, the authorities introduced government

sponsorship for Russian classes and Theology teachers for Russian-Tatar schools, which were also financed using zemstvo, municipal, factory, and private (curators', custodians', patrons') funds [Vladimirova, 2009, p. 9–34; Samatova, 2010, p. 144].

In the 1880s–1890s, each Russian-Tatar school received funding of 460 rubles in the KED [St. Petersburg Branch of the Russian Academy of Sciences Archive, f. 177, inv. 2, file 11, s. 22–22 reverse] and 300–400 rubles in the OED [Central District Department of Education, 1885, No. 8, pp. 261, 262; 1886, No. 3, p. 112; No. 9, p. 384; 1888, Nos. 11 and 12, p. 362].

In 1887, OED Curator D. Mikhaylov mentioned many Tatars to be aware of how useful the Russian language and the ability to read and write in it are, and have a 'craving' to know Russia, which had been prevented by 'Mohammedan punishments and fanatic accusations'. He suggested that Russian classes should be compulsory at all Tatar classes, as they were in the Orenburg Cossack Host. The official conviction was that mullahs believed voluntary study of Russian to be a sin, while attending compulsory classes was not and could be permitted to 'appease the enemy', because the

enemy was so much stronger that they could not fight against it [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 109–109 reverse].

The authorities tended to establish Russian classes at major urban religious education centres¹⁵. Nearly all Russian classes were held in buildings other than the madrasah, which is explained by the principals' attitude. The Khushainiya Madrasah in Orenburg was an exception. It should be noted that many madrasahs could not afford desks and other school furniture in a separate building. Moreover, school administrations soon came to realise that placing Russian classes in a separate building increased the number of students who attended them [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 21060, s. 7]. New Tatar educational establishments could be founded in cities provided that they had Russian classes. For instance, the maktab of the second Mahallah in Chistopol closed in 1897 despite its principal's written undertaking 'to send students to Russian classes of the first Mahallah madrasah' [National Archives of the Republic of Tatarstan, f. 160, inv. 1, file 815, s. 21–21 reverse].

Russian-Tatar schools operated in Kazan, Astrakhan [Budilovich, 1905, p. 180], the uyezd centres Tetyushi (1885), Guryev, Ilets-kaya Zashchita (Ural region) [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 168], etc. Russian-Tatar schools in workers' settlements were an innovation [Central District Department of Education, 1887, No. 1, p. 36; 1903, No. 12, p. 466].

Most madrasah principals would not permit local children to go to the new type of schools on the pretext that they could eventually be baptised [National Archives of the Republic of Tatarstan, f. 160, inv. 1, file 619, s. 66–67 reverse].

¹⁵ In the madrasahs of Kazan (1872), Orenburg (1880) [Central District Department of Education, 1880, Nos. 3–4, p. 46], Uralsk, uyezd towns of Chistopol (1881) [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 8321, s. 121], and Troitsk [Russian State Historical Archive, f. 821, inv. 8, file 817, s. 922–922 reverse] (transformed into a Russian-Tatar two-year training school with 50–60 students) [Budilovich, 1905, p. 120], Belebey, Sterlitamak, Verkhneuralsk, etc.

However, nearly all schools had students, meaning that Russian was in demand. Russian teachers often asked the authorities to support them against the Kadimist. As a result, the Mullah of the first Mahalla in Chistopol Abdulvagapov was sentenced to administrative exile. However, he died in 1893 before the sentence was carried out [Amirkhanov, 1996, pp. 43–53]. In 1900, Tetyshi Mullah M. Bikchentayev was exiled from the province for 3 years [State Archive of the Russian Federation, f. 102, inv. 98, file 48, s. 1–5]. The repressive measures were a scare tactic against other imams.

It should be noted however, that not all Muslim clergy were opposed to Russian education. For instance, mullah Muhammadzyan Yakhin from the village of Novy Shinar, Mamadysh uyezd, initiated the establishment of a Russian-Tatar school in 1877 [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 13147, s. 1–4 reverse].

Most Muslims viewed compulsory Russian classes as infringing upon the traditions of the confessional school, which affected the 'nascent interest in the Russian language among Tatars' in a negative way [S'ezd direktorov, 1907, p. 61].

In order to mitigate local resistance, the OED administration began to close down some rural Russian classes in the 1880s, causing their number in the Orenburg and Ufa guberniyas to decrease to 9. Some madrasah Russian classes were transformed into one-year Russian-Muslim schools. In a number of cases, the funds of closed Russian classes at madrasahs and Russian-Muslims schools were used to establish schools for non-Russian Christians [Central District Department of Education, 1882, No. 12, p. 503; 1887, No. 4–5, p. 131; No. 9–10, p. 267; 1888, No. 11–12, p. 362; 1895, No. 5, p. 233].

More Muslims were appointed honorary school custodians in the Trans-Ural Region. They were awarded citations by the curator [Central District Department of Education, 1896, No. 6, pp. 196–197] and received government rewards [Central District Department of Education, 1899, No. 2, p. 60; 1904, No. 3, p. 73]. The KED did not appoint honorary

school custodians and curators that often [National Archives of the Republic of Tatarstan, f. 160, inv. 1, file 698, s. 190].

In 1882, the administration of the Orenburg Cossack Host adopted the most radical measure possible, by introducing compulsory education at Russian schools for Muslim Tatars¹⁶ [Russian State Historical Archive, Collection, f. 733, inv. 171, file 656, s. 109 reverse]. In 1892, the administration used the pretext that attendance of daytime classes at a Russian school affected students' academic performance in a negative way, and prevented school-age children from taking studying their native language and the Principles of Islam delivered by the mullah, which in fact isolated them from primary ethnic school [Fäxretdin, 1907, p. 26]. As a result, 1895 statistics reported the OKH to have as few as 14 'Tatar schools', offering instruction in Russian [Sevastyanov, 1895, p. 20].

Classes in Russo-Tatar School, Tetyushi. Photo from the early 20th century.

¹⁶ Starting in 1882 the children of Muslim Cossacks were taught to read and write in Russian from 9 am till 2 pm, and as for the mektebe, they were only able to attend during their 'free time': from 6 to 8 am and from 7 to 9 pm, leaving almost no time for rest. Once they officially decided that studies in a mektebe inhibited their ability from an early age to learn Russian and read and write, which was necessary for Cossacks serving their time in the army, the major-general Ershov, by the order of 9 September 1892, instructed to close all Tatar schools, and prohibited boys from attending mektebe. Instead, it was decided they were now to learn the fundamentals of Islam in village Russian schools three times a week on specially appointed days. The Orenburg Muslim Spiritual Assembly of 16 and 30 January 1893 lodged a complaint to the Ministry of Internal Affairs with six petitions from Muslim Cossacks of the Tatishchevo and Nizhne-Ozersk Cossack villages, with 10 reports of imams from various settlements of Cossack troop attached. However, the Ministry of National Education and the Ministry of Internal Affairs recognised the actions of the Orenburg authorities as 'correct' [Sbornik czirkulyarov, 1905, pp. 101–102].

Some OED Russian-Muslim schools were attended by both Russians and Tatars (Bashkirs) [Budilovich, 1905, p. 121], which would have been impossible in the KED.

A breakthrough in the establishment of Russian-Tatar schools took place at the turn of the century. Zemstvos played an important part in this event. While in 1895 the KED had 11 Russian-Tatar schools and 10 madrasah Russian classes [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 21785, s. 5], in 1902 there were as many as 41 Russian-Tatar educational establishments, including 9 madrasah Russian classes [Samatova, 2010, Appendix 7].

One of the key reasons behind the dramatic increase of Russian-Tatar schools in the OED was the absence of any opposition between Muslim communities and missionary institutions in the region. In 1902, there were 95 innovative schools in the region [Budilovich, 1905, pp. 119–120, 135, 145].

Free innovative Muslim schools mainly targeted the poor social strata—the peasantry and the burghers. They were not the only educational establishments that taught Tatars to read and write in Russian. Merchants' and clergymen's children had private teachers to help them learn the official language. A small group of Tatar youth went to Russian primary

Iskhak Kazakov while working in Tetyushi Russo-Tatar school. Photo, 1897.

schools. Mullah candidates tended to avoid such schools, preferring private teachers.

Russian teachers played a major part in the development of innovative schools. The average annual salary of teachers at government-funded Russian-Tatar schools in the KED was about 300 rubles [National Archives of the Republic of Tatarstan, f. 160, inv. 1, file 619, s. 8, 12]. At zemstvo schools it mostly depended on what zemstvo institutions could afford [State Archive of Kirov Oblast, f. 205, inv. 2, file 2388, s. 72 reverse–73; inv. 4, file 3739, s. 1]. Teachers of Russian enjoyed the 'right to work as parish teachers' [National Archive of the Republic of Tatarstan, f. 92, inv. 1, file 21785, s. 4] and the same right of pension and benefits as teachers at public schools. However, no procedure had been established for receiving these benefits [Mir islama, 1913, Vol. 2, p. 268]. Dutiful teachers of Russian were awarded government rewards [Central District Department of Education, 1895, No. 11–12, p. 456; 1897, No. 1, p. 7; 1902, No. 9, p. 337] and a citation by the educational district curator [Central District Department of Education, 1897, No. 8, p. 295; 1897, No. 12, p. 404].

Some OED teachers did trade. They waited for the compulsory six years' term in office to

be over and then gave up teaching [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 109]. KTTS alumni received jobs as cashiers, office clerks, and book-keepers for private commercial and industrial enterprises or worked as private teachers for wealthy Tatar families [Gorokhov, 1941, p. 42].

Four-year Tatar teachers' schools were established in Simferopol (1872) and Ufa (1872–1876) within the new school policy. They offered training to teachers of Russian and mathematics. They enjoyed the status of educational establishments and as well as all the benefits and privileges granted to pro-gymnasiums [Sbornik postanovlenij po Ministerstvu narodnogo prosveshheniya, Vol. 6, Column 1255–1260]. Russian was the language of instruction for all subjects except for Islamic Theology. Studying was continuous except for Sundays as well as key Christian and Muslim holidays and summer vacation. All school graduates were obliged to work at a school for 6 years or repay the government's cost of their four-year education. After 12 years of service they could petition for the title of honorary citizen [Sbornik postanovlenij po Ministerstvu narodnogo prosveshheniya, Vol. 4, Column 752–758, 2139–2146].

In 1876, Count D. Tolstoy, who was inspecting the Ufa Tatar Teachers' School, found the first alumni to have poor knowledge of Russian and improper ideological orientations. Besides, he believed the rented building to be unfit for academic activities [Sbornik postanovlenij po Ministerstvu narodnogo prosveshheniya, Vol. 6, Column 1705–1706].

When the Tatar Teachers' School moved to Orenburg (OTTS) in the summer of 1877, it occupied the then-vacant building of the Bashkir Feldshers' School. The allowance for students of the school was increased from 90 to 120 rubles per person in 1881 because the number of students had been officially reduced from 40 to 30 [Central District Department of Education, 1883, No. 1, p. 9].

In 1890, the OTTS was closed because the Ministry of Public Education was dissatisfied with its performance 'in promoting Russian education among Muslims and bringing them

closer to the Russian nation'. 12 of its students were transferred to the KTTS [Enikeev, 1948, pp. 201–202].

In 1872, V. Radlov suggested establishing the Tatar Teaching Institute in Kazan to train teachers for madrasah Russian classes who would be able to 'raise Russian science in the eyes of the shakirds and make them want to grow closer to us... win the moral struggle against the learned tutors at Tatar schools' [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 10961, s. 12]. When the project was rejected, V. Radlov declared that a teaching school had to be established in the KED. In 1876, the KTTS opened to host 40 students at the government's cost. It was to become the 'key breeding ground' for teachers to work at innovative government funded Tatar and Bashkir schools.

The first KTTS Inspector was a Tatar teacher at 1st Kazan Gymnasium M. -G. Makhmudov, replaced by Russian teacher Sh. Akhmerov (1881–1900), who M. Pinegin (1900–1907) succeeded after his death.

A gradual increase in the number of KTTS students, including those studying at their own cost, lecture attendees, and zemstvo scholarship awardees (in 1876–1, in 1901–5, in 1903–10) [National Archives of the Republic of Tatarstan, f. 142, file 74, s. 63] was indicative of improved credit with the Tatars, who were becoming increasingly interested in secular education for their children. In 1902, an attorney at the Kazan District Court S. Alkin was appointed Curator of the KTTS, whose office had been re-established.

The government allocated an annual maintenance amount of approximately 20, 000 rubles to the KTTS in the 1880s. K. Pobedonostsev was opposed to 'spending on Muslims' such a significant amount and submitted numerous suggestions to Minister I. Delyanov (1882–1897) and Alexander III, that the KTTS should be transformed into an educational establishment 'like the Kazan Teachers' Seminary' [St. Petersburg Branch of the Russian Academy of Sciences Archive, f. 177, inv. 2, file 11, s. 10].

External examinations were an alternative to attending a Tatar teachers' school for a Russian teaching license. Over the period that the KTTS existed, 128 men and 8 women were made teachers in primary Russian-Tatar educational establishments [Khakimov, 1972, p. 12]. The Bashkir Girls' Orphanage in Ufa also prepared students for external tests. In 1899 a teaching class for Russian-Muslim school teachers opened at the Belebey Four-Year Municipal School [Budilovich, 1905, p. 135].

As Muslim educational establishments were established, officials in educational district administrations and the Ministry of Public Education began to think that Russian literacy would make mullahs improve their attitude towards new schools and even teach Russian to community children [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 42 reverse]. They even believed that knowledge of Russian among mullahs would even calm down community resistance to establishing innovative Muslim schools.

Mullahs who knew Russian and could write in it enjoyed greater authority within the community and the local administration, where officials could not speak local languages. He could be confident in a Russian environment, for instance, in government institutions. Inspector V. Radlov believed mullahs to be the group of rural dwellers that had the best knowledge of Russian [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 21060, s. 5 reverse].

The Minister of Public Education D. Tolstoy suggested in 1875 that knowledge of the Russian-Muslim school curriculum should be 'made compulsory' for candidates seeking Muslim clerical offices. The count offered the following justification: mullahs tell their parishes that studying Russian is 'sinful and inconsistent with the Quran and the Sharia'. When knowledge of the official language became mandatory, the ridiculous argument against Muslims' attending Russian classes or Russian-Tatar schools would cease to be valid [Russian State Historical Archive, f. 821, inv. 8, file 1051, s. 50 reverse–51].

Kazan School for Tatar Teachers.

However, feedback from heads of the Taurida, Orenburg, Ufa, Samara, Kazan guberniyas, Turgay and Ural regions, and the Inner Bukey Horde prevented the Ministry of Internal Affairs from enforcing this rule. The recommendation was issued that the beginning of the introduction of educational requirements should be established for each province individually. When approving clergymen in the OMSA District, knowledge of Russian was to be viewed as an advantage, etc. [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 10464, s. 38–46 reverse].

Taking into account the suggestions, D. Tolstoy submitted the following recommendations to the State Council in May 1877: 1) a Russian educational qualification requirement (primary school level) should be established as soon as possible for those seeking secular and public offices (in zemstvo, city, or village institutions); 2) teachers at Muslim schools and candidate clergymen should be required to be able to 'write and read in Russian clearly' from 1878 and know the curriculum of madrasah Russian classes beginning in 1880; 3) the establishment of new Muslim schools should be permitted provided that the community funds a Russian class. Geographically, the new regulations covered the whole Empire except for Siberia, the Turkestan Gov-

ernor-Generalship, the Caucasus and Transcaucasia [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 162–162 reverse].

The main reason why the authorities did not venture to implement the plan was the Russian-Turkish War of 1877–1878. Public officers were apprehensive, lest restrictive measures could trigger Muslim disturbances in the Crimea and the Volga Region. So they recommended reconsidering

the measures of the Ministry of Public Education 'under more favourable circumstances' [Russian State Historical Archive, f. 733, inv. 15539, s. 39 reverse].

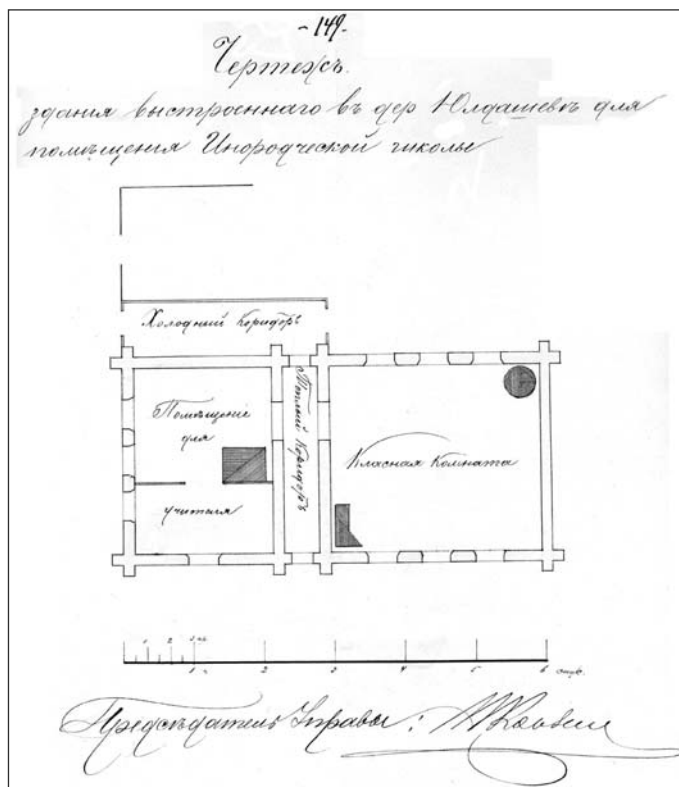

Orenburg Mufti S. Sultanov (1886–1915), re-appointed in March 1886, found OMSA members (village mullahs) to have inadequately poor knowledge in religious studies and records management skills, which were chiefly attributable to their Russian illiteracy. He found it necessary to set the requirement that all OMSA members were to be literate in Russian in accordance with the curricula of Tatar teachers' schools and uyezds primary schools, and for akhunds and hatibs (senior mullahs) of city mahallas as well as full-time military mullahs in regular and cossack troops, in accordance with the programs of public primary schools. The mufti found it premature to apply the requirement to most of the Tatar clergy in village parishes. He suggested that Russian literacy should be an advantage when several candidates competed for an office [Russian State Historical Archive, f. 821, inv. 8, file 1074, s. 5–6 reverse].

The law enforcement and educational departments 'enhanced and developed' the mufti's suggestions. They resolved that the requirements should be totally mandatory and apply to rural clergyman candidates as well.

Under the Law of 16 July 1888, candidates seeking membership in the Spiritual Assembly were to take examinations on the curriculum of the first four years at gymnasiums/the KTTS/uyezd, municipal, and two-year primary schools beginning in 1891. Urban akhund and hatib candidates had to prove their knowledge of the curriculum of the one-year public school, while mullah candidates in rural communities were to provide certificates issued by the uyezd school councils stating that they knew 'spoken Russian' [Complete Code of Laws of the Russian Empire–3, Vol. 8, No. 5419].

It should be noted that the Russian educational qualification requirement had become well-established for clergyman candidates in the Roman Catholic, Protestant, Armenian and Jewish faiths. They were expected to have completed a course at Russian educational establishments. Only the Muslim clergy (except for 'Shamanists' and Buddhists) enjoyed the 'privilege of non-mandatory Russian knowledge'. Thus, the government wanted to establish equal requirements for Muslim clergymen and those in other confessions.

Apprehension of possible disturbances and the mass Muslim petition campaign of 1888–1890 motivated the government to work out new, simplified requirements [Russian State Historical Archive, f. 821, inv. 8, file 1071, s. 85–86], which constituted the Tsar's Edict of 11 October 1890 [Complete Code of Laws of the Russian Empire–3, Vol. 10, No. 7120]. Beginning in 1891, those seeking OMSA membership were required to have a certificate confirming their ability to read and write. It was not until 1896 that it became mandatory for them to present certificates of course completion at a municipal school, while village mullah candidates were required to have

Layout of Russo-Bashkir zemstvo school in the village of Yuldashevo, Samara guberniya, 1873

a certificate confirming their ability to read and write in the Russian language. The new rule applied to 21 provinces, 4 regions, and the Inner Bukey Horde¹⁷. At the behest of the Ataman of the Orenburg Cossack Army, requirements for mullah candidates were simplified to the level of village mullahs. That is, they had to merely prove their ability to speak and read. Mullahs in the Ural and Siberian Cossack Armies, as well as municipal akhund and hatib candidates, were required to be literate in Russian equivalent to the curriculum of a one-year school. A board of the principal of the educational establishment and two

¹⁷ These included the Kazan, Orenburg, Ufa, Astrakhan, Samara, Saratov, Simbirsk, Penza, Vyatka, Nizhny Novgorod, Perm, Tambov, Ryazan, Tomsk, Tobolsk, Moscow, Saint Petersburg, Kherson, Kostroma, Yenissey, Irkutsk guberniyas, 4 regions (Urals, Semipalatinsk, Akmolinsk, Turgayskaya) and the Inner Bukey Horde.

teachers of secular subjects was to examine the candidates.

The government made further concessions. In 1892, re-examination was permitted after 6 months [Central District Educational Department, 1892, No. 10, p. 423], and in 1900, candidates were allowed to take examinations for a third time [Central District Department of Education, 1900, No. 4, p. 88]. The requirement that all candidates must submit two photos was established in 1896. From 1902, clergyman candidates were to pay a fee of 3 rubles, the same as had been imposed on seekers of teaching jobs [Central District Department of Education, 1903, No. 2, p. 50].

Mild as they were, the Russian qualification requirements for village mullah candidates minimised the possibility of them becoming Russian teachers.

Muezzins did not have to take the Russian tests that mullahs had to take and could be appointed provisional mullahs as long as the latter office remained vacant, provided that the term did not exceed half a year [Sbornik czirkulyarov, 1905, p. 12].

The Russian educational qualification requirements made madrasah Russian classes and Russian-Tatar schools more prestigious, but did not cause the number of their students to increase in that period. Private teachers often prepared students for Russian examinations [National Archives of the Republic of Tatarstan, f. 160, inv. 1, file 794, s. 3–4].

That is, it was common for Russian-Tatar schools and madrasah Russian classes to open under administrative pressure from the educational department in the first decades. This also had the reverse effect, as the population grew increasingly suspicious of the government's school policy. Tatars' interest for and willingness to obtain Russian education were often suppressed from the very beginning.

During this period, a system for training teachers of Russian was established, teaching aids developed and a local network of schools, funded by the government, zemstvos, city self-governing authorities, other institutions and concerned individuals.

Despite resistance from mullahs and the conservative part of rural communities, Russian classes and Russian-Tatar schools always had students, which suggests that literacy in Russian was in demand. However, locals did not allow Russian classes at maktabas. Only madrasahs offered such classes, which was no coincidence. In fact, studying the official language became characteristic of the intellectual side of Tatar society. Shakirds were the most learned Tatar group who study in madrasahs, while Russian-Tatar schools offered education to children whose parents could not afford a private teacher.

The few Russian-Tatar schools and the KTTS had become integral in Tatar national education by the turn of the century. Though Jadidism had been gaining momentum, their number increased steadily after 1905.

The teacher played a major part in introducing their students to Russian social life and culture. They taught them to see events in Tatar society and in Russia from a different point of view. Teachers were gradually able to persuade parish parents that innovative schools were 'harmless' to Muslims.

Governmental Control over Muslim Educational Institutions in the Volga and Ural Regions. The modernisation of Russian society made the national issue even more complicated. It was not all about an increased national awareness and booming cultures of ethno-confessional minorities. The issue was largely pre-determined by the actions of the imperial government, which had been working to establish police control over various national institutions, in particular, the education system. Its invasion into the closed, cultural space, segmented by confessional, national, and social borders, was usually accompanied by coercion and, sometimes, repression. Russification and pressure on secondary and primary schooling in the Kingdom of Poland began soon after the 1863 rebellion. In 1881, the Ministry of Public Education was given responsibility over central and village schools in former Bulgarian and German colonies, as well as schools in Jewish landowners' colonies in six provinces. Under the Tsar's Edict of 25 November 1885,

Baltic Evangelical-Lutheran schools were subjected to governmental supervision. They were followed by Protestant church schools in the Transcaucasian Krai in 1892 and Roman Catholic Church schools across the Empire in 1893 [Zagidullin, 1992a, p. 62].

Governmental measures for maktab and madrasahs in the Volga and Urals were entirely consistent with the policy of ensuring total control over non-Russian education systems. The question of establishing supervision over Muslim schools by the Ministry of Public Education was first raised in early 1866. 'Tatar schools are noteworthy. They circulated across Tatar villages in the Volga provinces to such a degree, that it is not Russians but Tatar mosque clergymen, trained by mentors with Bukharian education, who teach a large part of the Tatars to read and write. Therefore, this Muslim breeding-ground, hostile to us and fanatic as it is, has been determining and influencing the education of up to 1 million people in the Great Russian provinces' [Russian State Historical Archive, f. 821, inv. 8, file 806, s. 1]. This is how the educational department justified their ambition to control maktab and madrasahs in the Volga-Ural Region.

It should be noted that Muslim community public schools had previously hardly received any governmental supervision. In the pre-reform period, the Ministry of Internal Affairs controlled all schools except for military and religious ones. Russian law contained no provisions for Muslim schools in the OMSA District [Russian State Historical Archive, f. 821, inv. 8, file 806, s. 2–3].

Following the dissolution of the irregular Bashkir Army, Governor General N. Kryzhanovskiy in 1866 was the first to declare that 'some kind of administrative control' had to be ensured over Trans-Ural educational establishments. His suggestion was that conciliators should execute supervision, while governors would be responsible for authorising new Muslim schools [Dyakin, 1995, pp. 812–814].

The 'Regulations' of 1870 put the objective of subordinating maktab and madrasahs to the government on the agenda. Under the Law of

24 November 1874, all Tatar, Bashkir and Kazakh schools in KED and OED Muslim communities, as well as in the Nizhny Novgorod (Moscow Educational District) and Penza (Kharkov Educational District) provinces were subordinated to the Ministry of Public Education [Rozhdestvensky, 1902, p. 596].

The recommendation was that supervision over Muslim schools shall not begin until the dedicated instruction establishing procedural controls had been approved. Count D. Tolstoy entrusted the Instruction to KED Curator P. Shestakov, and V. Radlov authored the draft.

The Academic Committee of the Ministry of Public Education met on 26 January 1876 to discuss the Kazan draft [Russian State Historical Archive, f. 733, inv. 170, file 971, s. 1–1 reverse]. A new edition of the draft Instruction was thus prepared following the meeting, and was submitted to the Committee of Ministers in May 1876, after which the authority recommended its preliminary agreement with the Ministry of Internal Affairs. This occurred because the draft combined two separate provisions on supervision over Muslim school activities and coercive measures for the promotion of Russian education. Meanwhile, governmental supervision was not determined directly by the need for active coercive measures to establish Russian classes. Each of these aspects had specific features of their own.

The measures suggested for establishing governmental supervision ignored deep-running eastern maktab and madrasah traditions, and consisted of rapid and radical changes in the sphere. The requirements were radical because a number of internal regulations were suggested that were similar to those of Russian schools. Namely, the school principal was to formulate student lists, prepare annual reports on student and teaching staff contingencies, and build a curriculum to be approved by the educational administration. Starting in 1880, school principals had to be in correspondence with the controlling bodies of the Russian educational administration. Communities funding ethnic schools were prohibited from addressing school issues and the instruction methods

of the younger generation. Mudarris certificates could only be issued to individuals who knew Russian (reading and writing), and from 1880 to those who had mastered the curriculum of madrasah Russian classes. To implement these requirements would have formed a gap between traditional schools and mosques; most madrasah teachers would have been unable to work there because they did not know the official language.

It is especially noteworthy that only religious textbooks approved by the censors (§ 4) were established to be acceptable. Handwritten books were common in madrasahs at that time. Printed textbooks on Russian subjects were extremely few.

The recommendation was that mahallahs intending to establish new educational institutions bore the costs of Russian teachers regardless of the community's economic standing. If community or a madrasah/maktab principal openly resisted the establishment of Russian classes, the educational institution was to be shut down. The suggested administrative regulations discredited the idea that knowledge of the official language was useful.

It is also noteworthy that the inspector was not expected to deal with the nature of Islamic theology. He could only 'ensure dogmatic instruction without any interpretations that are inconsistent with loyalty to the Emperor and the Most August House or love for our Motherland—Russia—and inspire loathing for the Christian population' [Russian State Historical Archive, f. 773, inv. 170, file 971, s. 122–127].

The provisions in the draft Instruction on the management of other Muslim schools, funded by the government, communities, institutions, and private individuals, as well as on home and private teachers came from the Instruction to Instructors for People's Schools of 29 October 1871, which meant they were part of a uniform administrative system.

The 1876 draft Instruction represented the peak of the educational department's ambition to establish supervision over Muslim schools. Its provisions were gradually implemented, to varying extents, in the late 19th to early 20th century.

Discussion on the bill led the Emperor to approve the Circular Guidelines to KED and OED curators by the Minister of Public Education, which referred to the suggestions of the Ministry of Internal Affairs on 5 February 1882. The first paragraph of the Circular enabled officials at the educational department to start exerting practical control over Muslim schools. They were instructed to exercise caution when visiting educational establishments, collect statistics, and render spoken advice without setting any mandatory requirements. Officials were to prepare reports for the district curator following school inspections. The second paragraph of the Circular dealt exclusively with precautions. It recommended that officials start visiting and inspecting schools in areas where Muslims co-resided with Russians or non-Russian Christians. Only after the inspection of such educational establishments and areas were they permitted to proceed gradually into all-Muslim areas [Central District Educational Department, 1882, No 4, pp. 72–74].

In summation, the pragmatic approach of the Ministry of Internal Affairs dominated the discourse between enforcement and educational departments. This brought about a school policy that was different from the model implemented in the western governorate because it consisted of a circumspect approach to the promotion of Russian education and supervision over traditional Muslim educational establishments in the Empire's inland.

In the 1880s–1890s KED and OED Curators filed several suggestions to the Ministry of Public Education that a 'firm statement' should be made to mullahs to make them follow instructions received from inspectors of people's schools [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 3], the Decree of 5 February 1882 should be abolished, and control over Muslim schools enhanced. However, the government was adherent to a gradual and cautious approach.

A number of factors complicated inspector control over Muslim schools. In fact, this occurred because European requirements for accounting and control had already been established in schools, which were originally

founded according to the medieval Middle Asian model. Since in small villages maktab operated in the mullah's house, invasion by a representative of the authorities would mean infringement on the private property of the imam (principal).

Having proceeded with his new functions, V. Radlov addressed the mullahs of Kazan through the Circular of 15 April 1882, suggesting that they should provide statistics on their schools [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 15539, s. 32–33]. V. Radlov thus violated the law of 1882, which stipulated supervision over Muslim schools but offered no requirements for them to ensure greater efficiency. His written address caused the imams to protest, which the city's Tatar community supported.

Following V. Radlov's departure for the capital, KED officials were in fact removed from supervision over Muslim educational establishments.

A total of 85 schools were inspected in the OED in 1883–1887 [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 168–169 reverse]. It should be noted that V. Katarinsky became personally convinced of the confessional schools' 'religious and scholastic orientation' that by no means included any political influence on shakirds and parish people [Farkhshatov, 1994, p. 49].

OED governors instructed mullahs to annually submit data on their educational establishments' status (maktab or madrasah) and number of students to the inspectors of people's schools for reports 'on public education'. However, mullahs provided such data only very rarely. In 1887 the OED Curator asked the governors and Mufti of Orenburg to obligate mullahs to report several kinds of data on their schools to Inspector V. Katarinsky¹⁸. However, Mufti M.

Sultanov refused the offer by referring to the mullahs' subordination to the Spiritual Assembly exclusively on religious issues, suggesting that it was not his responsibility to deal with schooling [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 171–171 reverse].

After the office of Muslim school inspector was abolished in 1889, the KED administration did not transfer the function of supervision over maktab and mardasahs to anyone [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 21785, s. 12]. N. Ilminsky convinced the KED administration that the institutions did not deserve any attention and that they would practice 'the time-tested approach of governmental indifference to Mohammedan schools, at least until the enlightenment of non-Russian Christians is well-established enough to eliminate the threat of re-conversion into the Mohammedan faith' [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 21785, s. 14 reverse].

In order to rectify the situation, the Ministry of Public Education issued the Circular of 31 July 1891, which required the KED Curator to provide the following data on Muslim educational establishments: school count, teaching staff, shortcomings and measures to be taken to rectify them [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 21785, s. 17].

In his letter to D. Tolstoy dated 16 October 1886, N. Ilminsky recommended that future mullahs be banned from pursuing education in Turkey, Egypt and Arabia. He warned the influential official: '... our Tatars can be subjected to the influence of all kinds of rascals in these countries, Poles, Hungarians, and other enemies of Russia. Education and civilisation of Western Europe, which has been developing rapidly in these countries and bringing about new institutions and a literature that follows the western European model, can affect the schools of the Muslim East and, indirectly, our Tatar seekers of higher knowledge. This is how I see the distant future: the Tatar school

¹⁸ 1) name of the place, number of residents with an indication of their ethnic origin and confession; 2) names of the school principals, halfas, mudarrises and other persons associated with the school; 3) names of the institutions and places where these persons received education; 4) number of boys and girls attending the school with the names of their settlements; 5) school opening date, including dates of the beginning

and end of the academic year; 6) school building (rented, owned, etc.); 7) funding of the educational institution, whether waqfs (religious trusts) are available.

V. Katarinsky (sitting in the centre)

Photo from the second half of the 19th century

will exchange the Bukharian medieval scholasticism for the splendour of the Ottoman-European enlightenment and civilisation; the Tatar hostility to Russians will then shift from the religious sphere to culture and probably even politics... ' [Russian State Historical Archive, f. 733, inv. 171, file 656, s. 71 reverse–72]. This idea of N. Ilminsky, although worded differently, was included in the KED Curator's petition to the Ministry of Internal Affairs of 1891, in which he asked it to exclude mullahs who had received religious education abroad.

It was under the KED Curator's petition that the Ministry of Public Education agreed with Internal Affairs to issue the Circulars of 30 June and 10 July 1892.

In all educational districts the inspectors of people's schools were only responsible for Tatar-Russian schools [Budilovich, 1905, p. 187]. By the Circular of 30 June 1892 the Ministry of Public Education informed the Curators of

the KED, the OED, and Moscow¹⁹ and Kharkov²⁰ Educational Districts that new maktab and madrasahs could only be established subject to approval by people's school principals [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 19936, s. 1–3]. Thus, the legal framework for governmental control over Muslim educational establishments over a vast territory was officially established.

The Circular of 10 July 1892 on the introduction of new regulations was communicated to the Curators of the Kazan, Moscow, and Orenburg Educational Districts. It referenced the fact that maktab and madrasahs often used handwritten books promoting ideas that were 'adverse to Russian state-building principles' as a pretext to restrict the choice of textbooks to printed books that have been pre-approved by Russian censorship. Thus, the requirements to other primary educational establishments accountable to the Ministry of Public Education also applied to Muslim schools, which unified the administration. Mullahs who had received education in Muslim countries were ac-

cused of undermining 'the rapprochement between the Muslim population and the Russians' and impeding the promotion of the Russian language and Russian literacy. For this reason, only Russian subjects who had received an education in Russian were allowed to teach [Inorodcheskie i inovercheskie, 1903, p. 21].

Using handwritten textbooks was a medieval tradition that could also compensate for the lack of printed books and the shakirds lack of funds to afford expensive foreign reference materials. Copying books in the beautiful script of eastern calligraphy was a Muslim art in the world of Islam. Handwritten books were extremely important to the national culture and were passed on from generation to generation.

¹⁹ The Vladimir, Vologda, Kaluga, Kostroma, Moscow, Nizhny Novgorod, Orlov, Ryazan, Smolensk, Tver, Tula and Yaroslavl guberniyas.

²⁰ The Voronezh, Kursk, Penza, Tambov, Kharkov governorates and the Province of the Don Military Region.

When implemented, the Circular by the Ministry of Public Education threatened to derail the entire academic process.

In fact, the Ministry of Public Education began in 1892 to ignore the requirement to take a 'cautious and gradual approach' to controlling Muslim schools provided for in the Decree of 5 February 1882.

OED schools were inspected for books published in Muslim countries and handwritten works.

The special meeting (May 1894) called to address the issue of printed and handwritten materials used at Muslim schools resolved that the regulation on printed books would remain in effect, while existing handwritten textbooks could still 'be kept at schools', though the government would 'rely on its inspectorate to consider their copies when necessary' [Russian State Historical Archive, f. 821, inv. 8, file 816, s. 211]. In 1895, the Ministry of Public Education approved the list of foreign books acceptable at Muslim schools [Central District Department of Education, 1895, No. 7, pp. 230–231]. However, the authorities still failed to confiscate all foreign literature from schools. It should be noted that this enhanced control over textbooks motivated Tatars to prepare and publish maktab and madrasah textbooks that were in large part adjusted to the Russian requirements.

Under the Circular by the Ministry of Public Education of 30 June 1892 the KED administration obligated people's school administrative offices to collect data on Muslim schools without providing them uniform forms to do so [National Archives of the Republic of Tatarstan, f. 1, inv. 3, file 10495, s. 9–10].

This revealed that in 1892 KED had a total of 1, 108 schools. The data was collected with the help of uyezd police officers, with whom the Tatar population was more used to interacting. Inspectors were rightfully apprehensive, lest the Tatar people become dissatisfied with their visits [National Archives of the Republic of Tatarstan, f. 160, inv. 1, file 977, s. 27 reverse].

The Order by the Ministry of Public Education of 29 August 1899, under which maktab and madrasah principals were to submit an-

nual reports and student lists to inspectors for people's schools, was crucial to establishing the practice of regular inspector visits to confessional schools [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 24602, s. 5]. However, it was only principals of city schools who provided such data at first, while the rural clergy completely ignored the order [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 23954, s. 11–13, 38, 52]. Mullahs sent numerous petitions to the KED administration asking it to stop the inspection of Muslim schools by educational department officials.

OED Kazakhs welcomed the inspector as a guest of honour, while Tatars took an 'indifferent attitude' [Budilovich, 1905, p. 180]. Inspector V. Katarinsky never found out how many Muslim schools were in the OED, as Mullahs would not provide complete data or ask for permission to establish new schools. It was not until the inspectorate office for Muslim schools was abolished in 1903 that the management of primary schools was confronted with the fact that control was to finally be exercised over the numerous maktab and madrasahs [Budilovich, 1905, pp. 122, 123, 134–135].

Throughout the 1890s the government was attempting to regulate the internal organisation of maktab and madrasahs. The Circular of 31 July 1891 by the Ministry of Public Education obligated educational district administrations to ensure that proper sanitary conditions were maintained at maktab and madrasahs [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 19380, s. 2 reverse]. This was natural given the increased concern about school hygiene. However, no funds were allocated to improve any improper sanitary conditions at schools, and no schools were reported closed for this reason either.

The Ministry of Public Education made an attempt at using Muslim donations meant for confessional schools to develop the network of governmental educational establishments specialising in the promotion of Russian. All cases of donations to Muslim schools were referred immediately to the administrations of the educational districts under the Circular by the Min-

istry of Public Education dated 30 November 1896. In fact, the government prohibited the use of donations for ethnic schools and enabled the principals of primary schools to fund madrasah Russian classes from such donations [Sbornik zakonov, 1899, pp. 53–55]. However, the imperial government never achieved its ultimate goal. What prevented it from doing so were the miniscule donations in rural localities, which were in fact too scant for Russian classes. Therefore, the Ministry of Public Education stopped interfering in these affairs.

In its Order of 29 August 1899 the Ministry of Public Education restored the requirement that handwritten literature must not be accepted, which was provided for in the Circular of 10 July 1892. However, officials and imams agreed unofficially that handwritten textbooks could still be used in schools. The same order stipulated that Muslim schools could accept only Russian subjects who had obtained adequate permission from the local inspector with reference to their license to the effect that they can carry out such activities [National Archives of the Republic of Tatarstan, f. 160, inv. 1, file 907, s. 1–1 reverse].

In the latter quarter of the 19th century, the government did not interfere in the socio-cultural processes of the Tatar community. The first blow to the fledgling Jadid movement came in June 1901: the authorities closed down the All-Russian Innovative Teaching Courses at Mosque 9 of Seitov settlement, Orenburg guberniya, which the merchant Gabdulgani Khusainov had been running every summer since 1899 without obtaining any official permission [Shaydullina, 2010, p. 81–82].

In summation, in the post-reform period the KED and the OED became an experimental platform on which the government developed a mechanism to exercise control over traditional Muslim schools. The 'Regulations' of 1870 did not apply to the Odessa Educational District. Tatar disturbances broke out in Crimea in 1874 as a response to the government's attempt at introducing universal military service, and mass emigration was starting out of Russia.

The authorities failed to ensure control over maktab and madrasahs in the Volga and Ural Regions in the period in question. One of the root causes for this was their realisation that the Islamic scholastic education system was posing no threat to the state's interests. Tatar disturbances and mass protests against governmental interference in the sacred sphere of their religious life, namely confessional education, was another factor of no less significance. The all-Russian importance of the Volga and Ural regions' 'Muslim Tatar schooling issue' was a third reason. Peripheral Muslims had been watching the situation closely to see any signs of approaching restrictions regarding the autonomy of religious education as their integration became more intense.

The control over maktab and madrasahs could only be formal in nature because they were numerous, and the Russian primary education system was just a fledgling and required enormous funding and other efforts from officials at the educational department, who were too few and had inadequate Tatar skills. While in the early 20th century KED inspectors visited about 1/5 of all Tatar schools, in the OED officials at the educational department faced the fact that they were expected to exercise supervisory control over maktab and madrasahs following the abolition of the office of Muslim School Inspector (1903). It is thus safe to say that a mere outline of the control system had taken shape by the beginning of the 20th century. The educational department primarily collected statistics on student count and teaching staff, while visiting few schools.

Therefore, when the Muslim schools of the Volga and Ural regions became subordinate to the Ministry of Public Education in 1874, this formed the legal basis for control over and interference in the internal regulations and educational activities of confessional schools. Moreover, the governmental management of traditional Tatar, Bashkir, and Kazakh schools did not mean governmental funding to improve their conditions.

CHAPTER 4

Observance of the Religious Rights of Muslim Military Personnel

Ildus Zagidullin

The concept of the Russian military according to Peter I did not include any ethnic, that is, non-Russian unions. However, administrative control over the Empire's periphery indeed required adjustments to be made to local social relations. Historically, the country had the following three types of ethnic units: irregulars (regiments, hundreds, divisions), ethnically recruited regular units, and armed forces of autonomous territories [Lapin, 2001, p. 110, 113].

Tatars in Irregular troops and the Uhlan regiment. The first irregular Muslim units were probably the Taurida Division Mounted troops, founded in 1784 [Complete Code of Laws of the Russian Empire–1, Vol. 30, Section 1, No. 23362].

The Teptyar and landless peasant regiments formed in 1798 to guard the Orenburg Border included a 'regiment mullah' with a monthly salary of 12 rubles, equal to that of a scribe or a common Cossack [Complete Code of Laws of the Russian Empire–1, Vol. 44, Section 1, No. 18701]. The same conscription procedure was applied to Bashkir and Mishar cavalry regiments founded after the canton administrative system was introduced in the Cis-Ural region in 1798 [Kratkaya e'nciklopediya, p. 150]. Mullahs conscripted to regiments (of 500 people) received 300 rubles instead of 150 starting in 1833 [Complete Code of Laws of the Russian Empire–2, Vol. 7, Section 1, No. 5885].

Military mullahs were responsible not only for occasional services, but also for keeping morale up, which was especially important during wartime, and also admonitions according to the 'code of honour', which meant humane treatment of the prisoners of war, etc. In 1850 the office of the Chief Akhund of the Bashkir and Meshcheryak Army was established, and

the imam of the Caravanserai Mosque of the Irregular troops in the City of Orenburg G. Altynguzin was appointed to it. His responsibilities were confined to translations for the chancellery and the collection of information on the commanding staff's order [Azamatov, 2002, p. 745].

Following the partition of Poland and the annexation of the former Duchy of Lithuania by Russia, the Lithuanian and Polish Tatar Mounted Regiment was founded in 1797. During the reign of Alexander I the regiment gradually ceased to be multi-ethnic as a result of a lack of Polish and Lithuanian conscripts. In 1803 the regiment was divided into two confessional parts, and both of the regiments were renamed ulhan in 1807. The Lithuanian and Tatar regiment had a full-time military mullah. In 1832 the 15th Ulhan regiment, which consisted only of Tatars, was dissolved to help support the Polish Rebellion of 1830, only to be restored under the same name in 1853 with Russian conscripts only [Grishin, 1995, p. 42].

Ethnic Tatar and Bashkir units in irregular troops where favourable religious conditions were ensured therefore existed in the pre-reform period only.

In the Orenburg and Urak Cossack armies, as well as the Siberian Tatar Cossack regiment established in 1822, which included Muslim soldiers, there were no field or military mullahs.

Muslims in the Regular army. Among the Empire's Muslim peoples in the 19th century, Tatar tax-payers from the Volga-Ural region (from 1722) and Lithuanian-Polish Tatars were conscripted to the regular army. Bashkir, Mishar, and Teptyar ethnic and class groups were also added to the list in the post-reform period.

The regular army was filled in a manner to ensure a Russian percentage of 75% in each military unit [Zajęzkowski, 1973, p. 119].

The autocratic government viewed universal military service as the perfect opportunity to assimilate and Christianise ethno-confessional minorities. 'After universal military service was introduced, the army was used more consistently as a tool for the forced assimilation of non-Russian peoples into Russian culture and the Orthodox environment' [Kravchuk, 2005, p. 14]. When soldiers were first accommodated in barracks in the latter half of the 19th century, this increased Muslim 'participation' in Christian rituals: group Orthodox prayers in the regiments took place 5–6 times a day [Kotkov, 1999, p. 45].

The military oath was the most illustrative in terms of the extent to which religious rights were observed. According to the 1831 'Recruitment Regulations', clergymen were allowed to administer the oath to Muslim conscripts at recruitment offices in their native language. Where no clergyman was available, the oath could be administered by giving the printed version of the oath and the Quran to a literate Muslim; 'in case the one to take the oath was illiterate and no literate Muslims were available, the person appointed to administer the oath to him was to read out the oath written in Russian' [Russian State Historical Archive, f. 821, inv. 8, file 1159, s. 4–4 reverse].

The text of the military oath was an abridged translation of the uniform loyalty oath into high-register Tatar [Complete Code of Laws of the Russian Empire–2, Vol. 25, Section 1, No. 24117] and a Russian invention that disregarded Quranic requirements and Islamic law. A number of places in the text of the oath could be interpreted in several ways, especially where Christian obligations were imposed on Muslims. The new text of the military oath developed by the officials of the Asian Department of the Ministry of Foreign Affairs in 1861 combined Islamic rules with requirements established by the autocratic government. It contained no discrepancies between civil and Islamic law, and provided no opportunity for the evasion of military service, referring to a

'Quranic text' to impose the liability of observing the Muslim military serviceman oath [Tikhonov, 2008, p. 185]. At the end of the 19th century, the government gave up the practice of using indigenous languages. The Senate's Decree of 17 February 1899 emphasised that the Russian language was to be used for all state acts, in particular the military oath.

The political aspect of the religious issue in the army was determined by military campaigns that helped improve the observance of Muslim servicemen's religious rights. For instance, in the long-fought Caucasian War (1817–1864), namely in 1819, a three days' rest was granted to Muslim servicemen on the occasion of Kurban Bayram and Ramazan Bayram. Before the Crimean War was initiated, the Military Ministry re-specified the Islamic religious holidays that were days off. The Edict under which the regulations on the religious and ritual responsibilities of Jewish soldiers applied to Muslims was signed by Alexander of Russia on 26 June 1877, when the Russian-Turkic war broke out [Complete Code of Laws of the Russian Empire–2, Vol. 52, Section 1, No. 57518]. Starting on that date Muslims were able to hold praying sessions subject to the commander's permission, especially on religious holidays, 'under the supervision of a reliable comrade that they elect'. 'In the Russian–Japanese War, or more specifically in the spring of 1904, the commanding staff permitted appointing two soldiers to perform 'occasional divine services' for wounded Muslims at each hospital, and the offices of front military mullahs were introduced during the military campaign [Russian State Historical Archive, f. 821, inv. 8, file 1064, s. 75].

Compulsory divine service 'for the health and prosperity of His Imperial Majesty and His Most August House' ²¹ also made collective Muslim prayer well-established in the army.

²¹ At the end of the 19th century this list included the following dates: 1 January—New Year's Day; 23 April—the Name Day of Empress Alexandra Feodorovna; 6 May—Birthday of Emperor Nicholas II of Russia; 14 May—the day of coronation of Emperor Nicholas II of Russia and Empress Alexandra Feodorovna; 25 May—Birthday of the Empress Alexandra Feodorovna; 22 July—the Name Day of the mother

However, the issue was entrusted to unit commanders with the connivance of the Military Ministry because there was no procedure for securing Muslims' religious rights in military regulations.

The observance of Muslims' religious rights was the best and most thorough in *burial ceremonies*. Starting in 1834, the Military and Naval Ministries awarded an annual sum of 100 rubles to non-Christian clergymen, in particular mullahs, for occasional service in hospitals [Complete Code of Laws of the Russian Empire–2, Vol. 11, Section 1, pp. 465–466]. It should be noted that it was uncommon for the military department to deny such remuneration.

The observance of Islamic burial ceremonies much improved after D. Milyutin's military reforms began to be implemented. In particular, military hospitals specified the exact size of the canvas to replace the typical coffin and, where necessary and when so demanded by the mullah, also the boards to put around the body [Svod voenny'x, 1869, Ed. 4, Vol. 16, Article 189]. In 1871 remuneration for each religious ritual performed at medical institutions was established for clergymen. However, in some cases non-Orthodox soldiers were buried without religious ceremonies [Petrovsky-Stern, 2003, p. 85]. From 1880 mullahs received specified remuneration for 'sick rites' and 'burial rites' [Kotkov, 1999, p. 42]. In the Kazan Military District in 1902, the following cost was specified for one non-Christian service by a non-Christian clergymen: 1 ruble 50 kopecks—in the Kazan Military Hospital and the Samara, Perm, Yekaterinburg, Syzran and Izhevsk Steel and Weapons Plant; 1 ruble—in

hospitals in Irgiz, Turgay, Aktyube, Karabutak, Uil, Saratov, Astrakhan, Orenburg, Troitsk and Simbirsk [Prikazy', 1902, p. 9].

The fact that Muslim servicemen could rest on annual *Islamic religious holidays Kurban Bayram and Ramazan Bayram* and participate in collective holiday prayers were the main indicators of the observance of Muslim religious rights in the army. On an empire-wide scale this problem was resolved by the 'supreme' order of 10 July 1819: after receiving three days off, military Muslims had the opportunity to participate in festive public prayers in the closest mosques or perform rituals where they were stationed, provided the commander approved of it [Zagidullin, 2006, pp. 63–66].

However, as early as in the early 20th century the circulars of the military department no longer had compulsory days-off in the calendar of Islamic holidays during this time. It is clear the reason why the War Ministry changed its attitude to this issue was that the Orenburg Muslim Spiritual Assembly provided a new list of Islamic religious holidays, increasing their number up to 9 (13 days off). The circular of the main headquarters No. 1 dated 1 January 1902 [Fabrika, 1997, pp. 179–180] stated the following Islamic holidays: Kurban Bayram (Id al-Adha, Festival of Sacrifice) and Ramazan Bayram (Id al-Fitr)—3 days each, Arafah, Ashura, Mawlid an-Nabi, Ragaib, al-Isra wal-Miraj un-Nabi, Baraat, Laylat al-Qadr—1 day for each holiday, with indication of the day of celebration. The final decision regarding when days-off should be provided was made by the chiefs of the military district staffs [Spravochnik, Book 2, p. 302]. Thus, only in Kazan did the Kazan military district provide conditions for public praying that honoured Kurban Bayram and Ramazan Bayram, while the rest of the recommended Islamic holidays were ignored [Prikazy' i prikazaniya, 1902, p. 127].

In the Russian army mutual assistance between enlisted men and officers of different confessions was common: during the Christian Festivals duties were imposed on non-Christians, and vice versa.

In the army two models of public prayer during religious holidays were used: if there

of Emperor Nicholas II of Russia the Empress Maria Feodorovna; 17 October—the day when the deceased emperor Alexander Alexandrovich and all his august family escaped from the danger of being killed during the train crash; 21 October—the day of ascension to the throne of Emperor Nicholas II of Russia; 14 October—Birthday of the Emperor's mother Empress Maria Feodorovna; 22 November—Birthday and Name Day of the heir and Grand Duke Michael Alexandrovich of Russia; 6 December—Name Day of Emperor Nicholas II of Russia; the first day of Shawwal, upon the performance of Eid al-Fitr; the tenth day of Dhu'l-Hijjah, upon the performance of Eid al-Adha.

was no mosque in the settlement a building for the praying assembly was provided by the commanders; if a mosque was available the military Muslims used it or gathered together in a building rented by civilians [Central Historical Archives of the Republic of Bashkortostan, f. I-295, inv. 3, file 5944, s. 2-4] until the troop units were transferred to the barracks [Lapin, 1991, pp. 151, 152], and some Islamic soldiers satisfied their religious needs at the place of their own accommodation. The Friday festive prayer required complete ablutions, but the military bathing day fell on Sunday. The only opportunity for a Muslim to perform this ritual was if he had the day-off or at night [Nasyrov, 2005, p. 62]. *No special building was provided for military Muslims to perform the Friday and five daily Islamic prayers.* Perhaps the only exception are the institutions where military servants convicted of offenses served [Complete Collection of Laws of the Russian Empire-2, Vol. 24, Sec. 1, No. 23062]. The Resolutions on military correctional troops and serf military prisoners (1867) specified the days on which Islamic and Jewish prisoners were released from work for prayer, and the location where prayer was required to take place. In addition, non-Christian prisoners could not use more holidays than the Christians [Svod voenny'x, 1869, Part 4, Book 17, Article 86, 307].

Thus, one of the main 'impairments of religious rights' of Islamic soldiers should be considered the absence of the legal right to perform the Friday afternoon and five daily prayers. Their situation was in sharp contrast with the enlisted Orthodox men, who saw the performance of religious rituals to be an integral part of military duty.

Eating in troop units was regulated by the respective Charters, and there was an established food ration for soldiers and officers. Enlisted men had the right to receive money instead of wine, yet this rule was not complied with everywhere. A traditional source of food for soldiers was pork, which was prohibited for Muslims.

Before enlisted men settled in the barracks they had ample opportunities to organise their nutritional intake on an individual basis. In or-

der to comply with the Islam canons regarding nutrition, an enlisted Muslim living in the barracks was doomed to a half-starved existence.

After the discussion on 6 February 1906 in Ufa on the question on respecting the religious rights of Muslims, the public Tatar men requested the authorities exclude pork from the food ration of Muslim military servants and not provide them with alcoholic drinks. The Main Headquarters stated in its defense that it was impossible to arrange 'separate cooking' for Muslim soldiers due to their small number. When battalions and regiments were housed in various scattered locations, if Muslims ate from a common kitchen, in the commanders' opinion, the result would be the frequent absence of enlisted men from their troops and teams, which could adversely impact discipline. As regards drinking wine, it was stated that enlisted men were to be given money instead of their 'portion of wine', provided that 'they submit a statement of their refusal to drink wine' [Russian State Historical Archive, f. 821, inv. 8, file 633, s. 13, 32-32 reverse].

The internal order and common procedure for taking meals were the main obstacles in keeping fast for military Muslims.

Islamic Clergymen and the Military Department. In each troop unit Islamic soldiers formed a local ethnic confessional unit that elected the public clergyman. The Emperor's edict of 7 March 1849 declared for the field army sent to suppress the Hungarian Revolution established extremely simplified rules for taking exams to hold the position of public mullah for enlisted men: 1) the examination was conducted by a local civilian mullah; 2) 'attached the certificates issued, while making entries in the forms of the enlisted men being examined, to the exam sheets when they were qualified to be commissioned as officers and receive one and two thirds of an officer's salary'; 3) the military supervisors had no right to subject 'enlisted men who had successfully passed the test' to this procedure again [Complete Code of Laws of the Russian Empire-2, Vol. 24, Sec. 1, No. 23064].

The Emperor's edict of 26 June 1877 specified that in troop units situated in locations

where no civil imams were available, enlisted men shall elect public mullahs from their own environment [Arapov, 2003, p. 73].

However, public mullahs were only called up to perform public namaz and other occasional services as needed. Record keeping for deceased soldiers was the responsibility of commanders, who were to notify the local police to the fact of death.

In the first quarter of the 19th century the satisfaction of Muslim religious needs in military institutions was a matter of conscience of the local civil imams, and in no way the responsibility of the officers. In the second quarter of the century regulations on the allocation of funds to 'perform spiritual services' for the military ranks of non-Orthodox confessions started to be adopted.

The first staff military mullahs (received salary and retired with a pension) came to their positions not later than in the beginning of the 19th century in the Baltic fleet and guards units that remained in the capital. They were appointed from the ranks of enlisted Muslims who were familiar with Islamic rituals and could read and write in Russian.

In 1846 the legal position of Islamic clergymen in Guards troop units fell under regulations [Complete Code of Laws of the Russian Empire–2, Vol. 25, Section 1, No. 20036], and their number increased in 1850. The additional positions of staff assistants to the senior akhund (salary was 428 rubles per year), imam (294 rubles) and two muezzins (195 rubles each) were also created [Russian State Historical Archive, f. 821, inv. 8, file 1064, s. 11].

In 1848 military mullahs made an unsuccessful attempt through the Spiritual Assembly to obtain the right 'to wear religious clothes' instead of the soldier uniform, and a beard, as was practiced among the troop's Orthodox churchmen [Azamatov, 2002, p. 746].

In 1855 the regulation 'on the provision of travelling allowance to mullahs and rabbis' who were sent on missions to various troops to perform spiritual services and administer the oath to enlisted Muslim and Jewish men began to be enforced. Their allocations were the following: for trips, a travelling allowance (two

horses per person) and food allowance of 60 silver kopecks per person [Complete Code of Laws of the Russian Empire–2, Vol. 30, Section 1, No. 29904]. The new strategy of the authorities to some extent helped attract mullahs to hospitals, infirmaries, prisons, troop units, and judicial and other institutions. However, due to the fact that enlisted men of the Islamic confession were scattered across military districts that had no Islamic enclaves, these means could never be used to their full extent. The enforcement of the laws on the payment of services to civil mullahs depended fully on the availability of funds and the political will of the leadership of the military district and commander of the troop unit.

In places where the troop units of the Internal Guard of the Volga and Urals region (until 1866) were located, the positions of salaried mullahs were established in Kazan (1838), Simbirsk (1838) and Ufa (1844). Subject to the approval of the local military supervisors, and the good behaviour, initiative and persistence of enlisted men, a local parish imam could be granted a salary and become a staff military mullah who visited non-Christians at the time agreed with the commander to render spiritual services.

Military mullahs received parish registers from the Spiritual Assembly in which they entered information on the births, deaths, marriages and divorces in the families of military servants.

From 1870s–1890s the governorates and regions of the Orenburg Muslim Spiritual Assembly district had several military clergymen: in Saint Petersburg there was the senior akhund, his assistant imam and two muezzins, and one mullah in Helsingfors (Finnish Military District), Nizhny Novgorod, Kostroma (Moscow Military District), Warsaw (Warsaw Military District) [Zagidullin, 2006, pp. 22–29].

Over time the privileges of priests of other confessions began to be applied to military mullahs [Spravochnik, Book 1, p. 410; Priказы', 1887, p. 414; Complete Code of Laws of the Russian Empire–3, Vol. 10, Section 1, No. 6528].

In 1896 the staff positions of military mullahs were eliminated in the regular land forces [Complete Code of Laws of the Russian Empire–2, Vol. 30, No. 29903].

In 1845 the Navy Department instituted the staff positions of mullahs with an annual salary of 142 rubles 85 kopecks in silver for all Russian ports.

After the positions of military mullahs had been eliminated in the 1890s due to the small number of Muslim sailors in the Black Sea Fleet (Nikolaev port (Kherson guberniya) and Sevastopol), clergymen staff were only kept in the Caspian flotilla and in the Baltic fleet in Baku (imam) and Kronstadt (imam and assistant) [Zagidullin, 2006, p. 30].

In the early 20th century the Islamic community began to view the absence of salaried military mullahs as an impairment of the rights of co-religious military servants. Only in 1908 were the staff positions of military mullahs approved: 2 positions per district in the Vilna, Warsaw, Kiev, Amur river districts, and 1 position in the Moscow military districts. In finan-

cial terms, for the first time they were also now equal with the clergymen of other confessions [Abdullin, 2007].

Thus, the Military Department tried to meet the religious needs of confessional minorities, while at the same time observing the Orthodox religious traditions already integrated in the internal order of troop units. This was the main reason for the secularisation of the spiritual and ethical education of Muslim military servants in regular forces. In an institution as closed as the Russian army, completely incompatible principles did sometimes coexist. For instance, the principle of reduced religious tolerance (providing an opportunity to military servants to perform certain Islamic rituals) and the principle of the assimilation of co-religionists through baptism.

In the clerical state impairment of the religious rights of Muslim military servants was observed. Muslims paid state taxes and could hypothetically look to use these funds for the religious needs of their co-religionists in the army, as was the practice among enlisted Orthodox men.

CHAPTER 5

N. Ilminsky's Missionary System of Religious Enlightenment and the Peoples of the Volga-Ural Region

Leonid Taymasov, Radik Iskhakov

Throughout their centuries-long history in Russia, non-Russian peoples have witnessed varying degrees of unification among the multi-confessional population upon the foundation of Christian (Russian Orthodox) values. It was in the Middle Volga region where a number of novel missionary ideas were tested before they contributed to the promotion of Orthodox Christianity in the eastern periphery of the Russian Empire and beyond. The Orthodox mission's goals and methods changed depending on the epoch; after major shifts started taking place in the multi-ethnic society, the autocratic government continued to view Orthodox Christianity as crucial to the formation of an all-Russian identity. Intensified Orthodox missionary activities in the second half of the 19th brought about material changes to the nature and course of ethno-cultural processes in the Middle Volga region. Each epoch has its own heroes. Nikolai Ilminsky (1822–1891) made a special contribution to the Orthodox mission by developing and introducing the new concept of religious enlightenment known as the Ilminsky System.

He developed it largely because the government was searching for the best forms of a complete and powerful integration of local peoples into the Empire's social, legal and cultural environment. Other factors that played a part in the development of new approaches to missionary work and schooling and their adoption as official policy in the region was the need for efficient measures to check the cultural and religious influence of Islam. Increasing Orthodox conversion into Islam in the second half of the 19th century among not

only Christian Tatars, but also other non-Russian people of the region residing in contact areas, though of a local nature, could not but instill apprehension in the church and secular administrations who wanted to keep the Orthodox faith dominant, which the further territorial expansion of Islam could threaten. It was therefore permitted to engage Orthodox missionaries in the development of new measures to confront Islamic influences. A dedicated anti-Islamic department was established at the Kazan Theological Academy (KTA) in 1854. Starting in the 1840s Kazan missionaries carried out intense research on the status of Orthodox Christianity and Islam in local ethnic groups, and searched for new academic approaches that could make the Orthodox faith more influential among non-Russians, which eventually brought about this new ideology of enlightenment by N. Ilminsky. Chiefly because the author gave up on forced Russification and Christianisation, which had proven inefficient, and instead took into account the socio-cultural features of the non-Russian peoples, relying on their willingness to develop spiritually and culturally, his approach proved the most consistent with the goal of a stable and relatively quick promotion of the Orthodox ideology and Russian cultural identity among the non-Russians of Eastern Russia. This is why N. Ilminsky enjoyed complete support both locally (KED Curator P. Shestakov, Archbishop Antonius (Amfiteatrov) of Kazan) and at the state level (Minister of Public Education and Ober Procurator of the Synod D. Tolstoy (1865–1880), Chief Procurator of the Synod K. Pobedonostsev (1880–1905)). In the early 1870s his ideas

N. Ilminsky. Lithography from the 2nd half of the 19th century

underlay the basic educational and religious policy of the imperial government for non-Christian non-Russians in the region.

The bourgeois reforms of the 1860s and a certain degree of social democratisation in Russia awoke non-Russians' interest for history, culture and education. K. Ushinsky's teaching system, which was based on the idea of wide access to education, had a significant impact on the development of schooling. Taking into account the current socio-economic processes, N. Ilminsky estimated the ethno-confessional situation accurately and suggested certain ways of modernising and developing non-Russian education that were to become the main channel that brought Orthodox Christianity and Russian culture to the non-Russian population. In 1864 Ilminsky wrote that 'Christian peoples have been craving education recently'. He wanted to take advantage of the movement by 'turning it where we need, and proving the superiority of our education and religion in practice' [Ilminsky, 1865, p. 89]. Believing that school had an influence over one's 'mindset', he ad-

vocated for a new school that would not repel non-Russian Christians, but instead be 'intelligible and appealing' to them. He suggested instruction in their native language, as he believed it to be 'most efficient to translate educational books that are useful and edifying for common people into non-Russian languages' [Ilminsky, 1865, p. 7]. N. Ilminsky viewed using the native languages of non-Russian peoples as a way to attract them to Christianity as the first stage of their spiritual Russification. 'The religious motion of one's heart is so much more powerful and profound when non-Russians hear the Christian truth in their native language rather than in Russian... As soon as Christian custom and rules are instilled in non-Russians with the help of their own language, they will be Russified', he wrote [quoted by: Znamensky, 1892a, p. 204]. Spiritual Russification was viewed not as a transformation of non-Russians into Russians, but as a spiritual unity of Russia's peoples within an Orthodox framework.

Elaborate speculations and missionary experience led N. Ilminsky to realise that the familiar religious images of New Christians 'are the essence of their thinking and the foundation of their morals' [Ilminsky, 1864, p. 30]. He wrote, 'A simple man thinks and feels in a holistic manner, in one consistent direction, and he values his religious beliefs, whatever they are, because they are his life. Should we look down on non-Russians and despise their ideas as nonsensical? To make sure that the truth we teach to the common man takes deep root in their mind, we have to try on their own mindset, take their beliefs for granted and develop them. Christianity is capable of assimilating the obsolete, simple and unsophisticated beliefs of Shamanist peoples...' [Ilminsky, 1864, p. 8]. N. Ilminsky viewed native languages as the only solution to complicated missionary and educational issues. 'Those who speak to non-Russians in their mother tongue, ' he wrote, 'is understood by them and can persuade them, because with their words he uses elements of their thinking' [Ilminsky, 1864, p. 8]. N. Ilminsky described his system in a nutshell as a well-known triade in his let-

ter to K. Pobedonostsev: 'My armaments are non-Russian books, non-Russian divine service, and a non-Russian parish headed by a priest' [Ilminsky, 1898, p. 178].

The first step towards the development of his new missionary and educational approaches was the establishment of an educational institution guided by N. Ilminsky's theory. In 1863 the first tatar Christian to become an Orthodox leader and disciple of N. Ilminsky, Vasily Timofeev, started to provide instruction in Tatar to dozens of Kryashen children. In the following year the Kazan Central Christian Tatar School (KCCTS) was granted official status thanks to N. Ilminsky. It went on to become the model for schools opening in other localities in the Kazan guberniya and beyond. After Ilminsky's system had been introduced officially, all instruction in the first grade (2 years) of people's schools—one class, four years—was in the native language, while Russian was a subject. Russian then became the language of instruction in the second grade. N. Ilminsky believed people of the same ethnic origin as their students made the best teachers at non-Russian people's schools. He maintained that Russian teachers must know their students' mother tongue and use it for educational purposes. Ilminsky believed that textbooks 'should be written in the students' mother tongue' in cyrillic script. He wanted to adjust the organisational structure of Russian schools, their educational methods and how they were adapted to meet the population's ethnic features.

Despite support from outstanding members of the political elite, Ilminsky's theory always had numerous opponents among public activists and in the bureaucratic system. The confrontation between advocates for the system and its adversary peaked in the late 1860s. The fierce dispute had to answer the question of how indigenous peoples in Eastern Russia were to be integrated, whether through cultural and linguistic unification or Christian enlightenment. This would largely determine both the government's ethnic policy and the Russian Orthodox missionary movement.

One of the first forces to criticise the system was the Orthodox clergy, who viewed attempts at introducing divine services in non-Russian languages as debasing to the Orthodox Church [Grigoryev, 1948, p. 263]. Their protest motivated advocates of the new system to attract members of the local peoples to the clergy, ruining the traditional practice of parish inheritance and increasing competition.

Apart from purely missionary issues, the discussion on Ilminsky's system addressed educational methods for ethnic minorities. But the language of instruction as non-Russian was a real stumbling block. Even Ilminsky's friends and associates sometimes disapproved of his teaching experiments. For instance, E. Malov, who had been working with him for years and managing the KCCTS, was opposed to offering educational instruction in languages other than Russian to Christian Tatars. His diary contains a curious remark on this fact: 'Why force children to study in Tatar when their parents want Russian to be the language of instruction? We should accept this wish happily and make sure that non-Russians forget their language completely and become Russified; otherwise they will always be our enemies' [Malov, 1993, p. 41].

Apart from N. Ilminsky, the Chairman of the Buinsk School Council priest A. Baratynsky also raised the question of education for the indigenous peoples of Eastern Russia. In 1864 he filed two documents to the Ministry of Public Education, namely the 'Project for Organising Village Schools in the Buinsk Uyezd' and the 'Memorandum on the Introduction of Russian and Russian Literacy in Tatar Schools' [Russian State Historical Archive, f. 733, inv. 170, file 143, s. 1–28 reverse]. A. Baratynsky's suggested that Russian should be the only language of instruction at missionary schools because he believed language to be the key to ethnic identity. He believed that the development of non-Russian culture and written language could cause them to form an intelligentsia, create a culture, and eventually

demonstrate increasing national awareness and 'separatism' [Sbornik, 1869, p. 16]. In A. Baratynsky's opinion, 'the artificial reinforcement of the Tatar element in the eastern periphery of Russia (through the development of school education), and the merging of different non-Russian groups into a homogeneous non-Russian mass, even with considerable Christian enlightenment, is by no means welcome' [Sbornik, 1869, p. 15].

A. Baratynsky was supported by officials from the Ministry of Public Education, headed by a Member of the Academic Committee and Professor at the University of Saint Petersburg V. Grigoryev. Most of them expressed their opposition to further extending the use of Ilminsky's system at the Committee's extraordinary meeting on 20 February 1867. They believed that education for non-Russians should become the main channel of their Russification: 'the fact that education can only be successful when provided in a language intelligible to children does not mean that a non-Russian language should be the language of instruction at school. If we let this happen and publish special books in this language but with cyrillic characters... it might awaken tribal vanity and respect for their own language, which would be a nuisance to the Russian government and society' [National Archives of the Republic of Tatarstan, f. 10, inv. 2, file 1119, s. 138]. As an alternative to N. Ilminsky's ideas, educational Russification methods were suggested that were popular before the system

was established and used to be at the core of non-Russian education in the Empire. This approach was widely used in the Caucasus, where it was introduced in the 1850s on the order of the Curator of the Caucasian Educational District Baron Nikolai. The suggestion was to extrapolate this experience to the Middle Volga Region, while adding another year to the curriculum for Russian classes [Iskhakova, 2001, p. 170].

Members of the Kazan Committee for non-Russian Education, headed by P. Shestakov, Chairman of the School Council priest M. Zefirov, and Inspector of Chuvash Schools N. Zolotnitsky, disagreed openly and presented their own opinion to the Ministry of Public Education in early 1868.

Another reason why the dispute on Ilminsky's system was so complicated and tense and involved so many public officials and social activists who were not directly concerned, was its connection with an important issue that was on the agenda in the post-reform period and dealt with growing Russian national awareness and a search for Russian cultural and its ideological framework. The question was this: What is the key, fundamental indicator of being Russian in a modern society undergoing secularisation, cultural and linguistic affiliation (ability to speak Russian) or existing as Orthodox Christian? Lively literary polemics between representatives of the first approach (The editor of 'Moskovskiye Vedomosti' ('Moscow Newsletter') M. Katkov) [Sobranie, 1897] and Slavophile journalists like Yu. Samarin and I. Aksakov [Samarin, 1997] triggered an intense public response and was crucial to the government's decision. However, advocates for total cultural and linguistic unification, namely officials in the Ministry of Public Education who had experience in administration in the Western Krai and in the Caucasus, would not put up with the vision of N. Ilminsky and his associates, who believed Orthodox Christianity to be the 'cornerstone of both the Russian national identity and the Russian state', the acceptance of which would make non-Russians become culturally and spiritually 'Russian' [Ilminsky,

1883, p. 34]²². The polarisation in public education and the different ideological and conceptual approaches motivated the Ministry of Public Education to initiate a wider discussion on this complicated issue. Feedback was collected from 36 school councils in seven multi-ethnic governorates and published as a separate book in 1869 [Sbornik, 1869]. The information collected was discussed by an extended meeting of the Council of the Ministry of Public Education, which took place of 8 February 1870, presided over by D. Tolstoy and attended by the Curators of the Kazan and Orenburg Educational Districts.

Ilminsky's system there was officially recognised as the primary method of instruction for Christian representatives of the non-Russian eastern peripheral population of Russia. Though many activists were opposed to using languages other than Russian for missionary and educational activities, N. Ilminsky's associates prevailed. This is highly attributable to the administration of the Synod and the Ministry of Public Education, which relied on the intensification of Christian enlightenment for the region's indigenous peoples by developing missionary schools with the native languages of the population for instruction. As they realised the 'danger' of introducing Ilminsky's system on a large scale, which was capable of causing an increase in the national awareness of non-Russians, the religious and secular authorities still knew this to be a prerequisite for a breakthrough in the imposition of Orthodox Christianity on non-Russians and their integration into the Russian cultural environment.

The use of Ilminsky's system in educational missionary activities was enshrined in the Regulations on Educational Measures for non-Russians Who Inhabit Russia dated 26 March 1870 [Svod glavneyshix, 1882, pp. 42–45]. They notably mentioned: 'a) native languages

must be the instrument of primary education for each tribe; b) teachers at non-Russian schools must come from non-Russian tribes and have good Russian skills or be Russian and able to speak the non-Russian language... Textbooks include ABC books, appropriate prayers, short narratives from the Holy History, the Old and New Testament, and books edifying religion. To facilitate the transition to studying Russian for non-Russians... the books shall be printed in the non-Russian language using cyrillic, with or without translation into Russian, with the exception of prayer and other worship books, which must contain translations into Russian' [National Archives of the Republic of Tatarstan, f. 92, inv. 1, file 9940, s. 57 reverse–58].

The system became full-fledged in 1872 after the Kazan Seminary for Non-Russian Teachers (TSK) was established and N. Ilminsky was appointed its principal. The authors of the project expected the Seminary to facilitate a 'union between the non-Russian tribes and the Russian people through (Christian) enlightenment' [Voronets, 1873, p. 319]. As a closed-type educational establishment, the Seminary accepted both Russians and members of the indigenous peoples of the Middle Volga region. A large number of Russians were expected to ensure the Russification of the rest of the students by imposing Orthodox traditions and culture upon them. Four primary schools (Chuvash, Mordvin, Udmurt, Mari) opened on the premises of the TSK, where teaching practicums were offered to seminary students. N. Ilminsky remained in office until his death. He contributed to the establishment of the teaching schools in Ufa (1872), Birsik (Mari-Chuvash, 1882) and Orsk (Orenburg Kazakh School, 1883).

N. Ilminsky was also one of the co-founders of the missionary Brotherhood of St. Gury (1867) and the head of its Translation Board. Cyrillic alphabets were created for those peoples in Eastern Russia who did not have writing systems in order to 'deliver the truth of the Christian faith to them in their native language'. This was assisted in large part by

²² One such public figure was the author of the depolonisation and inculcation of the 'Russian concept' in the Western region and trustee of the Vilna school district (from 1868 also a member of the Board of the Ministry of National Education) I. Kornilov [see: Russian State Historical Archive, f. 970, inv. 1, file 99].

Kazan missionaries headed by N. Ilminsky, who developed the theoretical and scientific foundation for the new alphabets and translations of Orthodox texts into local languages. He translated not only into Tatar, but also into Chuvash, Mari, and Udmurt; he was an astonishingly quick learner when it came to languages. N. Ilminsky's activities were aimed at ensuring a 'powerful unification between non-Russians and the indigenous population by means of enlightenment', a term that primarily referred to Orthodox education. While promoting the Gospels to all peoples, he wanted to integrate non-Russians into the Russian and, indirectly, global culture to make the values of other peoples in Russia available to Russians. He often engaged members of the nascent ethnic intelligentsia in his translations. V. Timofeev and KCCTS students edited Tatar translations; G. Yakovlev, I. Kedrov, and P. Eruslanov handled Mari, while K. Andreev, and also I. Mikheev from the 1890s, worked with Udmurt, and A. Yurtov, M. Yevseyev, and others with Mordovian. Thanks to the development of public education, regional periodicals provided better coverage of the culture and religion of the Volga peoples, and a translation of the Holy Scripture was begun.

The fundamental principles of Ilminsky's teaching system as he described it in a number of works were as follows: 1) provide instruction to children in their native language and create reference materials—ABC books, readers, arithmetic and theology textbooks—in their native mother tongues; 2) teach Russian as a subject in Russian with the help of high-quality textbooks depending on the ethnic group of the students; all students were expected to possess enough knowledge of Russian 'to be able to understand further instruction in Russian' after four years of primary school; 3) high standards for teachers, who could be either the same ethnic group as their students or fluent in their native language, also Orthodox; 4) Ilminsky also attached great importance to girls' education, believing mixed sex study groups to be possible at secondary and higher educational establishments. According to the enlightener,

missionary primary schools were to undertake certain family functions, as non-Russian families could not provide a Christian upbringing. Ilminsky viewed Christian upbringing at school as opposed to being brought up in a Pagan or Islamic family. Therefore, academic activities had to make allowances for the ethnic group's national traditions, custom, lifestyle, and mindset. Teachers were expected to be at least fluent in the students' language, and preferably of the same ethnic affiliation. They were also expected to know Russian. Primary education was to combine instruction in the native language with Russian classes. Russian would only become the dominant language of instruction when mastered well enough. N. Ilminsky expected the educational programme to be of an exclusively religious missionary nature. He declared frankly that it is religious sense and not intelligence that he wanted to develop, and that he expected each student 'to develop a Christian spirit and be able to fathom Orthodox dogmas' [Yakovlev, 1998, p. 301].

Apart from the pedagogical constituent of Ilminsky's system, the church missionary aspect was also important, namely the use of native languages in divine services, and engaging indigenous clergymen to cooperate with missionary teachers in supporting the church among local residents who were not loyal Orthodox Christians. N. Ilminsky emphasised that Christianity can only take deep root in the mind of non-Russians if they came to understand its content and became full members of the parish. This required a divine service that would be intelligible in the congregation's native language. The chief conductor of church reforms in an ethnic parish was expected to be a spiritual leader who knew the local language enough to use it for missionary and educational activities. N. Ilminsky believed that a priest of the same ethnic group as his parish people would be the best candidate because 'apart from language skills, tribal affinity is important to meet the people's spiritual, that is, mental, moral, and Christian needs. This is why Russian priests and teachers who are fluent in the native language cannot have as

much influence on the non-Russian population as authentic non-Russians do' [quoted by: Mashanov, 1892, p. 174].

The possibility of appointing indigenous, non-Russian priests was enshrined in 1867, when D. Tolstoy submitted the suggestion to the Synod on N. Ilminsky's initiative that Christian Tatar priests should be assigned to Tatar Christian parishes. The Synod agreed with its Chief Procurator and permitted under the Order of 19 July 1867 to accept the alumni of missionary schools as ethnic parish priests upon the following conditions: mature age (at least 30), knowledge of the key Orthodox dogmas, divine service procedures, and Russian language [Russian State Historical Archive, f. 797, inv. 36, section 2, file 251, s. 17–20 reverse; *Izvlecheniya*, 1867, p. 46–47]. Later, the Synod's Order of 15 January 1883 officially permitted 'performing divine service in the languages of the non-Russian peoples of Eastern Russia', which de facto became common missionary practice of the Kazan and Altai missionaries in the late 1860s. The enactment specified the following scope of use for non-Russian languages in divine services: a) both public and private divine services in native languages was acceptable 'where a more or less significant number' of representatives of non-Russian Christian peoples were present; b) such a divine service was to 'use translations by the Translation Board' of the Orthodox Missionary Community under the Brotherhood of St. Gury; handwritten texts it approved were temporarily acceptable; c) wherever Russians attended the divine service, it was to be delivered in both the non-Russian language and Russian [O *czerkovnom*, 1883, pp. 14–15].

N. Ilminsky and his associates' efforts gradually caused non-Russian languages to become more common in church practice, and the indigenous Orthodox clergy grew. In particular, in 1904 the Bishopric of Kazan employed 68 indigenous priests, which accounted for 9.1% of its total clergy [Bobrovnikov, 1905, p. 178]. When Ilminsky's system was introduced, it turned the Russian
